## PREFACE.

The object of this Manual is to present descriptions of the wild fern-plants and seed-plants of northeastern North America in the light of our present understanding of them and of their interrelationships, accompanied by citations of their known natural distribution, their habitats, and their periods of flowering.

The area embraced in this study extends from Newfoundland and Labrador to Manitoba, the southern boundary of Virginia, Kentucky and Kansas, and the western boundary of Kansas and Nebraska.

The work is based largely on the text of the "Illustrated Flora" prepared jointly by the author and Judge Addison Brown, published by Chas. Scribner's Sons, 1896 to 1898 , in three volumes, which contain, in addition to the more lengthy descriptions than are possible in this book, owing to the necessity of issuing it in one volume of convenient size, illustrations of the species described, 4,162 in all. In order to afford ready reference by those using this Manual to figures of the plants, those of the "Illustrated Flora" are here cited by number at the beginning of each description [I. F. fig. 2042].

During the time which has elapsed since the publication of " Illustrated Flora" a number of additional species have been made known within the area included in both works, and descriptions of these have been incorporated into this Manual in so far as they are understood by me.

In order to meet present requirements in a text-book and to bring , Jur botany into closer relationship with procedure in other natural sci ences, all measurements are given in the metric system. For the convenience of those not yet wholly familiar with this system the following ${ }^{\gamma}$ table of approximate equivalents will be useful :

The arrangement of orders and families adopted is essentially that of Engler \& Prantl's " Natürlichen Pflanzenfamilien,'" Berlin, $1890-$ rgor, an arrangement which seeks to bring out something of the divelopmental relationships of the groups by proceeding from the more simple to the more complex. Order and family are not here regarded as synonymous terms, but are used, as by zoologists, in the sense of the former being composed of the latter ; thus the order Liliales is composed in our territory of the families Juncaceae, Melanthaceae, Liliaceae, Convallariaceae, Smilaceae, Haemodoraceae, Amaryllidaceae, Dioscoreaceae, and Iridaceae.

In the scientific nomenclature the principles adopted by the botanists of the American Association for the Advancement of Science at a meeting held in Rochester, N. Y., in 1892, and in Madison, Wis., in 1893 , supplementary to the Code of Nomenclature adopted by the International Congress of Botanists held in Paris, France, in 1867, have been followed ; these principles are essentially the same as those followed by American zoologists. An English name has also been associated with each species, accepted either from popular usage or chosen in reference to some more or less distinctive feature of the plant. The citation of synonyms is mainly restricted to cases in which the names here used differ from those in "Illustrated Flora."

Keys formed by the grouping of contrasting features have been prefixed to the descriptions of species, genera and families, and a general key to the orders follows this preface.

The collections on which the descriptions are based are nearly all at the New York Botanical Garden.

I take much pleasure in acknowledging important assistance in the preparation of the work by my associates, Prof. L. M. Underwood, Dr. John K. Small, Dr. P. A. Rydberg, Mr. G. V. Nash, and Mr. E. P. Bicknell.

N. L. B.

## TABLE OF CONTENTS.

General Key to the Orders
PAGE.
Descriptive Flora ..... 1-1036
Appendix ..... IC
Glossary of Special Terms ..... 105
Abbreviations of the Names of Authors ..... 1061
Index of Latin Names. ..... 1065
English Index of Plant Names ..... 107?

## GENERAL KEY TO THE ORDERS.

## Subkingdom PTERIDOPHYTA................... I

Spores developing into flat or irregular prothallia which bear the reproductive organs (antheridia and archegonia); flowers and seeds none.
Sporanges (spore-cases) borne on the back of a leaf, or in spikes or panicles.
Order 1. Filicales...... I
Order 2. Salviniales...
$\begin{aligned} & \text { Sporanges contained in sporocarps. } \\ & \text { Sporanges clustered underneath the scales of a terminal cone-like spike; stems } \\ & \text { jointed, rush-like. }\end{aligned}$
Order 3. EQUISETALES...
Sporanges borne in the axils of scale-like or tubular leaves.
Order 4. Lycopodiales.. $4_{3}$

## Subkingdom SPERMATOPHYTA <br> 30

Microspores (pollen-grains) developing into a tubular prothallium (pollentube); macrospores (embryo-sac) developing into a minute prothallium, and, together with it, remaining enclosed in the macrosporange (ovule) which ripens into a seed; flowering plants.

1. Ovules not enclosed in an ovary.
Class r. GYMNOSPERMAE.
2. Ovules enclosed in an ovary.
Class 2. ANGIOSPERMAE...

* Embryo with I cotyledon ; stem with no distinction into pith, wood and bark; leaves mostly parallel-veined. Subclass I. MONOCOTYLEDONES..
$\dagger$ Carpels I OR MORE DISTINCT (united, at least partially in family Scheuchzeriaceae of the order Naiadales, in which they are mostly united until maturity, and in family Vallisneriaceae, also of the Naiadales, which are aquatic herbs with imperfect flowers); parts of the flowers mostly unequal in number.

30
$3^{8}$

Inflorescence various, not a true spadix.
Flowers not in the axils of dry chaffy scales; our species aquatic or marsh plants.
Endosperm mealy or fleshy; perianth of bristles or chaffy scales; flowers monœecious, spicate or capitate. Order I. Pandanales..
Endosperm none, or very little; perianth corolla-like or herbaceous, or
Order 2. Naiadales.... 40
Flowers in the axils of dry chaffy scales, arranged in spikes or spikelets.
Order 3. Graminales... 61
Inflorescence a fleshy spadix, with or without a spathe; or plants minute, floating free, the flowers few or solitary on the margin or back of the thallus.

Order 6. Arales....... 228
$\dagger \dagger$ Carpels united into a compound ovary ; parts of the usually complete flowers mostly in 3's or 6's.
Seeds with endosperm.
Flowers regular, or nearly so (corolla irregular in Commelina).
Endosperm mealy; ovary superior. Order 7. Xyridales.... 235
Endosperm fleshy or horny; ovary superior or inferior.
Order 8. Liliales..... : 244
Flowers very irregular; ovary inferior.
Order 9. Scitaminales. 288
Seeds without endosperm, very numerous and minute; ovary inferior.
Order io. Orchidales.

Series I. Choripetalae.
$\ddagger$ Petals none (except in family Portulacaceae and in most Caryophyllactae, which are herbs with the leaves nearly always opposite, the seeds with enclosperm, and in the pistillate flowers of the walnuts) (Juglans). Calyx none (except in the family Juglandaceae, trees with odd-pinnate leaves).

Marsh herbs with small perfect flowers, in nodding spikes in our species.
Order 2. Piperales.
Trees or shrubs ; staminate flowers, and sometimes also the pistillate, in aments. Leaves simple.

Fruit many-seeded ; seeds with a tuft of hairs at one end.
Order 3. Salicales

## Fruit 1-seeded.

$\qquad$

Stigmas 2; ovule orthotropous; endosperm none
Order 4. Myricales........ 320
Style stigmatic above; ovule amphitropous; endosperm thin.
Order 5. Leitneriales.... 321
Leaves odd-pinnate; fruit a nut enclosed in a husk.
Order 7. Juglandales..... 322
Calyx present.
Flowers, at least the staminate ones, in aments. Order 8. Fagales. ......... 326
Flowers not in aments (in ament-like spikes in Morus) ; but variously clustered, or rarely solitary.

Flowers monœcious, diœecious or polygamous (sometimes perfect in Ulmus) ; ovary superior, i-celled. Order 9. Urticales....... 337
Flowers diœecious or perfect ; ovary inferior, at least in part.
Ovary i-celled. Order ir. Santalales...... 344
Ovary several-celled (usually 6-celled flowers perfect).
Order 12. Aristolochiales. 346
Flowers mostly perfect in our genera (diæcious in some species of Rumex in the family Polygonaceae ; monœecious or diœcious in some Chenopodiaceae and Amaranthaceae) ; ovary superior.

Embryo straight or nearly so; fruit an achene.
Order 13. Polygonales..... 350
Embryo coiled, curved or annular; fruit not an achene.
Order i4. Chenopodiales.
$\ddagger$ Petals present (wanting in Ceratophyllaceae, aquatic herbs with whorled dissected leaves; in many Ranunculaceae; in Calycocarpum, a diœecious vine of the Menispermaceae; in Lauraceae, alternate-leaved aromatic trees and shrubs; in Podostemaceae, aquatic herbs with the simple flowers involucrate; in Liquidambar, a tree of the Hamamelidaceae with palmately lobed leaves and capitate flowers; in Sanguisorba, pinnate-leaved herbs of the Rosaceae; in Xanthoxylum, pinnate-leaved trees of the Rutaceae; in Euphorbiaceae; in Callitrichaceae. Empetraceae and Buxaceae; in some of the Aceraceae and Rhamnaceae; in Thymeleaceae, Elaeagnaceae and in some species of Ludzuigia in Onagraceae: in Hippuris and Proserpinaca of the Haloragidaceae,
and in Nyssa of the Cornaceae).
A. Ovary superior, free from the calyx (partly or wholly inferior in some Saxifragaceae, in Hydrangeaceae, Grossulariaceae, Hamamelidaceae, Pomaceae, and

Carpels solitary, or several and distinct (united in some Nymphaeactae); stamens mostly hypogynous and more numerous than the sepals; sepals mostly
distinct.
'Carpels 2 or more, united into a compound ovary; stamens hypogynous; sepals mostly distinct.

Plants not insectivorous.

Insectivorous plants, secreting a viscid liquid, with basal leaves and scapose flowers.

Order 17. Sarraceniales.
Carpels solitary, or several and distinct, or sometimes united; stamens mostly perigynous or epigynous; sepals mainly united or confluent with the concave receptacle (hypanthium).

Order 18. Rosales. .
Carpels united into a compound ovary; sepals mostly distinct (united more or less in some Rhamnaceae).

Stamens few, rarely more than twice as many as the petals.
Stamens as many as the sepals or fewer and opposite them, or more numerous.

Ovules pendulous, the raphe toward the axis of the ovary.
Order 19. Geraniales..... 572
Ovules pendulous, the raphe away from the axis of the ovary, or erect, or ascending.

Order 2o. Sapindales. .... 597
Stamens as many as the sepals and alternate with them, opposite the petals when these are present; ovules erect.

Order 2I. Rhamnales.
611
Stamens usually very numerous (except in some Hypericaceae, in Elatinaceae, Violaceae and Passifloraceae); disc inconspicuous, or none.

Sepals valvate; placentæ united in the axis of the capsule.
Order 22. Malvales........ 61
Sepals or calyx-segments imbricated or convolute (except in Loasaceae, in which the calyx-tube is adnate to the ovary; placentæ mainly parietal, sometimes united in the axis.

Order 23. Parietales.... 623
B. Ovary inferior, adnate to the calyx, wholly or in part (except in Lythraceae and our Melastomaceae, where it is usually merely enclosed by it, and in Thymeleaceae and Elaeagnaceae, which are shrubs or trees with no corolla).

Fleshy spiny plants, with jointed stems, the leaves very small or none in our genera; calyx-segments and petals very numerous.

Order 24. Opuntiales...... 642
Herbs, shrubs or trees, not fleshy nor spiny; calyx-segments rarely more than 5 . Petals none in our species; ovary r-ovuled. Order 25. Thymeleales... 645 Petals present (except in some Haloragidaceae, small aquatic herbs).

Ovules several or numerous in each cavity of the ovary (except in Haloragidaceae and Trapaceae, aquatic herbs).

Order 26. Myrtales. . . . . . 647
Ovule I in each cavity of the ovary. Order 27. Umbellales..... 667
$\dagger \dagger$ Petals more or less united (nearly or quite separate in Clethraceae, Pyrolaceae, some Ericaceae, Primulaceae, Styracaceae, Asclepiadaceae, Oleaceae, Cucurbitaceae and Galax of the Diapensiaceae).

Series 2. Gamopeta.'z... 691
$\ddagger$ Ovary superior (except in Vacciniaceae and Symplocaceae, in which it is partly or wholly inferior).
Stamens mostly free from the corolla, or adnate merely to its base (at the sinuses of the corolla in Diapensia and Pyxidanthera of the Diapesiaceae), as many as the lobes and alternate with them, or twice as many. Order r. Ericales.......
Stamens borne on the corolla, as many as its lobes and opposite them, or twice as many, or more.
Herbs.
Order 2. Primulales... . 713
Shrubs or trees.
Order 3. Ebenales..
720
Stamens borne on the corolla, as many as its lobes or fewer, and alternate with them (in our species of Fraxinus and Adelia of the Oleaceae there is no corolla). Corolla not scarious, nerved.

Ovaries 2, distinct (except in some Loganiaceae, and in Gentianaceae and Menyanthaceae, in which the ovary is compound with 2 cavities or rarely more, or with I cavity and 2 placentæ ; flowers regular; stamens mostly adnate to only the lower part of the corolla; leaves mostly opposite.
Order 4. Gentianales...
Ovary I, compound (2-divided in Dichondra of the Convolvulaceae; in Boraginaceae and Labiatae mostly deeply 4-lobed around the style) : flowers regular or irregular ; stamens mostly adnate to the middle of the co-rolla-tube or beyond; leaves opposite or alternate.

Order 5. Polemoniales..
Anthers distinct.
Stamens as many as the corolla-lobes and alternate with them (one fewer in Linnaea of the Caprifoliaceae), or twice as many; ovary compound, with I ovule or more in each cavity ; leaves opposite or verticillate.
Order 7. Rubiales...... 860
Stamens mostly fewer than the corolla-lobes; ovary 1 -celled with I pendulous ovule, or 3 -celled with 2 of the cavities without ovules.
Order 8. Valerianales. 877
Anthers united (except in Campanula and Specularia of the Campanulaceae, in Ambrosiaceae and in Kuhnia of the Compositae).
Order 9. Campanulales. 88r

## FLORA.

## Subkingdom PTERIDÓPHYTA.

## Ferns and Fern-Allies.*

Plants containing woody and vascular tissues producing spores asexually, which, on germination, develop small flat mostly green prothallia (gametophyte). On these are borne the reproductive organs, the female known as archegones, the male as antherids. From the fertilization of the egg in the archegone by spermatozoids produced in the antherid, the asexual phase (sporophyte) of the piant is developed; this phase is represented by an ordinary fern, lycopod or horsetail. Comprising about 4000 living species, of which more than three-fourths are confined to tropical regions.

## Order I. FILICÀLES.

Spores, all of one kind and size, produced in sporanges, which are borne on the back of a leaf, in spikes or panicles.
Vernation erect, or inclined; sporanges in spikes, or panicles, opening by a transverse slit. Fam. I. Ophioglossacea.
Vernation coiled; sporanges reticulated, usually provided with a ring (annulus).
Sporanges opening vertically.
Sporanges panicled, with a rudimentary ring; marsh ferns.
Fam. 2. Osmundacea.
Sporanges sessile on a filiform receptacle: leaves filmy, translucent.
Fam. 3. Hymenophyllacea.
Sporanges ovoid, in panicles, or spikes, with a vertical ring.
Fam. 4. Schizcacea.
Sporanges opening transversely, provided with a vertical ring, borne in sori on the back or margin of a leaf.

Fam. 5. Polypodiacea.

## Family I. OPHIOGLOSSÀCEÆ Presl.

Adder's-Tongue Family.
More or less succulent plants consisting of a stem and leaf growing from a fleshy root. Sporophyll in the form of a spike or panicle, the sporanges formed from the interior tissues, naked, opening at maturity by a transverse slit. Spores yellow. Prothalli subterranean, devoid of chlorophyll. Contains five genera, three of which are American.

Veins reticulate ; sporanges cohering in a distichous spike. Veins free ; sporanges distinct, borne in spikes or panicles.

1. Opliioglossum.
2. Rotrychium.

## x. OPHIOGLÓSSUM L.

Low plants from a small fleshy rootstock, with slender fleshy roots, the bud for the following year formed at the side of the base of the stem. Leaves simple, solitary, borne on the stem. Sporophyll terminal, formed of two rows of large coales-

[^1]cent sporanges. Veins reticulate. Sports sulphur-yellow. [Name from the Greek, signifying the tongue of a snake, in allusion to the narrow spike of sporanges.] About 30 species of wide geographic distribution.
Leaf ovate to elliptic, large ; basal veins, 9-13 or more.
Areolæ with few veinlets; apex obtuse.
Areolæ broad, with many veinlets; apex mucronate,
Leaf lanceolate, small; basal veins 5-7.

1. O. vulgatum.
2. O. Engelmanni.
3. O. arenarium.
I. Ophioglossum vulgàtum L. Adder's-tongue. (I. F. f. i.) Rootstock short, oblique; stem slender, erect, simple, glabrous, $\mathbf{x}-4 \mathrm{dm}$. high, bearing the sessile thin ovate or elliptic-oblong leaf, 3-12 cm . long, near its middle ; leaf $\mathbf{r}-5$ cm . wide, rather firm in texture, distinctly reticulated, with few veinlets within the areolæ; basal veins $9-\mathbf{1 3}$; spike solitary, $\mathbf{I}-2.5 \mathrm{~cm}$. long, erect, the axis extending beyond the sporanges into a point. In moist meadows and thickets, Pr. Edw. Isl. to Alaska, south to Fla. Also in Europe and Asia. May-Aug.
4. Ophioglossum Engelmánni Prantl. (I. F. f. Ia.) Rootstock cylindric ; stem $8-22 \mathrm{~cm}$. high, bearing an elliptic or lanceolate-elliptic leaf which is $3-5$ cm . long. $1.5-5 \mathrm{~cm}$. wide, obtuse but sharply apiculate, fleshy but becoming pellucid; basal veins 13 or more, the transverse veinlets oblique, forming broad oblong-hexagonal areolæ with numerous included veinlets; spike $1.5-2.5 \mathrm{~cm}$. long, apiculate. In moist ground, Va. and Ind. to Mo., Tex. and Ariz.
5. Ophioglossum arenàrium E. G. Britton. (I. F. f. Ib.) Rootstock slightly thickened; stem $5-18 \mathrm{~cm}$. high, bearing a lanceolate leaf $2-5 \mathrm{~cm}$. long, $5-12 \mathrm{~mm}$. wide, with a long tapering base and an obtuse or rarely somewhat acute apex ; basal veins $5-7$, the central nearly parallel with short oblique veinlets, forming long narrow areolæ with few faint included veinlets near the middle of the leat and much shorter irregular ones toward the margin; spikes $1-3 \mathrm{~cm}$. long, ofter twisted, apiculate. Gregarious in a single colony near the seashore, Holly Beach, N. J.

## 2. BOTRÝCHIUM SW.

Fleshy plants with short erect rootstocks, and clustered fleshy roots, the bud for the succeeding year imbedded in the base of the stem. Leaf pinnately or ternately divided or compound, the sporophyll pinnate or tripinnate with sessile distinct sporanges in rows on either side of its branches, forming large panicles in some species. Veins free. Spores of various shades of yellow. [Greek, in allusion to the grape-like clusters of sporanges.] About 20 species, mostly natives of the northern hemisphere.
Bud for the following year enclosed in the base of the stem.
Leaf rising above the middle of the stem, small plants maturing in early summer.
Vernation partly inclined in one or both portions.
Leaf entire, or with 1-3 pairs of distant lunate decurrent segments.
I. B. tenebrosum.

Leaf with fan-shaped segments; sporophyll not bent in vernation.
2. B. Lunaria.

Leaf pinnatifid or 2-pinnatifid with narrow segments ; both leaf and sporophylls bent in vernation.
3. B. matricariafolium.

Vernation wholly inclined, recurved in the fertile portion; leaf triangular, sessile.
4. B. lanceolatum.

Leaf rising from little above the rootstock.
Vernation wholly straight ; bud smooth; leaf entire, or 2-6-lobed.
5. B. simplex.

Vernation inclined; bud pilose; leaf ample ternate.
Leaf segments obliquely ovate or oblong, large, $1-2 \mathrm{~cm}$. long.
6. B. obliguum.

Leaf segments laciniate, narrow, 1 mm . or less wide.
7. B. dissectum.

Leaf segments small, 3-6 mm. wide, rounded or ovate.
8. B. matricaria.

Bud enclosed in a cavity at one side of the base of the stem; leaf ternate, decompound, sessile at the middle of the stem.
9. B. Virginianum.
I. Botrychium tenebròsum A. A. Eaton. Plant $3-20 \mathrm{~cm}$. high. averaging $10-12 \mathrm{~cm}$., one-third of which is below ground; slender, fleshy, light green oi
yellowish after fruiting, transparent when dry; leaf above the middle of the stem, often immediately under the sporophyll, short-petioled, entire, lobed, or usually with I-3 pairs of distant alternate lunate decurrent entire segments; the apex emarginate or with a triangular elongation; sporophyll usually short-stalked, simple, or rarely with one or two short, somewhat dilated branches, bearing alternate or nearly opposite clusters of sporanges ; spores very large, verrucose; sporophyll not bent in vernation. Rich shady situations, usually among maples at the border of swamps; Mass. and N. H. to Cent. N. Y.
2. Botrychium Lunària (L.) Sw. Moonwort. (I. F. f. 3.) Plant very fleshy, $5-30 \mathrm{~cm}$. high. Leaf usually sessile, borne at or above the middle of the stem, pinnate with 2-8 pairs of lunate or fan-shaped lobes which vary from crenate to entire and are either close and imbricated or somewhat distant ; sporophyll 2-3-pinnate, often dense, $3-5 \mathrm{~cm}$. long, often about the height of the sterile ; apex only of the leaf bent over the nearly straight sporophyll in vernation. Greenland to Alaska, south to Conn., Cent. N. Y., Mich., Br. Col., and in the Rocky Mts. to Colo., mostly in fields. Also in N. Europe and Asia. June-July.
3. Botrychium matricariæfolium A. Br. (I. F. f. 4.) Plant 5-30 cm. high, often very fleshy. Sterile portion borne above the middle of the stem, shortstalked, ovate or oblong, I-2-pinnatifid or rarely 2 -pinnate, with obtuse divisions and narrow toothed segments; midveins disappearing by continued branching; sporophyll 2-3-pinnate, often much branched ; spores tuberculate; apex of both leaf and sporophyll turned downward in vernation. In grassy woods and swamps, N. S. to N. J., west to O. and Wash. Also in Europe. May-June.
4. Botrychium lanceolàtum (S. G. Gmel.) Angs. (I. F. f. 6.) Plant 7-20 cm . high, somewhat fleshy. Leaf closely sessile near the summit of the stem, 2 cm . or more wide, 3 -lobed or broadly triangular and 2 -pinnatifid, the ultimate segments lanceolate, acute, oblique, entire or dentate ; midvein continuous, with forking veinlets; sporophyll slightly overtopping the leaf, short-stalked, 2-3pinnate ; sporophyll recurved its whole length with the shorter leaf reclined upon it in vernation. In meadows, woods, and swamps, N. S. to Alaska, south to N. J., O., and in the Rocky Mts. to Colo. Also in Europe and Asia. June-July.
5. Botrychium símplex E. Hitchcock. (I. F. f. 2.) Plant 5-16 cm. high, slender, very variable. Leaf ovate, obovate, or oblong, entire, lobed, or pinnately parted, borne near the base of the stem ; sporophyll a simple or slightly compound spike, sometimes reduced to only a few sporanges; spores large for the genus, minutely tuberculate ; apex of leaf and sporophyll erect in vernation. In moist woods or meadows, Pr. Edw. Isl. to Md., west to Wyo. and Cal. Also in N. Europe. May-June.
6. Botrychium obliquum Muhl. (I. F. f. 5, as B. ternatum.) Plant robust, $15 \mathrm{~cm} .-5 \mathrm{dm}$. high. Leaf rising from near the base on a stalk $2-10 \mathrm{~cm}$. or more long, ternate with the three divisions nearly equal, bipinnate or somewhat tripinnatifid in larger forms, the ultimate segments obliquely ovate or oblong-lanceolate, the terminal of each division elongate, $\mathrm{I}-2 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. wide, the margins crenate or serrate ; sporophyll long-stalked, triquadripinnate ; bud densely pilose, both portions bent in vernation. Low woods and open places widely distributed from N. B. to Fla. and Mex, and westward to Minn.

Botrychium obliquum intermedium (D. C. Eaton) Underw. Plant larger, the leaf on a shorter stalk $2-5 \mathrm{~cm}$. long, the leaf sometimes reaching 15 cm . each way; lateral divisions smaller than the terminal: ultimate segments similar to the type, but mostly shorter. In low ground, N. N. Y. and N. E.
7. Botrychium dissectum Spreng. (I. F. f. 5a.) Plant 5-10 dm. high with slender fleshy stems. Leaf long-stalked from near the base of the stem. with broadly deltoid basal divisions, decompound ; secondary pinna lanceolate from a broader base, pinnate with laciniate and deeply cut pinnules, the ultimate divisions divergent, often 2 -toothed at their apices, usually less than 1 mm . wide : sporophyll long-stalked 2-3-pinnate; bud pilose, enclosed in the base of the stem, both pertions bent in vernation. Rare in E. Mass, and common from S. N. E. southward to Va., inland to Ind. and Ky.
8. Botrychium matricariæ (Schrank) Spreng. Plant $10-15 \mathrm{~cm}$. high, with slender fleshy stems. Leaf moderately short-stalked, ternate, small. 3-5 cm, wide and high, the three divisions similar, bipinnatifid or bipinate; ultimate segments
small, 3-6 mm. wide, rounded or somewhat obliquely ovate, the margins undulate or crenate ; sporophylls rather long-stalked for the size of the plant, 2-3-pinnate with large sporanges; bud pilose. In old meadows, N. N. E. and N. Y. and northward; also in Europe.
9. Botrychium Virginiànum (L.) Sw. (I. F. f. 7.) Plant $2-6 \mathrm{dm}$. high, the stem slender but fleshy. Leaf nearly or quite sessile above the middle of the stem, spreading, thin, ternate with the primary divisions pinnate to 2 -pinnate and the segments I-2-pinnatifid; ultimate segments oblong, more or less toothed near the apex; epidermal cells flexuous; sporophyll long-stalked, 2-3-pinnate; bud for the following year pilose, enclosed in a glabrous cavity at one side of the lower part of the stem ; sporophyll recurved its whole length, the leaf reclined upon it in vernation. In rich woods, N. S. to Fla., west to Br. Col. and Ariz. Also in Europe and Asia. June-July.

## Family 2. OSMUNDÀCEAE R. Br.

Large ferns with stout often erect rootstocks, $\mathbf{r}-2$ pinnate leaves which are coiled in vernation, the veins free, mostly forked, running to the margins of the pinnules or lobes. Sporanges large, globose, with mere traces of an elastic ring of cells or none, borne on modified contracted pinnæ or in clusters (sori) on the lower surfaces of the pinnules. Three genera; only one American.

## I. OSMÚNDA L.

Tall swamp ferns, growing in large crowns, with the fertile (spore-bearing) portions very much contracted, the short-pedicelled naked sporanges on the margins of their rachis-like divisions, which are destitute of chlorophyll. Veins forked, regular and prominent. Sporanges thin, reticulated, opening by a longitudinal cleft into two halves, a few parallel thickened cells near the apex representing the rudimentary transverse ring. Spores green. [From Osmunder, a name for the god Thor.] Six species, mostly of the north temperate zone.
Leaves bipinnate, fertile at the apex. I. O. regalis. Sterile leaves bipinnatifid.

Pinnæ of sterile leaf with a tuft of tomentum at base; fertile leaf distinct from sterile.
2. O. cinnamomea.

Pinnæ of sterile leaf without a tuft of tomentum at base: leaves fertile in the middle.
3. O. Claytoniana.
I. Osmunda regàlis L. Roval Fern. (I. F. f. 8.) Rootstock stout, bearing a cluster of several tall bipinnate leaves, $6 \mathrm{dm},-2 \mathrm{~m}$. high, and 3 dm . or more wide. Pinnæ $1.5-3 \mathrm{dm}$. long, $5-10 \mathrm{~cm}$. wide, the pinnules oblong-ovate or lanceolate-oblong, sessile or slightly stalked, glabrous, finely serrulate, especially near the apex and occasionally crenate towards the truncate, oblique or cordate base; sporophylls linear-cylindric, panicled at the summit, withering and shrivelling with age, greenish before maturity, but becoming dark brown after the spores have fallen. In swamps and marshes, N. B. to Fla., N. W. Terr., Neb. and Miss. Also in Mexico, Europe and Asia. May-July.
2. Osmunda cinnamòmea L. Cinnamon Fern. (I. F. f. 9.) Rootstock very large, widely creeping, bearing a circular cluster of sterile leaves with one or more fertile ones within. Stipes 3 dm . or more long, clothed with ferruginous tomentum when young, glabrous when old; sterile leaves $3 \mathrm{dm} .-1 \mathrm{~m}$. long, glabrous when mature, except a small tuft of tomentum at the base of each pinna; pinnæ linear-lanceolate, deeply pinnatifid into oblong obtuse segments ; sporophyll contracted, bipinnate, soon withering; sporanges cinnamon-colored after the copious green spores have been discharged. In wet places, N. S. to Minn., to Fla. and Mex. Forms occur with leaves variously intermediate between the fertile and sterile; some being sterile at the apex, others in the middle, others on one side only. May-June.
3. Osmunda Claytoniàna L. Clayton's Fern. (I. F. f. io.) Rootstock stout, bearing a circle of 2-pinnatifid leaves $6 \mathrm{dm} .-2 \mathrm{~m}$. high, 1.5-2.5 dm. wide ; sterile pinnæ without tufts of tomentum at the base, linear-lanceolate, deeply
cleft into oblong obtuse segments, some of the leaves contracted in the middle and bearing $2-5$ pairs of sporophylls with dense, cylindric divisions which are greenish at first, afterwards dark brown, finally withering ; leaves clothed with tomentum when young, glabrous when mature, the fertile ones taller than the sterile, and finally widely recurving. In moist places, Newf. to Minn., N. C. and Mo. Also in India. May-July.

## Family 3. HYMENOPHYLLACEAE Gaud.

Membranous, mostly small ferns with filiform or slender creeping rootstocks. Leaves usually much divided. Sporanges sessile on a filiform, usually elongated receptacle, surrounded by a transverse ring which opens vertically. Several genera, comprising some 200 species, very abundant in tropical regions.

## I. TRICHÓMANES L.

Delicate filmy ferns, the leaves usually much divided. Sporanges flattened, surrounded by a broad entire transverse ring opening vertically, sessile on the lower part of the slender filiform receptacle. Receptacle surrounded by a tubular or funnel-shaped indusium which is truncate or slightly 2 -lipped. [Greek, in allusion to the thin hair-like segments of some species.] About ioo species, mostly of tropical regions.
I. Trichomanes radicans Sw. Bristle Fern. (I. F. f. if.) Rootstock filiform, wiry, tomentose, creeping. Stipes (petioles) ascending, $2.5-7.5 \mathrm{~cm}$. long, naked or nearly so; leaves $5-20 \mathrm{~cm}$. long, $\mathbf{I} .5-3.3 \mathrm{~cm}$. wide, membranaceous, lanceolate or ovate-lanceolate, 2-3-pinnatifid; pinnæ ovate, obtuse, the upper side of the cuneate base parallel with or appressed to the narrowly winged rachis; segments toothed or cut into linear divisions ; indusia terminal on short lobes, $\mathrm{I}-4$ on a pinnule, the mouth slightly 2 -lipped, receptacle more or less exserted. On wet rocks. Ky. to Fla, and Ala, and widely distributed through the tropics.

## Family 4. SCHIZAEÀCEAE Reichenb.

Ferns of various habit, with simple or pinnate leaves. Sporanges borne in spikes or panicles, ovoid, sessile, provided with an apical ring, opening vertically by a longitudinal slit. Several genera and about ioo species, mainly tropical.
Sporanges in close 2-ranked spikes; leaves filiform or linear.

1. Schizaea.

Sporanges in ample panicles; pinnules palmate.
2. Lygodium.

## r. SCHIZAEA J. E. Smith.

Small slender ferns with filiform or linear leaves, the fertile distinct from the sterile. Sporanges sessile in close distichous spikes along the single vein of the narrow divisions of the sporophylls, provided with a complete apical ring. [Greek. in allusion to the cleft leaves of some species.] A genus of 19 species, of wide distribution, mostly tropical.
I. Schizaea pusílla Pursh. Curly-grass. (I. F. f. 12.) Sterile leaves linear, slender and tortuous. Sporophylls longer, 7-12 cm. high, the fertile portion terminal, consisting of about 5 pairs of crowded pinnæ, forming a distichous spike; sporanges ovoid or pyriform, sessile in two rows along the single vein of the narrow incurved linear divisions of the fertile leaf, partially concealed by its incurved margins, which are hooded at the apex and ciliate; ring apical, the sporanges opening by a vertical slit. In wet soil, pine-barrens of N. J. and in N. S. and Newf. Rare and local. Aug.-Sept.

## 2. LYGÒDIUM Sw.

Twining or climbing ferns, the lower divisions sterile, variously stalked and lobed, the fertile terminal, panicled. Sporanges ovoid, solitary or in twos in the axils of imbricated scale-like indusia, provided with an apical ring, opening verti-
cally. Indusia fixed by their broad bases to short oblique veinlets. [Greek, in allusion to the flexible stipes. 7 About 20 species, mostly tropical.
i. Lygodium palmàtum (Bernh.) Sw. Climbing Fern. Hartfurd Fern. (I. F. f. I3.) Rootstock slender, creeping. Stipes slender, flexible and twining; leaves 4-10 dm. long, their short aiternate branches 2 -forked, each fork bearing a nearly orbicular 4-7-lobed pinnule which is more or less cordate at the base with a narrow sinus; surfaces naked ; fertile pinnules contracted, several times forked, forming a terminal panicle ; sporanges solitary, each covered by a scale-like indusium. In moist thickets and open woods, N. H. and Mass. to Penn., Fla. and Tenn.; rare. Summer.

Family 5. POLYPODIÀCEAE R. Br.

## Fern Family.

Ferns of various habit, the rootstocks horizontal and often elongate, or short and erect, the leaves entire, pinnate, pinnatifid or decompound, coiled in vernation. Sporanges borne in clusters (sori) on the lower side or margins of the leaves or their segments, stalked, provided with a vertical ring, opening transversely. Sori with or without a membranous covering (indusium). Prothallium green. About 200 genera and 3000 species of wide distribution.
Leaves all flat, or their edges only slightly revolute.
Sori without indusia.
Sori roundish or not more than twice as long as broad.
Stipes articulated to the rootstocks; leaves in our species pinnatifid.
I. Polypodium.

Stipes not articulated to the rootstocks ; leaves in our species $2-3$-pinnatifid or ternate. 14. Phegopteris. Sori linear and marginal.
2. Notholaena.

Sori with marginal indusia formed of the more or less altered edge of the leaf.
Sporanges at the ends of veins, borne on a reflexed portion of the leaf.
3. Adiantum.

Sporanges borne on a continuous vein-like receptacle which connects the apices of the veins.
Sporanges at or near the ends of unconnected veins.
Leaves of two forms; stipes pale.
Leaves uniform; stipes usually dark-colored.
4. Pteridium.

Sori mostly forming a continuous indusium around the segment.
6. Pellaea.

Sori minute ; indusium usually interrupted, if continuous the segments small and bead-like.
7. Cheilanthes.

Sori dorsal or marginal, provided with special indusia.
Sori linear or oblong; indusia more than twice as long as broad.
Sori in chain-like rows parallel to the midribs or rachises.
8. Woodwardia.

Sori all oblique to the midrib or rachises; veins free.
Sori single on the upper side of a veinlet or rarely crossing it.
9. Asplenium.

Sori confluent in pairs with an apparently double indusium opening in

> the middle ; leaf simple.

Sori partly parallel to the midrib, partly oblique ; veins united.
iI. Camptosorus.

Sori roundish, indusia less than twice as long as broad.
Indusium superior.
Indusium orbicular, peltate, fixed by the centre. 12, Polystichum.
Indusium reniform or orbicular with a narrow sinus by which it is attached to the leaf.
13. Dryopteris.

Indusium delicate, partly inferior, fixed by a broad base and enclosing the sorus like a hood.
15. Filix.

Indusium wholly, inferior.
Indusium roundish or stellate.
Indusium cup-shaped or somewhat 2 -valved.
16. Woodsia.
17. Dennstaedtia.

Spore-bearing leaves closely rolled together with necklace-like segments.
Leaves with free veins ; rootstock stout, erect.
18. Mateuccia.

Leaves with anastomosing veins; rootstock creeping with scattered leaves.
19. Onoclea.

## 1. POLYPODDIUM L.

Pinnate or simple ferns with stipes articulated to the creeping rootstocks. Sori hemispheric, dorsal, in one or more rows on either side of the midribs. Indusium none. Sporanges pedicelled, provided with a vertical ring which bursts transversely. Veins free in the northern species. [Greek, in allusion to the branched rootstocks of some species.] About 350 species, of wide distribution, mostly tropical.

Lower surface of the leaf glabrous ; plant green.
Lower surface of the leaf densely scaly ; plant grayish.

1. P. vulgare.
2. P. polypodioides.
I. Polypodium vulgàre L. Polypody. (I. F. f. 71.) Rootstock widely creeping, densely covered with cinnamon-colored scales. Stipes light-colored, glabrous, $5-15 \mathrm{~cm}$. long; leaves ovate-oblong or narrowly oblong in outline, subcoriaceous, evergreen, glabrous on both surfaces, $7-25 \mathrm{~cm}$. long, $2.5-4.5 \mathrm{~cm}$. wide, cut nearly to the rachis into entire or slightly toothed, obtuse or subacute, linear or linear-oblong segments; sori large, borne about midway between the midrib and the margins of the segments; veins free. On rocks or rocky banks, almost throughout N. Am., Asia and Europe. Forms with the ends of the segments enlarged, somewhat palmately lobed, and the upper crested are known as var. cristatum. Forms with the segments broad and deeply pinnatifid are called var. Cambricum.
3. Polypodium polypodioìdes (L.) A. S. Hitchcock. (I. F. f. 72.) Rootstock widely creeping, woody, covered with small brown scales. Stipes densely scaly, 2.54.5 cm . long ; leaves oblong-lanceolate in outline, acute, coriaceous, evergreen, 3-15 cm . long, $2.5-4 \mathrm{~cm}$. wide, cut very nearly or quite to the rachis into entire oblong or linear-oblong obtuse segments, glabrous or nearly so on the upper surface, the lower densely covered with gray peltate scales with darker centres, as are also the rachises; veins indistinct, unconnected, and usually once forked. On trees or rarely on rocks, Pa. to Va. and Fla., west to Ill., Mo. and Tex., and throughout tropical.America.

## 2. NOTHOLAENA R. Br.

Mostly small rock-loving ferns, with 1 -3-pinnate or pinnatifid leaves and marginal roundish or oblong sori, which are at first distinct but soon confluent into a narrow band. Indusium none, but the sporanges are sometimes at first covered by the inflexed margin of the leaf. Veins free. Sporanges pedicelled, provided with a vertical transversely bursting ring. Lower surface of the leaf often covered with a white or yellow waxy powder, or in some species with a dense tomentum. [Greek in allusion to the woolly lower surfaces.] About 40 species, of wide distribution, most numerous in America. Besides the following, some I3 others are found in the mountainous portions of the southwestern $\mathrm{U} . \mathrm{S}$.
I. Notholaena dealbata (Pursh) Kunze. (I. F. f. 70.) Rootstock short, chaffy with narrow brown scales. Stipes tufted, wiry, very slender, shining, dark brown, $2.5-4.5 \mathrm{~cm}$. long; leaves triangular-ovate in outline, acute, broadest at the base. $2.5-10 \mathrm{~cm}$. long, 3-pinnate, the rachis black and shining; pinnæ ovate, the lower slender-stalked; ultimate pinnules ovate or obovate, obtuse, lobed, crenate or entire, small, scarcely 2 mm . long, white and powdery on the lower surface. On calcareous rocks, Mo. and Kan. to Ariz. and Tex.

## 3. ADIÁNTUM L.

Graceful ferns of rocky hillsides, woods, and ravines, with much divided leaves and short marginal sori borne on the under side of the reflexed and altered portion of the pinnule, which serves as an indusium. Stipes and branches of the leaves very slender or filiform, polished and shining. [Name ancient.] A genus of So or 90 species, mostly of tropical America.

Leaves 2-pinnate, ovate-lanceolate in outline. 1. A. Capillus-I'eneris.
Leaves dichotomously forked with pinnate branches.
I. Adiantum Capíllus-Véneris L. Venus-hair Frix. (I. F. f. 50.) Rentstock creeping, rather slender, chaffy with light-brown scales. Stipes very slemder. black or nearly so, shining, $7-22 \mathrm{~cm}$. Kong; leaves ovate-lanceolate in outline, bi-
pinnate below, simply pinnate above, membranous, commonly drooping, $1.5-6 \mathrm{dm}$. long, I-3 dm. wide at the base; pinnules and upper pinnæ wedge-obovate or rhomboid, rather long-stalked, glabrous, the upper margin rounded and more or less incised, crenate or dentate-serrate, except where it is recurved to form the indusia. In ravines, Va. to Fla., west to Mo., S. Dak. and Cal. Widely distributed.
2. Adiantum pedàtum L. Maiden-hair Fern. (I. F. f. 60.) Rootstock slender, creeping, chaffy, rooting along its whole length. Stipes $2-4.5 \mathrm{dm}$. long, dark chestnut-brown, polished and shining, dichotomously forked at the summit; leaves obliquely orbicular in outline, $2-4.5 \mathrm{dm}$. broad, the pinnæ arising from the upper sides of the two branches of the stipe, somewhat radiately arranged, the larger ones 1.5-2.5 dm. long, 2.5-5 cm. wide; pinnules oblong, triangularoblong, or the terminal one fan-shaped, short-stalked, the lower margin entire and slightly curved, the upper margin cleft, lobed or dentate, bearing the linear-oblong, often short sori. In woods, N. S. to Br. Col., south to Ga., Ark., Utah and Cal., in Alaska and W. Asia.

## 4. PTERÍDIUM Scop.

Large, mostly coarse ferns, growing in open sunny places, with variously divided leaves, and marginal linear continuous sori which occupy a slender or filiform receptacle, connecting the tips of free veins. Indusium membranous, formed of the reflexed margin of the leaf. Stipes continuous with the rootstock. [Greek name for ferns, from the fancied resemblance of their leaves to the wings of birds.] About 100 species of wide distribution, mostly of warm and tropical regions.
I. P. aquilìnum (L.) Kuhn. Brake. Bracken. (I. F. f. 6I.) Rootstock stout, woody, horizontal. Stipes 3-6 dm. long, straw-colored or brownish; leaves 6-12 dm. long, 3-9 dm. wide, usually glabrous, ternate, the three branches each bipinnate; upper pinnules undivided, the lower more or less pinnatifid. In sunny places, distributed over nearly the whole of N. Am. [Pteris aquilina L.]
P. aquilìnum pseudocaudàtum Clute. Pinnules sometimes linear and entire, or with the segments less crowded and the terminal lobe attenuate, narrow and entire. In sandy soil, N. J. to Fla. and Tex.

## 5. CRYPTOGRÁMMA R. Br. Rock-bRAKe.

Light green, alpine and arctic ferns with leaves of two kinds, the segments of the sterile much broader than those of the fertile, the sporanges in oblong or roundish sori, which are at length confluent and cover the backs of the fertile pinnules. Indusium formed of the somewhat altered margin of the pinnule, at first reflexed to the midrib, so that the segments appear pod-like, at length opening out flat. Sporanges borne at or near the ends of unconnected veins. [Greek, in allusion to the hidden sporanges.] Two species.
I. Cryptogramma acrostichordes R. Br. (I. F. f. 62.) Rootstock stout, short, chaffy. Stipes slender, densely tufted, straw-colored, $5-15 \mathrm{~cm}$. long, chaffy below; leaves ovate or ovate-lanceolate in outline, thin, glabrous, $2-3$-pinnate, the sterile shorter than the fertile, their ultimate segments and pinnules crowded, ovate, oblong or obovate, obtuse, crenate or slightly incised; fertile leaves with linear or linear-oblong segments $6-\mathbf{1 2} \mathrm{mm}$. long, 2 mm . or less wide, the margins involute to the midrib at first, expanded at maturity and exposing the light brown sporanges. Forming dense patches among rocks, Lab. and Hudson Bay to Alaska, south to Lakes Huron and Superior, Colo., and Cal.
2. Cryptogramma Stélleri (Gmel.) Prantl. (I. F. f. 63.) Rootstock slender, creeping, threadlike, somewhat scaly. Stipes scattered, 5-8 cm. long, straw-colored or pale brown, slightly chaffy below; leaves thin-membranous, ovate in out line, $5-13 \mathrm{~cm}$. long, $2.5-5 \mathrm{~cm}$. wide, 2-3-pinnate or pinnatifid above, the fertile taller than the sterile and with narrower pinnules and segments; pinnæ lanceolatedeltoid, cut to the rachis into a few blunt or subacute slightly lobed or entire segments; indusium broad, continuous; veins of the fertile leaves mostly only oneforked, everywhere apparent and conspicuous. On rocks, preferring limestone, Lab. to Br. Col., south to Mass., Penn., Iowa and Colo. Also in Asia. [Pellaea Stelleri Watt.]

## 6. PELLAÈA Link. Cliff-brake.

Rock-loving ferns of small or medium size with pinnate or pimatifid leaves and intramarginal sori borne on the ends of unconnected veins, at length confluent and forming a marginal line. Indusium commonly broad and membranous, formed of the reflexed margins of fertile segments which are more or less modified and membranous. Fertile and sterile leaves similar. Stipes usually dark-colored. [Greek, in allusion to the dark-colored stipes.] About 55 species, of wide distribution.

Leaves pinnate or 2 -pinnate with large pinnules.
Leaves small, 3 -pinnate, the pinnules narrow.

1. Pellaea atropurpùrea (L.) Link. (I. F. f. 64.) Rootstock short, densely clothed with rusty hair-like scales. Stipes tufted, $5 \mathbf{- 1 5} \mathrm{~cm}$. long, dark purple or nearly black; leaves coriaceous, lanceolate or ovate-lanceolate in outline, $1-3 \mathrm{dm}$. long, $5-15 \mathrm{~cm}$. wide, simply pinnate or 2 -pinnate below; rachis dark-brown or purple, glabrous or pubescent; pinnules and upper pinnæ $2.5-5 \mathrm{~cm}$. long, glabrous, 6 mm . or less wide, short-stalked or sessile; indusium formed of the slightly altered incurved margin of the pinnules; veins obscure, commonly twice forked. On rocks, preferring limestone, Ont. to Br. Col., south to Conn., Ga., Ariz. and N. Mex.
2. Pellaea dénsa (Brack.) Hook. (I. F. f. 65.) Rootstock rather slender, chaffy with blackish scales. Stipes densely tufted, wiry, slender, light brown, 7-22 cm . long; leaves ovate or triangular-oblong in outline, $2.5-4.5 \mathrm{~cm}$. long, densely 3 -pinnate, the segments $6-12 \mathrm{~mm}$. long, linear, nearly sessile, acuminate or mucronate, those of the fertile leaves tapering at each end, with narrowly recurved margins; apices of the rare sterile leaves sharply serrate, otherwise similar to the fertile ones. Mt. Albert, Gaspé, P. Q. Also from Br. Col. to Wyo. and Cal.

## 7. Cheilánthes Sw. Lip-fern.

Mostly pubescent or tomentose rock-loving and small ferns with much divided leaves, the sori terminal on the veins, ultimately more or less confluent. Indusium formed of the reflexed margin of the leaf, roundish and distinct or more or less confluent. Sporanges often much concealed in the scales or tomentum which covers the segments in many species. [Greek, in allusion to the lipped indusia of some species.] About 65 species, of temperate and tropical regions.

Leaves nearly glabrous, 2 -pinnate.

1. C. Alabamensis.

Leaves hirsute and glandular, not tomentose ; indusia not continuous.
2. C. lanosa.

Leaves more or less tomentose ; indusia mostly continuous.
Leaves $5-\mathrm{iocm}$. long; stipes slender, at length nearly glabrous. 3. C. Féei.
Leaves $\mathrm{I} .5-4.5 \mathrm{dm}$. long ; stipes stout, densely brown-tomentose. 4. C. tomentosa
I. Cheilanthes Alabaménsis (Buckl.) Kunze. (I. F. f. 66.) Rontstock creeping, rather stout and short, with slender brown scales. Stipes black, $7-\mathrm{I} 8 \mathrm{~cm}$. long, slender, wiry, villous at least towards the base with rusty wool; leaves lanceolate in outline, glabrous, $5-25 \mathrm{~cm}$. long, 2 -pinnate; pinnæ numerous, ovate-lanceolate, acuminate, very short-stalked, the lowest usually smaller than those above; pinnules oblong or triangular-oblong, mostly acute, often auriculate on the upper side of the base, more or less toothed or incised; indusia pale, membranous, interrupted by the incising of the pinnæ. On rocks, Va. to Ala., west to Ark. and Ariz.
2. Cheilanthes lanòsa (Michx.) Watt. (I. F. f. 67.) Rootstock short, creeping, with pale rusty-brown scales. Stipes tufted, wiry, chestnut-brown, $5-10 \mathrm{~cm}$. long, hirsute; leaves herbaceous, oblong-lanceolate in outline, $10-22 \mathrm{~cm}$. long. 2.5-5 cm . wide, gradually attenuate to the apex, 2 -pinnate ; pinnules somewhat distant, lanceolate-deltoid, acute, deeply pimatifid or incised, more or less covered with almost bristly hairs and usually somewhat glandular, obtuse or subacute; sori numerous, covered by the infolded ends of the rounded or oblong lobes. On rocks. West Rock, New Haven, and southern New York to Ga., west to Mo., Ark. and Tex.
3. Cheilanthes Féei Moore. (I. F. f. 68.) Rootstock short, covered with narrow brown scales lined with black. Stipes densely tufted, slender, ahout as long as the leaves, ai first covered with woolly hairs, at length nearly glabrous; leaves
ovate-lanceolate in outline, $5-10 \mathrm{~cm}$. long, $2.5-5 \mathrm{~cm}$. wide, 3 -pinnate or 2-pinnate with the pinnules pinnatifid, the upper surface slightly tomentose, the lower densely matted with whitish-brown woolly hairs; upper pinnæ oblong-ovate, the lower deltoid, the lowest distant; ultimate segments or lobes minute, the terminal ones slightly larger than the others, all roundish or obovate and much crowded; indusium narrow. On rocks, Ill.. to Br. Col., Tex. and Ariz. (C. gracilis Mett.)
4. Cheilanthes tomentòsa Link. (I. F. f. 69.) Rootstock stout, short, densely chaffy with light brown scales. Stipes tufted, I-2 dm. long, rather stout, densely brown-tomentose even when mature; leaves oblong-lanceolate in outline, 3 -pinnate, $1.5-4.5 \mathrm{dm}$. long, densely tomentose, especially beneath, with slender brownish-white obscurely articulated hairs; pinnæ and pinnules ovate-oblong or oblong-lanceolate, the ultimate pinnules about $\mathbf{I} \mathrm{mm}$. long, the terminai ones sometimes twice as large as the others; indusium pale, membranous, continuous. On rocks, Va. to Ga., west to Mo., Tex., Ariz. and Mex.

## 8. WOODWARDIA J. E. Smith. Chain-fern.

Large and rather coarse ferns of swamps or wet woods, with pinnate or nearly bi-pinnate leaves and oblong or linear sori, sunk in cavities of the leaf and arranged in chain-like rows, parallel to the margins of the pinnæ. Leaves all alike or the pinnæ of the fertile ones much narrower than those of the sterile. Indusia subcoriaceous, fixed by their outer margins to a veinlet and covering the cavity like a lid. Veins more or less reticulated. [Name in honor of Thomas Jenkinson Woodward, 1745-1820, English botanist.] Six species, mostly of the north temperate zone.

Leaves uniform; veins free between the sori and the margin. Leaves of two kinds; veins everywhere anastomosing.

1. W. Virginica.
2. W. areolata.
3. Woodwardia Virgínica (L.) J. E. Smith. (I. F. f. 42.) Rootstock long, stout, subterranean or creeping, chaffy. Stipes stout, 3-4.5 dm. long, nearly or quite naked, dark-colored below; leaves oblong-lanceolate, acute, at the apex, narrowed at the base, $3-6 \mathrm{dm}$. long, $15-22 \mathrm{~cm}$. wide, pinnate; pinnæ linear-lanceolate, usually alternate or some of them opposite, coriaceous, glabrous, acuminate at the apex, sessile, $7-15 \mathrm{~cm}$. long, deeply pinnatifid into ovate or oblong obtuse segments, their margins minutely serrulate; veins forming a single series of areolae on either side of the midvein, the sori borne on the outer curving veinlets; sterile and fertile leaves similar in outline. In swamps, N. S. to Ont. and Mich., south to Fla., La. and Ark.
4. Woodwardia areolàta (L.) Moore. (I. F. f. 43.) Rootstock slender, creeping, chaffy. Leaves of two kinds, the fertile taller than the sterile and borne on longer stipes, $3-6 \mathrm{dm}$. high, their pinnæ much contracted, narrowly linear, $7-12.5 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide, distant, their bases connected by a very narrow wing to the rachis or quite distinct; sterile leaves deltoid-ovate, membranous, broadest at the base, or sometimes with one or two small pinnæ below, the apex acuminate, the segments lanceolate or oblong-lanceolate, minutely serrulate, sometimes undulate, their bases connected by a rather broad rachis-wing; veins forming numerous areolae. In swamps, Me. to Fla., La. and Ark.; also in Mich.

## 9. ASPLENiUM L. Spleenwort.

Large or small ferns with entire, lobed, pinnate, 2-3-pinnate, or pinnatifid leaves, and linear or oblong sori oblique to the midribs or rachises. Leaves mostly uniform. Veins free. Indusia straight or curved, opening towards the midribs when single. Sporanges pedicelled, provided with an elastic ring, bursting transversely. [Ancient Greek name; some species were supposed to be remedies for diseases of the spleen.] A genus of some 200 species, of very wide geographic distribution.

Sori straight or rarely slightly curved, attached to the upper side of a vein; mostly small (except in No. 7).
Leaves pinnatifid or pinnate below, tapering to a point.
Stipes blackish below; lobes rounded or the lowest acuminate.

1. A. pinnatifidum.

Stipes blackish throughout; lobes acute or acuminate.
2. A. ebenoides.

Leaves once pinnate.
Pinnæ $7 \mathrm{~mm} .-8 \mathrm{~cm}$. long, mostly blunt.
Rachis chestnut-brown or blackish.
Pinnæ auricled at the upper side of the base.
Pinnæ opposite, oblong; rachis dark brown or black.
3. A. parvulum.

Pinnæ partly alternate, lanceolate; rachis chestnut-brown.
4. A. platyneuron.

Pinnæ not auricled, partly alternate, partly opposite.
5. A. Trichomanes.
6. A. viride.

Rachis green; pinnæ not auricled. Pinnæ 5-12 cm. long, acute or acuminate. Leaves 2-3-pinnatifid. Stipes green; leaves ovate-deltoid ; pinnules fan-shaped, veins flabellate.

> Stipes dark at the base, green above.

Leaves ovate-lanceolate, broadest near the base. 9. A. montanum.
Leaves lanceolate, broadest above the middle.
10. A. fontanum.

Stipes chestnut-brown throughout, as also the lower part of the rachis.
in. A. Bradleyi.
Sori usually more or less curved, sometimes horseshoe-shaped, often crossing to the outer or lower side of the veinlet; large ferns.
Leaves 2-pinnatifid; segments blunt, scarcely crenate. 12. A. acrostichoides.
Leaves 2 -pinnate; pinnules acute, toothed or pinnatifid. 13. A. Filix-foemina.
I. Asplenium pinnatífidum Nutt. (I. F. f. 46.) Rootstock short, creeping, chaffy. Stipes tufted, polished, blackish below, green above, $5-12 \mathrm{~cm}$. long, somewhat chaffy helow, at least when young; leaves broadly lanceolate in outline, $7-25 \mathrm{~cm}$. long, firm, tapering upward to a long narrow tip, pinnatifid or the lower parts pinnate ; lowest pinnæ or occasionally several pairs sometimes tapering to a point like that of the apex of the leaf; lobes or pinnæ rounded or the lowest acuminate. On rocks, N. J. and Pa. to Ill., south to Ga. and Ark.
2. Asplenium ebenoides R. R. Scott. (I. F. f. 47.) Rootstock short, chaffy. Stipes blackish tufted, $4-10 \mathrm{~cm}$. long ; leaves lanceolate in outline, variable in size and length, $8-25 \mathrm{~cm}$. long, $2.5-5 \mathrm{~cm}$. wide at the base, firm, tapering into a very long narrow acuminate apex, pinnatifid, or commonly pinnate below, the segments or pinnæ lanceolate from a broad base, acute or acuminate, irregular in length, the lower sometimes shorter than those just above; sori several on each segment, straight or slightly curved. On limestone, Conn. to Ind., south to Ala. Local; rare except in the last-named locality.
3. Asplenium párvulum Mart. \& Gal. (I. F. f. 48.) Rootstock short, chaffy with black stiff scales. Stipes tufted, blackish and shining, $2.5-5 \mathrm{~cm}$. long; leaves rather firm, linear-oblong or linear-oblanceolate, $7-25 \mathrm{~cm}$. long, $10-25 \mathrm{~mm}$. wide, once pinnate ; pinnæ $4-12 \mathrm{~mm}$. long, mostly opposite, oblong, obtuse, entire or crenulate, auricled on the upper side and nearly sessile, the middle ones the longest, the lower gradually shorter and reflexed; rachis dark brown or black; sori oblong, short, borne about midway between the midrib and the margin of the pinnæ, nearly or quite straight. On limestone, Va. to Fla., west to Mo., Tex.. and N. Mex.
4. Asplenium platyneùron (L.) Oakes. (I. F. f. 49.) Rootstock short. Stipes tufted, purplish-brown and shining, $2.5-10 \mathrm{~cm}$. long ; leaves linear, $2-4 \mathrm{~cm}$.
 20-40 pairs, lanceolate, subfalcate, alternate or partly so, sessile, crenatc. serrate or incised, auricled on the upper side at the base and occasionally also on the lower : lower pinnæ gradually smaller and oblong or triangular; sori $S_{-12}$ on each silk of the midrib of the pinnæ, becoming crowded at maturity. On rocks and banks. preferring limestone soil, Me. and Ont. to Fla., west to Colo. and Tex.
5. Asplenium Trichómanes L. (I. F. f. 50.) Rootstock short, nearly erect. chaffy with blackish scales. Stipes densely tufted, numerous. $2.5-12 \mathrm{~cm}$. lonis. purplish-brown and shining; leaves linear in outline, $7-20 \mathrm{~cm}$. leng, $12-20 \mathrm{~mm}$. wide, rather rigid, once pinmate, evergreen; pinnte oval or roundish-oblong. inequilateral, partly opposite, partly alternate, or nearly all opposite, cuncate at the base, the point of attachment to the dark bown rachis namow, their mareins slightly crenate; sori 3-6 on each side of the forking and evanescent midrib, short,
narrowed at either end. On rocks, preferring limestone, throughout nearly the whole of N. Aim. Also in Europe and Asia.
6. Asplenium víride Huds. (I. F. f. 51.) Rootstock stout, creeping, with brown nerveless scales. Stipes numerous, densely tufted, brownish below. green above ; leaves linear-lanceolate. $5-20 \mathrm{~cm}$. long, $8-20 \mathrm{~cm}$. wide, once pinnate, pale green, soft, herbaceous or almost membranous; rachis green ; pinnæ 12-20 pairs, ovate or rhomboid, deeply crenate, obtuse, unequal sided, their upper edges narrowed suddenly at the base, the lower obliquely truncate; sori oblong and numerous or scattered and fewer. On rocks, N. B. and Vt. to Br. Col. Also in northern Europe and Asia.
7. Asplenium angustifòlium Michx. (I. F. f. 52.) Rootstock stout, creeping, rooting throughout. Stipes growing in a crown, brownish or green above, chaffless, $2-3 \mathrm{dm}$. long, sometimes slightly scaly toward the base ; leaves lanceolate in outline, 3-6 dm. long, once pinnate, glabrous ; pinnæ 20-30 pairs, linear-lanceolate, or those of the sterile leaves lanceolate, acuminate at the apex. obtuse or truncate at the base, 5-12 cm. long flaccid, the margins entire or slightly crenulate ; fertile leaves commonly taller than the sterile, narrower, their pinnæ generally much narrower, often falcate; sori $20-30$ on each side of the midrib, linear, crowded. In moist woods P. Q. to Wis. south to Va. and Ky.
8. Asplenium Rùta-murària L. (I. F. f. 53.) Rootstock short, ascending. Stipes tufted, naked, green, $5-7 \mathrm{~cm}$. long ; leaves ovate or deltoid-ovate in outline, $5-12 \mathrm{~cm}$. long, glabrous, evergreen, 2-3-pinnate or pinnatifid above; pinnæ and pinnules stalked ; pinuules rhombic or obovate, mostly obtuse, dentate or incised, cuneate at the base ; veins flabellate; sori few, linear-oblong, confluent when mature and covering nearly the whole pinnule, the indusium membranaceous and delicate. On limestone, Vt. to Mich., Conn., Ala. and Mo. Also in Europe, Asia and N. Africa.
9. Asplenium montànum Willd. (I. F. f. 54.) Rootstock short, chaffy at the summit. Stipes tufted, naked, slender, blackish at the base, $5-7 \mathrm{~cm}$. long ; leaves $5-20 \mathrm{~cm}$. long, ovate-lanceolate in outline, acuminate at the apex; rather firm, I-2 pinnate ; lower pinnæ longest, pinnate or pinnatifid, the lobes or segments ovate or oblong; upper pinnæ less divided, merely toothed or incised; veins obscure ; sori linear-oblong, short, the lower ones sometimes double, usually abundant, often confluent at maturity and concealing the narrow membranous indusia. On rocks, Conn. and N. Y. to Ga., west to O. and Ark.
10. Asplenium fontànum (L.) Bernh. (I. F. f. 55.) Rootstock short, ascending, with narrow dark scales at the apex. Stipes tufted, $2.5-7 \mathrm{~cm}$. long, somewhat blackish at the base especially on the inner side, usually glabrous; leaves lanceolate, broadest above the middle, thin, $2-3$ pinnate, $7-15 \mathrm{~cm}$. long, $1-3 \mathrm{~cm}$. wide, acuminate at the apex, narrowed to the base; pinnæ IO- $\mathbf{I} 5$ pairs, the segments deeply dentate with spinulose teeth ; sori only $\mathbf{I}$ to 4 on each segment, covered with a membranous subentire indusium, rarely confluent. On rocks, Lycoming Co., Pa., and Springfield, O. Also in Europe.
II. Asplenium Brádleyi D. C. Eaton. (I. F. f. 56.) Rootstock short, chaffy with brown scales. Stipes tufted, slender, $5-7 \mathrm{~cm}$. long, chestnut-brown; leaves oblong-lanceolate or oblong, acuminate at the apex, not narrowed at the base, pinnate with 8-12 pairs of short-stalked or sessile, oblong-ovate pinnæ, the lower again pinnatifid or pinnate with oblong obtuse lobes or pinnules, which are toothed at the apex, the upper pinnatifid with dentate or nearly entire lobes; rachis brown; sori short, borne near the midrib, covered with the narrow indusium until maturity. On rocks, often preferring limestone, N. Y. to Ga. and Ala., west to Ark. Local. July--Sept.
12. Asplenium acrostichordes Sw. (I. F. f. 57.) Rootstock sinuous, creeping. Stipes $2-3 \mathrm{dm}$. long, straw-colored, somewhat chaffy below at least when young; leaves lanceolate in outline, 3-9 dm. long, 1.5-3 dm. wide, acute or acuminate at the apex, narrowed to the base, pinnate-pinnatifid; pinnæ linearlanceolate, sessile, acuminate, deeply pinnatifid into numerous oblong obtuse or subacute, slightly crenate segments; sori crowded, slightly curved or straight, the lower ones often double; indusium light-colored and somewhat shining when young. In rich moist woods, N. S. to Minn., south to Ga. and Ala. Also in E. Asia.
13. Asplenium Fillix-foémina (L.) Bernh. (I. F. f. 58.) Rootstock creeping, rather slender for the size of the plant. Stipes tufted, I.5-2.5 dm. long,
straw-colored, brownish or reddish; leaves broadly oblong-ovate or oblong-lancenlate, acuminate at the apex, 3-9 dm. long, bipinnate; pinnæ lanceolate, acuminate, short-stalked or the upper ones sessile, I-2 dm. long; pinnules oblong-lanceolate, incised or serrate, their lobes or teeth often again toothed, those toward the ends of the pinnæ confluent by a very narrow margin to the secondary rachis; sori short, the indusia straight or variously curved, sometimes horseshoe-shaped. In woods, thickets, and by walls and fences, N. S. to Alaska, south to Fla., La., and Ariz. Also in Europe and Asia.

## 10. PHYLLİTIS Hill, 1756. [Scolopendrium Adans. 1763.]

Large ferns with oblong or strap-shaped mostly entire leaves, and linear elongated sori which are almost at right angles to the midrib and contiguous in pairs, one on the upper side of a veinlet, the other on the lower side of the next contiguous veinlet, thus appearing to have a double indusium opening longitudinally along its middle. Five species, mainly of temperate regions. Only the following is known to occur in N. Am. [Greek name of the Harts-tongue.]
I. Phyllitis Scolopéndrium (L.) Newman. Harts-tongue. (I. F. f. 44.) Rootstock short, chaffy with light brown scales. Stipes $5-15 \mathrm{~cm}$. long, fibrillosechaffy below or sometimes up to the base of the leaf; leaves entire, bright green, firm, 2-4.5 dm. long, $2.5-6 \mathrm{~cm}$. wide, cordate at the base, the margins entire or undulate, the lower surface of the midrib sometimes chaffy; pairs of sori distinct, 4-15 mm. long; conspicuous on the lower surface, the sporanges dark brown at maturity; veins free, usually once forked near the midrib. On shaded cliffs of the corniferous limestone, Chittenango Falls and Jamesville, N. Y.; near South Pittsburg, Tenn.; Owen Sound, Ont., N. B. and Mex. Widely distributed in Europe, Asia and Africa.

## II. CAMPTOSÒRUS Link.

Slender ferns with tapering simple entire or undulate leaves, bearing linear or oblong sori several times longer than broad, irregularly scattered on either side of the reticulate veins or sometimes crossing them, partly parallel to the midrib and partly oblique to it, the outer ones more or less approximate in pairs. Indusium membranous. [Greek, referring to the bent or curved sori.] Two species.
I. Camptosorus rhizophýllus (L.) Link. Walking-Fern. (I. F. f. 45.) Rootstock short, usually creeping, chaffy. Stipes light green, $2.5-15 \mathrm{~cm}$. long, tufted, spreading; leaves rather thin, lanceolate, simple, long-acuminate at the apex, cordate, hastate or rarely narrowed at the base, $10-25 \mathrm{~cm}$. long, sometimes with a more or less elongated pair of basal auricles; tip of the leaf and sometimes the tip of one or both of the basal auricles rooting and forming a new plant by the ultimate withering away of its tissue, but commonly two or sometimes as many as four plants are found connected; sori usually numerous, irregularly scattered on the lower surface. On rocks, preferring limestone, P. Q. to Ont. and Minn., south to N. Car, and Kan.

## 12. POLÝSTICHUM Roth.

Coarse pinnate or bipinnate ferns growing from an erect rootstock, with round sori usually borne on the backs of the veins, the sterile and fertile leaves similar in outline. Indusium superior, centrally peltate, orbicular. Stipe continuous, not jointed with the rootstočk. Veins free. [Greek, signifying many rows, without obvious application.] Some 45 species of wide distribution.
Leaves once pinnate.

Stipes short; lower pinnæ much reduced.
Stipes longer; lower pinnæ usually little reduced.
Leaves 2 -pinnate.

1. Polystichum Lonchitis (L.) Roth. Holly-fern. (I. F. f. 26.) Rontstock short, stout, densely chaffy. Stipes $2.5 \cdot \mathbf{1 2 . 5} \mathbf{~ c m}$. long, bearmg large dark brown scales with some smaller ones ; leaves rigid, evergreen, narrowly lanceolate in outline, once pinnate ; pinne broadly lancolate-faleate, $2.5-5 \mathrm{~cm}$. longs, acute or acuminate at the apex, strongly auricled on the upper side at the hase and whliguly truncate on the lower, densely spinulose-dentate, the lowest commonly triangular
and shorter; sori large, at length contiguous, borne nearer the margin than the midrib. On rocks, Lab. to Alaska, south to Ont. and Br. Col., and in the Rocky Mts. to Utah. Also in N. Europe and Asia.
2. Polystichum acrostichoides (Michx.) Schott. Christmas Fern. (I. F. f. 27.) Rootstock stout, creeping. Stipes $12-16 \mathrm{~cm}$. long, densely chaffy ; leaves lanceolate, $1.5-6 \mathrm{dm}$. long, $7-12 \mathrm{~cm}$. wide, rigid, evergreen, subcoriaceous, once pinnate ; pinnæ linear-lanceolate, somewhat falcate, $2.5-7 \mathrm{~cm}$. long, acutish at the apex, half halberd-shaped at the base, bristly with appressed teeth, the lower scarcely smaller; fertile fronds contracted at the summit, bearing the large contiguous sori near the middle, which soon cover the whole lower surface. In woods and rocky places, N. B. and N. S. to Fla., west to Ont., Wis., and Miss. JulyAug. Forms with cut-lobed or incised pinnæ are known as var. Schweinitzii; occasional forms are 2-pinnatifid.
3. Polystichum Braùnii (Spenner) Fée. (I. F. f. 28.) Rootstock stout. Stipes $10-12 \mathrm{~cm}$. long, chaffy with both broad and narrow brown scales; leaves oblong-lanceolate, not coriaceous, 2 -pinnate, the rachis chaffy, at least below ; pinnæ numerous, close together, lanceolate or linear-lanceolate, broadest at the base, cut to the midvein into ovate or oblong pinnules; middle pinnæ $6-10 \mathrm{~cm}$. long, the lower gradually shorter; pinnules truncate and nearly rectangular at the base, acute or obtuse, sharply toothed and beset with long soft hairs and scales; sori small, mostly nearer the midvein than the margin. In rocky woods, Quebec to Alaska, south to Me., the mountains of Penn., Mich. and Br. Col. Aug.

## 13. DRYópteris Adans. Shield-fern.

Ferns with 2-3-pinnate or pinnatifid leaves and round sori usually borne on the backs of the veins, the fertile and sterile leaves similar in outline. Indusium flattish, cordate reniform, superior, fixed by its sinus. Stipe continuous, not jointed with the rootstock. Veins free. [Greek, signifying oak-fern, in allusion to the forest habitat of most species.] About 150 species, of wide distribution.

Texture thin-membranous; veins simple or once forked; leaves pinnatifid.

Lower pinnæ very much reduced.
Lower pinnæ little smaller than the middle ones.
Veins I-2-forked; sori crowded, 10-12 to a segment.
Veins simple; sori larger, distant, 4 -1o to a segment.
Texture firmer, sometimes subcoriaceous; veins forking freely.
Lêaves 2 -pinnatifid or 2 -pinnate; segments not spinulose.
Leaves small, narrowly lanceolate.
Leaves larger, mostly $0.4-$ I. 6 m . high.
Indusia large, thinnish and flat.
Pinnæ widest at the base. Pinnæ widest at the middle. Indusia convex, without marginal glands. Sori near the margin.
Sori near the midvein.

1. D. Noveboracensis.
2. D. Thelypteris.
3. D. simulata.
4. D. fragrans.
5. D. cristata.
6. D. Goldieana.
7. D. marginalis.
8. D. Filix-mas.

Leaves 2-pinnate or 3 -pinnatifid; segments spinulose-toothed.
Leaves ovate-lanceolate, usually not narrowed below ; scales of stipes usually with a dark centre. 9. D. spinulosa.
Leaves elongated-lanceolate, usually narrowed at the base; scales of the stipes pale brown.
I. Dryopteris Noveboracénsis (L.) A. Gray. (I. F. f. 29.) Rootstock slender, creeping. Leaves lanceolate, tapering both ways from the middle, 3-6 dm. long, $10-15 \mathrm{~cm}$. wide, membranous, long-acuminate at the apex, once pinnate; pinnre lanceolate, sessile, long-acuminate, deeply pinnatifid, ciliate and finely pubescen: beneath, $3-7 \mathrm{~cm}$. long, the two or more lower pairs gradually shorter and deflexed, commonly distant; segments flat, oblong, obtuse, the basal ones often enlarged; veins simple or those of the basal lobes forked; sori not confluent, borne near the margin; indusium minute, reniform, delicate, glandular. In moist woods, Newf. to Ont. and Minn., south to Ga., Ala. and Ark.
2. Dryopteris Thelýpteris (L.) A. Gray. (I. F. f. 30.) Rootstock slender, creeping. Leaves lanceolate or oblong-lanceolate, scarcely narrower at the base than at the middle, $3-8 \mathrm{~cm}$. long, $10-15 \mathrm{~cm}$. wide, short-acuminate, membranous, once
pinnate; pinnæ linear-lanceolate, short-stalked or sessile, mostly horizontal, acuminate at the apex, nearly truncate at the base, $3-7 \mathrm{~cm}$. long, slightly pubescent beneath, deeply pinnatifid; segments oblong, obtuse or appearing acute from the strongly revolute margins; veins regularly once or twice forked; sori crowded, Io-12 to each segment ; indusia reniform, slightly glandular or glabrous. In marshes, N. B. to Manitoba, south to Fla. and Tex. Also in Europe and Asia.
3. Dryopteris simulàta Davenp. (I. F. f. 31.) Rootstock wide-creeping, brownish; stipes 1.5-5 dm. long, straw-colored, dark brown at base, with deciduous scales; leaves $2-5 \mathrm{dm}$. long, $5-16 \mathrm{~cm}$. wide, oblong-lanceolate, tapering to an acuminate apex (abruptly tapering in the fertile leaf), little or not at all narrowed at the base; pinnæ 12-20 pairs, lanceolate, pinnatifid, the segments obliquely oblong, obtuse, entire, slightly revolute in the fertile leaf; surfaces finely pubescent, especially near the midribs; texture rather thin; veins simple, nearly straight; sori rather large, somewhat distant, 4-Io to each segment; indusia finely glandular at the margins, withering-persistent. In woodland swamps, Me. to Conn. and N. Y.
4. Dryopteris fràgrans (L.) Schott. (I. F. f. 32.) Rootstock stout, with brown shining scales. Stipes $5-10 \mathrm{~cm}$. long, chaffy; leaves lanceolate, firm, glandular, and aromatic, pinnate or nearly bipinnate, acuminate at apex, narrowed to the base, $7-30 \mathrm{~cm}$. long; pinnæ deeply pinnatifid, numerous, lanceolate, acute, $1.2-3 \mathrm{~cm}$. long ; segments oblong, obtuse, dentate or nearly entire, nearly covered by the large sori; indusium thin, nearly orbicular, persistent long after the sporanges have matured, its margin ragged and sparingly gland-bearing. On rocks, Labrador to Alaska, south to Vt. and Wis. Also in Greenland, Europe, and Asia.
5. Dryopteris cristàta (L.) A. Gray. (I. F. f. 33.) Rootstock stout, densely chaffy. Stipes of the sterile leaves 5-12 cm. long, those of the fertile $1.5-2.5 \mathrm{dm}$. long; leaves linear-oblong or lanceolate, acuminate, gradually and slightly narrowed to the base, rather firm, $3-8 \mathrm{dm}$. long, $10-15 \mathrm{~cm}$. wide, pinnate; pinnæ lanceolate or triangular-ovate, acuminate, deeply pinnatifid or the lower pinnate, the segments 6-10 pairs, serrate or incised; sori about midway between the margin and midrib; indusium thin, glabrous. In wet woods and swamps, Newf. to Manitoba, south to Ky. and Ark. Also in Europe and Asia.

Dryopteris cristata Clintoniàna (D. C. Eaton) Underw. Leaves 8-12 dm. long, with oblong-lanceolate pinnæ which are broadest at the base and $10-15 \mathrm{~cm}$. long; segments 8-16 pairs, linear-oblong, obscurely serrate; veins pinnately forking, bearing the sori near the midvein. Me. and Ont. to N. J., Penn. and Wis.
6. Dryopteris Goldieàna (Hook.) A. Gray. (I. F. f. 34.) Rootstock stout, chaffy. Stipes $2.5-4.5 \mathrm{dm}$. long, chaffy at least below ; leaves broadly ovate, rather firm, 6-12 dm. long, usually 3 dm . or more wide, glabrous or nearly so, dark green above, pinnate or nearly 2 -pinnate; lower pinnæ broadly lanceolate, widest at about the middle, $1.5-2.5 \mathrm{dm}$. long, $2.5-5 \mathrm{~cm}$. wide, parted into about 20 pairs of oblong-linear subfalcate segments which are serrate with appressed teeth; sori very near the midrib, close together but distinct, large ; indusium orbicular, glabrous, persistent. In rich woods, N. B. to Minn., south to N. Car. and Tenn.
7. Dryopteris marginàlis (L.) A. Gray. (I. F. f. 35.) Rootstock stout, ascending, chaffy with dark brown shining scales. Stipes $7-20 \mathrm{~cm}$. long, chaffy below; leaves borne in a crown, ovate-oblong or ovate-lanceolate in outline, subcoriaceous, $\mathbf{1 . 5 - 7 . 5 ~ d m}$. long, pinnate or 2-pinnate, acuminate at the apex, slightly narrowed at the base ; pinnæ numerous, lanceolate, nearly sessile, glabrous, $5-12.5 \mathrm{~cm}$. long. the lower broader and shorter than the middle ones, the upper pinnatifid, the lower pinnately parted into oblong, sometimes slightly falcate obtuse entire dentate or pinnately lobed pinnules; sori distinct, close to the margin, covered by the glabrous indusium. In rocky woods, Pr. Edw. Isl. to Minn. south to Ga., Ala. and Ark. A hybrid with $D$. cristata has been described.
8. Dryopteris Filix-más (L.) Schott. Male Fern. (I. F. f. 36.) Rootstock stout, ascending or erect, chaffy. Stipes $10-15 \mathrm{~cm}$. long, very chaffi- helow ; leaves oblong-lanceolate, acute, or acuminate at the apex, slightly narrowed to the base. 3-9 dm. long, rather firm, half evergreen, pinnate or partly 2 -pinnate: pinnæ lanceolate, broadest at the base, gradually acuminate to the apex. $7-15 \mathrm{~cm}$. Wong. pinnatifid almost to the rachis or pinnately divided into oblong glabrous bobes or pinnules; pinnules slightly dentate, incised or nearly entire ; sori large. home near the midvein, more numerous on the lower halves of the segments ; indusium firm,
convex, glabrous. In rocky woods, Lab. to Alaska, south to N. Mich. and Br. Col. Also in Greenland, Europe and Asia, and in the Andes of S. Am.
9. Dryopteris spinulòsa (Retz) Kuntze. (I. F. f. 37.) Rootstock chaffy. Stipes r.5-4.5 dm. long, bearing a few pale brown deciduous scales; leaves ovate-lanceolate, 2-pinnate, the pinnæ oblique to the rachis, elongated-triangular, rather thin, the lower pairs broadly triangular, slightly shorter than the middle ones; pinnules oblique to the midrib, connected by a very narrow wing, oblong, incised or pinnatifid with spinulose-toothed lobes; indusium glabrous. In rich woods, Newf. to Alaska and Wash., south to Ky. and Mich.

Dryopteris spinulosa intermèdia (Muhl.) Underw. Scales of the stipes few, brown with a darker centre; leaves oblong-ovate, $2-3$-pinnate, the pinnæ oblong-lanceolate, spreading, the lowest unequally triangular-ovate ; pinnules crowded, pinnately divided : indusium delicate, beset with stalked glands. Lab. to Alaska, south to N. Car. and Mo.

Dryopteris spinulosa dilatata (Hoffm.) Underw. Scales of the stipe large, brown with a darker centre; leaves broadly ovate or triangular-ovate, commonly 3 -pinnate; pinnules lanceolate-oblong, the lowest often much elongated ; indusium glabrous. Newf. to Wash. and Alaska, south along the Alleghenies to Ga. and Tenn. and to O. and Neb. Also in Europe and Asia.
10. Dryopteris Boòttii (Tuckerm.) Underw. (I. F. f. 38.) Rootstock, ascending. Stipes 2-3 dm. long, covered, at least below, with thin pale-brown scales; leaves elongated-oblong or lanceolate in outline, thin, acuminate at the apex, slightly narrowed at the base, nearly or quite 2 -pinnate, $3-7.5 \mathrm{dm}$. long, $7.5-12.5 \mathrm{~cm}$. wide ; pinnæ lanceolate, long-acuminate, broadest at the nearly sessile base; pinnules broadly oblong, very obtuse, the lower pinnatifid; sori distinct, borne about halfway between the midvein and margin ; indusium minutely glandular. In woods, N. S. to Minn., south to Del. and W. Va. Also in N. Eu. and Asia.

## 14. PHEGÓPTERIS Fée.

Medium-sized or small ferns with 2-3-pinnatifid or ternate leaves and small round sori borne on the backs of the veins below the apex. Stipe not jointed with the rootstock. Indusium wanting. Fertile (spore-bearing) and sterile leaves similar. Sporanges pedicelled, provided with a vertical ring, bursting transversely. [Greek, signifying beech-fern.] About 75 species of wide geographic distribution.
Leaves triangular, 2 -pinnatifid ; pinnæ sessile, adnate to the winged rachis.
Leaves longer than broad, usually dark green.
I. P. Phegopteris.
Leaves as broad as long, or broader, usually light green.
2. P. hexagonoptera.
Leaves ternate, with the three divisions petioled; rachis. wingless.

Divisions subequal, often deflexed at right angles to the stipe.
3. P. Dryopteris.

Terminal division largest erect, the leaves thus appearing pinnate.
4. P. Robertiana.
I. Phegopteris Phegópteris (L.) Underw. (I. F. f. 39.) Rootstock slender, creeping, somewhat chaffy at least when young. Stipes $15-22 \mathrm{~cm}$. long; leaves triangular, thin, mostly longer than wide, $10-25 \mathrm{~cm}$. long, $7-15 \mathrm{~cm}$. wide, acuminate at the apex, pubescent, especially on the veins beneath; pinnæ lanceolate or linear-lanceolate, acuminate at the apex, sessile, broadest above the base, pinnately parted very nearly to the rachis into oblong obtuse entire segments, the lower pair deflexed and standing forward; basal segments, at least those of the upper pinnæ, decurrent and adnate to the winged rachis. In moist woods, Newf. to Alaska, south to the mountains of Va., Mich. and Wash. Also in Europe and Asia. Aug.
2. Phegopteris hexagonóptera (Michx.) Fée. (I. F. f. 40.) Rootstock creeping, chaffy, somewhat fleshy. Stipes $2-4.5 \mathrm{dm}$. long, straw-colored, naked; leaves triangular, as broad as or broader than long, $2-3 \mathrm{dm}$. wide, slightly pubescent and often slightly glandular beneath, acuminate at the apex ; uppermost pinnæ oblong, obtuse, dentate or entire, small, the middle ones lanceolate, acuminate, the very large lowest pair broadest near the middle, pinnately parted nearly to the midvein into linear-oblong obtuse segments; sori mostly near the margin. In dry woods, Quebec to Minn., south to Fla. and La.
3. Phegopteris Dryópteris (L.) Fée. OAk-fern. (I. F. f. 4I.) Rootstock creeping. Stipes slender, I-3 dm. long, chaffy at least near the base ; leaves thin, broadly triangular, almost glabrous, I-2 dm. wide, ternate, the three primary divisions stalked, pinnate or partly bipinnate, the terminal one slightly larger, all spreading more or less at right angles to the stipe ; pinnules lanceolate or ob-long-lanceolate, obtuse to subacute, sessile; segments oblong, obtuse, entire or crenate, close together. In moist woods and swamps, Newf. to Alaska, south to Va., Minn., Or., and in the Rocky Mts. to Colo. Also in Europe and Asia.
4. Phegopteris Robertiàna (Hoffm.) A. Braun. Stipes $15-25 \mathrm{~cm}$. long, straw-colored when dry ; leaves $8-20 \mathrm{~cm}$. long, mostly erect, $12-18 \mathrm{~cm}$. wide, del-toid-ovate, bipinnate, the lowest pinnæ much the largest, pinnatifid or again pinnate; upper pinnæ smaller, pinnatifid, lobed or entire; sori numerous. Lab. to Ia. and Idaho. Also in Europe. (Phegopteris Dryopteris Robertiana Davenp.)

## 15. FILIX Adans, 1763. [Cystopteris Bernh. 1806.]

Delicate rock ferns with slender stipes, 2-4-pinnate leaves, and roundish sori borne on the backs of the veins. Indusium membranous, hood-like, attached by a broad base on its inner side and partly under the sorus, early opening and somewhat evanescent. Veins free. Sporanges pedicelled, provided with a transversely bursting vertical ring. [Ancient name of the fern plant.] Five species, natives of the north temperate zone.

Leaves ovate-lanceolate or lanceolate, 2-3-pinnate.

Leaves broadest at base, long-tapering, bearing bulblets beneath.
Leaves scarcely broader at base, short-pointed; no bulblets.
Leaves deltoid-ovate, 3 -4-pinnate.

1. F. bulbifera.
2. F. fragilis.
3. $F_{\text {. montana. }}$
I. Filix bulbìfera (L.) Underw. (I. F. f. 23.) Rootstock short, rooting. Stipes IO- 15 cm . long, light-colored; leaves elongated, lanceolate from a broad base, 3-8 dm. long, 2-3-pinnatifid or pinnate ; pinnules crowded, toothed or pimnatifid; rachis wingless, commonly bearing underneath, in the axils of the pinnæ and segments, large fleshy bulblets which fall away and propagate the plant; indusia short, truncate on the free side, early thrown back and withering. On moist rocks, especially limestone, Quebec to Wis., south to Tenn. and Ark.
4. Filix frágilis (L.) Underw. (I. F. f. 24.) Rootstock short. Stipes $10-20$ cm . long; leaves thin, oblong-lanceolate, slightly tapering below, $\mathbf{1}-3 \mathrm{dm}$. long, 2-3pinnatifid or pinnate ; pinnæ lanceolate-ovate, irregularly pinnatifid, with a broad central space and bluntly or sharply toothed segments decurrent along the margined or winged rachis, without bulblets; indusia narrow or acute at the free end, early withering ; texture membranous. On rocks and in moist grassy woods, Newf. to Alaska, south to Ga. and Ariz. Almost cosmopolitan.
5. Filix montàna (Lam.) Underw. (I. F.f.25.) Rootstock widely creeping. Stipes $15-22 \mathrm{~cm}$. long, slender; leaves deltoid-ovate, $3-4$-pinnate, about 15 cm . long and broad, the lowest pinnæ deltoid-lanceolate and much larger than the upper, their inferior pinnules $2.5-3 \mathrm{~cm}$. long; segments deeply divided into oblong lobes, deeply toothed; sori numerous; indusia acute, soon withering. On rocks, Lab. and Quebec to Br. Col., south to the north shore of L. Superior, and Colo. Also in N. Europe and Asia.

## 16. WOÒDSIA R. Br.

Small or medium-sized ferns, growing in rocky places, with $1-2$-pinnate or pinnatifid leaves and round sori borne on the backs of simply forked free veins. Indusia inferior, thin and often evanescent, roundish or stellate, either small and open or early bursting at the top into irregular lobes or segments. Stipes often jointed above the base and separating at the joint. [Name in honor of Joseph Woods, $\mathbf{1 7 7 6}^{\mathbf{7}} \mathbf{1 8 6 4}$, English architect and botanist.] About 15 species, natives of temperate and cold regions.

Indusium minute or evanescent, flat, concealed beneath the sorus, its margin cleft into slender hair-like segments,

Stipes obscurely jointed near the base; cilia of the indusium inflexed over the sporanges.
Leaves with more or less rusty chaff underneath. I. W. Ilvensis.
Leaves glabrous or nearly so.
Leaf lanceolate, not tapering below; pinnæ cordate-ovate, 5-7-lobed.
2. W. alpina.

Leaf linear or linear-oblong, often tapering both ways; pinnæ deltoid.
3. W. glabella.

Stipes not jointed; cilia of the indusium very short, hidden by the sporanges. Puberulent; indusium deeply cleft, ending in hairs with cylindric cells.
4. W. scopulina.

Leaves and stipes glabrous; indusium divided to centre into beaded hairs.
5. W. Oregana.

Indusium distinct, at first enclosing the sporanges, splitting into jagged lobes.
6. W. obtusa.
I. Woodsia Ilvénsis (L.) R. Br. (T. F. f. I6.) Rootstock short, cæspitose. Leaves lanceolate, $10-25 \mathrm{~cm}$. long, glabrous above, more or less covered with rusty chaff beneath, as are also the slender stipes; pinnæ crowded, sessile, pinnately parted, the crowded segments oblong, obscurely crenate; stipes jointed near the base; sori borne near the margins of the segments, somewhat confluent when old; indusium minute, concealed beneath the sorus, its margin cleft into filiform segments, which are inflexed over the sporanges and inconspicuous, especially when mature. On exposed rocks, Lab. and Greenland to Minn., south to N. Car. and Ky. Also in Europe and Asia.
2. Woodsia alpìna (Bolton) S. F. Gray. (I. F. f. 17.) Rootstock short, cæspitose. Leaves narrowly oblong-lanceolate, $5-15 \mathrm{~cm}$. long, ${ }^{15-25} \mathrm{~cm}$. wide, scarcely narrower below ; pinnæ cordate-ovate or triangular-ovate ; pinnately 5-7-lobed, glabrous or very nearly so on both surfaces; stipes jointed near the base; sori somewhat scattered on the segments; indusium as in the preceding species. On moist rocks, Lab. to Alaska, south to N. B., N. N. Y. and W. Ont.
3. Woodsia glabélla R. Br. (I. F. f. I8.) Rootstock small, cæspitose. Stipes obscurely jointed at the base; leaves linear or lanceolate, $5-12 \mathrm{~cm}$. long, $8-15 \mathrm{~mm}$. wide; pinnæ deltoid to ovate, the lower remote, obtuse, crenately lobed, often somewhat smaller than the middle ones, glabrous or nearly so; sori scattered on the segments; indusium minute, membranous, with $6-10$ radiating segments, covered by the sporanges, its filamentous segments only inflexed over them when young. On moist rocks, Lab. to Alaska, south to N. H., Vt., N. N. Y. and the north shore of L. Superior. Also in arctic and alpine Europe and Asia.
4. Woodsia scopulina D. C. Eaton. (I. F. f. 19.) Rootstock short, densely chaffy. Stipes $5-10 \mathrm{~cm}$. long, not jointed, puberulent like the rachis and lower surface of the leaf with minute flattened hairs and stalked glands; leaves lanceolate, $\mathbf{1 2 - 2 5} \mathrm{cm}$. long, tapering from about the middle to both ends; pinnæ numerous, oblong-ovate, pinnatifid into 10-16 oblong toothed segments; indusium hidden beneath the sporanges, very deeply cleft into short cilia with cylindric cells. In crevices of rocks, N. Minn. and W. Ont. to Or., south in the Rocky Mts. to Ariz., and in the Sierra Nevada to Cal. Summer.
5. Woodsia Oregàna D. C. Eaton. (I. F. f. 20.) Rootstock short. Stipes and leaves glabrous; stipes not jointed, brownish below; leaves $5-25 \mathrm{~cm}$. long, elliptic-lanceolate, the sterile shorter than the fertile; pinnæ triangular-oblong, obtuse, pinnatifid; lower pinnæ reduced in size and somewhat remote from the others; rachis straw-colored; segments oblong or ovate, dentate or crenate, the teeth often reflexed and covering the submarginal sori; indusia minute, concealed by the sporanges, divided almost to the centre into a few beaded hairs. On rocks, N. Mich., Minn. and Manitoba to Br. Col., south in the Rocky Mts. to Ariz., and in the Sierra Nevada to Cal. July-Aug.
6. Woodsia obtùsa (Spreng.) Torr. (I. F. f. 2I.) Rootstock short. Stipes not jointed, pale green, $7-15 \mathrm{~cm}$. long; leaves broadly lanceolate, $15-40 \mathrm{~cm}$. long, minutely glandular-pubescent, nearly 2 -pinnate; pinnæ rather remote, triangularovate, or oblong, pinnately parted into obtuse oblong crenate-dentate segments ; veins forked and bearing the sori on or near the minutely toothed lobes; indusia conspicuous, at first enclosing the sporanges, at length splitting into several jagged lobes, which are much wider than those in any of the preceding species. On
rocks, N. S. to N. N. Y., Wis. and Br. Col., south to Ga., Ala., the Ind. Terr. and Ariz. Ascends to 670 m . in Va. July-Aug.

## 17. DENNSTAEDTIA Bernh.

Large ferns with 2-3-pinnatifid leaves, and creeping or erect rootstocks. Sori small, globular, marginal or submarginal. Sporanges borne in an elevated globular receptacle, enclosed in the membranous cup-shaped inferior indusium, which is open at the top and on the outer side adherent to a reflexed toothlet of the leaf. Sporanges pedicelled, provided with a vertical ring which bursts transversely. Veins always free. [Named in honor of August Wilhelm Dennstedt, a student of the Flora of Weimar.] About 30 species of wide distribution.
I. Dennstaedtia punctilóbula (Michx.) Moore. (I. F. f. 22.) Rootstock creeping, not chaffy. Stipes stout, chaffless, pale green and sweet-scented ; leaves 310 dm . long, $12-20 \mathrm{~cm}$. wide, ovate-lanceolate, acute or acuminate, frequently longattenuate, usually 3-pinnatifid, thin and delicate; rachis and under surface minutely glandular and pubescent ; sori minute, each on a recurved toothlet, usually one at the upper margin of each lobe ; sporanges few ; indusium cup-shaped with a delicate membranous irregular margin. In various situations, most abundant on open hillsides, N. B. and Ont. to Ind. and Minn. (according to Upham), south to Ala. and Tenn. Ascends to 1680 m . in Va. Aug. (Dicksonia punctilobula A. Gray.)
18. MATEÚCCIA Todaro, 1866. [Struthiopteris Willd, 1809. Not Scop. 1760.]

Coarse ferns growing in a crown from an erect rootstock, with the sporophylls closely rolled together into necklace-like segments entirely unlike the broad bipinnatifid sterile leaves. Veins free.-Three species of the northern hemisphere.
I. Matteuccia Struthiópteris(L.) Todaro. Ostrich Fern. (I. F. f. 15.) Rootstock stout, ascending, bearing a circle of sterile leaves with one or more fertile ones within. Fertile leaves $3-5 \mathrm{dm}$. high, simply pinnate with necklaceshaped pinnæ which are formed of the closely revolute margins; sori crowded and confluent ; sterile leaves $6 \mathrm{dm} .-2 \mathrm{~m}$. high, I.5-4 dm. wide, broadly lanceolate, bipinnatifid, much the broadest above the middle and gradually tapering below, the lower pinnæ being gradually much reduced; veins pinnate, free and simple: texture firm ; rootstocks stoloniferous. In moist thickets, especially along streams, N. S. to N. J., west to Ill. and Br. Col. Also in Europe and Asia.

## 19. ONOCLÈA L.

Coarse ferns, with leaves growing separately from a wide creeping slender rootstock, with the sporophylls closely rolled up into berry-like segments, and entirely unlike the broad pinnatifid foliage leaves. Sori round, borne on the back of the veins. Indusium very thin and membranous, hemispheric or hood-shaped, fixed at the inferior side of the sorus. Sporophylls unrolling at maturity, allowing the spores to escape, and remaining long after the sterile leaves have been killed by frost. Veins forming small areolæ. [Name ancient, not originally applied to these plants.] A single species.
I. Onoclea sensıbilis L. Sensitive Fern. (I. F. f. 14.) Rootstock rather slender, rooting ; sporophylls $3-7 \mathrm{dm}$. high, persistent over winter, much contracted, and with short pinnules rolled up into berry-like closed involucres forming a narrow panicle; foliage leaves $3-13 \mathrm{dm}$. high, broadly triangular, deeply pinnatifid, the segments lanceolate-oblong, entire, undulate, or the lower pairs sinnuate-pinnatifid; veins freely anastomosing ; lowest segments tapering both ways from the middle. In moist soil, Newf. and Ont. to Minn. and south to the Gulf. Ascends to 900 m . in Va. Various forms intermediate between sporophylls and foliage leaves occur. Sensitive to early frosts. Aug.-Nov.

## Order 2. SALVINIÀLES.

Aquatic or uliginous herbs with entire or 2 -lobed, filiform, or $\downarrow$-foliolate leaves. Spores of two kinds and sizes (microspores and macrospores) contained in sporocarps.
Plants rooting in the mud; leaves 4 -foliolate or filiform,
Family 1. Marsianazat. Plants floating; leaves entire, or 2 -lobed.

Family 2. Salviniaceae.

## Family 1. MARSILEACEAE R. Br.

Perennial herbaceous plants rooting in mud, with slender creeping rootstocks and 4 -foliolate or filiform leaves. Asexual propagation consisting of sporocarps borne on peduncles which rise from the rootstock near the leaf-stalk or are consolidated with it, containing both macrospores and microspores. The macrospores germinate into prothallia which bear archegonia, while the microspores grow into prothallia bearing antheridia. Two genera and some 45 species of wide distribution.

## r. MARSÍLEA L.

Marsh or aquatic plants, the leaves commonly floating on the surface of shallow water, slender-petioled, 4 -foliolate. Peduncles shorter than the petioles, arising from their bases or more or less adnate to them. Sporocarps ovoid or beanshaped, composed of two vertical valves with several transverse compartments (sori) in each valve. [Name in honor of Giovanni Marsigli, an Italian botanist, who died about 1804.] About 40 species, widely distributed.

Sporocarps glabrous and purple when mature.
Sporocarps densely covered with hair-like scales.

1. M. quadrifolia. 2. M. vestita.
I. Marsilea quadrifòlia L. European Marsilea. (I. F. f. 73.) Rootstock slender, buried in the muddy bottoms of shallow lakes or streams. Petioles usually slender, $5^{-13} \mathrm{~cm}$. high, or when submerged sometimes elongated to 3-6 dm . Leaflets mostly triangular-obovate, variable in outline, 6-16 mm. long, 4-12 mm . wide, glabrous or rarely with scattered hairs when young, the margins entire; sporocarps 2 or rarely 3 on a branching peduncle, which is attached to the petiole at its base, covered with short yellowish-brown hairs when young, becoming glabrous and dark purple when mature ; sori 8 or 9 in each valve. Along the shores of Bantam Lake, Litchfield Co., Conn., whence it has been introduced into various parts of the country, notably into E. Mass. Also in Europe and Asia.
2. Marsilea vestita Hook \& Grev. (I. F. f. 74.) Rootstock slender. Petioles slender, 5-13 cm. high; leaflets similar to those of the preceding species, entire or toothed ; sporocarps $4^{-8} \mathrm{~mm}$. long, 4-6 mm . wide, with a short raphe, a short and blunt lower tooth and an acute and sometimes curved upper one, densely covered with soft spreading narrow hair-like scales, or (in the forms known as $\bar{M}$. mucronata) these are short and appressed or almost wanting ; sori 6-1 I in each valve. In wet sand or in shallow ditches, Kan, to Ariz. and Mex., north to Br . Col. Also found in Fla.

## Family 2. SALVINIÀCEAE Reichenb.

Small floating plants with a more or less elongated and sometimes branching axis bearing apparently 2-ranked leaves. Sporocarps soft, thin-walled, borne 2 or more on a common stalk, i-celled, with a central often branched receptacle, which bears macrosporanges containing a single macrospore or microsporanges containing numerous microspores. The macrospores germinate into prothallia which bear archegones, the microspores into prothallia which bear antherids. The family consists of two genera.

Leaves $12-18 \mathrm{~mm}$. long, 2-ranked, on mostly simple stems.
Leaves minute, closely imbricated on pinnately branching stems.

1. Salvinia.
2. Azolla.

## I. SALVíNIA Adans.

Floating annual plants with slender stems bearing rather broad 2-ranked leaves. Sporocarps globose, depressed, 9-14-sulcate, membranous, arranged in clusters, $\mathbf{I}$ or 2 of each cluster containing 10 or more sessile macrosporanges, each containing few macrospores, the others containing numerous smaller globose pedicelled microsporanges with very numerous microspores. Leaves rather dark
green, finely papillose on the upper surface. [Name in honor of Antonio Maria Salvini, 1633-1729, Italian scientist.] About 13 species of wide distribution.
I. Salvinia natans (L.) Hoffm. (I. F. f. 75.) Leaves oblong, rather thick, obtuse or emarginate at the apex, rounded or cordate at the base, entire, 15-30 cm . long, pinnately veined, bright green and papillose above, the lower surface densely matted with brown pellucid hairs; sporocarps $4-8$ in a cluster, the upper ones containing about io macrosporanges, each containing a few macrospores, the remainder containing numerous microsporanges each with numerous microspores; macrospores marked with 3 obtuse lobes which meet at the apex. Bois Brulé Bottoms, Perry Co., Mo., and near Minneapolis, Minn. Introduced into ponds in S. E. N. Y. Reported by Pursh in 18I4 from Cent. N. Y., but his exact station is unknown. Also in Europe and Asia.

## 2. AZÓLlA Lam.

Minute moss-like reddish or green floating plants, with pinnately branched stems covered with minute imbricated 2 -lobed leaves, and emitting rootlets beneath. Sporocarps of two kinds borne in the axils of the leaves, the smaller ovoid or acornshaped, containing a single macrospore at the base and a few corpuscles above it whose character is not fully known, the larger globose, producing many pedicelled sporanges, each containing several masses of microspores which are often beset with a series of anchor-like processes of unknown function. [Greek, signifying killed by drought.] About 5 species of wide geographic distribution.

1. Azolla Caroliniàna Willd. (I. F. f. 76.) Plants greenish or reddish, 2-4 mm . each way, deltoid or triangular-ovate, pinnately branching, sometimes covering large surfaces of water. Macrospores minutely granulate, with three accessory corpuscles ; masses of microspores armed with rigid septate processes; leaves with ovate lobes, their color varying somewhat with the amount of direct sunlight, the lower usually reddish, the upper green with a reddish border. Floating on still water, Ont. and W. N. Y. to Br. Col., south to Fla., Ariz. and Mex.

## Order 3. EQUISETÀLES.

Rush-like perennial plants, with mostly hollow jointed simple or often much-branched grooved stems, provided with a double series of cavities and usually with a large central one, the branches verticillate, the nodes provided with diaphragms. Rootstocks subterranean. Leaves reduced to sheaths at the joints, the sheaths toothed. Sporanges icelled, clustered underneath the scales of terminal cone-like spikes. Spores all of the same size and shape, furnished with 2 narrow strap-like appendages attached at the middle, coiling around the spore when moist and spreading, when dry and mature, in the form of a cross (elaters). Epidermis impregnated with silica, rough. Prothallium on the surface of the ground, green, usually diœcious.

## Family 1. EQUISETÀCEAE Michx. Horsetail Family.

The family consists of the following genus :

## 1. EQUisètum L. Horsetails. Scouring Rushes.

Characters of the order. [Name ancient, signifying horsetail, in allusion to the copious branching of several species.] About 25 species, of very wide geographic distribution.
Stems annual ; stomata scattered.
Stems of two kinds, the fertile appearing in early spring before the sterile,
Fertile stems simple, soon withering; sheaths of branches of sterile stems 4-toothed.

1. E. arvense.

Fertile stems branched when old, only the apex withering. Branches of the stem simple, their sheaths 3 -toothed. Branches compound.
2. E. pratensa
3. E. sylvaticum.

Stems all alike; spores mature in summer; branches simple or none.
Sheaths rather loose; branches usually long; stems bushy below, attenuate upwards.
Central cavity very small; spike long. 4. E. palustre.
Central cavity about one-half the diameter of stem; spike short.
5. E. littorale.

Sheaths appressed; branches usually short.
6. E. fluviatile.

Stems perennial, evergreen; spikes tipped with a rigid point; stomata in regular rows.
Stems tall, usually many-grooved.
Stems rough and tuberculate, prominently ridged.
Ridges with I line of tubercles; ridges of sheath tricarinate; stem stout.
7. E. robustum.

Ridges of the stem with 2 indistinct lines of tubercles; ridges of sheath
obscurely 4 -carinate; stem slender. Stems not tuberculate; sheaths enlarged upward.

8, E. hyemale.
9. E, laevigatum.

Stems low, slender, tufted, usually 5-10-grooved.
Central cavity small; sheaths 5 -10-toothed.
10. E. variegatum.
11. E. scirpoides.
I. Equisetum arvénse L. Field Horsetail. (I. F. f. 77.) Stems annual, with scattered stomata, the fertile appearing in early spring before the sterile. Fertile stems I-2.5 dm. high, not branched, soon withering, light brown, their loose scarious sheaths mostly distant, whitish, ending in about 12 brown acuminate teeth ; sterile stems green, rather slender, $5 \mathrm{~cm} .-6 \mathrm{dm}$. high, 6-19-furrowed, with numerous long mostly simple verticillate 4 -angled or rarely 3 -angled solid branches, the sheaths of the branches 4 -toothed, the stomata in 2 rows in the furrows; central cavity one-fifth to one-fourth the diameter of the stem. In sandy soil, especially along roadsides and railways, Newf. and Creenland to Alaska, south to Va. and Cal. Also in Europe and Asia. An occasional form in which the sterile stem bears a terminal spike is known as var. serotinum.
2. Equisetum praténse Ehrh. (I. F. f. 78.) Stems annual, 2-4 dm. high, with scattered stomata, the fertile appearing in spring before the sterile, branched when old, only its apex withering, the two becoming similar ; stems rough, 8-20 ridged with narrow furrows and cylindric or cup-shaped sheaths ; branches straight, rather short, simple, densely whorled, 3 -angled or rarely $4-5$-angled, solid; sheaths of the stem with about II short ovate-lanceolate teeth, those of the branches 3 -toothed ; rootstocks solid, acutely angled. In sandy places, N. S. and Rupert R. to Minn., and Alaska, south to N. J. and Colo. Also in Europe and Asia.
3. Equisetum sylváticum L. (I. F. f. 79.) Stems annual, with scattered stomata, the fertile appearing in early spring before the sterile, at first simple, at length much branched and resembling the sterile, only its naked apex withering. Stems $2-5 \mathrm{dm}$. high, usually 12 -furrowed, producing verticillate compound branches, the branchlets curved downward; sheaths loose, cylindric or campanulate, those of the stem with 8-14 bluntish teeth, those of the branches with 4 or 5 teeth, those of the branchlets with 3 divergent teeth; central cavity nearly one-half the diameter of the stem; branches and branchlets solid. In moist sandy woods and thickets, Newf. and Greenland to Alaska, south to Va. and Mich. Also in Europe and Asia.
4. Equisetum palústre L. (I. F. f. 8o.) Stems annual, slender, all alike, $2.5-4.5 \mathrm{dm}$. long, deeply 5-9-grooved, the grooves separated by narrow roughish winglike ridges, the central canal small ; sheaths rather loose, bearing about 8 subulatelanceolate whitish-margined teeth ; branches simple, few in the whorls, $4-7$-angled, always hollow, barely sulcate, more abundant below than above, their sheaths mostly 5 -toothed; spike rather long; stomata abundant in the furrows. In wet places, N. S. to Alaska, south to Me., W. N. Y., Minn. and Ariz. Also in Europe.
5. Equisetum littoràle Kuehl. (I. F. f. 8I.) Stems annual, very slender, all alike, $2-4.5 \mathrm{dm}$. high, slightly roughened, 6-19-grooved, the ridges rounded, the central canal one-half to two-thirds the diameter; sheaths dilated above, the uppermost inversely campanulate, their teeth herbaceous, membranous at the margins, narrow, lanceolate ; branches of two kinds, simple, some 4 -angled and hollow, some 3 -angled and solid, the first joint shorter or a trifle longer than the sheath of the stem; spike short with abortive-spores, these commonly with no elaters. On sandy river and lake shores, Me. and Ont. to N. J. and Penn., west to Br. Col. Also in Europe.
6. Equisetum fluviátile L. (I. F. f. 82.) Stems annual, all alike, $6 \mathbf{- 1 2} \mathrm{dm}$. high, Io-30-furrowed, very smooth, usually producing upright branches after the spores are formed, the stomata scattered. Sheaths appressed with about 18 dark brown short acute rigid teeth, air cavities wanting under the grooves, small under the ridges; central cavity very large ; branches hollow, slender, smaller but otherwise much like the stems, short or elongated ; rootstocks hollow. In swamps and along the borders of ponds, N. S. to Alaska, south to Va., Neb. and Wash. Also in Europe and Asia.
7. Equisetum robústum A. Br. (I. F. f. 83.) Stems perennial, stout, tall, evergreen, $1-2.5 \mathrm{~m}$. high, sometimes 2 cm . in diameter, 20-48-furrowed, simple or little branched. Ridges roughened with a single series of transversely oblong siliceous tubercles; sheaths short, cylindric, appressed, marked with black girdles at the base, and at the bases of the dark caducous teeth; ridges of the sheath 3-carinate; branches when present occasionally fertile; spikes tipped with a rigid point. In wet places, O to La . and Mex., west to Br . Col. and Cal. Also in Asia. May-June.
8. Equisetum hyemàle L. Scouring-Rush. (I. F. f. 84.) Stems slender, rather stiff, evergreen, $6-12 \mathrm{dm}$. high, with the stomata arranged in rows, rough, 8 - 34 -furrowed, the ridges with two indistinct lines of tubercles, the central cavity large, from one-half to two-thirds the diameter; sheaths rather long, cylindric, marked with one or two black girdles, their ridges obscurely 4 -carinate; teeth brown, membranous, soon deciduous; spikes pointed; stem rarely producing branches which are usually short and occasionally fertile; forms are sometimes found with longer sterile branches. In wet places and on banks, especially along rivers and lakes, throughout nearly the whole of N. Am., Europe and Asia.
9. Equisetum laevigàtum A. Br. (I. F. f. 85.) Stems 3-15 dm. high, simple or little branched, pale green, persistent, 14-30 furrowed, the ridges almost smooth. Sheaths elongated and enlarged upward, with a black girdle at the base of the mostly deciduous, white-margined teeth and rarely also at their bases; ridges of the sheath with a faint central carina and sometimes with faint short lateral ones ; stomata arranged in single series; central cavity very large, the wall of the stem very thin ; spikes pointed. Along streams and rivers, especially in clay soil, valley of the Delaware R. in N. J. and E. Penn. to N. Car. and La., west to Br. Col. and the Mexican border.
10. Equisetum variegàtum Schleich. (I. F. f. 86.) Stems slender, perennial, evergreen, $1.5-4.5 \mathrm{dm}$. long, usually simple from a branched base, tufted, 5-Io-furrowed, the stomata borne in regular rows. Sheaths companulate, distinctly 4 -carinate, variegated with black above, the median furrow deep and excurrent to the teeth and downward to the ridges of the stem, the teeth 5-10, each tipped with a deciduous bristle ; central cavity small, rarely wanting. Lab. and Greenland to N. Terr., south to N. H., W. N. Y., Neb. and Nev. Also in Europe and Asia. May-June.
II. Equisetum scirpordes Michx. (I. F. f. 87.) Stems perennial, evergreen, filiform, $4-15 \mathrm{~cm}$. long, somewhat rough, flexuous and curving. growing in slender tufts, mostly 6 -furrowed with acute ridges, simple or branching from near the base. Sheaths 3 -toothed, distinctly 4 -carinate, the central furrow broad, the lateral narrow, the bristly teeth rather persistent ; central cavity entirely wanting. On moist or wet wooded banks, Lab. to Alaska, south to Penn., Ill. and Br. Col. Also in Europe and Asia.

## Order 4. LYCOPODIÀLES.

Spores produced in sporanges, which are borne in the axils of scalelike or elongated leaves.

Spores all of one sort and size.
Fam. I. Lvcosodiaceae.
Spores of two sizes.
Leaves scale-like, 4-many-ranked, on branching stems.
Fam. 2. Selaginellaceae.
Leaves elongated, clustered on a corm-like trunk ; aquatic or mul plants.
Fam. 3. Isvetacese.

## Family 1. LYCOPODIÀCEAE Michx:

## Club-moss Family.

Somewhat moss-like, erect or trailing terrestrial herbs with numerous small lanceolate or subulate simple leaves, sometimes oblong or roundish, arranged in 2 -many ranks, the stems often elongated, usually freely branching. Sporanges I-3-celled, solitary in the axils of the leaves or on their upper surfaces. Spares uniform, minute. Prothallia (as far as known) mostly subterranean, with or without chlorophyll, monœecious. Four genera and about ino species.

## ı. LYCOPÒDIUM L. Club-mosses.

Perennial plants with evergreen I-nerved leaves arranged in 4-16 ranks. Sporanges coriaceous, flattened, reniform, I-celled, situated in the axils of ordinary leaves or in those of the upper modified, bract-like ones, which are imbricated in sessile or peduncled spikes, opening transversely into 2 valves, usually by a line around the margin. Spores all of one kind, copious, sulphur-yellow, readily inflammable from the abundant oil they contain. [Greek, meaning wolf's foot, perhaps in allusion to the branching roots of some species.] About 100 species of wide distribution.
Sporanges borne in the axils of leaves which are similar to those of the stem.
Sporanges mostly wanting in the axils of the upper, mostly 8 -ranked leaves.
Stems mostly erect, rigid; leaves uniform, ascending. I. L. Selago.
Stems somewhat lax, spreading ; leaves spreading or deflexed, alternately longer and shorter.
2. L. lucidulum.

Sporanges only in the axils of the upper leaves forming terminal spikes; leaves many-ranked.
Plant slender; leaves acute, soft, mostly entire. 3. L. inundatum.
Plant stout; leaves narrow, spinulose-pointed, bristle-toothed below the middle. 4. L. alopecuroides.

Sporanges borne in the axils of yellowish ovate or cordate scale-like leaves, which are very unlike those of the sterile stems.
Stems leafy up to the base of the spike or nearly so.
Spikes erect, closely sessile.
Stems erect, tree-like. 5. L. obscurum.

Stems creeping with ascending branches.
Leaves uniform, spreading, 5 -ranked.
Leaves of 2 forms, erect-imbricate, 4 -ranked.
Spikes erect, short-peduncled; leaves small, appressed, 4-ranked.
8. L. sabinaefolium.

Fertile branches with minute leaves so that the spikes appear long-peduncled.
Leaves uniform, many-ranked; stems terete.
9. L. clavatum.

Leaves of 2 forms, few-ranked; stems flattened.
Sterile stems entirely creeping; spikes solitary.
10. L Carolinianum.

Sterile stems with fan-like ascending branches; spikes clustered.
11. L complanatum.

1. Lycopodium Selàgo L. (I. F. f. 88.) Stems $7-15 \mathrm{~cm}$. high, thick, rigid, erect, 2-5 times forked, the branches forming a level-topped cluster. Leaves crowded, uniform, ascending, elongated-lanceolate, mucronulate, entire or spinu-lose-denticulate, nerved below, convex above, the upper mostly 8 -ranked, sterile, those below bearing the small sporanges in their axils, those of the lower half of the stem again sterile ; plant propagated also by bud-like organs which have a lower pointed bract and 2 or 3 upper fleshy and obovate ones. On rocks, Lab. and Greenland to Alaska, south to the mountains of Me., N. H., Vt. and N. N. Y., on the summits of the higher Alleghenies to N. Car., and to Mich. and Wash. Also in Europe and Asia.
2. Lycopodium lucídulum Michx. (I. F. f. 89.) Stems lax, ascending or spreading, thick, $2-3$ times forked, the branches $1.5-3 \mathrm{dm}$. high. Leaves widely spreading or reflexed, dark green, shining, I-nerved, acute, minutely toothed, a series of longer ones alternating with a series of shorter, the latter more frequently bearing the sporanges at a short distance below the summit of the stem ; sporanges
of preceding years often persistent; plant also propagated like the preceding species by gemmae, which fall to the ground and become new plants. In cold, damp woods, Newf. to Br. Col. south to N. Car. and Ia.
3. Lycopodium inundàtum L. (I. F. f. 90.) Plants, $2.5-13 \mathrm{~cm}$. long, with creeping flaccid forking brittle sterile stems closely appressed to the earth. Fertile stems erect, solitary, $2.5^{-15} \mathrm{~cm}$. high, terminated by a short spike; leaves lanceolate or lanceolate-subulate with hyaline margins, those of the spike similar to those below, acute, soft, spreading, mostly entire, those of the sterile stems curved upward; spikes rarely two together, $1.5-3.5 \mathrm{~cm}$. long, yellowish; sporanges transversely oval, splitting nearly to the base; spores large, reticulated. In sandy bogs, Newf. to W. Ont. and Mich., south to Fla. Also in Europe and Asia. Larger forms with fertile stems $\mathbf{1 2 - 1 7} \mathrm{cm}$. high and more pointed serrate leaves have been separated as var. Bigelovii.
4. Lycopodium alopecurordes L. (I. F. f. 9I.) Plant stout, leafy, the sterile branches flaccid, recurved and creeping, sometimes 25 cm . long. Fertile stems stout, rigid, erect, $15-50 \mathrm{~cm}$. high, terminated by a spike $1.8-3.5 \mathrm{~cm}$. long, and, including its leaves, $8-10 \mathrm{~mm}$. thick; leaves narrowly linear-subulate, those of the spike similar to those below, spinulose-pointed, spreading, conspicuously bristletoothed below the middle, those of the spike with long setaceous tips; sporanges transversely oval, splitting to near the base. In pine-barren swamps, N. J. to Fla., near the coast, west to Miss.
5. Lycopodium obscùrum L. Ground Pine. (I. F. f. 92.) Stems erect, I.5-3 dm . high, bushy, the branches fan-like, the rootstocks subterranean, nearly horizontal. Leaves lanceolate-linear, acute, entire, 8 -ranked on the main stem, those of the branches 6 -ranked, with the two upper and the two lower ranks shorter and appressed, or all alike and equally incurved-spreading, densely clothing the stems up to the bases of the spikes; spikes $\mathbf{I}-\mathbf{1 0}$ on each plant, $\mathbf{1 2 - 3 5} \mathrm{cm}$. long, composed of many-ranked ovate scarious-margined bracts (scale-like leaves), each with a transversely oval sporange in its axil. In moist woods, Newf. and Lab. to Alaska, south to the mountains of N. Car. and to Ind. Also in Asia.
6. Lycopodium annótinum L. (I. F. f. 93.) Stems much branched, slender, creeping, rather stiff, $3-\mathbf{1 2}$. dm. long, the branches similar, ascending, $12-20 \mathrm{~cm}$. high, sparingly forked. Leaves uniform, spreading, 5 -ranked, rigid, linearlanceolate, minutely serrulate, nerved below; spikes solitary or several at the ends of the branches, oblong-cylindric, $2.5-6 \mathrm{~cm}$. long, composed of ovate or ovatecordate, short-acuminate and denticulate bracts, each with a sporange in its axil; spores smooth or spinulose - reticulated on the basal surface. In woods and thickets, commonly in dry soil, Lab. to Alaska, south to N. J., W. Va., Mich., Colo. and Wash. Also in Europe and Asia. Mountain forms with more rigid pointed leaves have been separated as var. pungens.
7. Lycopodium alpinum L. (I. F. f. 94.) Stems elongated, creeping, with ascending densely crowded dichotomous branches. Leaves 4 -ranked, erect-imbricate, adnate-decurrent, of two forms; those of the lateral rows lanceolate, falcate, acute, carinate, concave within, those of the intermediate rows scarcely one-third as large, lanceolate-subulate, the upper and lower rows alike; spikes solitary at the apices of slightly elongated branches, erect, closely sessile, the stems leafy to their bases; bracts broadly ovate, acuminate, dentate; spores reticulated. In woods, Lab. to L. Superior, Wash. and Alaska. Sometimes united with L. complanatum. Also in Europe and Asia.
8. Lycopodium sabinaefòlium Willd. (I. F. f. 95.) Stems elongated, creeping, or subterranean with short erect dichotomous clustered ascending branche's, 5-8 cm. long. Leaves 4-ranked, small, appressed or slightly curved outward, lanceolate, mucronate, entire, apparently terete; spikes short-peduncled, solitary, cylindric, with cordate acuminate erose-denticulate or entire bracts ; sporanges transversely oval or somewhat reniform, deeply splitting. In cold woods, Lab, to N. J. and Br. Col.
9. Lycopodium clavàtum L. Running Pine. (I. F. f. 06.) Stems creeping, $3-20 \mathrm{dm}$. long, with similar short irregular ascending or decumbent denselyleafy branches. Leaves much crowded, many-ranked, incurved, linear-subulate, bristle-tipped, the lower denticulate, the upper nearly entire and slightly decurrent on either side ; spikes $1-4$ on long 8 -striate peduncles ; bracts membranous, round-
ish, erose-denticulate below, bearing in the axil a transversely oval sporange which splits nearly to the base ; spores narrowly reticulate. In woods, Lab. to Alaska, south to N. Car., Mich and Wash. Also in Europe, Asia and Cent. Am.
10. Lycopodium Caroliniànum L. (I. F. f. 97.) Sterile stems and their few short branches creeping, closely appressed to the earth, $2.5-8 \mathrm{~cm}$. long, emitting numerous roots on the lower side. Leave of fertile stems of two forms, the lateral ones broadly lanceolate, acute, and somewhat oblique, I-nerved, widely spreading, in 2 ranks with a shorter, intermediate row appressed on the upper side ; peduncles simple, slender, $5-15 \mathrm{~cm}$. high, clothed with small Dract-like leaves and bearing a single cylindric spike ; bracts cordate, short-acuminate, mostly entire with transversely oval sporanges in the upper axils. In moist pine-barrens, N. J. to Fla. and La. near the coast.
II. Lycopodium complanàtum L. (I. F. f. 98.) Stems extensively creeping, with erect or ascending fan-shaped branches several times forked above, with crowded flattened branchlets. Leaves minute, imbricate-appressed, 4 -ranked, the lateral rows with somewhat spreading tips, the intermediate smaller, narrower and wholly appressed, forming a flat surface; peduncle slender, $5-15 \mathrm{~cm}$. high, dichotomous, bearing 2-4 linear-cylindric spikes; bracts broadly ovate, acuminate, the margins pale and erose ; sporanges transversely oval, deeply splitting. In woods and thickets, Newf. to Alaska, south to N. Car., Mich. and Br. Col. Also in Europe and Asia. Forms with less distinctly dimorphous leaves and narrower, more erect and bushy branches have been separated as var. Chamaecyparissus.

## Family 2. SELAGINELLACEAE Underw.

Terrestrial, annual or perennial, moss-like plants with branching stems and scale-like leaves, which are many-ranked and uniform, or 4ranked and of two types spreading in two planes. Sporanges i-celled, solitary in the axils of leaves which are so arranged as to form more or less quadrangular spikes, some containing 4 macrospores (macrosporanges), others containing numerous microspores (microsporanges), which develop into small prothallia, those from the macrospores bearing archegones, those from the microspores antherids. The family consists of the following genus:

## r. SELAGINÉLLA Beauv.

Characters of family. [Name diminutive of Selago, ancient name of a Lycopodium.] About 340 species, widely distributed, most abundant in tropical regions.
Stem-leaves all alike, many-ranked.
Stems compact with rigid leaves; spikes quadrangular. I. S. rupestris.
Stems slender; leaves lax, spreading; spikes enlarged, scarcely quadrangular.
2. $S$. selaginoides.

Stem-leaves of 2 kinds; 4 -ranked, spreading in 2 planes.
3. S. apus
I. Selaginella rupéstris (L.) Spring. (I. F. f. 99.) Stems tufted, with occasional sterile runners and sub-pinnate branches, $2.5-8 \mathrm{~cm}$. high, commonly curved when dry. Leaves rigid, appressed-imbricated, 2 mm . or less long, linear or linearlanceolate, convex on the back, more or less ciliate, many-ranked, tipped with a distinct transparent awn; spikes sessile at the ends of the stem or branches, strongly quadrangular, $12-25 \mathrm{~mm}$. long, about 2 mm . thick; bracts ovate-lanceolate, acute or acuminate, broader than the leaves of the stem ; macrosporanges and microsporanges borne in the same spikes, the former more abundant. On dry rocks, Me. to Ont. and Br. Col., south to Ga., Mo. and Cal.
2. Selaginella selaginoides (L.) Link. (I. F. f. roo.) Sterile branches creeping, slender, $12-50 \mathrm{~cm}$. long, the fertile erect or ascending, thicker, $2.5-8 \mathrm{~cm}$. high, simple; leaves lanceolate, acute, lax and spreading, sparsely spinulose-ciliate, $2-4 \mathrm{~mm}$. long ; spikes solitary at the ends of the fertile branches, enlarged, oblonglinear, subacute, 2.5 cm . or less long, $4-5 \mathrm{~mm}$. thick; bracts of the spike lax, ascending, lanceolate or ovate-lanceolate, strongly ciliate. On wet rocks, Lab. to Alaska, south to N. H., Mich. and Colo. Also in N. Europe and Asia.
3. Selaginella apus (L.) Spring. (I. F. f. Ior.) Annual, light green, stems creeping, $2.5-10 \mathrm{~cm}$. long, much branched, flaccid, angled on the face. Leaves minute, membranous, of 2 kinds, 4 -ranked, spreading in 2 planes: upper leaves of the lower plane spreading, the lower reflexed, ovate, acute, serrulate, not distinctly ciliate; leaves of the upper plane ovate, short-cuspidate; spikes $6-16 \mathrm{~mm}$. long, obscurely quadrangular ; bracts ovate, acute, sometimes serrulate, acutely keeled in the upper half; macrosporanges more abundant toward the base of the spike. In moist shaded places, often among grass, Me. and Ont. to the N. W. Terr., south to Fla., La. and Tex.

## Family 3. ISOETÀCEAE Underw.

Quillwort Family.
Aquatic or marsh plants rooting in the mud, with a short buried 2 lobed or 3-lobed trunk (stem) sending out abundant roots and sending up a compact tuft of rush-like leaves. Sporanges sessile in the axils of the leaves, some containing macrospores (macrosporanges), others microspores (microsporanges) ; the former germinate into prothallia bearing only archegones, the latter into prothallia bearing usually only a single antherid. The family consists of the following genus only.

## I. ISÒETES L. Quillworts.

Submerged, amphibious or uliginous plants with a cluster of elongated awlshaped leaves rising from a more or less 2-3-lobed fleshy short stem, the leaves with or without peripheral bast-bundles, with or without stomata, bearing a small membranous organ (ligule) above the base. Sporanges sessile in the excavated bases of the leaves, orbicular or ovoid, the sides more or less covered with a fold of the inner side of the leaf-base (velum). The sporanges of the outer leaves usually contain spherical, mostly sculptured macrospores, those of the inner ones contain minute powdery usually oblong microspores. [Name Greek, taken from Pliny, apparently referring to the persistent green leaves.] About 50 species, widely distributed. Owing to their aquatic habitat and apparently local distribution, these plants are popularly little known.

Submerged or rarely emersed in very dry seasons; leaves quadrangular, without peripheral bast-bundles.
Stomata wanting; macrospores crested.
Leaves stout, rigid, scarcely tapering. I. I. lacustris.
Leaves slender, tapering.
Stomata present ; macrospores echinate.
2. I. Tuckermani.
3. I. echinospora.

Amphibious or submerged only in earlier stages; stomata always present on the quadrangular leaves.
Peripheral bast-bundles wanting.
Microspores papillose or tuberculate, not reticulate, white.
Leaves $5-8 \mathrm{~cm}$. long ; macrospores with minute warts. 4. I. saccharata.
Leaves $10-20 \mathrm{~cm}$. long ; macrospores with jagged crests. 5. I. riparia.
Microspores densely reticulate and often slightly papillose, dark brown ; macrospores with thick-walled reticulations.
6. I. foveolata.

Peripheral bast-bundles irregular or wanting ; submersed leaves very long; macrospores with convolute labyrinthine ridges.
7. 1. Eatoni.

Peripheral bast-bundles present.
Macrospores sparsely covered with irregular crests.
Macrospores with honeycomb-like reticulations.
'Terrestrial ; stomata abundant on the triangular leaves.
Leaves $\mathbf{1 5}-60$, usually black at the base.
Leaves $8-12$, bright green, paler at the base.
8. I. Dodgei.
9. I. Engelmanni.
I. Isoetes lacústris L. (I. F. f. 102.) Submerged or rarely above water ; leaves Io-25, rigid, rather thick, scarcely tapering, dark or olive green, obtusely quadrangular, $5-15 \mathrm{~cm}$. long ; stomata none; peripheral bast-bundles wanting : sporange orbicular or broadly elliptic, unspotted; velum rather natrow ; licule triangular, short or somewhat elongated; macrospores 500 S(o) $\mu$ in diameter, marked all over with distinct or somewhat confluent crests, and hearing three con-
verging ridges ; microspores 35-46 $\mu$ long, smooth. In water $0.3-1.6 \mathrm{~m}$. deep, Lab. to the N. W. Terr., south to E. Mass. and N. J. Also in Europe and Asia.
2. Isoetes Tuckermáni A. Br. (I. F. f. IO3.) Submerged or rarely partly or wholly emersed in dry seasons ; leaves 10-30, very slender, tapering, olivegreen, quadrangular, $5-8 \mathrm{~cm}$. long, without peripheral bast-bundles, the outer recurved ; sporange oblong, mostly white, its upper one-third covered by the velum; macrospores $440-560 \mu$ in diameter, with wavy somewhat parallel and branching ridges on the upper half, separated by the three converging ridges, the lower covered with an irregular network ; microspores 26-32 $\mu$ long, nearly smooth. In ponds, Newf. to Middlesex County, Mass., clustered in shallow water.
3. Isoetes echinóspora Braùnii (Durieu) Engelm. (I. F. f. Io4.) Submerged or rarely emersed; leaves $\mathbf{1 2 - 2 5}$, tapering, soft, reddish-green, $7-\mathbf{2 0} \mathrm{cm}$. long, without peripheral bast-bundles, bearing stomata only toward the tip ; sporange orbicular or broadly elliptic, spotted, one-half to three-fourths covered with the velum ; macrospores $400-500 \mu$ in diameter, covered with broad spinules which are often slightly confluent and incised at the tips ; microspores 26-39 $\mu$ long, smooth. Lab. and Greenland to Alaska, south to N. J., Penn. and Utah.

Isoetes echinospora robústa Engelm. Much larger than the preceding, leaves 25-70 or even more $12-30 \mathrm{~cm}$. long, with abundant stomata throughout. With the preceding.

Isoetes echinospora Boóttii Engelm. Leaves 12-20, soft, erect, bright green, ro- 13 cm . long, with a few stomata near their tips; sporange nearly orbicular, with pale spots, two-thirds or more covered by the velum ; macrospores $390-500 \mu$ in diameter, with longer and more slender simple spinules ; microspores $26-30 \mu$ long. In ponds, Middlesex County, Mass., usually submerged.

Isoetes echinospora muricàta (Durieu) Engelm. Leaves 15-20, flaccid, bright green, $15-30 \mathrm{~cm}$. long, bearing few stomata ; sporange broadly oval, with pale-spots, about onehalf covered by the velum ; macrospores $400-580 \mu$ in diameter, with shorter and more confluent, almost crest-like spinules; microspores $28-32 \mu$, slightly rough on the edges. Submerged in running water in tributaries of Mystic Pond, Middlesex County, Mass.
4. Isoetes saccharàta Engelm. (I. F. f. 105.) Amphibious or uliginous with a flat depressed trunk. Leaves IO-20, olive-green, pale at the base, spreading, 5-8 cm . long, quadrangular ; stomata numerous ; sporange oblong, unspotted, with a narrow velum covering only one-fourth or one-third of its surface ; peripheral bastbundles wanting ; ligule triangular, rather short ; macrospores $400-470 \mu$ in diameter, with very minute distinct or rarely confluent warts as if sprinkled with grains of sugar : microspores papillose, $24-28 \mu$ long. In mud overflowed by the tides, Wicomico and Nanticoke rivers, E. Md. and near Washington, D. C.
5. Isoetes riparia Engelm. (I. F. f. Io6.) Amptibious or uliginous, usually emersed; leaves $15-30$, deep green, rather rigid, $10-20 \mathrm{~cm}$. long, quadrangular, bearing numerous stomata ; peripheral bast-bundles wanting; ligule rather short, triangular ; sporange mostly oblong, distinctly spotted with groups of brown cells, one-fourth or rarely one-half covered with the velum ; macrospores $450-650 \mu$ in diameter, marked with distinct or anastomosing jagged crests or somewhat reticulate on the lower side ; microspores $28-32 \mu$ long, more or less turberculate. Borders of the lower Delaware R. to Me.
6. Isoetes foveolàta A. A. Eaton. (I. F. f. Io6c.) Amphibious from a bilobed or rarely trilobed base ; leaves $15-70$, stout $5-15 \mathrm{~cm}$. long, pinkish even when dry or rarely dark green; stomata scattered found only near the tips; no peripheral bast-bundles; monoicous or becoming dioicous; velum covering onefourth or one-third of the sporange; ligule round-ovate; sporanges thickly sprinkled with dark cells which are often collected in groups ; macrospores $380-560 \mu$ in diameter, covered beneath with very thick-walled reticulations, the openings appearing like little pits; reticulations elongate on the upper surface of the spore ; microspores dark brown, $22-35 \mu$ long, densely reticulate and usually slightly papillose. In muddy banks of the Pautuckaway River, Epping and E. Kingston, N. H.
7. Isoetes Éátoni Dodge. (I. F. f. 106b.) Amphibious from a large trunk $2.5-10 \mathrm{~cm}$. in diameter. Leaves of the submerged plant 20-200, varying in length up to 7 dm ., marked with an elevated ridge on the ventral side; leaves of the emersed plant shorter, $7 \cdot 5-15 \mathrm{~cm}$. long, stomata abundant; peripheral bastbundles irregular in occurrence or often wanting; velum covering one-fourth of the
sporange ; polygamous; sporanges large, io by 4 mm ., pale, spotted ; macrospores small, $300-400 \mu$ in diameter, marked with convolute labyrinthine ridges and cristate on the angles of the inner face ; microspores $25-30 \mu$ in diameter, smooth or slightly papillose. In mud flats, E. Kingston and Epping, N. H.
8. Isoetes Dódgei A. A. Eaton. (I. F. f. Io6a). Plant amphibious from a 2 -lobed trunk. Leaves $10-75,2-4.5 \mathrm{dm}$. long, when submersed, erect or spirally ascending when scattered ; emersed leaves $10-15 \mathrm{~cm}$. long, tortuous and often interlaced, with numerous stomata and usually four bast-bundles ; velum narrow, covering from one-fifth to one-fourth of the sporange ; sporanges thickly sprinkled with dark brown cells; macrospores more numerous on submersed plants, globose $500-675 \mu$ in diameter, sparsely covered with irregular crests which at maturity separate into irregular groups leaving bare spaces, serrate or spinulose at the top: microspores more numerous on emersed plants, 22-40 $\mu$ in diameter, ashy, papillose. In mud flats, E. Kingston, N. H.
9. Isoetes Engelmánni A. Br. (I. F. f. 107.) Amphibious, usually partly immersed when mature. Leaves 25-100, light green, quadrangular, tapering, 22-50 cm . long, bearing abundant stomata; peripheral bast-bundles present; sporange oblong or linear-oblong, unspotted; velum narrow ; macrospores $400-520 \mu$ in diameter, covered with honeycomb-like reticulations ; microspores $24-28 \mu$ long, mostly smooth. In ponds and ditches, rooting in mud, Me. to Del. and Penn., Ill. and Mo.

Isoetes Engelmanni válida Engelm. Leaves 50-200, keeled on the upper side, 4.5-6 dm . long ; sporange linear oblong, $\mathrm{r}-2 \mathrm{~cm}$. long, one-third to two-thirds covered by the velum ; microspores $320-480 \mu$ in diameter ; microspores $24-27 \mu$ long, spinulose. Warriorsmark, Cornwall and Smithville, Pa., and Wilmington, Del.

Isoetes Engelmanni grácilis Engelm. Leaves 8-12, slender, 22-30 cm. long; bastbundles often quite small or only two present; spores as in the typical form. S. New Eng. to N. J.
10. Isoetes melanópoda J. Gay. (I. F. f. 1o8.) Terrestrial with a subglobose deeply 2 -lobed trunk. Leaves $15-60$, slender, erect, bright green, with a blackish shining base, $12-15 \mathrm{~cm}$. long, triangular, bearing stomata throughout, well developed peripheral bast-bundles, thick dissepiments and small air-cavities within; ligule triangular, awl-shaped; sporange mostly oblong, spotted with a narrow velum ; polygamous ; macrospores $250-400 \mu$ in diameter with low more or less confluent tubercles, often united into worm-like wrinkles, or almost smooth ; microspores 23$28 \mu$ long spinulose. In moist prairies and overflowed fields, Ill. to Ia., Mo. and Tex.
II. Isoetes Bútleri Engelm. (I. F. f. IOg.) Terrestrial from a subglobose trunk. Leaves $8-15$, bright green, paler at the base, triangular, $4.5-18 \mathrm{~cm}$. long, bearing numerous stomata, and with well developed peripheral bast-bundles, thick dissepiments and small air cavities within; sporange usually oblong, spotted ; velum very narrow or none; ligule small, triangular; diocious; macrospores $500-630 \mu$ in diameter, with distinct or confluent tubercles ; microspores $28-34 \mu$ long, dark brown, papillose. On rocky hillsides, St. Louis, Mo., and on saline flats, Ind. Terr.

# Subkingdom SPERMATÓPHYTA. 

Seed-bearing Plants.

Plants producing seeds which contain an embryo formed of one or more rudimentary leaves (cotyledons), a stem (hypocotyl, radicle), and a terminal bud (plumule), or these parts sometimes indifferentiated before germination. Microspores (pollen-grains) are borne in microsporanges (anther-sacs) on the apex or side of a modified leaf (filament). The macrosporanges (ovules) are borne on the face of a flat or inrolled much modified leaf (carpel) and contain one macrospore (embryo-sac) ; this develops the minute female prothallium, an archegone of which is fertilized by means of a tube (pollen-tube), a portion of the male prothallium sprouting from the pollen-grain.

There are two classes which differ from each other as follows :
Ovules and seeds borne on the face of a scale; stigmas none. Class i. Gymnospermae. Ovules and seeds contained in a closed cavity (ovary); stigmas 1 or more.

Class 2. Angiospermae.

## Class I. GYMNOSPĖRMAE.

Ovules (macrosporanges) naked, not enclosed in an ovary, this represented by a scale or apparently wanting. Pollen-grains (microspores) dividing at maturity into two or more cells, one of which gives rise to the pollen-tube (male prothallium), which directly fertilizes an archegone of the nutritive endosperm (female prothallium) in the ovule.

The Gymnosperms are an ancient group, first known in Silurian time. They became most numerous in the Triassic age. They are now represented by not more than 450 species of trees and shrubs.

There are three orders, Pinales, Cycadales and Gnetales, the first of which is represented in our area by the Pine and Yew Families.

Family I. PINÀCEAE Lindl.
Pine Family. Conifers.
Resinous trees or shrubs, mostly with evergreen narrow entire or scalelike leaves, the wood uniform in texture, without tracheae, the tracheids marked by large depressed disks, the pollen-sacs and ovules borne in separate spikes (aments). Perianth none. Stamens several together, subtended by a scale ; filaments more or less united; pollen-sacs (anthers) 2-several-celled, variously dehiscent; pollen-grains often provided with two lateral inflated sacs. Ovùles with two integuments, orthotropous or amphitropous, borne solitary or several together on the surface of a scale, which is subtended by a bract in most genera. Fruit a cone with numerous, several or few, woody, papery or fleshy scales ; sometimes berry-like. Seeds wingless or winged. Endosperm fleshy or starchy, copious. Embryo straight, slender. Cotyledons 2 or several. About 25 genera and 240 species of wide distribution, most abundant in temperate regions.

Scales of the cone numerous (except in Larix); leaf-buds scaly.<br>Cone-scales woody; leaves needle-shaped, $2-5$ in a sheath. 1. Pinus.<br>Cone-scales thin; leaves linear-filiform, scattered or fascicled, not in sheaths. Leaves fascicled on very short branchlets, deciduous. 2. Larix. Leaves scattered, persistent.<br>Cones pendulous; leaves jointed to short persistent sterigmata.<br>Leaves tetragonal, sessile.<br>3. Picea.<br>Leaves flat, short-petioled.<br>4. Tsuga.<br>Cones erect ; sterigmata inconspicuous or no e.<br>5. Abies.<br>Scales of the cone few (3-12); leaf-buds naked.<br>Cone-scales spiral, thick; leaves deciduous.<br>6. Taxodium.<br>Cone-scales opposite ; leaves persistent.<br>Cone oblong, its scales not peltate. Cone globose, its scales peltate.<br>7. Thuja.<br>Fruit fleshy, berry-like, a modified cone.<br>8. Chamaecyparis.<br>9. Juniperus.

## r. PÌNUS L.

Evergreen trees with two kinds of leaves, the primary ones linear or scale-like, deciduous, the secondary ones forming the ordinary foliage, narrowly linear, arising from the axils of the former in fascicles of $2-5$ (rarely solitary in some western species), subtended by the bud-scales, some of which are united to form a sheath. Staminate aments borne at the bases of shoots of the season, the clusters of stamens spirally arranged, each in the axil of a minute scale; filaments very short; anthers 2 -celled, the sacs longitudinally dehiscent. Ovule-bearing aments solitary or clustered, borne on the twigs of the preceding season, composed of numerous imbricated minute bracts, each with an ovule-bearing scale in its axil, ripening into a large cone, which matures the following autumn, its scales elongating and becoming woody. Seeds 2 on the base of each scale, winged above, the testa crustaceous. [Name Celtic.] About 75 species, of the northern hemisphere.
Leaves 5 in a sheath ; cone-scales little thickened at the tip.

1. P. Strobus.

Leaves $2-3$ in a sheath; cone-scales much thickened at the tip.
Cones terminal or subterminal.
Leaves 2 in a sheath; cones $3-6 \mathrm{~cm}$. long, their scales pointless.
2. P. resinosa.

Leaves 3 in a sheath; cones $1-2.5 \mathrm{dm}$. long, their scales prickle-tipped.
Cones light, $1.5-2.5 \mathrm{dm}$. long; leaves 2.5-4 dm. long. 3. P. palustris.
Cones very heavy and woody, $1-\mathrm{r} .5 \mathrm{dm}$. long; leaves $\mathrm{r} .2-2.5 \mathrm{dm}$. long.
Cones lateral.
Cone-scales with neither spine nor prickle; leaves in 2's. 5. P. divaricata. Cone-scales tipped with a spine or prickle.

Leaves some or all of them in 2's.
Cones $3-7 \mathrm{~cm}$. long, their scales tipped with prickles.
Leaves stout, $3^{-6} \mathrm{~cm}$. long.
6. P. Virginiana.

Leaves slender, $7-13 \mathrm{~cm}$. long. 7. P. echinata.

Cones $8-12 \mathrm{~cm}$. long, their scales tipped with very stout short spines.
8. P. pungens.

Leaves in 3 's (very rarely some in 2 's or 4 's).
Leaves I.5-2.5 dm. long; old sheaths $1-2.5 \mathrm{~cm}$. long; cones oblong-conic. 9. P. Taeda.

Leaves $7-13 \mathrm{~cm}$. long; old sheaths $0.6-1.2 \mathrm{~cm}$. long; cones ovoid.
1о. P. rigida.

1. Pinus Stròbus L. White Pine. Weymouth Pine. (I. F. f. ifo.) A large forest tree, the bark nearly smooth except when old, the branches horizontal. verticillate. Leaves 5 in a sheath, very slender, pale green and glaucous. 712 cm . long, with a single fibro-vascular bundle, the dorsal side devoid of stomata: sheath: loose, deciduous; ovule-bearing aments terminal, peduncled; cones subterminal. drooping, cylindric, often slightly curved, $10-15 \mathrm{~cm}$. long, about 2.5 cm . thick when the scales are closed, resinous; scales slightly thickened at the apex, obtuse and rounded or nearly truncate, without a terminal spine or prickle. In woods. often forming dense forests, Newf. to Man., south along the Allegh. to (ra. and to III. and Ia. June.
2. Pinus resinòsa Ait. Canadian Pine. Rei Pine. (l. F. f. ilif.) A tall forest tree, the bark reddish, rather smooth. flaky when old. Leaves 2 in colk sheath, slender, dark green, $10-15 \mathrm{~cm}$. long, with 2 fibro-vascular bundles: sheaths

12-25 mm. long when young; staminate aments $12-18 \mathrm{~mm}$. long; cones subterminal, oval-conic, $3-6 \mathrm{~cm}$. long, usually less than 2 cm . thick while the scales are closed; scales thickened at-the apex, obtuse, rounded and devoid of spine or prickle. In woods, Newf. to Man., Mass., Penn., Wisc. and Minn. May-June.
3. Pinus palústris Mill. Long-leaved Pine. Georgia Pine. (I. F. f. i12.) A large tree, sometimes attaining a height of 30 m ., the bark nearly smooth. Leaves in 3's, slender, dark green, clustered at the ends of the branches, 2.5-4 dm. long, with 2 fibro-vascular bundles; sheaths $1.5-3 \mathrm{~cm}$. long; buds long; staminate aments rose-purple, $5-9 \mathrm{~cm}$. long, very conspicuous ; cones terminal, spreading or erect, conic-cylindric, $1-2.5 \mathrm{dm}$. long, $5-8 \mathrm{~cm}$. thick before the scales open; scales thickened at the apex, with a transverse ridge bearing a short central recurved prickle. In sandy, mostly dry soil, Va. to Fla and Tex., mostly near the coast. March-April.
4. Pinus ponderòsa Dougl. Western Yellow Pine. (I. F. f. II3.) One of the largest trees, attaining a maximum height of nearly 80 m . and a trunk diameter of 5 m . Branches widely spreading or somewhat drooping ; bark light red, scaly ; leaves in 3's (rarely some of them in 2 's), rather stout, $\mathbf{1}-2.5 \mathrm{dm}$. long, slightly scabrous; cones subterminal, very dense, heavy, ovoid-conic, 1-1.5 dm. long, 3-4.5 cm . thick; scales much thickened at the apex, the transverse ridge prominent, with a triangular subulate short stout recurved prickle. Mont. to Br. Col., Neb., Tex., Mex. and Cal.; the shorter-leaved eastern form which reaches our area has been distinguished from the western type as var. scopulorum. April-May.
5. Pinus divaricàta (Ait.) Gord. Labrador Pine. Gray Pine. (I. F. f. II4.) A slender tree, usually 12-20 m. high, but sometimes reaching 30 m ., and a trunk diameter of I m., the branches spreading, the bark becoming flaky. Leaves in 2 's, stout, stiff, more or less curved, spreading or oblique, crowded along the branches, seldom over 3 cm . long; fibro-vascular bundles 2 ; cones commonly very numerous, lateral, oblong-conic, usually upwardly curved, $2.5-5 \mathrm{~cm}$. long, $18-30 \mathrm{~mm}$. thick when mature; scales thickened at the end, the transverse ridge a mere line with a minute central point in place of spine or prickle at maturity; young scales spinytipped. In sandy soil, N. B. to Hudson Bay and the N. W. Terr., south to Me., N. N. Y., N. Ill. and Minn. May-June.
6. Pinus Virginiàna Mill. Jersey Pine. Scrub Pine. (I. F. f. II5.) A slender tree, usually small, the old bark dark-colored, flaky, the branches spreading or drooping. Leaves in 2's, dark green, rather stout and stiff, spreading when old, $3-7 \mathrm{~cm}$. long, with 2 fibro-vascular bundles; young sheaths rarely more than 5 mm . long; cones commonly few, lateral, recurved when young, spreading when old, oblong-conic, 3-6 cm. long, their scales somewhat thickened at the apex, the low transverse ridge with a short central more or less recurved prickle. In sandy soil, L. I. to S. C., Ala., S. Ind. and Tenn. April-May.
7. Pinus echinàta Mill. Yellow Pine. Spruce Pine. (I. F. f. ii6.) A forest tree, reaching a maximum height of about 30 m . and a trunk diameter of r. 5 m ., the branches spreading. the old bark rough in plates. Leaves some in 2's, some in 3 's, slender, not stiff, dark green, $7-13 \mathrm{~cm}$. long, spreading when mature; fibro-vascular bundles 2 ; young sheaths $10-16 \mathrm{~mm}$. long; cones lateral, oblongconic, about 5 cm . long, usually less than 2.5 cm . thick when the scales are closed; scales thickened at the apex, marked with a prominent transverse ridge and armed with a slender, nearly straight, deciduous prickle. In sandy soil, S. N. Y. to Fla., Ill., Kans. and Tex. Produces shoots from stumps. May-June.
8. Pinus pùngens Michx.f. Table-Mountain Pine. Hickory Pine. (I. F. f. II7.) A tree with a maximum height of about 20 m . and trunk diameter of I m., the branches spreading, the old rough bark in flakes. Leaves mostly in 2's, some in 3 's, stout and stiff, light green, $6-10 \mathrm{~cm}$. long, crowded on the twigs ; fibro-vascular bundles 2 ; young sheaths io-16 mm . long; cones lateral, usually clustered, long-persistent, ovoid, $8-12 \mathrm{~cm}$. long, $5-7 \mathrm{~cm}$. thick, while the scales are closed, nearly globular when these are expanded; scales thick, woody, their ends with a large elevated transverse ridge, centrally tipped by a stout reflexed or spreading spine $4-5 \mathrm{~mm}$. long. In woods, sometimes forming forests, W. N. J. and Cent. Pa. to Ga. and Tenn. May.
9. Pinus Taèda L. Loblolly Pine. Old-field Pine. (I. F. f. ir8.) A forest tree, reaching a height of 50 m . and a trunk diameter of 1.6 m ., the
branches spreading, the bark thick and rugged, flaky in age. Leaves in 3's, (rarely some of them in 2's), slender, not stiff, light green, ascending or at length spreading, $15-25 \mathrm{~cm}$. long; fibro-vascular bundles 2 ; sheaths $16-25 \mathrm{~mm}$. long when young ; cones lateral, spreading, oblong-conic, $7-\mathbf{1 2} \mathrm{cm}$. long, thick before the scales open; scales thickened at the apex, the transverse ridge prominent, acute, tipped with a central short triangular reflexed-spreading spine. S. N. J. to Fla., Tex. and Ark. April-May.
10. Pinus rígida Mill. Pitch-pine. Torch-pine. (I. F. f. irg.) A tree reaching a maximum height of about 27 m ., and a trunk diameter of 1 m ., the branches spreading, the old bark rough, furrowed, flaky in strips. Leaves in 3's (very rarely some in 4 's), stout, stiff, rather dark green, $7-13 \mathrm{~cm}$. long, spreading; fibro-vascular bundles 2 ; sheaths $8-13 \mathrm{~mm}$. long when young; cones lateral, ovoid, $3.5-7 \mathrm{~cm}$. long, becoming nearly globular when the scales open, commonly numerous and clustered; scales thickened at the apex, the transverse ridge acute, with a stout central triangular recurved-spreading prickle. In dry, sandy or rocky soil, N. B. to Ont., W. Va., Ga. and Tenn. Develops shoots from stumps. AprilMay.

## 2. LÀRIX Adans.

Tall trees with horizontal or ascending branches and small narrowly linear deciduous leaves, without sheaths, in fascicles on short lateral scaly bud-like branchlets. Aments short, lateral, monœcious, the staminate from leafless buds; the ovule-bearing buds commonly leafy at the base and the aments red. Anther-sacs 2 -celled, the sacs transversely or obliquely dehiscent. Pollen-grains simple. Cones ovoid or cylindric, small, erect, their scales thin, spirally arranged, obtuse, persistent. Ovules 2 on the base of each scale, ripening into 2 reflexed somewhat winged seeds. [Name ancient, probably Celtic.] About 9 species, natives of the north temperate and subarctic zones. Besides the following 2 others occur in the western parts of N. Am.
I. Larix larícina (Du Roi) Koch. American Larch. Tamarack. Hackmatack (I. F. f. I2O.) A slender tree, attaining a maximum height of about 35 m . and a trunk diameter of I m., the branches spreading, the bark close or at length slightly scaly. Leaves pale green, numerous in the fascicles, $\mathbf{I}-2.5 \mathrm{~cm}$. long, about 0.5 mm . wide, deciduous in late autumn; fascicles borne on short lateral branchlets about 4 mm . long; cones short-peduncled at the ends of similar branchlets, ovoid, obtuse, $12-17 \mathrm{~mm}$. long, composed of about 12 suborbicular thin scales, their margins entire or slightly lacerate. In swampy woods and about margins of lakes, Newf. to the N. W. Terr., south to N. J., Penn., Ind. and Minn. March-April.

## 3. PÌCEA Link.

Evergreen conic trees, with linear short 4 -sided leaves spreading in all directions, jointed at the base to short persistent sterigmata, on which they are sessile, falling away in drying, the bare twigs appearing covered with low truncate projections. Leaf-buds scaly. Staminate aments axillary, nearly sessile; anthers 2celled, the sacs longitudinally dehiscent, the connective prolonged into an appendage ; pollen-grains compound; ovule-bearing aments, terminal, ovoid or oblong; ovules 2 on the base of each scale, reflexed, ripening into 2 more or less winged seeds. Cones ovoid or oblong, obtuse, pendulous, their scales numerous, spirally arranged, thin, obtuse, persistent. [Name ancient.] About 14 species, natives of the north temperate and subarctic zones. Besides the following, 3 others occur in the northwestern parts of N. Am.

Twigs and sterigmata glabrous, glaucous; cones oblong-cylindric.
Twigs pubescent, brown; cones ovoid or oval.
Leaves not glaucous.
Leaves glaucous.

1. P. Canadensis.
2. P. Mariana.
3. P. brevifolia.
4. Picea Canadénsis (Mill.) B. S. P. White Sprocr. (I. F. f. 12I.) A slender tree, attaining a maximum height of ahout 50 m . and a trunk diameter of I m., but usually much smaller. Twigs and sterigmata glabous, pale and glaucous; leaves light green, slender, $12-16 \mathrm{~mm}$. long, very acute; cones cylindric or
oblong-cylindric, pale, $3 \cdot 5-5 \mathrm{~cm}$. long, $12-17 \mathrm{~mm}$. thick before the scales open; scales almost membranous, their margins usually quite entire; bracts incised. Newf. to Huds. Bay and Alaska, south to Me., N. N. Y., Mich., the Black Hills, Mont. and Br. Col. Sometimes with a strong, skunk-like odor. AprilMay.
5. Picea Mariàna (Mill.) B. S. P. Black Spruce. Red Spruce. (I. F. f. 122 and 123.) A tree, sometimes 35 m . high, the trunk sometimes reaching a diameter of 3.3 m ., the branches spreading, the bark smooth or only slightly roughened. Twigs pubescent; sterigmata pubescent or glabrate; leaves thickly covering the twigs, green, stout, straight or curved, rarely more than 16 mm . long, obtuse or acuminate or merely mucronate at the apex; cones oval or ovoid, $2-5 \mathrm{~cm}$. long, mostly persistent on the twigs for two or more seasons, their scales with entire, lacerate or erose margins. Newf. to Huds. Bay and the N. W. Terr., south to N. J., N. C., Mich. and Minn. Tree very variable in the size of cones and in the thickness of its leaves; the leaves of the lower branches often very sharppointed, while those of the upper are blunt or mucronate. May-June.
6. Picea brevifòlia Peck. Swamp Spruce. (I. F. f. i22a.) A small slender tree, or on mountains reduced to a shrub. Twigs pubescent; sterigmata glabrous, or slightly pubescent; leaves nearly straight, mostly glaucous, obtuse, or merely mucronate, stout, 4-12 mm. long; cones oval, persistent for two seasons or more, $1.5-3 \mathrm{~cm}$. long, the scales with eroded margins. In swamps and bogs, Vt. to Ont., N. N. Y. and Mich. June.

## 4. TSÜGA Carr.

Evergreen trees with slender horizontal or drooping branches, flat narrowly linear scattered short-petioled leaves, spreading and appearing 2 -ranked, jointed to very short sterigmata and falling away in drying. Leaf-buds scaly. Staminate aments axillary, short or subglobose; anthers 2 -celled, the sacs transversely dehiscent, the connective slightly produced beyond them; pollen-grains simple. Ovulebearing aments terminal, the scales about as long as the bracts, each bearing 2 reflexed ovules on its base. Cones small, ovoid or oblong, pendulous, their scales scarcely woody, obtuse, persistent. Seeds somewhat winged. [Name Japanese.] About 7 species, the following of E. N. Am., 2 in N. W. N. Am., 2 or 3 Asiatic.

Cones $1-2 \mathrm{~cm}$. long, their scales remaining appressed.
Cones $2.5-3 \mathrm{~cm}$. long, their scales widely spreading at maturity.

1. T. Canadensis.
2. T. Caroliniana.
3. Tsuga Canadénsis (L.) Carr. Hemlock. (I. F. f. 124.) A tall forest tree, sometimes 35 m . high, the trunk reaching 1.6 m . in diameter, the lower branches somewhat drooping, the old bark flaky in scales. Foliage dense; leaves obtuse, flat, $12-18 \mathrm{~mm}$. long, less than 2 mm . wide, dark green above, pale beneath, the petiole less than one-half as long as the width of the blade; cones oblong, obtuse, as long as or slightly longer than the leaves, their scales suborbicular, obtuse, minutely lacerate or entire, not widely spreading at maturity. N. S. to Minn., south to Del., along the Alleghenies to Ga. and Ala. and to Mich. and Wis. April-May.
4. Tsuga Caroliniàna Engelm. Carolina Hemlock. (I. F. f. 125.) A forest tree attaining a maximum height of about 27 m . and a trunk diameter of 1.3 m., the lower branches drooping. Leaves narrowly linear, obtuse, rather light green above, nearly white beneath, $14-22 \mathrm{~mm}$. long, the petiole nearly as long as the width of the blade; cones $2.5-3 \mathrm{~cm}$. long, the scales firm but scarcely woody, oblong, obtuse, widely spreading at maturity. S. W. Va. to S. Car. and Ga. in the mountains. April.

## 5. À BIES Juss.

Evergreen trees with linear flat scattered sessile leaves, spreading so as to appear 2 -ranked, but in reality spirally arranged, not jointed to sterigmata, and commonly quite persistent in drying, the naked twigs marked by the flat scars of their bases. Staminate aments axillary; anthers 2 -celled, the sacs transversely
dehiscent, the connective prolonged into a short knob or point; pollen-grains compound. Ovule-bearing aments lateral, erect; ovules 2 on the base of each scale, reflexed, the scale shorter than or exceeding the thin or papery, mucronate or aristate bract. Cones erect, subcylindric or ovoid, their scales deciduous from the persistent axis, orbicular or broader, obtuse. [Ancient name of the firs.] About 20 species, natives of the north temperate zone, chiefly in boreal and mountainous regions. Besides the following, some 7 others occur in the western parts of N. Am. and I in Mex.

Bracts serrulate, mucronate, shorter than the scales; leaves obtuse. r. A. balsamea. Bracts aristate, reflexed, longer than the scales; leaves mostly emarginate.

2. A. Fraseri.

I. `Abies balsàmea (L.) Mill. Balsam Fir. (I. F. f. 126.) A slender forest tree attaining a maximum height of about 30 m . and a trunk diameter of 1 m ., usually much smaller and on mountain tops and in high arctic regions reduced to a low shrub. Bark smooth, warty with resin "blisters." Leaves fragrant in drying, less than 2 mm . wide, $12-20 \mathrm{~mm}$. long, obtuse, dark green above, paler beneath or the youngest conspicuously whitened on the lower surface; cones cylindric, $5-10 \mathrm{~cm}$. long, $2-3 \mathrm{~cm}$. thick, upright, arranged in rows on the upper side of the branches, violet or purplish when young: bracts obovate, serrulate, mucronate, shorter than the broad rounded scales. Newf. and Lab. to Hud. Bay and the N. W. Terr., south to Mass., Penn., along the Alleghenies to Va. and to Mich. and Minn. Canada balsam is derived from the resinous exudations of the trunk. May-June.
2. Abies Fràseri (Pursh) Lindl. Fraser’s Balsam Fir. (I. F. f. 127.) A forest tree, similar to the preceding species. Leaves, especially the younger, conspicuously whitened beneath, $1-2 \mathrm{~cm}$. long, nearly 2 mm . wide, emarginate or some of them obtuse at the apex ; cones oblong-cylindric or ovoid-cylindric, $5-8 \mathrm{~cm}$. high, about 2.5 cm . thick, their scales rhomboid, much broader than high, rounded at the apex, much shorter than the papery bracts, which are reflexed, their summits emarginate, serrulate and aristate. On the high Alleghenies of S. W. Va., N. Car., and Tenn. May.

## 6. TAXÒDIUM L. C. Rich.

Tall trees with horizontal or drooping branches, and alternate spirally arranged sessile linear or scale-like leaves, deciduous in our species, spreading so as to appear 2 -ranked, some of the twigs commonly deciduous in autumn. Leaf-buds naked. Staminate aments very numerous, globose, in long terminal drooping panicled spikes, appearing before the leaves; anthers 2-5 celled, the sacs 2 -valved. Ovule-bearing aments ovoid, in small terminal clusters, their scales few, bractless, each bearing a pair of ovules on its base. Cones globose or nearly so, the scales thick and woody, rhomboid, fitting close together by their margins, each marked with a triangular scar at its base. Seeds large, sharply triangular-pyramidal. [Name Greek, referring to the yew-like leaves.] Three known species, the following of S. E. N. Am., I Mexican, I Chinese.

1. Taxodium distichums (L.) L. C. Rich. Bald Cypress. (I. F. f. 128.) A large forest tree, attaining a maximum height of about 50 m . and a trunk diameter of nearly 3 m ., the old bark flaky in thin strips. Leaves narrowly linear, flat, thin, $\mathbf{I}-2 \mathrm{~cm}$. long, $\mathbf{I} \mathrm{mm}$. wide, or less, rather light green, acute, those on some of the flowering branches smaller, scale-like; cones globose or slightly longer than thick, pendent at the ends of the branches, very compact, $2-3 \mathrm{~cm}$. in diameter; surfaces of the scales irregularly rugose above the inverscly triangular scar; seeds 8 -10 mm. long. In swamps and along rivers, Del. to Fla., west to Tex., north in the Miss. Valley region to S. Ind., Mo. and Ark. The roots develop upright conic "knees" sometimes $\mathbf{I} .5 \mathrm{~m}$. high and .4 m . thick. MarchApril.

## 7. THÛJA L.

Evergreen trees or shrubs with frond-like foliage, the leaves small or minute. scale-like, appressed, imbricated, opposite, 4 -ranked, those of the ultimate branchlets mostly obtuse, those of some of the larger twigs acute or subulate. Aments
monœcious, both kinds terminal, the staminate globose; anthers opposite, 2-4 celled, the sacs globose, 2 -valved. Ovule-bearing aments ovoid or oblong, small, their scales opposite, each bearing 2 (rarely $2-5$ ) erect ovules. Cones ovoid or oblong, mostly spreading or recurved, their scales 6-10, coriaceous, opposite, not peltate, dry, spreading when mature. Seeds oblong, broadly or narrowly winged or wingless. [Name ancient.] About 15 species, natives of North America and eastern Asia. Besides the following, another occurs from Idaho and Or. to Alaska.
I. Thuja occidentalis L. White Cedar. Arbor Vite. (I. F. f. I29.) A conical tree, reaching a height of 22 m . and a trunk diameter of 1.6 m ., the old bark deciduous in ragged strips. Scale-like leaves of the ultimate branches nearly obicular, obtuse, $2-3 \mathrm{~mm}$. broad, the two lateral rows keeled, the two other rows flat, causing the twigs to appear much flattened; leaves of the older twigs narrower and longer, acute or acuminate; mature cones, $8-10$ long, their scales obtuse; seeds broadly winged. In wet soil and along the banks of streams, forming almost impenetrable forests northward, N. B. to James Bay and Man., south to N. J., along the Alleghenies to N. C. and to Ill. and Minn. May-June.

## 8. CHAMAECÝPARIS Spach.

Evergreen trees, similar to the Thujas, with minute opposite appressed 4 -ranked scale-like leaves, or those of older twigs subulate, and small monocious terminal aments. Staminate aments as in Thuja, but the filaments broader and shieldshaped. Ovule-bearing aments globose, their scales opposite, peltate, each bearing 2-5 erect ovules. Cones globose, the scales thick, peltate, each bearing 2-5 erect seeds, closed until mature, each with a central point or knob. Seeds winged. [Greek, meaning a low cypress.] About 7 species, the following of the eastern U . S., 2 in western N. Am., 3 or 4 Japanese.
I. Chamaecyparis thyoìdes (L.) B. S. P. Southern White Cedar. (I. F. f. 130.) A forest tree, reaching a maximum height of about 30 m . and a trunk diameter of 1.5 m . Leaves of the ultimate branchlets ovate, acute, scarcely I mm . wide, those of the lateral rows keeled, those of the vertical rows slightly convex, each with a minute round discoid marking on the centre of the back, those of the older twigs narrower and longer, subulate; cones about 6 mm . in diameter, blue, each of their closely fitting scales with a small central point; seeds narrowly winged. In swamps, Mass. and N. H. to N. N. J., Fla. and Miss., mostly near the coast. April-May.

## 9. JUNÍPERUS L.

Evergreen trees or shrubs with opposite or verticillate, subulate or scale-like. sessile leaves, commonly of 2 kinds, and diœcious or sometimes monœcious, small globose axillary or terminal aments. Leaf-buds naked. Staminate aments oblong or ovoid ; anthers 2-6-celled, each sac 2-valved. Ovule-bearing aments of a few opposite somewhat fleshy scales, or these rarely verticillate in 3's, each bearing a single erect ovule or rarely 2 . Cones globose, berry-like by the coalescence of the fleshy scales, containing I-6 wingless bony seeds. [Name Celtic.] About 30 species, natives of the northern hemisphere, some of them extending into tropical regions. Besides the following, 4 or 5 others occur in the western parts of North America.
Leaves all subulate, prickly pointed, verticillate; aments axillary.
Small erect tree or shrub; leaves slender, mostly straight.

1. J. communis.

Low depressed shrub; leaves stouter, mostly curved.
2. J. nana.

Leaves of 2 kinds, scale-like and subulate, mostly opposite; aments terminal.
Tree; fruit on short straight branches.
Depressed shrub; fruit on short recurved branches.
I. Juniperus commùnis L. JUNIPER. (I. F. f. I3I.) A low tree or erect shrub, sometimes attaining a height of 8 m , and a trunk diameter of 25 cm ., usually smaller, the branches spreading or drooping, the bark shreddy. Leaves subulate, rigid, spreading, or some of the lower reflexed, mostly straight, prickly pointed, verticillate in 3 's, often with smaller ones fascicled in their axils, $1-2 \mathrm{~cm}$. long, less than 2 mm . wide, channeled and commonly whitened on the upper surface; aments
axillary; berry-like cones sessile or very nearly so, dark blue, 6-8 mm . diameter. On dry hills, N. S. to Br. Col., south to N. J., Penn., Mich., Neb. and in the Rocky Mts. to N. Mex. Also in Europe and Asia. The fruit is used for flavoring gin. April-May. Fruit ripe Oct.
2. Juniperus nana Willd. Low Juniper. (I. F. f. 132.) A depressed rigid shrub, seldom over 0.5 m . high, forming circular patches often 3-4 m. in diameter. Leaves similar to those of the preceding, but stouter, similarly channeled and often whitened above, appressed-ascending, rather rigid, spiny-tipped, $8-12 \mathrm{~mm}$. long, mostly incurved, densely clothing the twigs, verticillate in 3 's; aments axillary: berry-like cones blue, $8-10 \mathrm{~mm}$. in diameter. In dry, open places, Lab. to Br. Col., south to Mass., N. Y., Mich. and in the Rocky Mts. to Col. and Utah. Also in Europe and Asia. The characteristic growth in a depressed circular patch gives the plant a very different aspect from the true Juniper. April-May.
3. Juniperus Virginiàna L. Red Cedar. Savin. (I. F. f. I33.) A tree, reaching a maximum height of about 32 m . and a trunk diameter of 1.6 m ., conic when young, but the branches spreading in age. Leaves mostly opposite, all those of young plants and commonly some of those on the older twigs of older trees subulate, spiny-tipped, $4-8 \mathrm{~mm}$. long, those of the mature foliage scale-like, acute or subacute, closely appressed and imbricated, 4-ranked, causing the twigs to appear quadrangular; aments terminal; berry-like cones light blue, glaucous, about 6 mm . in diameter, on straight peduncle-like branchlets of less than their own length, r-2 seeded. In dry soil, N. B. to Br. Col., Fla., Tex., N. Mex. and Ariz. Also in the W. I. Wood used in large quantities in the manufacture of lead pencils. April-May. Fruit ripe Sept.-Oct.
4. Juniperus Sabina L. Shrubby Red Cedar. (I. F. f. 134.) A depressed shrub, seldom more than 1.3 m . high. Leaves similar to those of the preceding species, those of young plants and the older twigs of older plants subulate, spiny-tipped, those of the mature foliage scale-like, appressed, 4 -ranked, acute or acuminate; aments terminal; berry-like cones light blue, somewhat glacuous, 8 -10 mm . in diameter, borne on recurved peduncle-like branchlets of less than their own length, I-4 seeded. On banks, N. S. to Br. Col., south to Mass., N. N. Y., Minn. and Mont. Also in Europe and Asia. April-May.

## Family 2. TAXACEAE Lindl.

Trees or shrubs, resin-bearing except Taxus. Leaves evergreen or deciduous, linear, or in several exotic genera broad or sometimes fan-shaped, the pollen-sacs and ovules borne in separate clusters or solitary. Perianth wanting. Stamens much as ir the Pinaceae. Ovules with either one or two integuments; when two, the outer one fleshy ; when only one, its outer part fleshy. Fruit drupe-like or rarely a cone. About 8 genera and 75 species, of wide geographic distribution, most numerous in the southern hemisphere. The Maiden-hair Tree, Ginkgo biloba, of China and Japan, with fan-shaped leaves, is an interesting tree, formerly included in the group, much planted for ornament, now regarded as forming a distinct natural family.

## 1. TÁXUS.

Evergreen trees or shrubs, with spirally arranged short-petioled linear flat mucronate leaves, spreading so as to appear 2 -ranked, and axillary and solitary. sessile or subsessile very small aments; staminate aments consisting of a few scaly bracts and 5-8 stamens, their filaments united to the middle; anthers $f$-i-celled. Ovules solitary, axillary, erect, subtended by a fleshy, amnular disk which is bracted at the base. Fruit consisting of the fleshy disk which becomes cupshaped, red, and nearly encloses the bony seed. [Name anciont.] About 6 species, natives of the north temperate zone. Besides the following, another oceurs in Fla., one in Mex. and one on the Pacific coast.
I. Taxus Canadénsis Marsh. Americin \ew. (ikolvo Hemiock. (I. F. f. 135.) A low shrub, seldom over 1.5 m . high. Leaves dark green on both sides, narrowly linear, mucronate, narrowed at the base, $12-20 \mathrm{~mm}$. long, nearly 2 mm . wide, persistent on the twigs in drying; staminate aments shomese, 2 mm . hong, usually numerous; ovules usually few; fruit red and pulper resinous, ablong,
nearly 6 mm . hig, the top of the seed not covered by the fleshy integument. In woods, Newf. to Man., N. J., in the Alleghenies to Va., and to Ia. April-May.

## Class II. ANGIOSPÈRMAE.

Ovules (macrosporanges) enclosed in a cavity (the ovary) formed by the infolding and uniting of the margins of a modified rudimentary leaf (carpel), or of several such leaves joined together, in which the seeds are ripened. The pollen-grains (microspores) on alighting upon the summit of the carpel (stigma) germinate, sending out a pollen-tube which penetrates its tissues and reaching an ovule enters the orifice of the latter (micropyle), and its tip coming in contact with a germ-cell in the embryosac, fertilization is effected. In a few cases the pollen-tube enters the ovule at the chalaza, not at the micropyle.

There are two sub-classes, distinguished as follows:
Cotyledon one; stem endogenous. Sub-class i. Monocotyledones. Cotyledons two ; stem (with rare exceptions) exogenous.

Sub-class 2. Dicotyledones.

## Sub-class I. MONOCOTYLÉDONES.

Embryo with a single cotyledon and the first leaves of the germinating plantlet alternate. Stem composed of a ground-mass of soft tissue (parenchyma) in which bundles of wood-cells are irregularly imbedded; no distinction into wood, pith and bark. Leaves usually parallel-veined, mostly alternate and entire, commonly sheathing the stem at the base and often with no distinction of blade and petiole. Flowers mostly $3^{-}$ merous or 6-merous.

## Ordè I. PANDANÀLES.

Our species aquatic or marsh plants, with narrow elongated leaves and very small, imperfect and incomplete flowers in spikes or heads. Perianth of bristles, or of chaffy scales. Ovary I, I-2-celled. Endosperm mealy or fleshy.

The order takes its name from the tropical genus Pandanus, the socalled Screw-Pine.

Flowers in terminal spikes.
Flowers capitate, the heads axillary to leaf-like bracts.

Fam. r. Typhaceae.
Fam. 2. Sparganiaceae.

## Family I. TYPHÀCEAE J. St. Hil. <br> Cat-tail Family.*

Marsh or aquatic plants with creeping rootstocks, fibrous roots and glabrous erect, terete stems. Leaves linear, flat, ensiform, striate, sheathing at the base. Flowers monœecious, densely crowded in terminal spikes, which are subtended by spathaceous, usually fugacious bracts, and divided at intervals by smaller bracts, which are caducous, the staminate spikes uppermost. Perianth of bristles. Stamens 2-7, the filaments connate. Ovary I, stipitate, I-2-celled. Ovules anatropous. Styles as many as the cells of the ovary. Mingled among the stamens and pistils are bristly hairs, and among the pistillate flowers many sterile flowers with clavate tips. Fruit nutlike. Endosperm copious. The family comprises only the following genus:

## 1. TY̌PHA L.

Characters of the family. [Name ancient.] About 10 species, widely distributed in temperate and tropical regions. Besides those here described, another occurs in Cal.

[^2]Spikes darik brown or black, the pistillate and staminate usually contiguous, the former without bractlets; stigmas spatulate or rhomboid ; pollen. 4-grained.

1. T. latifolia.

Spikes light brown, the pistillate and staminate usually distant, the former with bractlets; stigmas linear ; pollen in simple grains.
2. T. angustifolia.

1. Typha latifòlia L. Broad-leaved Cat-tail. (I. F. f. 136.) Stems stout, $\mathrm{I}-2.7 \mathrm{~m}$. high. Leaves $6-25 \mathrm{~mm}$. broad; spikes dark brown or black, the staminate and pistillate portions usually contiguous, each $7.5-30 \mathrm{~cm}$. long and often 2 cm . or more in diameter, the pistillate without bractlets; stigmas rhomboid or spatulate; pollen-grains in 4's; fruit furrowed, bursting in water; seeds with a separable outer coat. In marshes, throughout N. Am., except the extreme north. Also in Europe and Asia. June-July. Fruit, Aug.-Sept.
2. Typha angustifollia L. Narrow-leaved Cat-tail. (I. F. f. 137.) Stems slender, $1.5-3.5 \mathrm{~m}$. high. Leaves mostly narrower than those of the preceding species, $4-\mathbf{1 2} \mathrm{mm}$. wide; spikes light brown, the staminate and pistillate portions usually distant, the two together sometimes 0.5 m . long, the pistillate, when mature, $6-\mathrm{I} 6 \mathrm{~mm}$. in diameter, and provided with bractlets; stigmas linear or linear-oblong; pollen-grains simple; fruit not furrowed, not bursting in water; outer coat of the seed not separable. Abundant in marshes along the Atlantic Coast from N. S. to Fla. and Cuba, but also occurring rather rarely inland. Also in Europe and Asia. June-July. Fruit, Aug.-Sept.

## Family 2. SPARGANIÀCEAE Agardh. 1858.

Bur-reed Family.*
Marsh or pond plants with creeping rootstocks and fibrous roots, erect or floating simple or branched stems, and linear alternate leaves, sheathing at the base. Flowers monœcious, densely crowded in globose heads at the upper part of the stem and branches, the staminate heads uppermost, sessile or peduncled. Spathes linear, immediately beneath or at a distance below the head. Perianth of a few irregular chaffy scales. Stamens commonly 5, their filaments distinct; anthers oblong or cuneate. Ovary sessile, mostly I-celled. Ovules anatropous. Fruit mostly I-celled, nutlike. Embryo nearly straight, in copious endosperm. The family comprises only the following genus :

## ェ. SPARGÀNIUM L.

Characters of the family. [Greek, referring to the ribbon-like leaves.]
About Io species, of temperate and cold regions. Besides the following, one occurs in Cal.

Fruit sessile.
Fruit stalked.
Inflorescence branching.
Inflorescence simple.
Staminate heads $4-6$, pistillate $2-6,10-16 \mathrm{~mm}$. in diameter. 3. S. simplex.
Staminate heads $1-2$, pistillate $x-3,4^{-10} \mathrm{~mm}$. in diameter. 4. S. minimum.
i. Sparganium eurycárpum Engelm. Broad-fruited Bur-reen. (I. F. i. 138.) Stems stout, $\mathbf{I}-2.8 \mathrm{~m}$. high, branching. Leaves flat, slightly kected beneath, the lowest $1-2 \mathrm{~m}$. long; staminate heads numerous; pistillate heads $2+\mathrm{cm}$ the stem or branch, sessile or peduncled, hard, compact and $2-3 \mathrm{~cm}$. in diameter when mature; style 1 ; stigmas $\mathbf{I}-2$; nutlets $6-10 \mathrm{~mm}$. long, whtusely +5 -angled. narrowed at the base, the top rounded, flattened or depressed, abruptly tippod with the style; scales as long or nearly as long as the fruit and as many as its angles, often with 2 or 3 other exterior ones, somewhat spatulate. the apex roundea, denticulate or eroded. In marshes and along streams, Newf. to Br. Col., south to Va., Mo., Utah and Cal.
2. Sparganium andrócladum (Engelm.) Morong. Branconve Buk-kekl. (1. F. f. 139,) Stem slender, more or less branching, 2.5-0 cm. high. listillate
heads 3-7, sessile or the lowest peduncled, axillary or the peduncles and branches axillary ; style 1 ; stigma I (rarely 2 ); fruiting heads $12-25 \mathrm{~mm}$. in diameter ; nutlets fusiform, 4-6 mm. long, 3 mm . thick, often strongly contracted at the middle, tapering into the style ; scales oblong, as long as the nutlets or shorter, the exterior ones narrower ; stalk of fruit 2 mm . long or more. In bogs or shallow water, N. S. to Ont. and Br. Col., south to Fla. and La. June-Aug.

Sparganium andrócladum flúctuans Morong. Floating in deep water with long slender stems and thin leaves $2-7 \mathrm{~mm}$. wide; inflorescence usually sparingly branched; fruiting heads $8-12 \mathrm{~mm}$. in diameter. In cold ponds, N. B. to Penn.
3. Sparganium símplex Huds. Simple-stemmed Bur-reed. (I. F. f. I40.) Stem slender, $3-60 \mathrm{~cm}$. high, simple. Leaves more or less triquetrous, $4-8 \mathrm{~mm}$. wide; inflorescence $2-20 \mathrm{~cm}$. long ; staminate heads $4^{-6}$; pistillate 2-6, sessile or the lowest peduncled; fruiting heads $10-16 \mathrm{~mm}$. in diameter; nutlets fusiform or narrowly oblong, obtusely angled at the apex, more or less contracted in the middle, smaller than those of the preceding species and more tapering at the summit; scales denticulate, about one-half as long as the nutlets; stigma linear, as long as the style or shorter, rarely 2 ; stalk of fruit about 2 mm . long. Borders of ponds and streams, Newf. to Br, Col., Penn., Mont. and Cal. June-Aug.

Sparganium simplex angustifolium (Michx.) Engelm. Floating in deep water. Leaves very long, $I-3 \mathrm{~mm}$. wide, their sheaths often inflated at the base; staminate and pistillate heads $1-4$; fruiting heads $6-15 \mathrm{~mm}$. in diameter. In mountain lakes and slow streams, Newf. to Ore., N. Y. and Cal.
4. Sparganium mínimum Fries. Small Bur-reed. (I. F. f. I4I.) Floating, stems very slender, $0 . \mathrm{I}-\mathrm{I} \mathrm{m}$. long. Leaves thin and lax, $\mathrm{I}-5 \mathrm{~mm}$. wide ; inflorescence 2 cm . or more long; staminate heads I-2 ; pistillate, I-3, sessile, axillary, supra-axillary or the lowest on an axillary peduncle ; ripe fruiting heads $4-10 \mathrm{~mm}$. in diameter; nutlets ovoid, slightly triangular, tapering abruptly into the style, 2-4 mm. long, twice as long as the denticulate scales; stigma ovaí, often oblique, about as long as the style; stalk of the nutlet $0.5-1 \mathrm{~mm}$. long, often apparently none. In ponds and streams, N. B. to Man. and Ore., south to N. J., Mich. and Utah. Also in northern Europe. Dwarf forms, growing out of water, sometimes occur with stems $3^{\prime}-6^{\prime}$ high. June-Aug.

## Order 2. NAIADÀLES.

Aquatic or marsh herbs, the leaves various in form. Flowers perfect, monœecious or diœcious. Perianth present, or wanting. Parts of the flower mostly unequal in number. Carpels I or more, mostly distinct and separate (united in Vallisneriaceae; united at least until maturity in Scheuchzeriaceae) ; endosperm none, or very little.

Perianth, if present, inferior ; carpels mostly distinct. Perianth-segments, when present, herbaceous.

Carpels distinct ; aquatic herbs. Fam. r. Naiadaceae. Carpels united until maturity; bog plants; flowers racemed or spiked.

Fam. 2. Scheuchzeriaceae. Perianth of 2 series of segments, the outer green, the inner mostly white.

Fam. 3. Alismaceae.
Perianth superior; carpels united.
Fam. 4. Vallisneriaceae.

## Family i. NAIADÀCEAE Lindl.*

Immersed aquatic plants with slender, often branching, leafy stems, the leaves flat or filiform, and perfect, monœcious or diœcious, spicate axil-

[^3]lary or spadiceous flowers. Perianth of 4 segments, or a hyaline envelope, or wanting. Stamens I-4 or occasionally more, distinct and hypogynous in the perfect flowers, solitary or connate in the sterile. Anthers extrorse, I-2-celled. Ovaries I-9, mostly distinct, I-celled, mostly i-ovuled. Carpels rarely dehiscent. Seeds straight or curved. Endosperm none. About io genera and ioo species of wide geographical distribution, most abundant in temperate regions. The months noted in the descriptions indicate the fruiting period.

Flowers perfect.

Perianth of 4 distinct segments.
Perianth none; flowers naked.
Flowers monœcious or diœcious.
Leaves entire.
Leaves r-nerved, $2-8 \mathrm{~cm}$. long; 0.5 mm . or less wide.
Leaves many-nerved, o. $3-1.6 \mathrm{~m}$. long, $2-8 \mathrm{~mm}$. wide.
Leaves spiny-toothed on the margins.

1. Potamogeton.
2. Ruppia.
3. Zanuichellia.
4. Zostera.
5. Naias.

## I. POTAMOGETTON L.

Leaves alternate or the uppermost opposite, often of 2 kinds, submerged and floating, the submerged mostly linear, the floating coriaceous, lanceolate, ovate or oval. Spathes stipular, often ligulate, free or connate with the base of the leaf or petiole, enclosing the young buds and usually soon perishing after expanding. Peduncles axillary, usually emersed. Flowers small, spicate, green or red. Perianth-segments 4, short-clawed, concave, valvate. Stamens 4 , inserted on the claws of the perianthsegments. Anthers sessile. Ovaries 4, sessile, distinct, I-celled, I-ovuled, attenuated into a short style, or with a sessile stigma. Fruit of 4 drupelets, the pericarp usually thin and hard or spongy. Seeds crustaceous, campylotropous, with an uncinate embryo thickened at the radicular end. [Greek, in allusion to the aquatic habitat.] About 65 well-defined species, natives of temperate regions. Besides the following, 3 others occur in the southern parts of N. Am.

Stipules axillary and free from the leaf.
With floating and submerged leaves.
Submerged leaves bladeless.
Nutlets more or less pitted. . I. P. natans.
Nutlets not pitted.
2. P. Oakesianus.

Submerged leaves with a proper blade.
Submerged leaves of 2 kinds, lanceolate and oval or oblong.
Uppermost broadly oval or elliptic, lowest lanceolate.
3. P. amplifolius.

Uppermost lanceolate and pellucid, lowest oblong and opaque.
4. P. pulcher.

Submerged leaves all alike, capillary or linear-setaceous.
i-nerved or nerveless. 25. P. Vaseyi. 3 -nerved merged leaves all alike, linear.
26. P. lateralis.

Submerged leaves all alike, linear.
Nearly the same breadth throughout, obtusely pointed, coarsely cellularreticulated in the middle.
5. P. Nuttallii.

Broader at base, acute, without cellular-reticulation.
9. P. heterophyllus.

Submerged leaves all alike, lanceolate.
Uppermost leaves petioled, lowest sessile. 6. P. alpinus.
All the leaves petioled.
All the leaves petioled.
Floating leaves large, broadly elliptic, rounded or subcordate at base. ir. P. Illimuensis.

Floating leaves narrowly elliptic, tapering at base.
7. $P$. lonchites.

Floating leaves mostly obovate or oblanceolate, tapering at base.
8. P. Fiaxoni.

All the leaves sessile or subsessile.
Fruit only 2 mm . long, obscurely 3 -keeled.
10. $P$. spathulacerormis.

Fruit 3 mm . long, distinctly 3 -keeled.

With submerged leaves only.
Without propagating buds and without glands.
Leaves with broad blades, mostly lanceolate or ovate, many-nerved.
Leaves subsessile or short-petioled, mostly acute or cuspidate.
13. $P$. lucens.

Leaves semi-amplexicaul, obtuse and cucullate at the apex.
14. P. praelongus.

Leaves meeting around the stem, very obtuse at the apex, not cucullate.
15. P. perfoliatus.

Leaves with narrow blades, linear or oblong-linear, several-nerved. Leaves oblong-linear, 5-7-nerved, obtuse at the apex.
16. P. Mysticus.

Leaves narrowly linear, 3 -nerved, acute at the apex.
21. P. foliosus.

Leaves with narrow blades, capillary or setaceous, $x$-nerved or nerveless.
17. P. confervoides.

With propagating buds or glands, or both.
With buds, but without glands.
Leaves serrulate, $3-7$-nerved. 18. P. crispus.
Leaves entire, with 3 principal and many fine nerves.
19. P. zosteraefolius.

Commonly with glands, but no buds.
Stems long-branching from the base ; leaves lax, flat, 3 -nerved, abruptly acute or cuspidate.
20. P. Hillii.

Stems simple ; leaves strict, revolute, 3-5-nerved, acuminate.
With both buds and glands.
Glahds large and translucent ; buds rare. 22. P. obtusifolius.
Glands small, often dull ; buds common.
Leaves linear, $5-7$-nerved.
23. P. Friesiz.

Leaves linear, 3 -nerved.
27. P. pusillus.

Leaves capillary, I -nerved or nerveless.
28. P. gemmiparus.

Stipules adnate to the leaves or petioles.
With both floating and submerged leaves.
Submerged peduncles as long as the spikes, clavate, often recurved.
29. $P$. diversifolius.

Submerged peduncles none, or at most hardly 2 mm . long.
With submerged leaves only.
Stigma broad and sessile.
30. P. Spirillus.

Style apparent ; stigma capitate.
Fruit without keels or obscurely keeled.
Fruit strongly 3 -keeled.
Leaves entire, 3-5-nerved. 33. P. interruptus.
Leaves minutely serrulate, finely many-nerved. 34. P. Robbinsiz.

## I. Potamogeton nàtans L. Cominon Floating Pondweed. (I. F. f. 142.)

 Stems $0.6-\mathrm{I} .3 \mathrm{~m}$. long, simple or sparingly branched. Floating leaves thick, the blade ovate, oval or elliptic, $5-10 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, usually with a short abrupt tip, rounded or subcordate at the base, many-nerved; submerged leaves reduced to phyllodes which commonly perish early; stipules sometimes 10 cm . long, acute, 2 -keeled; peduncles as thick as the stem. $5-10 \mathrm{~cm}$. long; spikes very dense, about 5 cm . long; fruit turgid, $4-4.5 \mathrm{~mm}$. long, about 2.5 mm . thick, scarcely keeled, narrowly obovoid, slightly curved on the face; style broad; nutlet hard, pitted or impressed on the sides, 2 -grooved on the back; embryo forming an incomplete circle, the apex pointing toward the base. In ponds and streams, throughout N. Am. except the extreme north, extending into Mex. Also in Europe and Asia. July-Aug.
## 2. Potamogeton Oakesiànus Robbins. Oakes' Pondweed. (I. F. f. I43.)

 Stems very slender, often much branched from below. Floating leaves elliptic, mostly obtuse, rounded or subcordate at the base, $2-5 \mathrm{~cm}$. long. IO- 20 mm . wide, 12-20-nerved; petioles $5-15 \mathrm{~cm}$. long; submerged leaves mere capillary phyllodes, often persistent; peduncles $2-8 \mathrm{~cm}$. long, commonly thicker than the stem; spikes cylindric, $12-25 \mathrm{~cm}$. long; stipules acute, hardly keeled; fruit obovoid, about 3 mm . long, 2 mm . thick, nearly straight on the face, 3 -keeled, the middle keel sharp; style apical or subapical; sides of the nutlet not pitted, but sometimesslightly impressed; embryo circle incomplete, the apex pointing toward the base. In still water, Anticosti to N. Penn. and N. J. Summer.
3. Potamogeton amplifòlius Tuckerm. Large-leaved Pondweed. (I. F. f. 144.) Stems long, simple or occasionally branched. Floating leaves oval or ovate, abruptly pointed at the apex, rounded at the base, $5-10 \mathrm{~cm}$. long, $3-5 \mathrm{~cm}$. wide, many-nerved; submerged leaves mostly petioled, large, the uppermost often elliptic or oval, $7-15 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, the lowest lanceolate, often 20 cm . long, with about 25 nerves, often with the sides closed and assuming a falcate shape; stipules tapering to a long sharp point, sometimes 10 cm . long ; peduncles thickened upward, $5-20 \mathrm{~cm}$. long ; spikes $2-5 \mathrm{~cm}$. long ; fruit $4-5 \mathrm{~mm}$. long, 2.5 mm . thick, turgid, the pericarp hard, obliquely obovoid, 3 -keeled; face more or less angled; style subapical ; embryo slightly incurved. In lakes, Ont. to Br. Col., south to Conn., Ky. and Neb. July-Sept.
4. Potamogeton púlcher Tuckerm. Spotted Pondweed. (I. F. f. I45.) Stems simple, terete, black-spotted, $0.3-0.7 \mathrm{~mm}$. long. Floating leaves usually massed at the top on short lateral branches, alternate, ovate or round-ovate, subcordate, $2-8 \mathrm{~cm}$. long, 5-II cm. wide, many-nerved; peduncles about as thick as the stem, $5-10 \mathrm{~cm}$. long, spotted; submerged leaves of 2 kinds, the uppermost pellucid, lanceolate, long-acuminate, undulate, $7-20 \mathrm{~cm}$. long, $\mathbf{I}-3.5 \mathrm{~cm}$. wide, tapering at the base into a short petiole, 10-20-nerved; the lowest much thicker, opaque, spatulate, long; stipules 2 -carinate; fruit $4-4.5 \mathrm{~mm}$. long, 3 mm . thick, turgid, tapering into a stout apical style, the back sharply 3-keeled; face angled near the middle, with a sinus below ; embryo coiled. In ponds and pools, Me. to Ga. and Mo. July.
5. Potamogeton Nuttállii Cham. \& Sch. Nuttall's Pondweed. (I. F. f. 146.) Stems slender, compressed, mostly simple, o.3-2 m. long. Floating leaves opposite, elliptic, to obovate, obtuse, short-petioled, $3-8 \mathrm{~cm}$. long, $8-24 \mathrm{~mm}$. wide, many-nerved; submerged leaves linear, 2-ranked, $5-17 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, 5 -nerved, the 2 outer nerves nearly marginal, the space between the 2 inner and the midrib reticulated; stipules obtuse, hyaline, not keeled; peduncles $2-13 \mathrm{~cm}$. long; spikes $\mathbf{I}-2.5 \mathrm{~cm}$. long ; fruit round-obovoid $2.5-4 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. thick, 3 -keeled, the sides flat and indistinctly impressed; style short, apical ; embryo coiled one and one-third times. In ponds and streams, N. S. to Penn. and S. C. June-Aug.
6. Potamogeton alpìnus Balbis. Northern Pondweed. (I. F. f. 147.) Plant of a ruddy tinge; stems simple or branched, somewhat compressed. Floating leaves spatulate or oblanceolate, obtuse, many-nerved, tapering into petioles $2-12 \mathrm{~cm}$. long; submerged leaves semi-pellucid, the lowest sessile, the uppermost petioled, oblong-linear or linear-lanceolate, obtuse or rarely acute, narrowed at the base, 7-30 cm. long, 4-20 mm. wide, 7-17-nerved; stipules broad, faintly 2 -carinate, obtuse or rarely acute; spikes $2-3 \mathrm{~cm}$. long; fruit obovoid, lenticular, reddish, 2.5 mm . long, 2 mm . thick, 3 -keeled, the middle keel sharp, the face arched, beaked by the short recurved style; apex of the embryo pointing directly to the basal end. In ponds, N. S. to Br. Col., N. J. and Cal. Also in Europe. July-Aug.
7. Potamogeton lonchites Tuckerm. Long-leaved Pondweed. (I. F. f. 148.) Stem terete, much branched, $\mathbf{I}-2 \mathrm{~m}$. long. Floating leaves rather thin, elliptic, pointed at both ends, $5-15 \mathrm{~cm}$. long, $1-3 \mathrm{~cm}$. wide, many-nerved. petioled; submerged leaves pellucid, $10-32 \mathrm{~cm}$. long, $4-24 \mathrm{~mm}$. wide, rounded at the base or tapering into a petiole; stipules acuminate, strongly or faintly 2 carinate; peduncles thickening upward, $5-8 \mathrm{~cm}$. long; spikes cylindric, 2-5 cm . long; fruit about 4 mm . long, $2-3 \mathrm{~mm}$. thick, obliquely obovod. the face nearly straight, the back 3 -keeled, the middle keel rounded or often with a projecting wing under the style, not impressed on the sides; embryo slightly incurved, apex pointing slightly inside of the base. In ponds and slow streams, N. Mr. to Wash., Fla. and Cal. July-Oct.

Fotamogeton lonchites Noveboracénsis Morong. Floating leaves thicker, $7^{-1}+\mathrm{cm}$. long, about 5 cm . wide, $20-2$-nerved, abruptly pointed or whtuse at the apex: peduncles sometimes ro- 12 cm . and spikes 7.5 cm . long. Lakes of Cent. N. Y.
8. Potamogeton Fáxoni Merong. Fixon's Povilifen. (I. だ. f. ifu.) Floating leaves numerous, mostly obovate or oblanceolate. Whunt-pointed or ohtuse
at the apex, narrowed at the base, often strikingly like those of $P$. spathulaeformis, 5-9 cm. long, $15-25 \mathrm{~mm}$. wide, $13-17$-nerved, petioled; submerged leaves oblonglanceolate, acute or sometimes obtuse, $7-13 \mathrm{~cm}$. long, $1-25 \mathrm{~cm}$. wide, $5-13$-nerved, often with an irregular areolation on each side of the midrib; petioles $\mathbf{I} .2-2.5 \mathrm{~cm}$. in length; peduncles slightly thicker than the stem; spikes dense, $2-5 \mathrm{~cm}$. long; fruit not collected. Little Otter Creek and Lake Champlain, Ferrisburg, Vt.
9. Potamogeton heterophýllus Schreb. Various-Leaved Pondweed. (I. F. f. I50.) Stems slender, compressed, much branched, sometimes 4 m . long. Floating leaves pointed at the apex, mostly rounded or subcordate at the base, 1.5Io cm . long, $8-30 \mathrm{~mm}$. wide, 10-18-nerved, on petioles $2-10 \mathrm{~cm}$. long; submerged leaves pellucid, sessile, linear-lanceolate, acuminate, cuspidate, rather stiff, $2-15$ cm . long, 2-16 mm. wide, 3-9-nerved, the uppermost often petioled; peduncles often thickened upward, sometimes clustered; stipules spreading, obtuse 1.5-2.5 cm . long; spikes $1.8-25 \mathrm{~cm}$. long; fruit roundish or obliquely obovoid, $2-3 \mathrm{~mm}$. long, $1-2 \mathrm{~mm}$. thick, indistinctly 3 -keeled; style short, obtuse, apical; apex of the embryo nearly touching the base, pointing slightly inside of it. A very variable species, occurring in different forms throughout almost all N . Am. except the extreme north. Also in Europe. July-Sept.

Potamogeton heterophýllus graminifòlius (Fries) Morong. Submerged leaves delicate, flaccid, linear, $4-12 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide With the type.

Potamogeton heterophýllus myriophýllus (Robbins) Morong. Stems dichotomously branching, very leafy; submerged leaves delicate, about 2.5 cm . long and 4 mm . wide, 3-5nerved, linear or the upper oblanceolate; floating leaves elliptic or lanceolate-oblong; rootstock tuberous. Mass., R. I. and Conn.

Potamogeton heterophýllus mínimus Morong. Stems long and almost capillary, the internodes 7 -10 cm . long, densely clustered on short lateral branches, $1-2.5 \mathrm{~cm}$. long, scarcely 0.5 mm . wide, acuminate, I -nerved; floating leaves $\mathrm{I}-3.5 \mathrm{~cm}$. long, $6-18 \mathrm{~mm}$. wide, lanceolate, oval or ovate, usually clustered at the summit of the stem. Mass. and N. H.
ro. Potamogeton spathulaefórmis (Robbins) Morong. Spatulate-Leaved Pondweed. (I. F. f. 15I.) Stems many, branched, o.6-1 m. long. Floating leaves obovate or elliptic, abruptly acute at the apex, rather thin, $13-23$-nerved, $2-6 \mathrm{~cm}$. long, $1.5-2.5 \mathrm{~cm}$. wide, borne on slender petioles; submerged leaves pellucid, spatulateoblong or linear-lanceolate, $5-10 \mathrm{~cm}$. long, $6-18 \mathrm{~mm}$. wide, $5-13$-nerved, cuspidate or spinescent, sessile or subsessile, often reduced to phyllodes with a very narrow blade and a long acumination at the base and apex; peduncles often thickening upward, $2-5 \mathrm{~cm}$. long; stipules obtuse, faintly keeled, the apex slightly hooded; spikes large ; fruit about 2 mm . long, roundish or obliquely ovoid, obscurely 3 -keeled, with a curved or slightly angled face; embryo with the apex pointing slightly inside of the base. In Mystic Pond, Medford, Mass. Also in Europe. Summer.
II. Potamogeton Illinoénsis Morong. Illinois Pondweed. (I. F. f. 152.) Stem stout, much branched above. Floating leaves opposite, numerous, thick, IO-14 cm. long, 5-9 cm. wide, many-nerved 'oval or broadly elliptic, shortpointed, petioled; submerged leaves numerous, $10-20 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. wide, 13-19-nerved, acuminate or the uppermost acute, mostly tapering at the base into a short, broad, flat petiole, rarely reduced to phyllodes; stipules $5-8 \mathrm{~cm}$. long, obtuse, strongly 2 -carinate ; peduncles $5-10 \mathrm{~cm}$. long; spikes $2-5 \mathrm{~cm}$. long; fruit roundish or obovoid, 3-4 mm. long, 2-3 mm. thick, dorsally 3 -keeled; style short, blunt. In ponds, Ill. to Ia. and Minn. Aug.
12. Potamogeton Zízii Roth. Ziz's Pondweed. (I. F. f. 153.) Stems slender, branching. Floating leaves elliptic, $4-10 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide, manynerved; petioles mostly short ; submerged leaves mostly lanceolate or oblanceolate, thin, acute or cuspidate, $5^{-15} \mathrm{~cm}$. long, $6-30 \mathrm{~mm}$. wide, $7^{-17}$-nerved; stipules obtuse, 2 -keeled ; peduncles thicker than the stem, $6-15 \mathrm{~cm}$. long; spikes $2-5 \mathrm{~cm}$. long ; fruit obliquely obovoid, $2.5-4 \mathrm{~mm}$. long, about 2 mm . thick, the face dorsally 3 -keeled; style short. blunt, facial ; apex of the embryo pointing directly to the base. In lakes and streams, Que. to Mont., Fla. and Wyo. Also in Europe. July-Aug.

Potamogeton Zizii Methyénsis (A. Benn.) Morong. Middle leaves narrow ; upper leaves oval ; stipules long; fruit small. Methy Lake, Can.
13. Potamogeton lùcens L. Shining Pondweed. (I. F. f. 154.) Stem thick, branching below and often with masses of short leafy branches at the summit. Leaves all submerged, elliptic, lanceolate or the uppermost oval, shining, sessile or shortpetioled, $6-20 \mathrm{~cm}$. long, $1.5-4 \mathrm{~cm}$. wide, the tips otten serrulate ; stipules 2 -carinate, sometimes very broad ; peduncles $7-15 \mathrm{~cm}$. long ; spikes $5-6 \mathrm{~cm}$. long, very thick; fruit about 3 mm . long and 2.5 mm . thick, roundish, the face usually with a slight inward curve at the base; apex of the embryo pointing transversely inward. In ponds, N. S. to Fla., west to Cal. and Mex. Local. Also in Europe. Sept.-Oct.

Potamogeton lùcens Connecticuténsis Robbins. Stems flexuous; leaves acuminate ; fruit larger than that of the type (about 4 mm . long), distinctly 3 -carinate and with a facial style. Saltonstall's Pond, Conn., and White Plains, N. Y.
14. Potamogeton prælóngus Wulf. " White-stemmed Pondweed. (I. F. f. 155.) Stems white, flexuous, flattened, much branched, growing in deep water, sometimes 2.6 m . long. Leaves all submerged, oblong or oblong-lanceolate, semiamplexicaul, bright green, $\mathrm{I}-3.5 \mathrm{~cm}$. long, $5-30 \mathrm{~cm}$. wide, with $3-5$ main nerves; stipules white, scarious, obtuse and commonly closely embracing the stem; peduncles $7-50 \mathrm{~cm}$. long, erect, straight, about as thick as the stem; spikes $2-5$ cm . long, thick, cylindric; fruit dark green, obliquely obovoid, $4-5 \mathrm{~mm}$. long, 3-4 mm . thick, the back much rounded, often with the upper curve nearly as high as the style; the middle keel sharp ; style short, obtuse, facial. N. S. to Br. Col., N. J., Minn. and Cal. Also in Europe. June-July.
15. Potamogeton perfoliàtus L. Clasping-leaved Pondweed. (I. F. f. 156.) Stems slender, much branched. Leaves all submerged, orbicular or ovate, sometimes lanceolate, usually obtuse and minutely serrulate at the apex, cordateperfoliate at the base, $3-5 \mathrm{~cm}$. long, $0.5-2.5 \mathrm{~cm}$. wide; peduncles 3.5 cm . long, usually erect or slightly spreading; spikes $1.5-2.5 \mathrm{~cm}$. long; fruit obliquely obovoid, $2.5-3 \mathrm{~mm}$. long, 2 mm . thick, obscurely 3 -carinate on the back, the face slightly curved outwardly toward the top, the sides with a shallow indentation which runs into the face; style nearly facial; embryo slightly incurved or with its apex pointing directly toward the base. In ponds and streams, Newf. to Br. Col., Fla., and Cal. Also in Europe and Asia. July-Sept.

Potamogeton perfoliàtus Richardsònii A. Bennett. Leaves $2-12 \mathrm{~cm}$. long, $8-16$ mm . wide at the broadened amplexicaul base, often curving inward at the apex, $13-23$ nerved. Fruit somewhat larger than that of the type, about 4 mm . long and 2.5 mm . thick. N. N. E. to Or., Del., Neb., and Cal.
16. Potamogeton Mýsticus Morong. Mystic Pond Pondweed. (I. F. f. 157.) Whole plant very slender and delicate, stems irregularly branching above, nearly filiform, terete, $0.3-3.3 \mathrm{~m}$. long. Leaves all submerged, scattered oblonglinear, $2-4 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, $5-7$-nerved, obtuse and rarely with minute serrulations near the apex, abruptly narrowed at the base and sessile or partly clasping; stipules obtuse, about 12 mm . long, hyaline and with many fine nerves. mostly deciduous, but sometimes persistent and closely sheathing the stem; spikes few, capitate, $4^{-6}$-flowered, borne on erect peduncles $2-5 \mathrm{~cm}$. long; immature fruit obovoid, less than 2 mm . long, about $\mathbf{I} \mathrm{mm}$. wide, obscurely 3 -keceled on the back, slightly beaked by the slender, recurved style. Mystic Pond. Medford, and Miacount Pond, Nantucket, Mass. Aug.-Sept.
17. Potamogeton confervordes Reichb. Alga-like: Povilwた! (I. F. i. 158.) Stems slender, terete, $15-45 \mathrm{~cm}$. long, the upper branches repeatedly forking. Leaves very delicate, flat, setaceous, $2-6 \mathrm{~cm}$. long. the hrodest scarcely 0.5 mm . wide, tapering to a long hair-like point. $1-3$-nerved and often with a few cross-veins; stipules delicate, obtuse, 4-6 mm. hong: peduncles 520 cm . leng. erect. somewhat thickened upward; spikes 6-8 mm. long: fruit roundish-ohowoid. Z 3 mm . long and about as thick, the back sometimes a little angular or sinume. b-hechet, the middle keel sharp, the face notched near the hase, the sides impressed with a shallow indentation which runs into the noteh of the fiwe : apex of the embero nearly touching the base a little to one side. In cohl or mountain ponds, Mic. and N. H. to N. J. and Penn. Also in Europe. Aug.-Sept.
18. Potamogeton críspus L. Curled-leaved Pondweed. (I. F. f. 159.) Stems branching, compressed. Leaves 2 -ranked, linear-oblong or linear-oblanceolate, sessile or semi-amplexicaul, obtuse, serrulate, crisped, $\mathbf{1 - 1 0} \mathrm{cm}$. long, 6-14 mm . wide, 3-7-nerved, the midrib often compound and the outer nerves very near the margin; stipules small, scarious, obtuse, early perishing; peduncles $2-5 \mathrm{~cm}$. long, frequently recurved in fruit, sometimes very numerous; spikes about I cm . long, appearing very bristly with the long-beaked drupelets when in fruit ; fruit ovoid, about 3 mm . long, 2 mm . or more wide, 3 -keeled on the back, the middle keel with a small projecting tooth near the base, the face slightly curved, the style facial and nearly as long as the drupelet; embryo small, its apex pointing directly toward its base. The plant is mainly propagated by peculiar winter buds. In fresh, brackish or even salt water, Mass., Penn., and Va. Also in Europe. Aug.
19. Potamogeton zosteraefòlius Schum. Eel-Grass Pondweed. (I. F. f. 160.) Stems much flattened, sometimes winged, widely branching. Leaves linear, obtuse and mucronate or sharp-pointed at the apex, $5-30 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, with 3 principal nerves and many fine ones; stipules scarious, obtuse, finely nerved, soon perishing ; peduncles $3-10 \mathrm{~cm}$. long; spikes cylindric, about 1 cm . long, 12-15-flowered; fruit obovoid with a broad base, about 4 mm . long, 2.5-3 mm . thick, 3 -keeled on the back, the lateral keels rather obscure; face arched, beaked with a short recurved style; embryo slightly incurved. The plant is propagated by the terminal leaf-buds, which sink to the bottom, and rest during the winter. In still or running water, N. B. to N. J., west to Or. Also in Europe. July-Aug.
20. Potamogeton Híllii Morong. Hill's Pondweed. (I. F. f. 16i.) Stems slightly compressed, slender, widely branching, $0.3-0.6 \mathrm{~m}$. long. Leaves linear, acute, cuspidate, or often almost aristate, $2-6 \mathrm{~cm}$. long, $0.5 \cdot-2.5 \mathrm{~mm}$. wide, $3-$ nerved, the lateral nerves delicate and nearer the margins than the midrib; stipules whitish, many-nerved, obtuse, $6-10 \mathrm{~mm}$. long; peduncles about 1 cm . long, erect or slightly recurved; spikes capitate, 3-6-fruited; fruit obliquely obovoid, obtuse at the base, about 4 mm . long, $2-2.5 \mathrm{~mm}$. thick, 3 -carinate on the back, the middle keel sharp and more or less undulate, flat on the sides, face slightly arched; style nearly facial, short; embryo coiled. In ponds, E. N. Y. to Mich. There are two forms of the species, the one 2-glandular at the base of the leaves, the other glandless. July-Sept.
21. Potamogeton foliosus Raf. Leafy Pondweed. (I. F. f. 162.) Stems flattened, much branched, $0.3-1 \mathrm{~m}$. long. Leaves $2-5 \mathrm{~cm}$. long, $\mathbf{I}-2 \mathrm{~mm}$. wide, acute, 3 -nerved; stipules white, hyaline, obtuse or sometimes acute, $\mathbf{1 - 2} \mathrm{cm}$. long; peduncles more or less clavate, erect; spikes about 4-flowered; fruit lenticular or nearly orbicular, about 2 mm . in diameter, 3 -keeled on the back, the middle keel winged, sinuate-dentate, often with projecting shoulders or teeth at each end, the face strongly angled or arched, sharp, often with a projecting tooth at the base; style apical. In ponds and streams, N. B. to Br. Col., Fla., N. Mex. and Cal. July-Aug.

Potamogeton foliòsus Niagarénsis (Tuckerm.) Morong. Larger. Stems o.6-1. m . long, leaves sometimes over 7.5 cm . in length and 2 mm . wide, $3-5$-nerved; stipules larger and occasionally acute; spikes 8-12-flowered. Niagara Falls to Mich. and Cal.
22. Potamogeton obtusifòlius Mert. \& Koch. Blunt-Leaved Pondweed. (I. F. f. I63.) Stems usually slender, compressed, widely branching. Leaves linear, $5-8 \mathrm{~cm}$. long, I-4 mm. wide, obtuse, often mucronate, usually 3 -nerved with a broad midrib, sometimes 5-7 nerved, 2 -glandular at the base, the glands large and translucent; stipules white or scarious, many-nerved, obtuse, $1-2 \mathrm{~cm}$. long, often as long as or longer than the internodes; peduncles numerous, slender, erect; spikes $6-8 \mathrm{~mm}$. long, ovoid. $5-8$-flowered; fruit obliquely obovoid, about 3 mm . long and 2 mm . thick, 3 -keeled; style short, blunt, nearly facial. In still water, Que. to Penn., Minn., and Wyo. Also in Europe. July-Aug.
23. Potamogeton Frièsii Ruprecht. Fries' Pondweed. (I. F. f. 164.) Stems compressed, $0.5-1.3 \mathrm{~m}$. long, branching. Leaves $3-6 \mathrm{~cm}$. long, about 2 mm .
wide, acute, obtuse or cuspidate at the apex, mostly 5 -nerved, rarely 7 -nerved, 2-glandular at the base, the glands small; stipules white, hyaline, finely nerved, obtuse or acute, $\mathbf{I}-2 \mathrm{~cm}$. long; peduncles often thicker than the stem and sometimes thickening upward; spikes, when developed, interrupted; fruit quite similar to that of $P$. pusillus, but with a recurved style, usually with a shallow pit on the sides, and with the apex of the embryo pointing toward the basal end. In still water, N. B. to N. Y., west to Br. Col. Also in Europe. Propagating buds occasional. July-Aug.
24. Potamogeton rùtilus Wolfg. Slender Pondweed. (I. F. f. 165.) Stems very slender, $0.2-0.6 \mathrm{~m}$. long, compressed, simple or nearly so. Leaves $2-3.5 \mathrm{~cm}$. long, $0.5-1 \mathrm{~mm}$. wide, acute or acuminate, strict, nearly erect, 3-5nerved, revolute, often 2 -glandular at base and bright green, the nerves prominent beneath; stipules acute, $\mathbf{I}-2 \mathrm{~cm}$. long, often longer than the internodes and hiding the bases of the leaves above, persistent, becoming white and fibrous with age; peduncles $1-3.5 \mathrm{~cm}$. long; spikes $6-10 \mathrm{~mm}$. long, usually dense, but sometimes interrupted; fruit obliquely obovoid, about 2 mm . long and I mm. thick, obscurely keeled or the back showing only 2 small grooves; apex of the drupelet tapering into a short facial nearly straight recurved style; embryo circle not complete, the apex pointing a little inside of the base. Anticosti and James Bay to Mich. and Minn. Also in Europe.
25. Potamogeton Vàseyi Robbins. Vasey's Pondweed. (I. F. f. 166.) Stems filiform, widely branching below, and with many short lateral branches above, $0.3-0.5$ long, the emersed fertile forms in shallow water, and the more common sterile submerged forms in water from $2-3 \mathrm{~m}$. in depth. Floating leaves on the fertile stems only, coriaceous, in 1-4 opposite pairs, oval, oblong or obovate, 8-10 mm . long, 4-6 mm. wide, with 5-9 nerves deeply impressed beneath, tapering at the base into petioles $6-8 \mathrm{~mm}$. long; submerged leaves capillary, $2-4 \mathrm{~cm}$. long; stipules white, delicate, many-nerved, acute or obtuse, $4-6 \mathrm{~mm}$. long; peduncles 6-12 mm. long, thickening in fruit; spikes 4-6 mm. long, 2-6 fruited; fruit roundish-obovoid, about 2 mm . long and nearly as thick, 3 -keeled, the middle keel rounded, tipped with a straight or recurved style. E. Mass. to S. Ont. and O. The plant is furnished with propagative buds. July-Aug.
26. Potamogeton lateràlis Morong. Opposite-Leaved Pondweed. (I. F. f. 167.) Stems filiform, much branched. Floating leaves on sterile shoots only, coriaceous, elliptic, obtuse, $8-10 \mathrm{~mm}$. long, $2-4 \mathrm{~mm}$. wide, $5-7$-nerved, the nerves deeply impressed beneath, usually in $\mathbf{I}-3$ opposite pairs which stand at right angles to the stem on petioles $6-20 \mathrm{~mm}$. long; submerged leaves linear, acute, $2-8$ cm . long, $0.5-1 \mathrm{~mm}$. wide, 1 -3-nerved, 2 -glandular at the base, but the glands small and often obsolete; stipules small, hyaline, many-nerved, obtuse, deciduous; peduncles and floating leaves lateral, widely spreading at maturity, sometimes recurved, spikes capitate or often interrupted, 3-4-flowered; fruit obliquely obovoid. about 2 mm . long, lenticular, the back much curved and 2 -grooved, the face arched and surmounted by the nearly sessile stigma; curve of the embryo oval, its apex nearly touching its base. In lakes and slow streams, E. Mass. to Mich. Proliferous shoots at the summit of the stem and on the upper branches appear late in the season, as the plants are beginning to decay. July-Aug.
27. Potamogeton pusíllus L. Small Pondweed. (I. F. f. 168.) stems filiform, branching, $0.1-0.6 \mathrm{~m}$. long. Leaves all submerged, linear, obtuse and mucronate or acute at the apex, 2 -glandular at the base, 2.8 cm . lons, about 1 mm . wide, $\mathbf{I}$-3-nerved, the lateral nerves often obscure; stipules short, hyaline. obtuse; peduncles usually $6-18 \mathrm{~mm}$., or rarely 7.5 cm . long; spikes $3-10$-flowered; truit obliquely ellipsoid, about 2 mm . long and 1 mm . thick, curved and $2-\mathrm{grex} \mathrm{wed}$ on the back or sometimes with 3 distinct keels, the face slightly arched, beaked by a straight or recurved style; apex of the embryo slightly incurved and pointing obsliquely downward. Propagative buds occur in greater or less abundance. In ponds and slow streams, N. B. to Br. Col., south to Via., Tex.. and Cal. Also in Europe. July-Aug.

Potamogeton pusillus Panormitìnus (Biv.) Morong. L'ppermost leaves subcoriaceous, spatulate, opposite, divaricate, 3 - 5 -nerved, 8 -10 mm. long, tapering into a broad petiole as long as the blade. Ottawa, Ont. Also in Europe.

Potamogeton pusflus polyphyllus Morong. Stem $7^{-14} \mathrm{~cm}$. long, divaricately branching from the base and very leafy throughout; leaves very obtuse, 3 -nerved. Plant not known to flower, but abundantly provided with propagating buds which are thickened, hardened and closely invested with imbricated leaves. E. Mass.

Potamogeton pusillus Sturróckii A. Bennett. A rare form with delicate bright green pellucid leaves, $2-8 \mathrm{~cm}$. long, obtuse or often apiculate at the apex, less than 2 mm . wide, sometimes 5 -nerved; fruit much smaller than that of the type, short-beaked. E. Mass. Also in Europe.
28. Potamogeton gemmíparus (Robbins) Morong. Capillary Pondween. (I. F. f. 169.) Stems filiform, terete, branching, o.I-I. 3 m . long. Leaves capillary, sometimes not as wide as the stem, often with no perceptible midrib, tapering to the finest tip, $2-8 \mathrm{~cm}$. long, 2 -glandular at the base; stipules $\mathbf{I}-2.5 \mathrm{~cm}$. long, mostly deciduous; spikes interrupted, 3-6-flowered; peduncles filiform, or sometimes slightly thickened, $\mathrm{I}-5 \mathrm{~cm}$. long; fruit seldom formed, similar to that of $P$. pusillus, except that it is flatter and somewhat impressed on the sides. In ponds, E. Mass. and R. I. It is commonly propagated by its abundant buds; the leaves and stems are often alike in thickness, so that the plant seems to consist of threads. Aug.-Sept.
29. Potamogeton diversifòlius Raf. Rafinesque's Pondweed. (I. F. f. 170.) Stems flattened or sometimes terete, much branched. Floating leaves coriaceous, the largest 2.5 cm . long by 1.2 cm . wide, oval or elliptic and obtuse, or lan-ceolate-oblong and acute; petioles filiform or dilated; submerged leaves setaceous, seldom over 0.5 mm . wide, $2-8 \mathrm{~cm}$. long; stipules obtuse or truncate, $6-10 \mathrm{~mm}$. long, those of the floating leaves free, those of the submerged leaves sometimes adnate; emersed peduncles $6-14 \mathrm{~mm}$. long; submerged peduncles $4-6 \mathrm{~mm}$. long, clavate, as long as the spikes; emersed spikes $6-10 \mathrm{~mm}$. long, occasionally interrupted; fruit cochleate, rarely over I. mm. long, 3-keeled, the middle keel narrowly winged and usually with 7 or 8 knob-like teeth on the margin, the lateral keels sharp or rounded; embryo coiled $11 / 2$ times. In still water, Me. to Fla., west to Neb. and Tex. June-Sept.

Pomategon diversifolius multidenticulàtus Morong. Differs from the type in the numerous teeth of the fruit, as many as 12 being sometimes found on the middle keel, and each lateral keel with 6-8 more, the teeth often bristle-like and sometimes 2 -pronged. Conn. to E. Penn. and Del.

Potamogeton diversifolius trichophyllus Morong. Plant about 15 cm . long, without floating leaves, the submerged leaves as fine as floss silk and entirely nerveless. Lake Marcia, N. J.
30. Potamogeton Spiríllus Tuckerm. Spirail Pondweed. (I. F. f. 17 I.) Stems compressed, branched, $15-50 \mathrm{~cm}$. long, the branches often short and recurved. Floating leaves oval or elliptic, obtuse, the largest about 2.5 cm . long and 1.2 cm . wide, with $5-\mathrm{I} 3$ nerves deeply impressed beneath, their petioles often 2.5 cm . long; submerged leaves linear, 3-4 mm. long, about I mm. wide, mostly 5 -nerved; stipules of the upper floating leaves free; those of the submerged leaves adnate to the blade or petiole; spikes above water $6-10 \mathrm{~mm}$. long, continuous, the lower mostly sessile, capitate and I-Io-fruited; fruit cochleate, roundish, less than 2 mm . long, flat and deeply impressed on the sides, 3 -keeled on the back, the middle keel winged and sometimes 4 - 5 -toothed; style deciduous; embryo spiral, about $1 \frac{1}{2}$ turns. In ponds and ditches, N. S. and Ont. to Minn., south to Va., Mo., and Neb. June-Aug.

3 !. Potamogeton filifòrmis Pers. Filiform Pondweed. (I. F. f. 172.) Stems from a running rootstock, slender, $1-7 \mathrm{~m}$. long, filiform above, stout and thick toward the base. Leaves numerous, $5-30 \mathrm{~cm}$. long, $0.5-1 \mathrm{~mm}$. wide, I-nerved with a few cross veins; sheaths about 2 mm . long and the free part of the stipule 12 mm . long, scarious on the edges; flowers on long, often recurved peduncles, 2-12 in each whorl; fruit $2-3 \mathrm{~mm}$. long, slightly less than 2 mm . wide, the sides even, the back not keeled, the face nearly straight or obtusely angled near the top; stigma nearly or quite sessile, remaining on the fruit as a broad truncate projection. In ponds and lakes, Anticosti to W. N. Y. and Mich. August.

Potamogeton filifòrmis Macòunii Morong. Leaves $2-7.5 \mathrm{~cm}$. long, the largest Imm . or more wide, obtuse, stiff, with a strong midrib and raised or slightly revolute margins; fruit rarely more than 2 mm . long; peduncles only $1.5-2 \mathrm{~cm}$. long; plant commonly with a compact bushy habit. In brackish or salt water lakes, prairie region of Can.
32. Potamogeton pectinàtus L. Fennel-leaved Pondweed. (I. F. f. 173.) Stems slender, much branched, $0.3-1 \mathrm{~mm}$. long, the branches repeatedly forking. Leaves setaceous, attenuate to the apex, I-nerved, $2.5-15 \mathrm{~cm}$. long, often capillary and nerveless; stipules half free, $\mathbf{1 . 2 - 2 . 5} \mathbf{~ c m}$. long, their sheaths scarious on the margins; peduncles filiform; the flowers in verticils; fruit obliquely obovoid, with a hard thick shell, 3-4 mm . long, $2-2.5 \mathrm{~mm}$. wide, without a middle keel, but with obscure lateral ridges on the back, plump on the sides and curved or occasionally a little angled on the face; style straight or recurved, facial; embryo apex pointing almost directly toward the basal end. In fresh, brackish, or salt water, Cape Breton to Br. Col., south to Fla., Tex., and Cal. Also in Europe. July-Aug.
33. Potamogeton interrúptus Kitaibel. Interrupted Pondweed. (I. F. f. 174.) Stems arising from a running rootstock which often springs from a small tuber, $0.6-\mathrm{I} .3 \mathrm{~m}$. long, the branches spreading like a fan. Leaves linear, $7-\mathrm{I} 5$ cm . long, $2-25 \mathrm{~mm}$. wide, 3 - 5 -nerved, with many transverse veins; narrow, I nerved leaves occur on some plants and these are acuminate, much like those of $P$. pectinatus; stipules partially adnate to the leaf-blade, sometimes with narrowly scarious margins, the free part shorter and scarious, obtuse; spikes interrupted; fruit broadly, obliquely obovoid, obtuse at the base, the largest 4 mm . long and nearly as broad, prominently keeled and with rounded lateral ridges on the back, the face nearly or quite straight; style facial, erect. In ponds and streams, Pr. Edw. Isl. to N. Ind., Mich., and Neb. Also in Europe. Aug.
34. Potamogeton Robbínsii Oakes. Robbins' Pondweed. (I. F. f. 175.) Stems stout, widely branching, o.6-1. 3 m . long, from running rootstocks sometimes 0.3 m . long. Leaves linear, $7-\mathrm{I} 3 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide, acute, finely manynerved, crowded in 2 ranks, minutely serrulate, auriculate at the point of attachment with the stipule; stipules adnate, the free part $\mathbf{I} \mathbf{. 2 - 2 . 5} \mathrm{cm}$. long, acute, persistent, white, membranous, mostly lacerate; peduncles $2-7 \mathrm{~cm}$. long, the inflorescence frequently much branched and bearing from 5-20 peduncles; spikes interrupted, flowering under water; fruit obovoid, about 4 mm . broad and 3 mm wide, 3 -keeled on the back, the middle keel sharp, the lateral ones rounded, the face arched, the sides with a shallow depression which runs into the face below the arch; style subapical, thick, slightly recurved; apex of the embryo pointing a little inside the basal end. In ponds and lakes, N. B. to Or., south to Del., Penn., and Mich. The plant is freely propagated by fragments of the stems which throw out rootlets from each joint, but this is the rarest of our species to form fruit. Aug.-Sept.

## 2. RÚPPIA L.

Slender, widely branched aquatics with capillary stems, slender alternate I-nerved leaves tapering to an acuminate apex, and with membranous sheaths. Flowers on a capillary spadix-like peduncle, naked, consisting of 2 sessile anthers, each with 2 large separate sacs attached by their backs to the peduncle, having between them several pistillate flowers in 2 sets on opposite sides of the rachis, the whole cluster at first enclosed in the sheathing base of the leaf. Stigmas scesile, peltate. Fruit a small obliquely-pointed drupe, several in each cluster and pedicelled; embryo oval, the cotyledonary end inflexed, and both that and the hypocotyl immersed. [Name in honor of Heinrich Bernhard Rupp, a (icrman hetanist.] In the development of the plants the staminate flowers drop off and the peduncle elongates, bearing the pistillate flowers in 2 clusters at the end, but after fertilization it coils up and the fruit is drawn below the surface "of the water.

Three or four species, occurring in salt and brackish waters all over the work. The following are the only ones known to occur in N. Am.
I. Ruppia maritima L. Maritime Ruppia. (I. F. f. I76.) Stems usually whitish, often 1 m . long, the internodes irregular, naked. Leaves $2-8 \mathrm{~cm}$. long, 1.5 mm . or less wide; sheaths with a short free tip; peduncles in fruit sometimes 0.3 m . long; pedicels $4-6$ in a cluster, $\mathrm{I}-3.5 \mathrm{~cm}$. long; drupes with a dark hard shell, ovoid, about 2 mm . long, often oblique or gibbous at the base, pointed with the long style, but varying much in shape; forms with very short peduncles and pedicels, and with broad, strongly marked sheaths occur. Common in brackish or salt water along the Atlantic and Pacific Coasts of N. Am. and in the saline districts in the interior. Widely distributed in the Old World and in S. Am. July-Aug.
2. Ruppia occidentàlis S. Wats. Western Ruppia. (I. F. f. 177.) Stems stouter, the branching fan-like. Leaves $7-20 \mathrm{~cm}$. long, with large branches and leaves often thickly clustered at the nodes, the sheaths overlapping each other; drupes larger, ovoid or pyriform, borne on pedicels about 2 mm . long, the peduncles. bright red when fresh and sometimes nearly 0.7 m . in length. In saline ponds, Neb. to Br. Col. Summer.

## 3. ZANNICHÉLLIA L.

Stems, flowers and leaf-buds all at first enclosed in a hyaline envelope, corresponding to the stipule in Potamogeton. Staminate and pistillate flowers in the same axil; the staminate solitary, consisting of a single 2 -celled anther, borne on a short pedicel-like filament; the pistillate $2-5$. Ovary flask-shaped, tapering into a short style; stigma broad, hyaline, somewhat cup-shaped, its margins angled or dentate. Fruit a flattish falcate nutiet, ribbed or sometimes toothed on the back. Embryo bent and coiled at the cotyledonary end. [In honor of J. H. Zannichelli, 1662-1729, Italian physician and botanist.] Two or three species of very wide geographical distribution in fresh-water ponds and streams.
I. Zannichellia palústris L. Zannichellia. (I. F. f. I78.) Stems capillary, sparsely branched, the rhizome creeping; roots fibrous. Leaves $2-7 \mathrm{~cm}$. long, 0.5 mm . or less wide, acute, thin, I-nerved with a few delicate cross-veins; spathe-like envelope separate from the leaves and fruits at maturity; fruits $2-6$ in a cluster, 2-4 mm . long, sometimes sessile, sometimes pedicelled, sometimes the whole cluster peduncled; style persistent, straight or curved, $\mathbf{I}-\mathbf{2} \mathrm{mm}$. long; plant flowering and ripening its fruit under water. In fresh or brackish ponds, pools or ditches, nearly throughout N. Am., except the extreme north, and widely distributed in the Old World. July-Sept.

## 4. NÀIAS L.

Slender, branching aquatics, wholly submerged, with fibrous roots. Leaves opposite, alternate or verticillate, sheathing at the base. Flowers monœcious or diœccious, axillary, solitary, sessile or pedicelled. Sterile flower with a double perianth, the exterior one entire or 4-horned at the apex, the interior one hyaline, adhering to the anther; stamen sessile or stalked, 1-4-celled, apiculate or 2-lobed at the summit. Fertile flowers of a single ovary which tapers into a short style; stigmas 2-4, subulate. Mature carpel solitary, sessile, ellipsoid, its pericarp crustaceous. Seed conformed to the pericarp and embryo to the seed, the raphe distinctly marked. [Greek, a water-nymph.] About Io species, occurring in fresh water all over the world. The following are the only ones known in N. Am.:
Sheaths broadly rounded, their margins entire or with a few large teeth. I. N. marina.

Sheaths narrowly and obliquely rounded, each margin with 5-10 minute teeth; leaves linear.
Seeds shining, with $30-50$ rows of faint reticulations. 2. N. flexilis.
Seeds dull, with 16-20 rows of strongly marked reticulations. 3. N. Guadalupensis. Sheaths auriculate; leaves delicately filiform.
4. N. gracillima.
I. Naias marina L. Large Naitas. (I. F. f. 179.) Diœcious; stem stout, compressed, commonly armed with teeth twice as long as their breadth. Leaves opposite or verticillate, $1-2.5 \mathrm{~cm}$. long, about 2 mm . wide, with 6-10 spine-pointed teeth on each margin and frequently several along the back; sheaths with rounded lateral edges; fruit large, $4-5 \mathrm{~mm}$. long, the pericarp tipped with a long persistent
style and 3 thread-like stigmas; seed not shining, rugose. In lakes, Cent. N. Y. to Fla., west to Cal. Also in Europe. Summer.

Naias marìna grácilis Morong. Internodes $2-8 \mathrm{~cm}$. long, with a few teeth on the upper part ; leaves scarcely 0.5 mm . wide, with $15-24$ large teeth on the margins and a few on the back; sheaths with 2 or 3 teeth on each margin; seed sculptured with about 25 rows of nearly square or irregularly oblong reticulations. Cent. N. Y. and Fla.

Naias marina recurvàta Dudley. Branches and leaves recurved; leaves $6-12 \mathrm{~mm}$. long, narrow, with 2-4 large teeth on each margin and none on the back; internodes short, naked, or with I or 2 teeth; sheaths I-toothed on each side. Cayuga Marshes, N. Y.
2. Naias fléxilis (Willd.) Rost. \& Schmidt. Slender Naias. (I. F. f. i8o.) Stem slender, forking. Leaves linear, pellucid, acuminate or abruptly acute, I-2.5 cm . long, $\mathbf{I}-2 \mathrm{~mm}$. wide, numerous and crowded on the upper parts of the branches, with 25-30 minute teeth on each edge ; sheaths obliquely rounded with 5 -10 teeth on each margin ; fruit ellipsoid with very thin pericarp, $2-4 \mathrm{~mm}$. long, $0.5-1 \mathrm{~mm}$. in diameter ; style long, persistent ; stigmas short ; seed smooth, shining, strawcolored, sculptured, though sometimes quite faintly, with $30-40$ rows of nearly square or hexagonal reticulations which are scarcely seen through the dark pericarp. In ponds and streams throughout nearly all N. Am. Also in Europe. Summer.

Naias fléxilis robústa Morong. Stem stout, few-leaved, i-2 m. long; internodes elongated. Mass. to Mich. and Tex.
3. Naias Guadalupénsis (Spreng.) Morong. Guadaloupe Naias. (I. F. f. 181.) Stems nearly capillary, $0.3-0.7 \mathrm{~m}$. long, widely branched from the base. Leaves numerous, $12-18 \mathrm{~mm}$. long, o.5-1 mm. wide, acute, opposite or in fascicles of 2-5, frequently recurved, with sheaths and teeth like those of $N$. flexilis but generally with 40-50 teeth on each margin of the leaf: fruit about 2 mm . long ; pericarp dark and strongly marked by $16-20$ rows of hexagonal or rectangular reticulations which are transversely oblong; seed straw-colored, not shining. In ponds and lakes, Neb. to Or. and Tex., east to Fla. Also in tropical America. July-Sept.
4. Naias gracíllima (A. Br.) Morong. Thread-like Naias. (I. F. f. I82.) Diœcious; stem capillary, $15-40 \mathrm{~cm}$. long, much branched, the branches alternate. Leaves numerous, opposite or often fascicled in 3's-5's or more, setaceous, $2-5 \mathrm{~cm}$. long, usually with about 20 minute teeth on each margin ; sheaths auricled, with 6 or 7 teeth on each auricle, the teeth standing upon setaceous divisions of the sheath; stigmas very short; fruit oblong-cylindric, r mm. long, o. 5 mm . in diameter, slightly curved inwardly or straight, the pericarp straw-colored or purplish, marked by about 25 rows of irregularly oblong reticulations; seed not shining. In pools and ponds, E. Mass. to Del. and Mo. July-Sept.

## 5. ZOSTERA L.

Marine plants with slender rootstocks and branching compressed stems. Leaves 2-ranked, sheathing at the base, the sheaths with inflexed margins. Spadix linear, contained in a spathe. Flowers monœcius, arranged alternately in 2 rows on the spadix. Staminate flower merely an anther attached to the spadix near its apex, r-celled, opening irregularly on the ventral side; pollen thread-like. Pistillate flower fixed on its back near the middle ; ovary 1 ; style elongated; stigmas 2 , capillary; mature carpels flask-shaped, membranous, rupturing irresularly, beaked by the persistent style ; seeds ribbed; embryo ellipsoid. [Creek, referring to the ribbon-like leaves.] About 6 species of marine distribution. Besides the following one occurs in Fla. and one on the Pacific Coast.
I. Zostera marina L. Eel-grass. Grass-wrack. (I. F. f. is3.) Leaves ribbon-like, obtuse at the apex, $0.3^{-2} \mathrm{~m}$. long, $2-8 \mathrm{~mm}$. wide. with $3^{-7}$ principal nerves. Spadix $2.5-6 \mathrm{~cm}$. long; flowers about 6 mm . long. crowided, usually from IO-20 of each kind on the spadix ; ovary somewhat vermiform ; at anthesis the stigmas are thrust through the opening of the spathe and drop off before the anthers of the same spadix open; the anthers at anthesis work themselves out of the spathe and discharge the glutinous stringy pollen into the water ; seeds cylindric, strongly
about 20 -ribbed, about 3 mm . long, and 1 mm . in diameter, truncate at both ends, the ribs showing very clearly on the pericarp. In bays, streams, and ditches along the Atlantic Coast from Greenland to Fla., and on the Pacific from Alaska to Cal. Also on the coasts of Europe and Asia. Summer.

# Family 2. SCHEUCHZERIÀCEAE Agardh.* 

## Arrow-grass Family.

Marsh herbs with rush-like leaves and small spicate or racemose perfect flowers. Perianth 4-6 parted, its segments in two series, persistent or deciduous. Stamens 3-6. Filaments very short or elongated. Anthers mostly 2 -celled and extrorse. Carpels 3-6, I-2-ovuled, more or less united until maturity, dehiscent or indehiscent. Seeds anatropous. Embryo straight. Four genera and about io species of wide geographic distribution.

Leaves all basal ; flowers numerous on naked scapes, spicate or in spike-like racemes.

1. Triglochin.

Stem leafy; flowers few in a loose raceme.
2. Scheuchzeria.

## r. TRIGLÒCHIN L.

Marsh herbs with basal half-rounded ligulate leaves with membranous sheaths. Flowers in terminal spikes or racemes on long naked scapes. Perianth-segments 3-6, concave, the 3 inner ones inserted higher up than the outer. Stamens 3-6; anthers 2 -celled, sessile or nearly so, inserted at the base of the perianth-segments and attached by their backs. Ovaries 3-6, I-celled, sometimes abortive ; ovules solitary, basal, erect, anatropous. Style short or none. Stigmas as many as the ovaries, plumose. Fruit of 3-6 cylindraceous oblong or obovoid carpels, which are distinct or connate, coriaceous, costate, when ripe separating from the base upward from a persistent central axis, their tips straight or recurved, dehiscing by a ventral suture. Seeds erect, cylindraceous or ovoid-oblong, compressed or angular. [Greek, in allusion to the three-pointed fruit of some species.] About 9 species, natives of the temperate and subarctic zones of both hemispheres. Only the following are known to occur in N. Am.:

Carpels 3.
Fruit linear or clavate, tapering to a subulate base.
Fruit nearly globose.

1. T. palustris.
2. $T$, striata.
3. $T$. maritima.
I. Triglochin palústris L. Marsh Arrow-grass. (I. F. f. 184.) Rootstock short, oblique, with slender fugacious stolons. Leaves linear, shorter than the scapes, $\mathbf{I} 2-30 \mathrm{~cm}$. long, tapering to a sharp tip; ligule very short ; scapes $\mathbf{I}$ or 2, slender, striate, $0.2-0.6 \mathrm{~m}$. high; racemes $12-30 \mathrm{~cm}$. long; pedicels capillary, in fruit erect-appressed and $5-7 \mathrm{~mm}$. long; perianth-segments 6 , greenish-yellow ; anthers 6 , sessile ; pistil of 3 united carpels, 3 -celled, 3 -ovuled; stigmas sessile; fruit $6-7 \mathrm{~mm}$. long, linear or clavate; ripe carpels separating from the axis and hanging suspended from its apex, the axis 3 -winged. In bogs, N. B. to Alaska, south to N. Y., Ind. and Mont. Also in Europe and Asia. July-Sept.
4. Triglochin striàta R. \& P. Three-ribbed Arrow-Grass. (I. F. f. 185.) Rootstocks upright or oblique. Scapes I or 2, more or less angular, usually not over 0.3 m . high; leaves slender, slightly fleshy, nearly or quite as long as the scapes, $0.5-2 \mathrm{~mm}$. wide; flowers very small, light yellow or greenish, in narrow racemes; pedicels $\mathbf{1}-2 \mathrm{~mm}$. long, not elongating in fruit; perianth-segments 3 , stamens 3; anthers oval, large; pistil of 3 united carpels; fruit subglobose or somewhat obovoid, about 2 mm . in diameter, appearing 3 -winged when dry by the contracting of the carpels; carpels coriaceous, rounded and 3 -ribbed on the back;

[^4]axis broadly 3-winged. In saline marshes, Md. to Fla. and La. Also in tropical America. June-Sept.
3. Triglochin marítima L. Seaside Arrow-grass. (I.F. f. I86.) Rootstock without stolons, often subligneous, the caudex thick, mostly covered with the sheaths of old leaves. Scape stout, nearly terete, $0.1-0.7 \mathrm{~m}$. high; leaves halfcylindric, usually about 2 mm . wide; raceme elongated, often 0.4 m . long or more; pedicels decurrent, $2-3 \mathrm{~mm}$. long, slightly longer in fruit; perianth-segments 6 , each subtending a large sessile anther; pistil of 6 united carpels; fruit oblong or ovoid, 5-6 mm . long, 3-4 mm . thick, obtuse at the base, with 6 recurved points at the summit; carpels 3 -angled, flat or slightly grooved on the back, or the dorsal edges curving upward and winged, separating at maturity from the hexagonal axis. In salt marshes, along the Atlantic seaboard from Lab. to N. J., and in fresh or saline marshes across the continent to Alaska and Cal. Also in Europe and Asia. July-Sept.

## 2. SCHEUCHŻÉRIA L.

Rush-like bog perennials with creeping rootstocks, and erect leafy stems, the leaves elongated, half-rounded below and flat above, striate, furnished with a pore at the apex and a membranous ligulate sheath at the base. Flowers small, racemose. Perianth 6-parted, regularly 2 -serial, persistent. Stamens 6, inserted at the base of the perianth-segments ; filaments elongated ; anthers linear, basifixed, extrorse. Ovaries 3 or rarely 4-6, distinct or connate at the base, $\mathbf{1}$-celled, each cell with I or 2 collateral ovules. Stigmas sessile, papillose or slightly fimbriate. Carpels divergent, inflated, coriaceous, I-2-seeded, follicle-like, laterally dehiscent. Seeds straight or slightly curved, without endosperm. [Name in honor of Johann Jacob Scheuchzer, 1672-1733, Swiss scientist.] A monotypic genus of the north temperate zone.

1. Scheuchzeria palústris L. (I. F. f. 187.) Leaves $10-40 \mathrm{~cm}$. long, the upper ones reduced to bracts; stems solitary or several, usually clothed at the base with the remains of old leaves, $10-40 \mathrm{~cm}$. tall ; sheaths of the basal leaves often 10 cm . long with a ligule 12 mm . long; pedicels spreading in fruit; flowers white, few, in a lax raceme ; perianth-segments membranous, I-nerved, 3 mm . long, the inner ones the narrower ; follicles $4-8 \mathrm{~mm}$. long, slightly if at all united at the base ; seeds oval, brown, with a very hard coat. In bogs, Lab. to Hudson Bay and Br . Col., south to N. J., Penn., Wis. and Cal. Also in Europe and Asia. Summer.

## Family 3. ALISMÀCEAE DC.*

## Water-Plantain Family.

Aquatic or marsh herbs, mostly glabrous, with fibrous roots, scapose stems and basal long-petioled sheathing leaves. Inflorescence racemose or paniculate. Flowers regular, perfect, monœcious or diœecious, pedicelled, the pedicels verticillate and subtended by bracts. Receptacle flat or convex. Sepals 3, persistent. Petals 3, larger, deciduous, imbricated in the bud. Stamens 6 or more ; anthers 2 -celled, extrorse or dehiscing by lateral slits. Ovaries numerous or rarely few, I-celled, usually with a single ovule in each cell. Carpels becoming achenes in fruit in our species. Seeds uncinate-curved. Embryo horseshoe-shaped. Endosperm none. Latex-tubes are found in all the species, according to Micheli. About 13 genera and 70 species, of wide distribution in fresh water swamps and streams.

[^5]
## x. ALİSMA L.

Perennial or rarely annual herbs with erect or floating leaves, the blades severalribbed, the ribs connected by transverse veinlets, or seemingly pinnately veined. Scapes short or elongated. Inflorescence paniculate or umbellate-paniculate. Flowers small, numerous on unequal 3-bracteolate pedicels, the petals white or rose-tinted. Stamens 6 or 9 , subperigynous. Ovaries few or many, borne in one or several whorls, ripening into flattened achenes which are $2-3$-ribbed on the curved back and I-2-ribbed on the sides. [Greek, said to be in reference to the occurrence of the typical species in saline situations.] About Io species, widely distributed in temperate and tropical regions. The following are known to occur in eastern N. Am.

Stamens 6, strongly compressed ; flowers panicled.

1. A. Plantago-aquatica. Stamens 9, turgid ; flowers umbelled.
2. A. tenellum.
3. Alisma Plantàgo-aquática L. Water Plantain. (I. F. f. 188.) Leaves ovate, acute at the apex, cordate, rounded or narrowed at the base, the blades 3 -Io-ribbed; petioles $2-25 \mathrm{~cm}$. long; scapes occasionally 2 from the same root, usually solitary, $0.2-1.3 \mathrm{~m}$. high; inflorescence a large loose panicle; pedicels verticillate in 3's-Io's, subtended by 3 striate acuminate bracts; petals $1-2 \mathrm{~mm}$. long; styles deciduous, the base remaining as a small point or short beak on the inner curve of the achene; stigma small, terminal; achenes obliquely obovate, nearly 2 mm . long, arranged in a circle, forming an obtusely triangular truncate head. In shallow water or mud throughout N. Am. Also in Europe and Asia. June-Sept.
4. Alisma tenéllum Mart. Dwarf Water Plantain. (I. F. f. i89.) Plant delicate, stoloniferous, $2-12 \mathrm{~cm}$. high. Leaves lanceolate or linear-lanceolate, the blades acute at both ends, $6-30 \mathrm{~mm}$. long, 2-6 mm . wide; petioles longer or shorter than the blades, narrowly dilated at the base; scape solitary, often surpassing the leaves, commonly reclined; umbel $2-8$-flowered; pedicels very unequal, often recurved in fruit ; bracts lanceolate, more or less connate at the base; flowers white; stamens 9 ; style much shorter than the ovary; ovaries numerous; achenes in several whorls, coriaceous, turgid, obovate, not I mm. long, enclosed by the erect persistent sepals, the beak short, sharp. In mud, Mass. to W. Ont. and Minn., south to Fla., Mo., and Tex. April-Aug.

## 2. ECHINÓDORUS Rich.

Perennial or annual herbs with long-petioled elliptic, ovate or lanceolate, often cordate or sagittate leaves, 3-9-ribbed and mostly punctuate with dots or lines. Scapes often longer than the leaves; inflorescence racemose or paniculate, the flowers verticillate, each verticil with 3 outer bracts and numerous inner bracteoles: flowers perfect: sepals 3 , distinct, persistent; petals white, deciduous: receptacle large, convex or globose; stamens 12-30; ovaries numerous; style obliquely apical, persistent; stigma simple; fruit achenes, more or less compressed, coriaceous, ribbed and beaked, forming spinose heads. [Greek, in allusion to the spinose heads of fruit.] About I4 species, mostly natives of America. Only the following are known in N. Am. :

Scapes reclining or prostrate; style shorter than the ovary ; beak of achene short.

1. E. radicans.

Scapes erect; style longer than the ovary; beak of achene long.
2. E. cordifolius.
I. Echinodorus radicans (Nutt.) Engelm. Creeping Bur-head. (I. F. f. 190.) Leaves coarse, ovate, obtuse, cordate, $5-20 \mathrm{~cm}$. long, $3-18 \mathrm{~cm}$. wide, marked with short pellucid lines, the nerves $5-9$, connected by netted cross-veins. Petioles sometimes 0.5 m . long; scapes creeping, o.6-1.4 m. long, slightly scabrous, often rooting at the nodes; verticils distant; pedicels 3-12, unequal, slender or filiform; sepals persistent, much shorter than the heads; petals larger, obovate, about 6 mm . long; stamens about 20; style shorter than the ovary; achenes numerous, about 4 mm . long, 6-1o-ribbed, with 2-several oval glands on each side and beaks about one-
fourth their length; fruiting heads 8 mm . in diameter. In swamps, Ill. to N. C. and Fla., west to Mo. and Tex. June-July.
?. Echinodorus cordifòlius (L.) Griseb. Upright Bur-head. (I. F. f. i9I.) Leaves variable in form, often broadly ovate, obtuse, cordate at the base, $15-20$ cm . long and wide, but in smaller plants sometimes nearly lanceolate, acute at each end and but $2-5 \mathrm{~cm}$. long; petioles angular, striate; scapes I or more, erect, 12-40 cm . tall; flowers 3-6 in the verticils; pedicels erect after flowering; sepals shorter than the heads; petals $4-6 \mathrm{~mm}$. long; stamens often 12 ; styles longer than the ovary; fruiting heads very bur-like, $4-6 \mathrm{~mm}$. in diameter ; achenes about 3 mm . long, narrowly obovate or falcate, 6-8-ribbed; beak apical, oblique, about one-half the length of the achene. In swamps and ditches, Ill. to Fla., Mo. and Tex. Also in tropical America. June-July.

## 3. LOPHOTOCÀRPUS T. Durand.

Annual, bog or aquatic herbs with basal leaves, and simple erect or rarely branching scapes bearing flowers in verticils of 2-3 ai the top. Sepals 3, distinct, persistent, erect after flowering and enclosing or enwrapping the fruit. Petals white, deciduous. Receptacle strongly convex. Bracts membranous, those of the lower verticils orbicular or ovate and obtuse, connate at the base, those of the staminate flowers lanceolate and acute, free, or connate. Stamens $9-15$, hypogynous, inserted at the base of the receptacle. Filaments flattened. Pistils numerous: ovule solitary, erect, anatropous; style elongated, oblique, persistent. Achenes winged or crested. Embryo horseshoe-shaped. [Greek, signifying crested fruit.] About 9 species, the following of E. N. Am., 2 in W. N. Am., the others of tropical America.

Leaves with sagittate or hastate blades, seldom bladeless. Plants growing in fresh-water ponds and marshes.
Basal lobes of the leaves widely divergent; large plants, 2-4 dm. high : petioles spongy, thick.

1. L. calycinus.

Basal lobes not widely divergent ; low plants, I-1. 5 dm . high ; petioles slender.
2. L. depauperatus.

Leaves mostly bladeless phyllodes. Submersed seashore and tidal-flat aquatics.

Phyllodes thick, spongy, nodose, $1-3$ dm. long.
Phyllodes flat, spatulate, not nodose, $3-7 \mathrm{~cm}$, high.
3. L. spongiosus.
4. L. spathulatus.

1. Lophotocarpus calycinus (Engelm.) J. G. Smith. Leaves floating or ascending, entire, hastate, sagittate, or triangular crescent-shaped, the basal lobes spreading, ovate, acute or acuminate, the apex acute or obtuse, the blade varying from $10-20 \mathrm{~cm}$. long, sometimes 30 cm . wide at the base. Scape simple, weak and at length decumbent, shorter than the leaves; verticils of flowers 2-5; fertile pedicels very thick, recurved in fruit, equalling or longer than the slender sterile ones ; petals $6-10 \mathrm{~mm}$. long ; filaments papillose, about as long as the anthers : achene cuneate, 2 mm . long, narrowly winged on the margins, tipped with a short horizontal triangular, beak. In swamps, N. B. to Va. and La., Okla. and s. Dak. July-Sept.
2. Lophotocarpus depauperàtus (Engelm.) J. G. Smith. Sagittaria carycina depauperata Engelm. in herb. Low, Io-I5 cm. high; petioles slender, ascending; blades elliptic, hastate or sagittate, acute, 3 -nerved, $1.8-3.3 \mathrm{~cm}$, long, the basal lobes divergent; scape half as long as the leaves: fertile pedicels slender, $8-25 \mathrm{~mm}$. long; fruiting head depressed-globose. $6.5-8 \mathrm{~mm}$. in diameter; achenes broadly cuneate, 1.5 mm . long, 2 mm . wide, the slender horizontal beak one-third the width of the body. Margins of ponds. Wis. to the Ind. Terr. June-Sept.
3. Lophotocarpus spongiòsus (Engelm.) I. (r. Smith. Sarittrian arimina spongiosa Engelm. Submersed aquatic, with thick, spongy nowlose phyllowes and scapes $10-30 \mathrm{~cm}$. high ; blades $5-10 \mathrm{~cm}$. long. spatulate and ohtusce or chliptic and truncate, or hastate or sagittate with narrow, falcately-diversent, acute hoses 2-10 mm. wide, often half as long as the blade: scape simple, terete. spmey, half the length of the potioles, at length decumbent, bearing 2 or 3 verticils of 1 ; flowers each; fertile pedicels $3-6 \mathrm{~mm}$. thick, $10,35 \mathrm{~cm}$. long; fruting head
depressed-globose, 7-10 mm . in diameter ; achenes $2-2.5 \mathrm{~mm}$. long, cuneate, with a narrow dorsal wing and a very short ascending or horizontal beak. Margins of brackish ponds and tide-water marshes, N. B. to Va. July-Aug.
4. Lophotocarpus spathulàtus J. G. Smith. Low aquatic, $3-7 \mathrm{~cm}$. high ; phyllodes bladeless or sometimes spatulate at the tip, ascending, with the edges vertical through a twist in the base, 3-6 mm . wide, obtuse or rounded at the apex. Scape simple, usually shorter than the phyllodes, $3-4 \mathrm{~cm}$. long, one- or two-flowered, thickened, reflexed after flowering ; bracts scarious, broadly ovate, obtuse ; stamens 6-9, the filaments flattened, incurved, broadest at the base, 1.5-2 mm . long, glabrous ; anthers I mm. long, oblong ; sepals oblong-orbicular, 3 mm . long, nerveless, thin, scarious on the margins, and papery in fruit ; petals ovateorbicular, obtuse, shorter than the sepals ; achenes $1-5 \mathrm{~mm}$. long, obovate, obtuse, narrowly winged on the back to about the level of the beak and sometimes with a transverse lateral ridge near the tip; beak slender, oblique or horizontal. Sandy beaches above salt-water but within the influence of tides. Newburyport, Mass. Type collected by A. A. Eaton, 1898.

## 4. SAGITtÀRIA L.

Perennials, mostly with tuber-bearing or nodose rootstocks, basal long-petioled nerved leaves, the nerves connected by numerous veinlets, and erect, decumbent or floating scapes, or the leaves reduced to bladeless phyllodes. Flowers monœcious or diœcious, borne near the summits of the scapes in verticils of 3 's, pedicelled, the staminate usually uppermost. Verticils 3-bracted. Sepals persistent, those of the pistillate flowers reflexed or spreading in our species. Petals 3, white, deciduous. Stamens inserted on the convex receptacle; staminate flowers sometimes with imperfect ovaries. Pistillate flowers with numerous distinct ovaries, sometimes with imperfect stamens ; ovule solitary ; stigmas small, persistent. Achenes numerous, densely aggregated in globose or subglobose heads, compressed. Seed erect, curved. [Latin, referring to the arrow-shaped leaves of some species.] About 30 species, natives of temperate and tropical regions. Besides the following, some Io others occur in the southern and western parts of N. Am.

Fertile pedicels slender, ascending, not reflexed in fruit.
Leaf-blades sagittate; filaments glabrous.
Basal lobes one-fourth to one-half the length of the blade. Beak of the achene more than one-fourth its length.

Beak of the achene erect.
Fruiting pedicels shorter than the bracts; leaves broad.

1. S. longirostra.

Fruiting pedicels longer than the bracts; leaves narrow.
2. S. Engelmanniana.
3. S. latifolia.

Beak of the achene horizontal or oblique. Beak of the achene less than one-fourth its length.

Petioles rather short, curving; bracts long; bog species.
4. S. arifolia.

Petioles elongated; bracts short; aquatic species.
5. S. cuneata.

Basal lobes two-thirds to three-fourths the length of the blade.
6. S. longiloba.

Leaf-blades entire, or rarely hastate or cordate.
Filaments slender, tapering upward; leaves seemingly pinnately veined.
Filaments glabrous; bracts connate.
7. S. ambigua.

Filaments cobwebby-pubescent; bracts mostly distinct.
8. S. lancifolia.

Filaments abruptly dilated, pubescent; veins distinct to the base of the blade.
Fruiting heads sessile or very nearly so.
Both staminate and pistillate flowers pedicelled.
9. S. rigida.

Leaves reduced to terete nodose phyllodes, rarely blade-bearing.
10. S. teres.

Leaves reduced to flat nodeless phyllodes, rarely blade-bearing; petals with a rose-colored spot at base. II. S. Eatoni.
Leaves rigid; blades elliptic-linear. 12. S. cristata.
Leaves not rigid; blades lanceolate or linear-oblong, phyllodes flat, nodose; petals white.
13. S. graminea.

Fertile pedicels stout, reflexed in fruit; filaments dilated.
Filaments pubescent; leaf-blades ovate or ovate-elliptic. 14. S. platyphylla.
Filaments glabrous; leaf-blades linear-lanceolate or reduced to phyllodes.
15. S. subulata.

1. Sagittaria longiróstra (Micheli). J. G. Smith. Long-beaked Arrowhead. (I. F. f. 193.) Monœcious, glabrous, scapes erect, rather stout, o.4-1 m. tall. Leaves broad, sagittate, $10-30 \mathrm{~cm}$. long, abruptly acute at the apex, the basal lobes ovate or ovate-lanceolate, acute, one-third to one-half the length of the blade; scape usually longer than the leaves, 6 -angled below; bracts triangularlanceolate, acuminate, $1.5-3 \mathrm{~cm}$. long, longer than the fertile pedicels; petals $16-28$ mm . long; styles curved, twice as long as the ovaries; achene obovate, about 4 mm . long, winged on both margins, the ventral margin entire or undulate, the dorsal eroded, its sides with a short crest, its beak stout, erect, or somewhat recurved. In swamps and along ponds, N. J. and Penn. to Ala. July-Sept.
2. Sagittaria Engelmanniàna J. G. Smith. Engelmann's Arrow-head. (I. F. f. 194.) Monœcious, glabrous; scape erect or ascending, slender, $20-50 \mathrm{~cm}$. high. Leaves narrow, $4-20 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, acute or obtuse at the apex, the basal lobes narrowly linear, acuminate, one-third to one-half the length of the blade; scape striate, about as long as the leaves; bracts lanceolate, acute, shorter
 about twice as long as the ovaries; achene obovate, 4 mm . long, winged on both margins, and with I-3 lateral wing-like crests on each face, the beak short, stout, erect, about I mm. long. In shallow water, N. H. and Mass. to Del., near the coast. Aug.-Sept.
3. Sagittaria latifolia Willd. Broad-leaved Arrow-head. (I. F. f. 195.) Monœcious or sometimes diœcious, glabrous or nearly so ; scape stout or slender, $0.1-1.2 \mathrm{~m}$. tall, simple or branched. Leaves exceedingly variable in form and size, sometimes linear-lanceolate and acuminate at the apex, sometimes wider than long and obtuse; basal lobes from $\frac{1}{4}$ to $\frac{1}{2}$ as long as the blade; bracts acute, acuminate or obtuse, the upper ones sometimes united; flowers $2.5-4 \mathrm{~cm}$. wide; achene 2-4 mm . long, broadly winged on both margins, its sides even or I-ribbed, the beak about one-third its length, horizontal or nearly so. In shallow water, throughout N. Am., except the extreme north, extending to Mex. Variable. July-Sept.

Sagittaria latifolia pubéscens Muhl. Whole plant pubescent, varying from merely puberulent to densely hirsute. Ont. to N. J., Fla, and Ala.
4. Sagittaria arifòlia Nutt. Arum-leaved Arrow-head. (I. F. f. 196.) Glabrous or nearly so, terrestrial or partially submerged; scape weak, ascending, $0.2-0.5 \mathrm{~m}$. long. Leaves sagittate, broad, acute at the apex, about as long as the scape, their margins slightly curved, their basal lobes acute or acuminate, onefourth to one-third the length of the blade; petioles usually curving outwardly; bracts lanceolate, acute, usually equalling or longer than the fertile pedicels, often reflexed; petals $6-10 \mathrm{~mm}$. long; achene cuneate-obovate, about 2 mm . long, winged on both margins, the sides smooth, the beak short, erect. Quebec to Minn. and Br. Col., south to Me., Mich., Kans., N. Mex., and Cal.
5. Sagittaria cuneàta Sheldon. Floating Arrow-head. (I. F. f. 197.) Aquatic, submerged, rooting in sand; scape very slender, simple, terete, o.3-0.6 m . long, bearing the flowers at the surface of the water. Leaves long-petioled, the blade floating, sagittate, linear-lanceolate, acuminate, $5-10 \mathrm{~cm}$. long, the basal lobes acuminate, about one-fourth its length; phyllodes of two kinds, one petiolelike and as long as the leaves, the other lanceolate, and clustered at the base of the plant; bracts ovate-lanceolate, acute, $4-6 \mathrm{~mm}$. long, much shorter than the slender fertile pedicels; flowers $\mathbf{1} .2-1.6 \mathrm{~cm}$. broad; achene only 1 mm . long, whovate-cuncate, its beak very short, erect. In shallow water, Minn. to Wash. and Br. Col. Aug.-Sept.
6. Sagittaria longíloba Engelm. Long-hobed Arrow-mein. (I. F. f. ios.) Monœecious; glabrous; scape slender, simple or rarely branched. 0.3-0.0 m. tall. Leaves long-petioled, the apex acute, the basal lobes linear-lancolate, acuminate. about three-fourths the length of the blade; bracts lancoolate, acuminate, 0.8 mm . long, much shorter than the very slender fertile pedicels which are longer than the
sterile ones; stamens numerous, the filaments longer than the anthers; achene about 2 mm . long, quadrate-obovate, somewhat broader above than below, winged on both margins, its beak exceedingly short. In shallow water, Neb. to Colo., south to Tex. and Mex.
7. Sagittaria ambígua J. G. Smith. Kansas Sagittaria. (I. F. f. I99.) Monœcious; glabrous; scape erect or ascending, o.3-0.6 m. high. Leaves lanceolate, entire, long-petioled, acute or acuminate at both ends, seemingly pinnately veined, really $5-7$-nerved, $12-20 \mathrm{~cm}$. long, equalling or shorter than the scape; bracts lanceolate, acuminate, $1-1.6 \mathrm{~cm}$. long, much shorter than the slender fruiting pedicels, connate at the base, papillose; stamens $20-25$; filaments glabrous, longer than the anthers; achene about 2 mm . long, oblong, curved, narrowly winged on both margins, its sides smooth and even, its beak short, oblique. In ponds, Kan. and the Ind. Terr.
8. Sagittaria lancifòlia L. Lanced-Leaved Sagittaria. (I. F. f. 200.) Monœcious, glabrous; scape rigid, erect, stout or rather slender, striate, branched or simple, longer than the leaves. Leaves lanceolate or oblong-lanceolate, acute or acuminate at both ends, firm, entire, the blades 5-9-nerved, o.2-0.4 m. long, gradually narrowed into the long petioles, apparently pinnately veined; flowers numerous, $\mathrm{I}-2.5 \mathrm{~cm}$. broad; bracts ovate or ovate-lanceolate, usually not united at the base, glabrous or nearly so, equalling or shorter than the fruiting pedicels; stamens numerous; filaments cobwebby-pubescent, equalling or longer than the anthers; achene narrowly obovate-cuneate, $2-3 \mathrm{~mm}$. long, winged on both margins, its sides smooth, its beak tapering, oblique. In swamps and shallow water, Del. to Fla. and Tex., near the coast. Widely distributed in tropical America.
9. Sagittaria rígida Pursh. Sessile-fruited Arrow-head. (I. F. f. 201.) Monœeious, glabrous; scape simple, weak, curving, ascending or decumbent, shorter than the leaves. Leaves very variable, linear, lanceolate, elliptic or broadly ovate, acute or obtuse at the apex, entire or with 1 or 2 short or slender basal lobes; bracts ovate, obtuse, 4-8 mm. long, united at the base or sometimes distinct; heads of fruit sessile or very nearly so; pedicels of the sterile flowers $1-2.5 \mathrm{~cm}$. long; filaments dilated, mostly longer than the anthers, pubescent; achene narrowly obovate, 3-4 mm . long, winged on both margins, crested above, tipped with a stout nearly erect, beak of about one-fourth its length. In swamps and shallow water, Quebec to Minn., N. J., Tenn., Mo. and Neb. July-Sept.
io. Sagittaria tères S. Wats. Slender Sagittaria. (I. F. f. 202.) Monœcious; glabrous; scape slender, erect, simple, I. $5-4.5 \mathrm{dm}$. long, bearing only I-3 verticils of flowers. Leaves usually reduced to elongated terete nodose phyllodes or some of them short and bract-like, one or two of the longer ones occasionally bearing a linear blade; bracts ovate, obtuse, about 3 mm . long, much shorter than the filiform fruiting pedicels, which are longer than the sterile ones; flowers $12-16 \mathrm{~mm}$. broad; stamens about I2, their dilated filaments pubescent, shorter than the anthers; achene broadly obovate, 2 mm . long, the ventral margin winged, the dorsal 7 -II-crested, the sides bearing several crenate crests, the beak short, erect. In ponds, Mass. to S. Car. Aug.-Sept.
II. Sagittaria Éatoni J. G. Smith. Eaton's Sagittaria. Monœecious, $0.1-0.2 \mathrm{~m}$. high, glabrous; scape simple, slender, ascending, weak, bearing $\mathbf{1}, \mathbf{2}$, or rarely 3 verticils of flowers. Leaves mostly bladeless phyllodes, rarely with linear-lanceolate, acute or acuminate blades $1.8-3 \mathrm{~cm}$. long, 2-4 mm . wide; the phyllocies flat, nodeless; lowest verticil with two fertile flowers, and one staminate; fertile pedicels $4^{-8} \mathrm{~mm}$. long, shorter than the sterile ones, very slender; sepals ovate-lanceolate, obtuse, 4 mm . long; petals white, with a rose-colored spot at the base, obovate-cuneiform, emarginate; stamens 12; mature achenes not known; pistils very minute, $80-100$. Ripple-swept, sandy shores, between high and low tide, above the influence of salt water, Newburyport, Mass.

12 Sagittaria cristàta Engelm. Crested Sagittaria. (I. F. f. 203.) Monœcious; scape slender, erect, $0.3-0.8 \mathrm{~m}$. high, simple, bearing 4 or 5 verticils of flowers at or above the surface of the water. Leaves long-petioled, spongy and rigid, reduced to slender phyllodes or bearing linear-lanceolate or elliptic blades 5-10 cm . long, and $6-25 \mathrm{~mm}$. wide; bracts acute, $4-8 \mathrm{~mm}$. long, much shorter than the slender fertile pedicels; flowers $1.6-2^{\circ} \mathrm{cm}$. broad; stamens about 24 ; filaments dilated, pubescent, at least at the middle, longer than the anthers; achene obliquely
obovate, the dorsal margin with a broad crenate wing, the ventral straight-winged, each side bearing 2 crenate crests, the beak short, oblique. In shallow water, Ia. and Minn. Phyllodes are commonly developed from the nodes of the rootstock. July-Aug.
13. Sagittaria gramínea Michx. Grass-leaved Sagittaria. (I. F. f. 204.) Monœcious or diœcious; glabrous; scape simple, erect, o. $1-0.6 \mathrm{~m}$. tall. Leaves long-petioled, the blades linear, lanceolate or elliptic, acute at both ends, $5-\mathbf{I} 5 \mathrm{~cm}$. long, $\mathbf{I}-6 \mathrm{~cm}$. wide, $3-5$-nerved, with nerves distinct to the base, or some of them occasionally reduced to flattened phyllodes; bracts ovate, acute, 3-6 mm. long, much shorter than the slender or filiform fruiting pedicels, connate to the middle or beyond; flowers $8-12 \mathrm{~mm}$. broad; stamens about 18 ; filaments dilated, pubescent, longer than or equalling the anthers; achene obovate, $1-2 \mathrm{~mm}$. long, slightly wing-crested on the margins and ribbed on the sides, the beak very short. In mud or shallow water, Newf. to Ont. and S. Dak., south to Fla. and Tex. Early leaves often purplish. July-Sept.
14. Sagittaria platyphylla (Engelm.) J. G. Smith. Ovate-leaved Sagittaria. (I. F. f. 205.) Monœecious; glabrous; scape erect, simple, rather weak, mostly shorter than the leaves. Leaves rigid, the blades ovate, ovate-lanceolate or ovate-elliptic, short-acuminate or acute at the apex, rounded, gradually narrowed or rarely cordate or hastate at the base, seemingly pinnately-veined, 5-15 cm . long; bracts broadly ovate, acute, connate at the base, $4-8 \mathrm{~mm}$. long; flowers $\mathbf{1} .6-3 \mathrm{~cm}$. broad; fertile pedicels stout, divergent in flower, reflexed in fruit, $\mathbf{I}-6$ cm . long; filaments dilated, pubescent, rather longer than the anthers; achene obliquely obovate, winged on both margins, the dorsal margins somewhat crested, the sides with a sharp wing-like ridge. In swamps and shallow water, S. Mo. to Miss. and Tex. Phyllodes, when present, oblong or oblanceolate. July-Sept.
15. Sagittaria subulàta (L.) Buchenau. Subulate Sagittaria. (I. F. f. 206.) Monœcious or rarely diœcious; scape very slender, $5-15 \mathrm{~cm}$. high, fewflowered, about equalling the leaves. Leaves all reduced to rigid phyllodes or sometimes bearing linear or linear-lanceolate blades $2-4 \mathrm{~cm}$. long; bracts united to the apex or becoming partly separated; flowers $\mathbf{I}-1.6 \mathrm{~cm}$. broad; fertile pedicels reflexed and much longer than the bracts in fruit; stamens about 8; filaments about equalling the anthers, dilated, glabrous; achenes rather less than 2 mm . long, obovate, narrowly winged, with two or three crests on each side, the wings and crests sometimes crenate; beak short. In tide-water mud, S. N. Y. and Penn. to Fla. and Ala. July-Sept.

Sagittaria subulata gracillima (S. Wats.) J. G. Smith. Submerged; leaves o.6-1. 3 dm. long, bladeless or bearing small 3 -nerved lanceolate blades $2-5 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. wide; scape simple, terete or compressed, about as long as the leaves; flowers few, $1.6-2 \mathrm{~cm}$. broad. E. Mass. and R. I. Perhaps a distinct species. Fruit not seen.

> Family 6. VALLISNERIÀCEAE Dumort.
> Tape-Grass Family.

Submerged or floating aquatic herbs, the leaves various. Flowers regular, mostly diœecious, appearing from an involucre or spathe of $1-3$ bracts or leaves. Perianth $3-6$-parted, the segments either all petaloid or the 3 outer ones small and herbaceous, the tube adherent to the orary at its base in the pistillate flowers. Stamens 3-12, distinct or monadelphous. Anthers 2-celled. Ovary i-celled with 3 parietal placenta or 6-9-celled. Styles 3-9, with entire or 2-cleft stigmas. ()rules anatropous or orthotropous. Fruit ripening under water, indehiscont. Seeds numerous, without endosperm. About $1+$ genera and to species of wide distribution in warm and temperate regions. Besides the following. another genus, Halophila, occurs on the coast of Fla.

[^6]
## 1. PHILOTRIA Raf.

Stems submerged. elongated. branching. leafy. Leaves opposite or whorled. crowder. I-nerved. pellucid. minutely serrulate or entire. Flowers dicecious or polygamous. arising from an ovoid or tubular 2 -cleft spathe. Perianth 6-parted. at least the 3 inner segments petaluid. Staminate flowers with 9 stamens, the anthers oblong, erect. Ovary i-celled with 3 parietal placentr. Stigmas 3. nearly sessile, 2-lobed. Fruit oblong, coriaceous, few-seeded. [Name from the Greek. referring to the leaves, which are often whorled in threes.] About io species, inhabitants of fresh-water ponds and streams in temperate and tropical America.
I. Philotria Canadénsis (Michx.) Britton. Whter-weed. Ditch-moss. Water Thyme. Stems o.i-I m. long. Leaves linear or elliptic, acute or ubtuse, serrulate or entire. verticillate in 3 's or 4 's or the lower opposite. $4-15 \mathrm{~mm}$. long. I-t mm. wide; flowers axillary, white, the staminate minute, sessile, breaking off at the time of flowering and rising to the surface where they shed their pollen around the pistillate ones; pistillate flowers expanding on the surface. which they reach by means of the slender calyx-tube. which varies in length from 5-25 cm ., their spathes $10-15 \mathrm{~mm}$. long; stigmas spreading. papillose or pubescent. Nearly throughout N. Am.. except the extreme north. Naturalized in Europe. It has been maintained that there are four N. Am. species. May-Aug.

The plant of the northern lakes and rivers, with ovate or oral leares, is apparently the type of the species. The plant of the Atlantic States with lanceolate or linear-lanceolate leaves is the Serpicula zerticillata angustifoüa Muhl. (I. F. f. 207); that of the Central States from Minn, to Ky. and Mo.. with leaves similar to this, but pellucid. and the stems shorter, is Cdora Canadensis minor Engelm. These three appear to be distinct, but for lack of flowers and fruit in the material at my command, I am at present unable to characterize them further.

## 2. VALLISNĖRIA L.

Aquatic diœcious submerged perennials, with long grass-like floating leaves. Staminate flowers with a $2-3$-parted spathe on a short scape. numerous, nearly sessile on a conic receptacle; perianth 3 -parted; stamens generally 2 (I-3). Pistillate flowers on a very long flexuous or spiral scape, with a tubular, 2-cleft. I-flowered spathe; perianth-tube adnate to the ovary. 3 -lobed and with 3 small petals; ovary I-celled with 3 parietal placentæ; stigmas 3. nearly sessile. short, broad, 2-toothed with a minute process just below each sinus; orules numerous. borne all over the ovary-wall. orthotropous. Fruit elongated, cylindric. crowned with the perianth. [-Vamed for Antonio Vallisneri, 1661-1730, Italian naturalist.] A monotypic genus of wide distribution both in the Old World and the New.
I. Vallisneria spiràlis L. TApe-Grass. Eel-grass. (I. F. f. 208.) Plant rooting in the mud or sand. stoloniferous. Leates thin. narrowly linear. 5 -nerved, obtuse, sometimes serrate near the apex. $0.2-2 \mathrm{~m}$. long, $4-18 \mathrm{~mm}$. wide, the 2 marginal nerves faint; the staminate bud separates from the scape at the time of flowering and expands upon the surface of the water; pistillate flowers upon a long thread-like scape, the spathe $12-25 \mathrm{~mm}$. long. enclosing a single white flower; ovary as long as the spathe; after receiving the pollen from the staminate flowers the scape of the pistillate contracts spirally; ripe fruit $5-17 \mathrm{~cm}$. long. In quiet waters, N. B. to Fla., Minn.. Iowa and Tex. The "wild celery" of Chesapeake Bay, and a favorite food of the canvas-back duck. Aug.-Sept.

## 3. LIMNÒBIUM L. C. Richard.

Aquatic. stoloniferous herbs, the leares fascicled at the nodes, petioled, broad, often cordate. Flowers monœecious, white, from sessile or stipitate, 2-leaved, membranous spathes. Perianth 6 -parted, the segments petaloid, the 3 outer oblong-oval, the 3 inner oblong-linear. Staminate flowers $2-4$ in a spathe. longpeduncled, the stamens united in a column bearing 6-12 anthers at different heights, sometimes producing only 9-12 staminodia, the filaments tipped with abortive anthers. Pistillate flowers sessile or short-peduncled with 3-6 vestigial stamens; ovary 6-9-celled with as many central placentæ; stigmas as many as the
cells, each 2-parted. Fruit a many-seeded berry. [Greek, referring to the aquatic habitat.] Three or four species, natives of America.

1. Limnobium Spóngia (Bosc.) L. C. Richard. Frog's-bit. (I. F. f. 209.) Blades of the leaves orbicular or broadly ovate, cordate or reniform, faintly 5-7nerved and cross-veined, purplish and spongy beneath, $2-5 \mathrm{~cm}$. broad, on petioles $2-25 \mathrm{~cm}$. in length. Stolons rooting and sending up flowers and leaves at the nodes; peduncles of the staminate flowers, $7-10 \mathrm{~cm}$. long, those of the pistillate flowers stouter, $2.5-5 \mathrm{~cm}$. long, nodding in fruit. In shallow, stagnant water, Lake Ont. to Fla., Ill., Mo. and La. July-Aug.

## Order 3. GRAMINÀLES.

Grasses and sedges. Monocotyledonous plants, mostly herbaceous, with leafy or leafless, usually simple, stems (culms), the leaves usually narrow and elongated, entire or minutely serrulate. Flowers mostly perfect, small, incomplete, in the axils of dry, chaffy scales (glumes) arranged in spikes or spikelets.

Fruit a caryopsis (grain); culm mostly hollow. Fruit an achene; culm solid.

Fam. 1. Gramineae.
Fam. 2. Cyperaceae.

## Family I. GRAMÍNEAE Juss.*

Grass Family.
Annual or perennial herbs, of various habit, rarely shrubs or trees Culms (stems) generally hollow, but occasionally solid, the nodes closed Leaves sheathing, the sheaths usually split to the base on the side opposite the blade; a scarious or cartilaginous ring, naked or hairy, rarely wanting, called the ligule, is borne at the orifice of the sheath. Inflorescence spicate, racemose or paniculate, consisting of spikelets composed of two to many z-ranked imbricated bracts, called scales (glumes), the two lowest in the complete spikelet always empty, one or both of these sometimes wanting. One or more of the upper scales, except sometimes the terminal ones, contains in the axil a flower, which is usually enclosed by a bract-like awnless organ called the palet, placed opposite the scale and with its back toward the axis (rachilla) of the spikelet, generally $2-$ keeled; sometimes the palet is present without the flower, and vice versa. Flowers perfect or staminate, sometimes monœcious or diœcious, subtended by $1-3$ minute hyaline scales called the lodicules. Stamens i-6, usually 3. Anthers 2 -celled, versatile. Ovary i-celled, i-ovuled. Styles I-3, commonly 2 and lateral. Stigmas hairy or plumose. Fruit a seed-like grain (caryopsis). Endosperm starchy. About 3500 species widely distributed throughout the world, growing in water and on all kinds of soil. Those yielding food-grains are called cereals. The species are more numerous in tropical countries, while the number of individuals is much greater in temperate regions, often forming extended areas of turf. The time of year noted is that of ripening seed.

## KEY TO THE TRIBES AND GENERA.

[^7][^8]Flowering scale and palet membranous; second scale spiny (in ours).
III. Zoysieae.

Flowering scale and palet of the perfect flower coriaceous or chartaceous ; spikelets involucrate in Nos. 18 and 19; scales 3 or 4 .
IV. Paniceae. Spikelets flattened laterally, 1 -flowered; scales 2.
V. Oryzeae.
$B$. Spikelets I-many-flowered; rachilla generally articulated above the two lower scales (below them in Nos. 38, 46, 54 and 61) and frequently extending beyond the flower in r-flowered spikelets.

Culms herbaceous.
Spikelets upon pedicels in panicles, spike-like panicles or racemes, not in rows.
Spikelets with but I perfect flower, which is terminal except in Nos. 42 and 43 .
Fifth scale enclosing a perfect flower ; palet i-nerved.
VI. Phalarideae.

Third scale enclosing a perfect flower ; palet 2-nerved.
VII. Agrostideae.

Spikelets with 2 or more perfect flowers (or one staminate in Nos. 46 and 51).
Flowering scales generally shorter than the empty lower ones, usually with a bent awn on the back. VIII. Aveneae.
Flowering scales generally longer than the empty lower ones, unawned or with a straight awn from the apex.
X. Festuceae.

Spikelets in two rows, forming a one-sided spike or raceme.
IX. Chlorideae.

Spikelets in two opposite rows, forming an equilateral spike (unilateral in Nardus).
XI. Hordeae.

Culms woody, at least at the base ; tall reeds.
XII. Bambuseae.

## Tribe I. Maydeae.

Fertile spikelets imbedded in the joints of the thick rachis.

1. Tripsacum.

## Tribe II. Andropogoneae.

Joints of the rachis not much thickened nor excavated for the reception of the spikelets. Spikelets alike, perfect.
Spikelets not alike, the sessile perfect, the pedicelled staminate, empty or wanting.
Inflorescence composed of spike-like silky racemes.
Racemes usually in pairs, rarely in $3^{\prime}$ 's -5 's and digitate, the rachis internodes and pedicels opaque ; fourth scale of the spikelet with a blade.
4. Andropogon.

Racemes panicled, the rachis internodes and pedicels thickened on the margins and with the intervening portion thin and translucent; fourth scale of the spikelet pedicel-like, without a blade.
5. Amphilophis.

Inflorescence paniculate.
Pedicelled spikelet wanting (in our species).
6. Sorghastrum.

Pedicelled spikelet present and usually staminate.
7. Sorghum.

Joints of the rachis greatly thickened and excavated for the reception of the spikelets.
3. Manisuris.

## Tribe III. Zoysieae.

Spikelets in a terminal spike; second scale spiny.
8. Nazia.

## Tribe IV. Paniceae.

Spikelets without a subtending involucre of bristles or valves.
Spikelets all alike.
Second scale of the spikelet not enlarged nor saccate at the base.
Spikelets arranged in one-sided racemes.
Spikelets with a swollen ring-like callus at the base.
12. Eriochloa.

Spikelets without a callus.
Racemes alternate or scattered, rarely in a terminal pair, or sometimes single and slender, in the latter case the spikelets broadly oval and obtuse.
Spikelet of 3 scales.

Opening in the flowering scale turned away from the rachis of the raceme ; spikelets usually oval or orbicular and obtuse, rarely narrower and acute.
9. Paspalum.

Opening in the flowering scale turned toward the rachis of the raceme ; spikelets lanceolate to ovate, acute. 10. Anastrophus.

Spikelets of 4 scales.
Spikelets awnless, the scales glabrous.
14. Brachiaria.

Spikelets with the second and third scales hispid on the nerves and usually long-awned, or in one species the third scale only awn-pointed. 15. Echinochloa.
Racemes long and slender, digitate or whorled, sometimes single or in pairs; spikelets lanceolate and acute. 13. Syntherisma.
Spikelets arranged in a true panicle, either open or contracted.
16. Panicum.

Second scale of the spikelet much enlarged, many-nerved, deeply saccate at the base.
17. Sacciolepis.

Spikelets of two kinds, one borne on terminal panicles, the other solitary on subterranean peduncles and maturing seed.
11. Amphicarpon.

Spikelets subtended by an involucre consisting of :
I-many persistent bristles ; spikelets in dense spikes or spike-like panicles, deciduous.
18. Chaetochloa.

2 spine-bearing valves forming a bur enclosing the spikelets and deciduous with them.
19. Cenchrus.

## Tribe V. Oryzeae.

Spikelets monœcious; tall aquatic grasses.
Pistillate spikelets ovate, borne at the apex of each branch of the panicle.
20. Zizaniopsis.

Pistillate spikelets linear, borne on the upper branches of the panicle,
21. Zizania.

Spikelets not monœecious; grasses of swamps or wet grounds.
22. Homalocenchrus.

## Tribe VI. Phalarideae.

Third and fourth scales
small and empty or rudimentary, not awned ; stamens 3. 23. Phalaris.
empty, awned upon the back; stamens 2.
24. Anthoxanthum.
subtending staminate flowers with 3 stamens; fertile flowers with 2 stamens.
25. Savastana.

## Tribe ViI. Agrostideae.

Flowering scale indurated at maturity, of firmer texture than the empty scales, and closely enveloping the grain.
Rachilla not prolonged beyond the palet.
Flowering scale with a three-branched awn ; stamens mostly 3.
26. Aristida.

Flowering scale with a simple awn.
Flowering scale narrow ; awn persistent.
Awn tortuous or twisted, stout ; callus evident. 27. Stipa.
Awn straight, very slender; callus minute.
31. Aluhlenter gria.

Flowering scale broad; awn slender, straight, deciduous: callus whtuse.
Flowering scale glabrous, or pubescent with short hairs,
28. Oryzopsis.

Flowering scale pubescent with copious long silky hairs extending much beyond the scale.
Flowering scale awnless.
29. Eriocoma. 30. Milium.

Rachilla with a pedicel-like extension beyond the palet ; stamens 2 .
32. Brachyclytrum.

Flowering scale hyaline or membranous at maturity ; empty scales coarser ; srain hense.
Spikelets in a dense spike-like panicle. (Eome species of No. 37 may be looked for bere.)

Spikelets 6 mm . or less long.
Spikelets readily deciduous at maturity.
Empty scales not awned.
35. Alopecurus.

Empty scales awned.
38. Polypogon.

Spikelets not deciduous; empty scales persistent.
Flowering scales slightly exceeding the empty ones.
33. Heleochloa.

Flowering scales much shorter than the empty ones.
34. Phleum.
43. Ammophila.

Spikelets $10-12 \mathrm{~mm}$. long; tall seashore grasses.
Spikelets variously panicled; panicle not spike-like, except in a few species of No. 37 .
Seed loosely enclosed in the pericarp, which opens readily at maturity.
Empty scales minute; low arctic grass. 36. Phippsia.
Empty scales not minute; no callus, awns or hairs. 37. Sporobolus.
Seed adherent to the pericarp.
Palet I-nerved; stamen I ; flower plainly stalked : scales not hairy.
40. Tina.

Pales 2-nerved; stamens 3 ; flower not plainly stalked.
Flowering scale bifid, with a delicate awn on its back; rachilla prolonged into a short bristle.
45. Apera.

Flowering scale entire; rachilla not prolonged into a bristle.
Callus with a tuft of long hairs at the base (except in some species of genus 42.)
Rachilla extended beyond the pales.
Rachilla not extended beyond the palet
42. Calamagrostis.
us naked or with very short hairs.
Empty scales somewhat shorter than the flowering ones; arctic grass.
Empty scales longer than the flowering ones; panicle open ; spikelets small. 41. Agrostis.

## Tribe VIII. Aveneae.

Spikelets deciduous; lower flower perfect, upper staminate, awned ; plant velvety.
46. Holcus.

Spikelets not deciduous ; empty scales persistent, flowering ones deciduous.
Spikelets of 2 perfect flowers; rachilla not prolonged beyond the upper one.
47. Ara.

Spikelets 2-many-flowered ; rachilla prolonged beyond the upper flower.
Awn of flowering scale upon the back, inserted below the teeth.
Flowers all perfect, or the upper ones staminate or wanting.
Spikelets less than 12 mm . long; grain free, unfurrowed.

- Flowering scale finely erose-dentate or 2 -lobed.

48. Deschampsia.

Flowering scale cleft or 2 -toothed, with the teeth sometimes produce into awns.
49. Trisetum.

Spikelets over 12 mm . long; grain furrowed, usually adherent to the scales.
50. Avena.

Upper flower perfect, lower staminate, its scale strongly awned.
51. Arrhenatherum.

Awn from between the lobes or teeth of the flowering scale, generally twisted.
52. Danthonia.

## Tribe IX. Chlorideae.

Flowers perfect or some of them rudimentary.
${ }_{1}$ perfect flower in each spikelet; sometimes 2 in Nos. 59 and 61.
No empty scales above the flower.
Spikelets deciduous.
Rachis produced beyond the upper spikelet; spikelets narrow.
54. Spartina.

Rachis not so produced ; spikelets globose, sometimes 2-flowered.
61. Beckmannia.

Spikelets not deciduous; empty scales persistent; low slender grasses.
Spikes 2-6, slender, digitate, $2.5-5 \mathrm{~cm}$. long.
53. Capriola.

Spikes many along a common axis, $5-10 \mathrm{~cm}$. long.
58. Schedonnardus.

One-several empty scales above the flower.
Lower empty scales 4 ; spike solitary, dense. 55. Campulosus.
Lower empty scales 2 .
Spikes in false whorls or closely approximate; scales long-awned. 56. Chloris.

Spikes remote, or the lowest only approximate.
Spikelets scattered or remote on filiform spikes.
Spikelets crowded, sometimes 2-flowered.
Spikes 4 or less; spikelets numerous, 25 or more. 59. Bouteloua.

Spikes numerous, 12 or more; spikelets few, 12 or less.
60. Atheropogon.

2-3 perfect flowers in each spikelet.
Spikelets densely crowded ; spikes usually digitate.
Spikes with terminal spikelets.
62. Eleusine.

Spikes without terminal spikelets, the rachis extending beyond them into a point.
63. Dactyloctenium.

Spikelets distinctly alternating ; spikes remote.
64. Leptochloa. Spikelets diœcious, very unlike; spikes short; low prairie grass. 65. Bulbilis.

## Tribe X. Festuceae.

Rachilla with long hairs enveloping the flowering scale ; tall aquatic grass.
67. Phragmites.

Rachilla and flowering scales naked or hairy, hairs much shorter than the scales.
Stigmas barbellate ; spikelets in clusters of $3^{-6}$ in the axils of stiff spinescent leaves.
66. Munroa.

Stigmas plumose ; spikelets not in the axils of leaves; inflorescence various.
Spikelets of two forms, the fertile 1-3-flowered, surrounded by the sterile, consisting of many empty pectinate scales.
86. Cynosurus.

Spikelets all alike.
Flowering scale $\mathbf{x}-3$-nerved, or rarely with faint additional intermediate nerves.
Flowering scales membranous; seed not beaked nor exserted from the scales.
Lateral nerves of flowering scale pilose.
Internodes of the rachilla long, the deeply 2 -lobed flowering scale attached by a long-pointed callus, which is copiously pilose on the outer surface. 70. Triplasis.
Internodes of the rachilla and the callus of the flowering scale short, blunt.
Panicle simple or compound, contracted or open, the spikelets on pedicels of varying length.
69. Tricuspis.

Panicle composed of long branches along which the appressed spikelets are arranged on short pedicels.
72. Diplachne.

Lateral nerves of the flowering scale glabrous.
Callus of the flowering scale conspicuously pubescent with long hairs.
Panicle contracted; flowering scale broadly oval, rounded at the apex. 74. Rhombolytrum.
Panicle open and diffuse; flowering scales lanceolate and acute.
71. Redfieldia.

Callus of the flowering scale glabrous.
Second empty scale similar to the first.
Panicle narrow, the branches appressed.
Panicle dull, interrupted; rachilla articulated.
73. Molinia.

Panicle shining, dense and spike-like ; rachilla continuous. 77. Koeleria.
Panicle open, the branches more or less spreading.
Rachilla continuous; flowering scales deciduous in fruit, the palet persistent.
75. Eragrestis.

Rachilla articulated; flowering scales and palets both deciduous with the rachilla internodes.
78. Catabrosa.

Second empty scale very dissimilar to the first, broad and rounded at the summit. 76. Eatonia.
Flowering scales coriaceous in fruit; seed beaked and exserted from the scales.
80. Korycarpus.

Flowering scales 5-many-nerved.
Flowering scales 3 -toothed at the apex.
68. Sieglingia.

Flowering scales not 3 -toothed at the apex.
Spikelets with 2 or more of the upper scales empty, broad and enfolding each other. 79. Melica.
Spikelets with the upper scales flower-bearing, or narrow and abortive.
Keel of the palet winged or with a linear appendage.
81. Pleuropogon.

Keel of the palet not appendaged.
Stigmas placed at or near the apex of the ovary; flowering scales awned only in Nos. 85 and 93.
Scales more or less strongly compressed and keeled.
Empty basal scales 3-6; spikelets flat, 2 -edged.
82. Uniola.

Empty basal scales 2; spikelets flattened.
Panicle contracted; spikelets diœecious.
83. Distichlis.

Panicle open; spikelets perfect.
Flowering scales herbaceous, awnpointed; spikelets collected in onesided clusters.
85. Dactylis.

Flowering scales scarious-margined; rachis glabrous or with webby hairs.
Spikelets large, cordate.
84. Briza.

Spikelets mostly smaller, not cordate.
Empty scales projecting beyond the uppermost flowering ones; arctic grass.
88. Dupontia.

Uppermost scales exceeding the empty ones; flowering scales 2 -10, mostly webby at base.
87. Poa.

Flowering scales membranous; rachis hirsute with stiff hairs, extended into a hairy appendage.
90. Graphephorum.

Scales rounded on the back, at least below.
Flowering scales with a basal ring of hairs, toothed at apex ; water grass.
89. Scolochloa.

Flowering scales naked at the base:
Obtuse or subacute and scarious at the apex, usually toothed.
Plainly 5-7-nerved ; styles present.
91. Panicularia.

Obscurely 5 -nerved; no style.
92. Puccinellia.

Acute, pointed or awned at apex.
93. Festuca.

Stigmas plainly arising below the apex of the ovary; scales mostly awned.
94. Bromus.

## Tribe XI. Hordeae.

Stigma I; spike unilateral; spikelets I-flowered, narrow.
95. Nardus. Stigmas 2; spike symmetrical.

Spikelets solitary at the notches of the rachis.
Flowering scales with their backs turned to the rachis.
96. Lolium.

Flowering scales with their sides turned to the rachis.
Spikelets I-2-flowered in slender articulate spikes. 97. Lepturus.

Spikelets 2-many-flowered in stout inarticulate spikes (articulated in one species).
98. Agropyron.

Spikelets 2-6 at each joint of the rachis; scales mostly long-awned.
Spikelets r-flowered or with the rudiment of a second flower.
99. Hordeum.

- Spikelets 2-many-flowered.

Rachis of the spike articulated, readily breaking up into joints.
1oo. Sitanion.
Rachis of the spike continuous, not breaking up into joints.
Empty scales a little smaller than the flowering ones.
1о1. Elymus.
Empty scales very small or none.
102. Hystrix.

## Tribe XII. Bambuseae.

Tall canes with large flat spikelets in panicles or racemes.
103. Arundinaria.

## 1. TRIPSACUM L.

Tall perennial grasses with thick rootstocks, rather broad, flat leaves and monœcious flowers. Spikelets I-2-flowered, in terminal or axillary, solitary or clustered, elongated spikes. Staminate spikelets in 2's at each node of the upper part of the axis. 2 -flowered, consisting of four scales, the two outer coriaceous, the two inner thinner, the palet hyaline; stamens 3. Pistillate spikelets in excavations at the lower joints of the spike, I-flowered; stigmas exserted; style slender. Grain partly enclosed in the excavations of the spikes, covered in front by the horny exterior lower scale. [Name from the Greek, in allusion to the polished outer scales.] About 3 species, natives of tropical and temperate America. Besides the following, another occurs in the southern United States.

1. Tripsacum dactyloìdes L. Gama-grass. (I. F. f. 210.) Rootstock $\mathbf{1 . 2 5 - 2 . 5} \mathrm{cm}$. thick, culms stout, erect, $\mathbf{I}-2 \mathrm{~m}$. tall. Leaves smooth and glabrous, 3 dm . or more long, $\mathbf{r} .25-3.75 \mathrm{~cm}$. wide; spikes terminal, and in the upper axils, solitary or $2-3$ together, $\mathbf{I}-\mathbf{1 . 2 5} \mathrm{dm}$. long; outer scales of the staminate spikelets linear and obtuse, 8 mm . long, about 2 mm . wide, faintly many-nerved; exterior scale of the pistillate spikelets horny, shining. In swamps or along streams, Conn. to Kansas, south to Fla. and Tex. June-Sept.

## 2. ERIÁNTHUS Michx.

Tall, generally robust, perennial grasses, with thick creeping rootstocks, long flat leaves, and perfect flowers in terminal panicles. Spikelets generally with a ring of hairs at the base, 2 at each node of the jointed rachis, one sessile, the other with a pedicel, generally I-flowered. Scales 4, the two outer indurated, the inner hyaline, the fourth bearing a terminal straight or contorted awn; palet small, hyaline; stamens 3. Grain oblong, free, enclosed in the scales. [Greek, referring to the woolly spikelets.] About $\mathbf{1 7}$ 'species, natives of the temperate and tropical regions of both hemispheres. Besides the following, four others occur in the Southern States.

Awn spiral.

1. E. alopecuroides.

Awn straight.
Panicle lax; branches long and spreading; basal hairs longer than the outer scale of the spikelet.
2. E. saccharoides.

Panicle compact or strict; branches short and erect or appressed; basal hairs equalling or shorter than the outer scale of the spikelet.

Outer scale about 5 mm . long. Outer scale about 8 mm . long.
3. Fi. compartus.
4. E. brevibarbis.

1. Erianthus alopecuroìdes (L.) Ell. Spiral-Alivill Plome-grass. (I. F. f. 2II.) Culms stout, erect, 1.5-3 m. tall, the summit and the axis of the panicle densely pubescent. Sheaths glabrous; leaves $1.5-6$ dm. long, $1.25-2.5 \mathrm{~cm}$. wide; panicle oblong, $1.5-3 \mathrm{dm}$. long, $5-7.5 \mathrm{~cm}$. wide, branches spreading. $7.5-12.5$
cm . long, slender, loose; awn $\mathbf{1 2 - 1 6 ~ m m}$. long, the portion included in the outer scales tightly spiral. bent at point of exsertion, and thence loosely spiral. In damp soil, N. J. to Ky. and Mo., south to Ga. and Ala. Sept.
2. Erianthus saccharoìdes Michx. Plume-grass. (I. F. f. 212.) Culms robust, erect, r. $4-3 \mathrm{~m}$. tall, the summit and the axis of the panicle densely pubescent, with appressed long rigid silky hairs. Sheaths densely pubescent at the throat; leaves $0.6-2.5 \mathrm{~cm}$. wide; panicle lax. broadly oblong, $1.25-3.75 \mathrm{dm}$. long, $5^{-10} \mathrm{~cm}$. wide, its branches spreading, $5-10 \mathrm{~cm}$. long, internodes about 4 mm . long; outer scales of the spikelet a little exceeding the pedicel and about one-half as long as the basal hairs; awn $2-2.5 \mathrm{~cm}$. long, scabrous. In moist sandy soil, S. E. Va. to Fla. and La. Aug.-Sept.
3. Erianthus compáctus Nash. Contracted Plume-grass. (I, F. f. 213.) Culms $\mathrm{I}-3 \mathrm{~m}$. tall, the summit and axis of the panicle densely pubescent with appressed long rigid silky hairs. Sheaths glabrous, or pubescent at the top; leaves $6-12 \mathrm{~mm}$. wide; panicle narrowly oblong, $\mathbf{1}-1.5 \mathrm{dm}$. long, about 3.75 cm . wide; branches erect, $2.5-5 \mathrm{~cm}$. long; internodes about 2 mm . long; outer scales of the spikelet exceeding the pedicels and about equalling the basal hairs; awn $1-2 \mathrm{~cm}$. long, scabrous. In moist soil, N. J. to N. C. and Tenn. Aug.-Sept.
4. Erianthus brevibàrbis Michx. Short-bearded Plume-Grass. (I. F. f. 214.) Culms stout, erect, $1-2 \mathrm{~m}$. tall, nodes naked or scantily barbed, the summit and axis of the panicle smooth or scabrous. Sheaths glabrous; leaves rough, 34.5 dm . long, 6 -10 mm . wide, acuminate; panicle linear-oblong, $2-2.5 \mathrm{dm}$. in length, $2.5-3.75 \mathrm{~cm}$. wide, branches erect, $5-12.5 \mathrm{~cm}$. long, internodes about 5 mm . long; outer scales of the spikelet about 8 mm . long, twice the length of the pedicel and equalling or twice as long as the basal hairs, lanceolate, long-acuminate; inner scales shorter; awn $\mathbf{1} .8-2.5 \mathrm{~cm}$. long, straight, scabrous. In moist soil, Del. to N. C. and La. Autumn.

## 3. MANISŨRIS L.

Mostly tall perennials, with running rootstocks, narrow flat leaves and cylindrical jointed spikes, terminal and from the upper axils. Spikelets in pairs at each node of the excavated rachis, one sessile and perfect, the other with a pedicel and either staminate or empty. Scales of the perfect spikelet 4, the outermost thick and coriaceous, covering, together with the pedicel of the sterile spikelet, the excavation in the rachis; second scale chartaceous; third and fourth hyaline, the latter subtending a palet and perfect flower. Stamens three. Styles distinct. Grain free. [Greek, in allusion to the tail-like spikes.] About 25 species, widely distributed in tropical and temperate countries.
Culms from a creeping rootstock, round; sheaths round, narrow.
I. M. cylindrica. Culms tufted, no rootstocks, much flattened, at least below ; sheaths much compressed, broad, keeled.
2. M. rugosa.

1. Manisuris cylíndrica (Mx.) Kuntze. Creeping Mansuris. Culms 3-io dm . tall, slender; leaves 3 dm . or less long, $\mathrm{I}-3 \mathrm{~mm}$. wide; racemes $\mathrm{I}-2 \mathrm{dm}$. long; sessile spikelets $4.5-5 \mathrm{~mm}$. long, about equalling the internodes, the first scale more or less pitted in longitudinal lines, or rarely unpitted, the the pits often containing a subulate hair; pedicellate spikelets reduced to 1 or 2 scales, the pedicel linear, shorter than the sessile spikelet and curved around its margin. In sandy soil, Ga. and Fla. to Tex.; also in Mo., Ark. and Ind. Terr. June-Aug.
2. Manisuris rugòsa (Nutt.) Kuntze. Wrinkled Manisuris. (I. F. f. 215.) Culms $6-12 \mathrm{dm}$. tall, compressed, much branched above. Sheaths compressed; leaves flat, $1.5-6 \mathrm{dm}$. long, $2-6 \mathrm{~mm}$. wide; spikes partially included in the sheath or more or less exserted, $3-5 \mathrm{~cm}$. long; outermost scale of the spikelets about 4 mm . long, strongly transverse-rugose. In wet soil along the coast, Del. to Fla., west to Tex. June-Sept.

## 4. ANDROPÒGON L.

Perennial grasses with usually long narrow leaves, and terminal and axillary racemes. Spikelets in pairs at each node of the jointed hairy rachis, one sessile and perfect, the other with a pedicel and either staminate, empty or reduced to a
single scale. Perfect spikelet consisting of 4 scales, the outer 2 coriaceous, the second keeled and acute, the two inner hyaline, the fourth more or less awned and subtending a palet and perfect flower. Stamens $\mathbf{1}-3$. Grain free. [Greek, in allusion to the bearded rachis.] About 150 species, widely distributed in tropical and temperate regions. Besides the following, some 25 others occur in the southern and western parts of N. Am.

Racemes singly disposed; apex of the rachilla internodes with a translucent cup-shaped entire or irregularly-toothed appendage.
Spikelets $5-7 \mathrm{~mm}$. long; sheaths of the innovations green. r. A. scoparius.
Spikelets 8-10 mm. long; sheets of the innovations strongly compressed, glaucous.
2. A. littoralis.

Racemes disposed in pairs or more ; apex of the rachis internodes unappendaged.
Pedicellate spikelet sterile, of x or 2 scales, much smaller than the sessile one. Racemes usually protruding from the lateral fissure of the spathe, sometimes more or less exserted from the apex, the peduncle never long-exserted.
Branches of the inflorescence crowded at the summit of the culm in a dense corymbiform panicle.
3. A. corymbosus.

Branches of the inflorescence scattered along the culm in a long linear panicle.
4. A. Virginicus.

Racemes much exserted on long peduncles.
Stamen I; upper sheaths much enlarged.
5. A. Elliottii.

Stamens 3 ; sheaths not enlarged.
First scale of the spikelet nerveless between the keels; terminal hairs of the internodes about twice their length. 6. A. argyraeus.
First scale of the spikelet with 2 or 3 nerves between the keels; terminal hairs of the internodes about equalling them.
7. A. Cabanisii.

Pedicellate spikelet as large as or larger than the sessile, of 4 scales and a staminate or rarely perfect flower.
Fourth scale of sessile spikelet with a long geniculate awn, more or less spiral at the base.
Outer two scales of the sessile spikelet more or less hispidulous all over; hairs on the rachis internodes usually 2 mm . or less long.
8. A. furcatus.

Outer 2 scales of the sessile spikelet smooth or nearly so, except on the nerves; hairs of the rachis internodes 3-4 mm. long, usually yellow.
9. A. chrysocomus.

Fourth scale of the sessile spikelet awnless or with a short, straight, untwisted awn.
Marginal hairs on the pedicels and rachis internodes copious, stiff.
1о. A. Halliz.
Marginal hairs on the pedicels and rachis internodes scant or almost wanting, lax, crisped.
11. A. paucipilus.
I. Andropogon scopàrius Michx. Broom Beard-Grass. (I. F. f. 216.) Culms tufted, ${ }^{6-12 \mathrm{dm}}$. tall. Sheaths sometimes glaucous; leaves $1.5-3 \mathrm{dm}$. long. scabrous ; spikes $2.5-5 \mathrm{~cm}$. long, loose, solitary, on long-exserted slender peduncles: rachis slender, flexuous, joints and pedicels ciliate with long, spreading hairs; outermost scale of sessile spikelet about 6 mm . long; awn spiral, $10-12 \mathrm{~mm}$. long ; pedicelled spikelet a single awn-pointed scale. In dry sandy fields, N. B. to Alb, south to Fla. and Tex. Aug.-Oct.
2. Andropogon littoràlis Nash, n. sp. Seaside Beard-grass. Culms densely tufted, 8-10 dm. tall, the innovations with the leaves and strongly com-- pressed sheaths glaucous; leaves 2 dm . long or less, rough ; racentes i-t cm . long, rarely longer; sessile spikelets 8 -10 mm . long, the awn of the fourth scale geniculate, spiral, ro- 15 mm . long ; pedicellate spikelet a single-awned scale. In sand along the seashore, N. Y. and N. J. Aug.-Oct.
3. Andropogon corymbòsus (Chapm.) Nash. Busuli hearin-(ik.sis. (l. F. f. 22 I .) Culms 4-10 dm. tall, from a little exceeding to twice as long as the hasal leaves; sheaths keeled, those at the base much compressed and equitant, rough, more or less papillose-hirsute; culm leaves rough; spathes very rough, tightly enrolled around the common peduncle, which is usually as long as the spathe and hispidulous toward the summit; racemes in pairs, more or less exserted, $2-3 \mathrm{~cm}$.
long; sessile spikelet $4-5 \mathrm{~mm}$. long, the awn $\mathbf{1}-\mathrm{I} .8 \mathrm{~cm}$. long. Wet soil, D. C. to Fla. and Miss. Sept.-Oct. [A. glomeratus (Walt.) B. S. P. in part.]

Andropogon corymbosus abbreviàtus (Hack.) Nash. Differs from the type in having the spathes generally about equalling the racemes, and few if any of them narrow and enrolled on the peduncles. Similar situations, Long Island to Fla. Sept.-Oct.
4. Andropogon Virgínicus L. Virginia Beard-grass. (I. F. f. 220.) Culms tufted, $5-10 \mathrm{dm}$. tall, many times longer than the basal leaves; sheaths, at least the lower ones, more or less tuberculate-hirsute on the margins; leaves 4 dm . long or less, more or less hirsute on the upper surface near the base; spathes 3-5 cm . long, broad; racemes generally in pairs, $2-3 \mathrm{~cm}$. long; sessile spikelets 3-4 mm . long, the awn IO-15 long; pedicellate spikelet wanting or rarely present as a minute scale. Dry or moist fields, Mass. to Ill., south to Fla. and Tex. Aug.Sept.
5. Andropogon Ellióttii Chapm. Elliott's Beard-grass. (I. F. f. 222.) Culms tufted, $5^{-8} \mathrm{dm}$. tall; lower sheaths and those of the innovations densely ap-pressed-hirsute, those of the inflorescence much enlarged and much crowded at the summit, $8-11 \mathrm{~cm}$. long; leaves 2 dm . or less long, rough above and hirsute near the base; racemes in pairs, slender, $3-4 \mathrm{~cm}$. long, those on the longer branch at each node exserted, the rest concealed in the sheaths; sessile spikelets $4.5-5 \mathrm{~mm}$. long, the awn geniculate, $1.5-2.3 \mathrm{~cm}$. long, usually spiral at the base, the column much exserted. Dry sandy soil, Pa. (according to S. Watson), south to Fla. and Miss. Sept.-Oct.
6. Andropogon argyraèus Schultes. Silvery Beard-grass. (I. F. f. 217.) Culms 6-12 dm. tall, simple at base, generally much branched above. Sheaths somewhat compressed; basal leaves $1.5-3 \mathrm{dm}$. long; upper $5-20 \mathrm{~cm}$. by 2 mm . wide; spikes in pairs, $2.5-5 \mathrm{~cm}$. long, on exserted slender peduncles; joints of the rachis and pedicels pubescent with long, silky-white, spreading hairs; outermost scale of sessile spikelet about 5 mm . long, acuminate, hispidulous; awn loosely spiral, $12-18 \mathrm{~mm}$. long, scabrous; pedicelled spikelet a minute deciduous scale. In dry sandy soil, Del. to Mo., south to Fla. and Tex. Sept.
7. Andropogon Cabanísii Hack. Cabanis’ Beard-grass. Culms 6-io dm . tall. Sheaths smooth or a little roughened; leaves 2.5 dm . or less long, smooth beneath, rough above; racemes in pairs, $4-7 \mathrm{~cm}$. long, grayish; sessile spikelets $6-7 \mathrm{~mm}$. long, broadly lanceolate, the first scale strongly hispidulous and $2-3$-nerved between the keels; pedicellate spikelet of a single hispidulous scale $3-3.5 \mathrm{~mm}$. long. Dry soil, Pa. (according to Hackel) and Fla. June-Aug.
8. Andropogon furcàtus Muhl. Forked Beard-grass. (I. F. f. 219.) Culms stout, 9-18 dm. tall. Sheaths smooth and glabrous; leaves $1.5-4.5 \mathrm{dm}$. long; spikes $2-5$, in pairs or approximate, $5-10 \mathrm{~cm}$. long; joints of rachis and pedicels ciliate with short hairs; outermost scale of sessile spikelet 6-8 mm . long; awn 10-14 mm. long; loosely spiral, geniculate; pedicelled spikelet of 4 scales. In dry or moist soil, Me. to Man., south to Fla. and Tex. Aug.-Sept.
9. Andropogon chrysocòmus Nash, n. sp. Yellow-haired Beard-Grass. Culms 7-15 dm. tall; sheaths smooth and glabrous; leaves 3 dm . long or less, smooth beneath, a little roughened above; racemes in 2 's -4 's, $5-9 \mathrm{~cm}$. long, stout, long-exserted; sessile spikelets about I cm . long, the outer 2 scales hispid on the nerves, the awn of the fourth seale twisted at the base, geniculate, $10-12 \mathrm{~mm}$. long; pedicellate spikelet awnless. Dry soil, Kans. to Tex. July-Sept.
10. Andropogon Hàllii Hack. Hall's Beard-grass. (I. F. f. 218.) Culms robust, $9-18 \mathrm{dm}$. tall, more or less glaucous. Sheaths somewhat glaucous; leaves 3 dm . long or less; spikes $2-5,5-10 \mathrm{~cm}$. long; outermost scale of sessile spikelet about 8 mm . long, acuminate, glabrous at base, from sparingly to copiously silkypubescent toward the apex; awn straight, $4-10 \mathrm{~mm}$. long, or sometimes wanting; pedicelled spikelet consisting of 4 scales, generally larger than the sessile spikelet and enclosing three stamens. Dry sandy soil, Kans. and Mont. to Mex. Aug.Sept.

Ir. Andropogon paucípilus Nash, $n$. $s p$. Scant-haired Beard-grass. Culms ro-12 dm. tall, rather stout. Sheaths smooth and glabrous, as are the leaves which are erect and 3 dm . long or less; racemes in 2 's -3 's, $5-7 \mathrm{~cm}$. long, exserted;
sessile spikelets $9-10 \mathrm{~mm}$. long, the outer 2 scales hispid on the nerves toward the apex, pubescent toward the summit with long loose-crisped hairs; pedicellate spikelet similar to the sessile one, staminate. In dry soil, Mont. and Neb. July.

## 5. AMPHILÒPHIS Nash.

Perennial grasses with usually flat leaves and showy, often silvery-white, panicles, the axis short, making the panicle appear fan-like, or elongated with the branches more scattered. Racemes usually numerous, the internodes with manifestly thickened margins, the median portion thin and translucent, the pedicels of the same structure, the margins ciliate with usually long hairs. Sessile spikelets of 4 scales, the first one 2 -keeled, the second i-keeled, the third and fourth scales hyaline, the latter very narrow, stipe-like, somewhat thickened, gradually merging into a usually geniculate, contorted or spiral awn, or the awn rarely wanting. Pedicellate spikelets staminate and similar to the sessile, or sterile and smaller than them. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scales. [Greek, in reference to the hairs surrounding the spikelets.] About 30 species, in temperate and tropical countries.
I. Amphilophis Torreyànus (Steud.) Nash. Torrey's Beard-grass. (I. F. f. 223.) Culms erect, $4.5-10.5 \mathrm{dm}$. tall, the nodes naked. Sheaths more or less glaucous; leaves $7.5-17.5 \mathrm{~cm}$. long, glaucous; spikes $2.5-3.75 \mathrm{~cm}$. long in a terminal long-exserted panicle $4-10 \mathrm{~cm}$. long; outermost scale of sessile spikelet 3-4 mm . long, about equalling the terminal hairs of the rachis-joints, lanceolate, acute; awn $8-16 \mathrm{~mm}$. long, spiral; pedicelled spikelet rudimentary. In dry soil, Kans. to Ariz. and Mex. Aug.-Sept. (Andropogon Torreyanus Steud.)

## 6. SORGHÁSTRUM Nash.

Generally tall grasses, ours perennials, with long, narrow, flat leaves and terminal panicles. Spikelets in pairs, or 3's at the end of the branches, one sessile and perfect, the lateral pedicelled, empty, or reduced to the pedicel only. Perfect spikelet consisting of 4 scales, the two outer indurated and shining, the inner hyaline, the fourth awned and subtending a palet and perfect flower, or the palet sometimes wanting. Stamens 3. Styles distinct. Stigmas plumose. Grain free. [Named in reference to its resemblance to sorghum.] Ahout 15 species, in temperate and tropical countries. (Chrysopogon Benth. Not Trin.)
I. Sorghastrum avenàceum (Michx.) Nash. Indian Grass. (I. F. f. 224.) Culms $9-24 \mathrm{dm}$. tall. Lower leaves 3 dm . or more in length; panicle $\mathrm{I}-3 \mathrm{dm}$. long, brownish-yellow; branches $5 \mathbf{- 1 0} \mathrm{~cm}$. long, erect-spreading ; spikelets erect or somewhat spreading ; first scale of sessile spikelet $6-8 \mathrm{~mm}$. long, pubescent with long hairs; second scale glabrous; awn I-2 $\mathbf{c m}$. long, the column having but a single bend; lateral spikelets wanting. In dry fields, Ont. to Man., south to N. H., Fla. and Ariz. Aug.-Sept. (Chrysopogon avenaceus Benth.)

## 7. SÓRGHUM Pers.

Annual or perennial grasses, with long, broad, flat leaves and terminal ample panicles. Spikelets in pairs at the nodes, or in 3's at the ends of the branches. one sessile and perfect, the lateral pedicelled, staminate or empty. Sessile spikelet consisting of 4 scales, the outer indurated and shining, obscurely-nerved, inner hyaline, the fourth awned and subtending a small palet and perfect flower, or palet sometimes wanting. Stamens 3. Styles distinct. Grain free. [Name Indian.] About 13 species, of wide distribution in tropical and warm-temperate regions.

1. Sorghum Halepénse (L.) Pers. Johnson-grass. (I. F. f. 225.) Culms 9-20 dm. tall; sheaths smooth; leaves 3 dm . or more long, 6-25 mim. Whde; panicle from I.5-4.5 dm. long; outer scales of sessile spikelet 4-6 mm. long, usually purplish. pubescent with long appressed hairs; awn when present $8-16 \mathrm{~mm}$. long. In fields and waste places, southern Pa. to Mo. and Kans., south to Fla. and Tex. Native of southern Europe and Asia. July-Sept.

## 8. NÀZIA Adans.

An annual grass, diffusely branched, with flat leaves and I -flowered decid wus spikelets, either solitary or in clusters of 3-5 in a terminal spike. Scales of spikelet 2 or 3, the outermost small or wanting. the second rigid and covered with hooked prickles, the third membranous, subtending a palet and perfect flower. [Name
unexplained.] A monotypic genus, native of tropical and temperate regions of the Old World.
I. Nazia racemòsa (L.) Kuntze. Prickle-grass. (I. F. f. 226.) Culms $5-35 \mathrm{~cm}$. tall, pubescent above. Leaves $2.5-7.5 \mathrm{~cm}$. long, rather strongly ciliate; spike $2.5-10 \mathrm{~cm}$. long, sometimes partially included in the somewhat inflated upper sheath; second scale coriaceous, 3 mm . long, 5 -nerved; third scale 2 mm . long, I-nerved. Occasional in ballast and waste places about the seaports. July-Sept.

## 9. PÁSPALUM L.

Perennial grasses, various in habit, with generally flat leaves and I-flowered spikelets, borne singly or in pairs in 2 rows on I-sided spikes, which are single, in pairs or panicled. Spikelets oblong to orbicular, flat on the outer surface, convex on the inner. Scales 3 , the outer ones membranous, the inner one indurated and subtending a palet and perfect flower. Stamens 3. Styles separate. Stigmas plumose. Grain ovoid or oblong, free. [An ancient Greek name for some grass, used by Hippocrates.] About 160 species, of wide distribution in tropical and temperate regions, most abundant in America.
Rachis of the racemes very broad, twice the width of the spikelets, or nearly so, which are partially concealed by its inrolled margins.
Rachis extending beyond the spikelets, long-acuminate; spikelets about I mm. long. 1. P. mucronatum.

Rachis not extending beyond the spikelets, acute ; spikelets 2 mm . long.
2. P. membranaceum.

Rachis of the racemes narrower than the spikelets, not inrolled on the margins.
Racemes 2 , approximately in a pair at the summit of the culm ; rootstocks extensively creeping; culms not tufted.
3. P. distichum.

Racemes I -several, alternate; culms tufted.
Culms simple, no branches from the upper sheath ; racemes stout. Spikelets obtuse, glabrous.

Spikelets 3 mm . or less long.
Leaves very hirsute on both surfaces ; the hairs on the sheaths very dense and long.
4. P. plenipilum.

Leaves glabrous beneath, or nearly so.
Spikelets elliptic, hence longer than broad, decidedly convex on the inner side ; sheaths glabrous or nearly so.
5. P. laeve.

Spikelets orbicular, or nearly so, hence as broad as long, but little convex on the inner side ; sheaths hirsute.
6. $P$. circulare.

Spikelets 4 mm , or more long.
7. P. glabratum.

Spikelets acute, long villous-ciliate on the margins.
8. P. dilatatum.

Culms branched, the upper sheath containing from $1-3$ branches; racemes slender.
Leaves glabrous on both surfaces, or the midnerve sometimes pubescent beneath.
Sheath margins glabrous. 9. P. ciliatifolium.
Sheath margins pubescent.
Spikelets orbicular, hence as broad as long, straw-color, 2 mm . in diameter. $\quad$ 1o. $P$. stramineum.
Spikelets broadly obovate to oval, longer than broad, green, 1.5 mm . long.
II. P. longipedunculatum.

Leaves pubescent on both surfaces.
Pubescence of copious soft short-appressed hairs.

- Culms prostrate, the lower leaves I dm. or less long.

12. P. prostratum.

Culms erect, the lower leaves 1.5 dm . or more long.
13. P. Bushiz.

Pubescence of more or less spreading and usually rather long stout hairs.
Culm densely pilose below the racemes; lower sheaths usually glabrous or nearly so. 14. P. pubescens.

Culm glabrous; lower sheaths generally hirsute.
Spikelets $\mathbf{1}-1.5 \mathrm{~mm}$. long. $\quad 15 . P$. setaceum.
Spikelets $2-2.25 \mathrm{~mm}$. long.
Racemes on the main culm 1 , or sometimes 2 ; spikelets glabrous; leaves rather thin. 16. P. Muhlenbergiz.
Racemes on the main culm 2 or 3 ; spikelets pubescent; leaves thick.

1. Paspalum mucronàtum Muhl. Water Paspalum. (I. F. f. 227.) Culms ascending, $1.5-9 \mathrm{dm}$. long, from a floating or creeping base, branched. Sheaths very loose or inflated, smooth or scabrous, glabrous or pubescent ; leaves 7.5-30 cm . long, $6-25 \mathrm{~mm}$. wide, acuminate, scabrous; spikes $20-100$, $1.25-7.5 \mathrm{~cm}$. long, alternate or sometimes approximately whorled, slender ; rachis flat, thin, exceeding the spikelets, long-acuminate, scabrous, its margins nearly enclosing the spikelets: spikelets in two rows, about I mm. long, elliptic, pubescent; outer scales very thin, 2 -nerved, the first one usually a little the longer. In water, Va. to southern Ill. and Kans., south to Fla. and Tex. Also in tropical America. Sept.
2. Paspalum membranàceum Walt. Walter's Paspalum. (I. F. f. 228.) Culms erect or ascending, much branched, smooth, creeping at the base. Sheaths a little inflated, smooth; leaves $3.75-8.75 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide; spikes $3-7$, alternate, about 2.5 cm . long, the lower ones usually included in the upper sheath; rachis not exceeding the spikelets, flat, thin, $2-3 \mathrm{~mm}$. wide, acute, smooth, its inrolled margins partly enclosing the spikelets ; spikelets about 2 mm . long, crowded in 2 rows, oval, obtuse, smooth; outer scales 5 -nerved; third scale lenticular, slightly shorter than the outer ones. Moist or wet grounds, N. J. and Del. to southern Ohio, south to Fla. and Tex. Sept.
3. Paspalum dístichum L. Joint-grass. (I. F. f. 229.) Culms erect, 1.5-6 dm. tall, extensively creeping at base. Sheaths smooth, sometimes ciliate on the margins, or sparsely pubescent; leaves flat, $3.75-12.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, acuminate, smooth; spikes $2.5-6.25 \mathrm{~cm}$. long, in pairs, or occasionally with a third, exserted ; rachis flat, $\mathbf{I - 2 ~ m m}$. wide, smooth ; spikelets $2.5-3 \mathrm{~mm}$. long, elliptic, somewhat pubescent or glabrous, acute, nearly sessile in 2 rows; outer scales 3 -5-nerved, slightly exceeding the acute third one, which is sparingly bearded at the apex. Va. to Mo. and Cal., south to Fla., Tex. and Mex. Also in the West Indies, Central and South America. Aug.-Sept.
4. Paspalum plenípilum Nash, n. sp. Long-hatred Paspalum. Culms tufted, erect, rather slender, 3-8 dm. tall. Sheaths little compressed, very densely pubescent with long spreading white hairs; leaves erect or nearly so, 2.5 dm . or less long, $4-6 \mathrm{~mm}$. wide, densely pubescent on both surfaces with stiff hairs, those toward the base on the upper surface very long; racemes $2-4$, ascending, $3-6 \mathrm{~cm}$. long; spikelets singly arranged, oval, $2.5-2.75 \mathrm{~mm}$. long and about 2 mm . broad, prominently convex on the inner side, the empty scales glabrous, 3 -nerved. In dry places, N. J. Aug.
5. Paspalum laeve Michx. Field Paspalum. (I. F. f. 234.) Bright green. culms rather stout, erect or ascending, 3-9 dm. tall, glabrous. Sheaths compressed, glabrous or somewhat pubescent; leaves $7 \cdot 5-30 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, acuminate, glabrous beneath, hirsute above near the base; spikes 2-6, 3.5-7.5 cm. long, more or less spreading, alternate, about $2-5 \mathrm{~cm}$. apart on the single stout peduncle, pilose in the axils; spikelets $2.5-3 \mathrm{~mm}$. long, oval, close, crowded in 2 rows, glabrous. In moist fields, R. I. to Ky. and Mo., south to Fla. and Tex. Ascends to 1700 ft . in N. C. Aug.-Sept.
6. Paspalum circulàre Nash, $n$. $s p$. Round-flowered Paspalum. Culms erect or nearly so, 3-8 dm. tall. Sheaths compressed, at least the lower ones hirsute; leaves erect or ascending, 3 dm . or less long, 5-8 mm. wide, glabrous beneath. hirsute above toward the base; racemes usually in pairs, sometimes in 3.5 rarely in 4's, 4-9 cm. long; spikelets singly arranged, orbicular, about 3 mm . in diameter, the inner side but slightly convex, the empty scales glabrous, very thin. bright green, 3 -nerved. In moist or dry fields, N. Y. to N. C.; also in Mo. JulySept.
7. Paspalum glabràtum (Engelm.) Mohr. Engelmann's Paspariam. (I. F. f. 235.) Culms stout, erect, 9-18 dm. tall, from a creeping rootstock, glabrous. Sheaths glabrous, sometimes glaucous; leaves $2-4 \mathrm{dm}$. long. 0.14 mm. wide, acuminate, glabrous beneath, hirsute above; spikes 2-5, on the single stout peduncle, $5-\mathbf{1 2} \mathrm{cm}$. long, erect or ascending, bearded in the axils: rachis about 2 mm . wide, flat on the back, scabrous on the margins; spikelets +mm . long. broadly oval, glabrous, glaucous, singly disposed and crowded in 2 rows: outer scales 5-nerved; third scale striate. Noist places, Del. to Ky. and Kians., south to Fla. and Tex. Sept. (Paspalum Floridanum Michx. in part.)
8. Paspalum dilatàtum Poir. Tall Paspalum. (I. F. f. 230.). Culms erect, $9-\mathbf{1 8} \mathrm{dm}$. tall. Sheaths compressed, smooth and glabrous; leaves 3 dm . or more long, 4-10 mm. wide, sometimes with a tuft of hairs at the base; spikes $4-12$, $5-12.5 \mathrm{~cm}$. long, spreading, alternate; rachis of the spikes narrow, less than 2 mm . wide, somewhat flexuous, scabrous; spikelets about 3 mm . long, in 3 or 4 rows, acute; outer scales 5 -nerved, the first villous on the margins, the second glabrous or sparsely pubescent, the third nearly orbicular, minutely punctate-striate. In moist soil, Va. to Fla., west to Tex. Aug.-Sept.
9. Paspalum ciliatifòlium Michx. Ciliate-Leaved Paspalum. Culms tufted, erect, 4-8 dm. tall. Sheaths smooth and glabrous; leaves $5-25 \mathrm{~cm}$. long, $6-15 \mathrm{~mm}$. wide, smooth and glabrous on both surfaces, the margins conspicuously ciliate with long hairs; racemes single or sometimes in 2 's, $5-11 \mathrm{~cm}$. long; spikelets in pairs, $1.8-2.1 \mathrm{~mm}$. long and $\mathrm{I} .5-\mathrm{I} .8 \mathrm{~mm}$. broad, oval to broadly obovate, the empty scales 3 -nerved, or the midnerve rarely lacking in the second, glabrous. In sandy or rocky soil, D. C. and Va. to Fla. and Miss. June-Sept.
io. Paspalum stramíneum Nash, $n . s p$. Straw-colored Paspalum. Foliage yellowish-green, the spikelets, and sometimes also the sheaths, pale straw-color. Culms tufted, $2-8 \mathrm{dm}$. tall; sheaths, all but the lower ones, glabrous except on the margins; leaves erect or nearly so, firm, long-ciliate on the margins, otherwise glabrous, $5^{-25} \mathrm{~cm}$. long, $5-10 \mathrm{~mm}$. wide; racemes $4-10 \mathrm{~cm}$. long, usually in pairs, rarely I or 3 ; spikelets in pairs, orbicular, 2 mm . in diameter, the first scale 3nerved, pubescent, the second scale 2 -nerved, glabrous or nearly so. In sandy places and fields, Neb., Kans. and Ind. Terr. July-Sept. (Paspalum ciliatifolium Michx. in part.)
II. Paspalum longipedunculàtum Le Conte. Long-stalked Paspalum. (I. F. f. 233.) Culms reclining or decumbent, 3-4.5 dm. long, smooth, leafy at base. Sheaths glabrous or ciliate on the margins, pilose at the throat; leaves 2.58.75 cm . long, 4-6 mm. wide, ciliate on the margins and along the midnerve; peduncles I-2 from the upper sheath; spikes $1-2,2.5-6.25 \mathrm{~cm}$. long, more or less curved; rachis very narrow, more or less flexuous; spikelets about 1.5 mm . long; outer scales 3 -nerved, the first one glabrous or sometimes sparsely pubescent; third scale slightly exceeding the outer ones. Sandy soil, N. C. to Fla., Ky. and Tenn. Aug.-Sept.
10. Paspalum prostràtum Nash, $n$. sp. Prostrate Paspalum. Culms prostrate, tufted, forming large, dense masses, $5-8 \mathrm{dm}$. long. Sheaths, as well as both surfaces of the leaves, softly and densely pubescent with short hairs; leaves erect or nearly so, ciliate on the margins, $3 \cdot 5-10 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. wide; racemes $5^{-}$ 7.5 cm . long, usually in pairs on the main culm; spikelets in pairs, about 2 mm . long and 1.8 mm . wide, oval, the outer scales densely pubescent, the first scale 3 -nerved, the second scale usually 2 -nerved by the suppression of the midnerve. In dry sandy soil, southeastern N. Y. to Del. Aug.-Sept.
11. Paspalum Búshii Nash, n. sp. Bush's Paspalum. Culms erect, 8-10 dm . tall, rather stout, lower sheaths pubescent, the others pilose on the margins; leaves erect or ascending, $5-20 \mathrm{~cm}$. long, $5-15 \mathrm{~mm}$. broad, ciliate on the margins, softly and densely pubescent on both surfaces with very short hairs; racemes io-12 cm . long, in 2's or 3 's on the main culm; spikelets in pairs, $2-2.2 \mathrm{~mm}$. long and about 1.8 mm . broad, oval, the empty scales densely pubescent, 3-nerved, or the second scale sometimes 2 -nerved by the suppression of the midnerve. In dry soil, Mo. Aug.
12. Paspalum pubéscens Muhl. Pubescent Paspalum. Culms erect, 48 dm . tall, pilose at the summit. Sheaths glabrous or nearly so; leaves $4-23 \mathrm{~cm}$. long, 3-6 mm . wide, rarely broader, densely long-pubescent on both surfaces; racemes usually $\mathbf{I}$, rarely $2,6-\mathbf{1 2} \mathrm{cm}$. long; spikelets in pairs, glabrous, about 2 mm . long, oval, $1.5-1.8 \mathrm{~mm}$. wide, the empty scales 3 -nerved, or the second 2 nerved by the suppression of the midnerve. In dry soil, N. J. and Pa. to Kans., south to Fla. and Tex. Aug.-Sept. (Paspalum ciliatifolium Michx. in part.)
13. Paspalum setàceum Michx. Slender Paspalum. (I. F. f. 23I.) Culms mostly erect, $3-6 \mathrm{dm}$. tall, slender, smooth. Sheaths and leaves generally very pubescent, the latter $7 \cdot 5-20 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, erect, acuminate; spikes $3.75-8.75 \mathrm{~cm}$. long, more or less curved, generally solitary, occasionally 2 , on a long-exserted slender peduncle, with usually 1 or 2 additional shorter pe-
duncles from the same upper sheath; spikelets about I. 5 mm . long, in 2 narrow rows, broadly obovate, very obtuse; empty scales 3-nerved, glabrous or pubescent; third scale obovate, shining. In dry fields, N. H. and Mass. to Ill., south to Fla. and Tex. Aug.-Sept.
14. Paspalum Muhlenbérgii Nash, n. sp. Muhlenberg's Paspalum. (I. F. f. 232.) Culms tufted, at first erect, at length reclining, 4-8 dm. long. Sheaths usually hirsute all over; leaves $5-20 \mathrm{~cm}$. long, usually $7-11 \mathrm{~mm}$. wide, sometimes narrower, ciliate on the margins with generally long hairs, more or less pubescent on both surfaces with similar hairs; racemes solitary or in 2's, $5-10 \mathrm{~cm}$. long; spikelets in pairs, glabrous, about 2 mm . long and 1.8 mm . wide, oval or broadly obovate, the empty scales 3 -nerved, or the second rarely 2 -nerved by the suppression of the midnerve. In fields or in sandy or stony ground, Mass. to Mo. and Ind. Terr., south to S. Car., Ga. and Miss. Aug.-Oct. (Paspalum ciliatifolium Michx. in part.)
15. Paspalum dasyphyllum Ell. Hairy-leaved Paspalum. Plant yellowish green. Culms tufted, 2-6 dm. tall; sheaths, as well as both surfaces of the leaves, densely pubescent with long, yellowish, spreading hairs; leaves erect or ascending, thick, 2 dm . or less long, usually $\mathrm{I}-2 \mathrm{~cm}$. broad; racemes on the main culm in 2's or 3 's, $4-10 \mathrm{~cm}$. long; spikelets in pairs, $2-2.2 \mathrm{~mm}$. long and about 1.8 mm . wide, broadly obovate, the first scale generally pubescent, 3 -nerved, the second scale glabrous, usually 2 -nerved or sometimes 3 -nerved. In dry, usually sandy, places, S. Car. to Fla.; also in Mo. June-Sept. (Paspalum ciliatifolium Michx. in part.)

## ro. ANÁSTROPHUS Schlecht.

Perennial grasses, with the culms usually rooting at the lower nodes, with flat leaves and I-flowered spikelets, borne singly in 2 rows in one-sided spikes which (in our species) are disposed in a single pair at the summit of the culm, or sometimes with an additional one a short distance below. Spikelets oblong to lanceolate, convex on the outer surface, flat on the inner. Scales 3, the outer 2 membranous, the inner one firm and with its opening turned toward the rachis, subtending a perfect flower. Stamens 3. Styles separate. Stigmas plumose. Grain free. [Greek, signifying turned around, referring to the spikelets.]

Spikelets less than 2 mm . long, oblong. Spikelets about 4 mm . long, broadly lanceolate.

1. A. compressus.
2. A. paspaloides.
I. Anastrophus compréssus (Sw.) Schlecht. (I. F. f. 236.) Stolons numerous, leafy, sometimes 6 dm . long. Culms I.5-6 dm. tall, slender, compressed, glabrous; sheaths loose; leaves glabrous, sometimes sparsely ciliate, obtuse, those of the culm 5-10 cm. long, 4-6 mm. wide, those of the stolons about 2.5 cm . long. $2-4 \mathrm{~mm}$. wide; spikes $2-5,2.5-5 \mathrm{~cm}$. long, approximate at the summit of the long and slender stalk; spikelets not crowded nor secund, about 2 mm . long, acute. Va. to Fla. and west to La. Widely distributed in tropical America. Probably not native in the U. S. Aug.-Sept. (Paspatum compressum Nees.)
3. Anastrophus paspaloides (Michx.) Nash. (I. F. f. 237.) Culms 3-7.5 dm . tall, from an extensively creeping base. Sheaths and leaves glabrous or pubescent, the latter $5-\mathbf{2 2} \mathrm{cm}$. long, 6-12 mm . wide, obtuse; spikes $3.75-8.75 \mathrm{~cm}$. long, in pairs, or sometimes with an additional one; rachis flat, about I mm. wide; spikelets about 4 mm . long, broadly lanceolate, acute, not crowded; outer scales 5-nerved, glabrous. Moist ground, Md. to Fla., west to Tex. July-Aug. (Paspalum paspaloides Scribn.)

## 11. AMPHICÀRPON Raf.

Erect perennial grasses, with flat leaves and spikelets of two kinds : one kind borne in terminal panicles, deciduous without perfecting fruit ; the other solitary. terminating subterranean peduncles, and maturing seed. Scales 3. membramous. the innermost subtending a palet and a perfect flower ; the scales of the subterranean spikelets become indurated and enclose the grain. Stamens 3. Stigmas plumose. [Greek, in allusion to the two kinds of spikelets.] Species 2, inhabiting the southeastern U. S., one of them restricted to Fla.

1. Amphicarpon Amphicàrpon (Pursh) Nash. (I. F. f. 238.) Culms 3-4.5 dm . tall. slender, glabrous. Sheaths papillose-hirsute; leaves $2.5-15 \mathrm{~cm}$. long. $4-\mathrm{I} 2$ mm . wide, erect, hirsute and ciliate; panicle linear, $\mathrm{I}-\mathrm{I} .5 \mathrm{dm}$. long, branches erect; spikelets about 4 mm . long. elliptic; outer scales 5 -nerved, glabrous; subterranean spikelets ovoid in fruit, about 6 mm . long. In moist pine barrens, N. J. to Fla. near the coast. Aug.-Sept.

12. ERIÓCHLOA. H. B. K.

Annual or perennial grasses, with flat leaves and short-pedicelled spikelets borne in secund spikes, which form a terminal panicle. Spikelets with an annular callus at the base and articulated to the pedicel. Scales 3, the two outer membranous, acute, the inner one shorter, indurated and subtending a palet and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. Grain free. [Greek, signifying wool-grass.]
I. Eriochloa punctàta (L.) W. Hamilt. Dotted Millet. (I. F. f. 239.) Culms 3-9 dm. tall. Sheaths sometimes pubescent ; leaves $5-25 \mathrm{~cm}$. long; spikes $4-25,2.5-5 \mathrm{~cm}$. long, sessile or nearly so; rachis pubescent; spikelets about 4 mm . long, ovate-lanceolate, acuminate; outer scales pubescent with appressed silky hairs, the third about 2 mm . long, rounded at the apex and bearing a pubescent awn about I mm. long. Neb. to Tex. and Mex. Widely distributed in trop. Am.
$I_{3}$. SYNTHERÍSMA Walt.
Annual grasses, with flat leaves and spikelets borne in pairs or sometimes in 3 's, in secund spikes which are digitate or approximate at the summit of the culm. Spikes often purplish. Scales of the spikelet 4, sometimes 3 by the suppression of the lowest one; the fourth or innermost scale chartaceous, subtending a palet of similar texture and a perfect flower. Stamens 3. Stigmas plumose. [Greek, cropmaking, in allusion to its abundance. 1 Species about 25, widely distributed in temperate and tropical regions.
Rachis of the racemes with the angles wingless; first scale of the spikelet wanting, or sometimes present as an inconspicuous rudiment.
Racemes usually short, $2-10 \mathrm{~cm}$. long; spikelets less than 2 mm . long.

1. S. filiformis.

Racemes usually exceeding io cm . long, rarely shorter; spikelets 2.25 mm . or more long.
2. S. villosa.

Rachis of the racemes with the lateral angles broadly winged; first scale of the spikelet usually present, generally wanting in Nos. 3 and 4.
Pedicels terete or nearly so, sparingly if at all hispidulous.
Sheaths and leaves strongly pubescent; second scale one-half or less as long as the spikelet. 3. S. serotina.
Sheaths and leaves glabrous; second scale nearly as long as the spikelet.
4. S. linearis.

Pedicels sharply 3 -angled, the angles strongly hispidulous.
Spikelets usually less than 3 mm . long; third scale with the first and second nerves on each side hispid above the middle.
5. S. sanguinalis. Spikelets more than 3 mm . long; third scale with the nerves smooth.
6. S. fimbriata.
I. Syntherisma filifórmis (L.) Nash. Slender Finger-Grass. (I. F. f. 242.) Culms I.5-7 dm. tall. Sheaths hirsute, at least the lower ones; leaves $3-20 \mathrm{~cm}$. long, $\mathrm{I}-4 \mathrm{~mm}$. wide; racemes $2-5,2-10 \mathrm{~cm}$. long, erect or ascending; spikelets about 1.8 mm . long, 0.75 mm . wide, elliptic, acute, in pairs, the first scale wanting, the second 3 -nerved, the third 7 -nerved, the fourth scale deep chestnut-brown at maturity. Dry sandy soil, N. H. to Mich., south to Del., N. C. and the Ind. Terr. July-Sept.
2. Syntherisma villòsa Walt. Southern Slender Finger-grass. Culms densely tufted, 6-14 dm. tall. Sheaths, at least the lower ones, hirsute; leaves $0.7-2.5 \mathrm{dm}$. long, $3-6 \mathrm{~mm}$. wide; racemes $2-8$, commonly more than $5.4-20 \mathrm{~cm}$. long, generally $12-15 \mathrm{~cm}$., erect or ascending; spikelets 2.5 mm . long, about 0.8 mm . wide, elliptic, acute, usually in 3 's, the first scale wanting, the second scale 3 -nerved, the third scale 7 -nerved, the fourth scale deep chestnut-brown at maturity. Sandy soil, principally along the coast, from Ga. and Fla. to Tex.; also in the Ind. Terr. and Ill. June-Oct.
3. Syntherisma serótina Walt. Late-flowering Finger-grass. (I. F. f. 24Ia.) Culms 2-5 dm. long, tufted, at length much branched and prostrate and rooting at the lower nodes. Sheaths, at least the lower ones, densely papillosehirsute with spreading hairs; leaves $1.5-10 \mathrm{~cm}$. long, usually less than 5 cm ., $3-10 \mathrm{~mm}$. wide, lanceolate, pubescent on both surfaces; racemes $2-6,2.5-10 \mathrm{~cm}$. long; spikelets about 1.5 mm . long and 0.6 mm . wide, elliptic, acute, usually in pairs, the first scale wanting, the second 3-nerved, the fourth scale white. Low, open grounds, Del. to Fla. and Miss. June-Oct.
4. Syntherisma lineàris (Krock.) Nash. Small Crab-grass. (I. F. f. 24I.) Culms 2-5 dm. tall, finally prostrate, and forming large mats. Sheaths smooth and glabrous; leaves $1.5-13 \mathrm{~cm}$. long, $2.5-6 \mathrm{~mm}$. wide, smooth and glabrous on both surfaces; racemes $2-5,2-8 \mathrm{~cm}$. long, finally widely spreading; spikelets slightly exceeding 2 mm . long and about I mm . wide, elliptic, acutish, usually in pairs, the first scale wanting or sometimes present as a mere rudiment, the second scale 3 -nerved, the third scale 7 -nerved, the fourth scale deep chestnutbrown when mature. Introduced into waste places and fields and along roadsides, N. S. to S. Dak., south to Fla. and Kans. July-Sept.
5. Syntherisma sanguinàlis (L.) Dulac. Large Crab-grass. (I. F. f. 240.) Culms I m. or less long, finally prostrate at the base and rooting at the lower nodes. Lower sheaths densely papillose-hirsute; leaves $4-20 \mathrm{~cm}$. long, 4-10 mm . wide, more or less papillose-hirsute on both surfaces; racemes $3-10,5-18 \mathrm{~cm}$. long; spikelets $2.5-3 \mathrm{~mm}$. long and about 0.8 mm . wide, elliptic-lanceolate, acute, in pairs, the first scale minute, triangular, the second scale 3 -nerved, about one-half as long as the spikelet, the third scale 7 -nerved, the fourth scale yellowish white, acutely apiculate. Cultivated places, fields, roadsides, etc., throughout N. Am., principally in the north. July-Aug.
6. Syntherisma fimbriàta (Link) Nash. Fimbriate Crab-Grass. Culms 8 dm . long or less, finally prostrate at the base and rooting at the lower nodes. Lower sheaths densely papillose-hirsute with spreading hairs; leaves $2-8 \mathrm{~cm}$. long, $5-10 \mathrm{~mm}$. wide, both surfaces glabrous or more or less pubescent; racemes $2-9,2-12 \mathrm{~cm}$. long; spikelets $3-3.5 \mathrm{~mm}$. long and about 0.8 mm . wide, lanceolate, very acute, in pairs, the first scale minute, the second scale 3 -nerved, more than onehalf as long as the spikelet, the third scale 7 -nerved, the fourth scale lanceolate, very acute, yellowish-white. Dry sandy soil, D. C. to Fla., west to Tex., also in Kans. June-Sept.

## 14. BRACHIÁRIA Ledeb.

Usualiy perennial grasses, with flat leaves and a panicle composed of alternate scattered one-sided racemes with the spikelets borne in 2 rows. Spikelets I-flowered, articulated to the pedicel below the empty scales. Scales 4 , the outer 3 membranous; fourth scale chartaceous, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. Grain free. Species about 100, natives of temperate and tropical regions.

[^9]1. Brachiaria digitarioìdes (Carpenter) Nash. Narrow PaNictim. (I. F. f. 245.) Glabrous, culms erect from a long and stout creeping rootstock, (1)-15 dm. tall, simple, stout, smooth. Sheaths smooth; leaves $1-2.5 \mathrm{dm}$. long, $\mathcal{S}-10 \mathrm{~mm}$. wike, long-acuminate; panicle linear, $\mathbf{1} .5-3 \mathrm{dm}$. long, its branches $2.5-7.5 \mathrm{~cm}$. heng, erect; spikelets about 2.5 mm . long, ovate, acute; first scale about onc-half as long as the spikelet, acute, 3 -nerved; second about 2 mm . long, 5 -nerved and a little exceeded by the 3 -nerved third one; the fourth 3 -nerved, slightly shorter than the third. In water, Del. to Fla. and Tex. July-Aug. (Limniome diģitariovides Carpenter.)
2. Brachiaria obtùsa (H. B. K.) Nash. Buevt l'avitim. (I. F. f. zfo.) Glabrous, culms erect, $3^{-6 ~ d m}$. tall, simple or branching at hasc, smonth. Sheaths smooth; leaves $6.25-22 \mathrm{~cm}$. long, 2-6 mm . wide, usually cect, long actuminate; panicle linear, $5-15 \mathrm{~cm}$. long; branches $1.8-3.7 \mathrm{~cm}$. hong appressed: spilelets about 3 mm . long, crowded, oval or obovoid, obtuse, turgid; first scale shorter
than the rest, obtuse, 5 -nerved; second, third and fourth scales about equal, the second and third 5 -nerved, the fourth chartaceous. Kans. to Ariz., south to Tex. and Mex. July-Sept. (Panicum obtusum H. B. K.)

## 15. ECHINOCHLOA Beauv.

Usually tall grasses, commonly annuals, with broad leaves and a terminal inflorescence consisting of one-sided racemes racemosely or paniculately arranged. Spikelets I-flowered, singly disposed, or in smaller racemes or clusters on the ultimate divisions of the inflorescence. Scales 4, the outer 3 membranous, hispid on the nerves, the third and usually also the second scale awned, or sometimes merely awn-pointed, the awn often very long; fourth scale indurated, shining, frequently pointed, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. Grain free. [Greek, in reference to the stout hispid hairs of the spikelets.] Species about 12, mostly in warm and tropical countries.
Sheaths glabrous.
Spikelets 3 mm . long, the second and third scales more or less awned.

1. E. Crus-galli.

Spikelets 2 mm . long, the second and third scales merely awn-pointed.
2. E. colona.

Sheaths, at least the lower ones, densely papillose-hirsute.
3. E. Walteri.
I. Echinochloa Crús-gálli (L.) Beauv. Barnyard-Grass. Cockspur-grass. (I. F. f. 243.) Culms 6-12 dm. tall, often branching at base. Sheaths smooth and glabrous; leaves $1.5-6 \mathrm{dm}$. long, $6-25 \mathrm{~mm}$. wide, glabrous, smooth or scabrous; panicle composed of $5-15$ sessile, erect or ascending branches, or the lower branches spreading or reflexed; spikelets ovate, green or purple, densely crowded in 2-4 rows on one side of the rachis; second and third scales about 3 mm . long, scabrous or hispid, the third scale more or less awned, empty, the fourth ovate, abruptly pointed. In cultivated and waste places, throughout N. Am. except the extreme north. Widely distributed as a weed in all cultivated regions. Naturalized from Europe. Aug.-Oct. (Panicum Crus-galli L.)
2. Echinochloa colòna (L.) Link. Jungle Rice. (I. F. f. 243a.) Culms tufted, smooth and glabrous, $1.5-7.5 \mathrm{dm}$. tall, often decumbent and rooting at the lower nodes. Sheaths compressed, usually crowded; leaves flat, $2.5-17 \mathrm{~cm}$. long, 2-8 mm. wide; inflorescence composed of 3-18 r-sided more or less spreading dense racemes, $6-30 \mathrm{~mm}$. long, disposed along a 3 -angled rachis and generally somewhat exceeding the length of the internodes; spikelets single, in pairs, or in 3's in 2 rows on one side of the hispidulous, triangular rachis, obovate, pointed, the first scale about one-half as long as the spikelet, 3 -nerved, the second and third scales a little more than 2 mm . long, awnless, 5 -nerved, hispid on the nerves, the fourth scale cuspidate. Fields and roadsides, Va. to Fla., Tex. and Mex. Common in all tropical countries. March-Sept. (Panicum colonum L.)
3. Echinochloa Walteri (Pursh) Nash. Salt-marsh Cockspur-grass. (I. F. f. 244.) Culms $9-18 \mathrm{dm}$. tall, robust, smooth. Sheaths, at least the lower ones, papillose-hispid; leaves 3 dm . or more long, $1.25-2.5 \mathrm{~cm}$. wide, strongly scabrous above; panicle $1.5-4.5 \mathrm{dm}$. long, consisting of $10-40$ ascending or spreading branches; spikelets ovate-lanceolate, densely crowded in 2-4 rows on one side of the scabrous and hispid rachis, brownish-purple; second and third scales about 3 mm . long, scabrous and hispid, tipped with upwardly barbed awns, sometimes Io-20 times their length; fourth scale ovate-lanceolate, acuminate. In marshes and ditches, principally within the influence of salt-water, Ont. to N. H. and R. I., Fla. and La. Aug.-Oct. (Panicum Walteri Pursh.)

## 16. PÁNICUM L.

Annuals or perennials, various in habit, with open or contracted panicles. Spikelets 1-2-flowered, when 2 -flowered the lower one staminate only. Scales 4, the 3 lower membranous, empty, or the third with a staminate flower, varying in the same species; the inner or fourth scale chartaceous, shining, enclosing a palet of similar texture and a perfect flower. Awns none. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the hardened fruiting scale and palet.
[Old Latin name for some grass, probably the cultivated Sorghum, referring to its panicle, taken from Pliny.] About 300 species, in temperate and tropical regions. The geographic distribution of many of our species is not well ascertained. The old English name Panic or Panic-grass is often applied to any of the species.

Palet of the fourth scale much enlarged at maturity, forcing the spikelet open and making it gape.

1. P. hians.

Palet of the fourth scale not enlarged, smaller than the scale.
Spikelets roughened with numerous tubercles, glabrous.
2. $P$. verrucosum.

Spikelets not tuberculate, or if so, the tubercles bearing hairs.
(A) Basal and culm leaves similar, usually elongated; spikelets lanceolate to ovate, commonly the former, acute to acuminate.
Lower sheaths round or but little flattened, not keeled.
Culms branched, at least at maturity; no scaly rootstocks nor stolons. Sheaths very pubescent.

Spikelets lanceolate, 3 mm . long or less.
Annuals; pedicels not usually more than 2-3 times as long as the spikelets.
Culms stout; panicle usually included at the base, its many branches repeatedly divided and bearing numerous spikelets.
3. P. capillare.

Culms slender; panicle exserted, its few branches but little divided, and bearing comparatively few spikelets.
Spikelets 2 mm . long, acute.
4. P. minus.

Spikelets 3 mm . long, acuminate. 5. P. flexile.

Perennial; pedicels commonly many times as long as the spikelets. 6. P. cognatum.

Spikelets ovate, 5 mm . long.
Sheaths glabrous.
7. P. miliaceum.
ulms simple, from stout, often scaly, rootstocks.
Culms tufted; rootstocks scaly. 9. P. virgatum.
Culms not tufted; rootstocks not scaly; leaves glaucous and very thick.

Io. $P$. amarum.
Lower sheaths much compressed, broad, keeled, often equitant.
Fourth scale of the spikelet sessile.
Spikelets $3-3.5 \mathrm{~mm}$. long, the apex curved. 13. P. rostratum.
Spikelets less than 3 mm . long, the apex not curved.
Ligule naked; culms finally much branched.
in. P. agrostoides.
Ligule ciliate ; culms simple or nearly so.
12. P. longifolium.

Fourth scale of the spikelet distinctly stalked. 14. P. stipitatum.
(B) Basal and culm leaves dissimilar, the former generally much shorter and broader than the latter; rosulate tufts of leaves often present in the fall ; spikelets oval to obovate or globose, obtuse, or rarely acutish (acute in No. 15).
( $A$ ) Middle leaves of the main culm less than 1.5 cm . wide, usually less than 1 cm . in width, the base rounded or truncate, rarely subcordate, sometimes narrowed toward the base.
(a) Leaves elongated, erect, narrow, distinctly narrowed toward the base, especially the lower ones.
Secondary panicles borne on short basal branches, which are nearly
concealed in the dense tufts.
Spikelets less than 3 mm . long, obtuse or acutish, pubescent.
16. P. Enslini.

Spikelets 3-4 mm. long, acute, glabrous.
15. $P$. depauperatum.

No concealed basal panicles.
Sheaths glabrous, or merely ciliate on the margins. Leaves linear, less than 5 mm . wide.

> 17. P. Werneri.

Leaves linear-lanceolate, $6-10 \mathrm{~mm}$. wide.
18. P. Bicknellii.

Sheaths densely pubescent. 19. $P$. laxiflorum.
(b) Leaves not elongated, lanceolate, not manifestly narrowed toward the base.
x. Culms, leaves, and sheaths glabrous or the latter two merely ciliate on the margins.
Spikelets glabrous.
Nodes of the culm naked.
Leaves divaricate; culms erect, short, the later branches bunched. 23. P. dichotomum.
Leaves erect; culms accumbent, weak, finally elongated, and the later branches scattered.
24. P. sphagnicola.

Nodes of the culm densely barbed.
25. P. barbulatum.

Spikelets pubescent.
Culms very slender, less than 2 dm . tall, densely tufted, simple.
22. P. Brittoni.

Culms not slender, 3 dm . or more tall, at length branched.
Spikelets elliptic; leaves smooth above or nearly so, naked at the base.
Panicle dense, the branches erect or nearly so; spikelets 1.5 mm . long. 27. P. Eatoni.
Panicle loose and open, the branches spreading; spikelets 2 mm . long. 28. $P$. boreale.
Spikelets globose or nearly so; leaves very rough above, thick, ciliate at the base.
46. P. spharocarpon.
2. Culms, sheaths or leaves, or all of them, pubescent.

* Spikelets 2.5 mm . or less long.
$\dagger$ Leaves glabrous, or if pubescent beneath, the hairs short and soft.
Primary leaves long and narrow, erect, thick, the numerous secondary leaves very narrow, $\mathbf{I} .5 \mathrm{~mm}$. or less wide, usually involute when dry.
Spikelets broadly obovoid, barely 2 mm . long.

20. $P$. neuranthum.

Spikelets elliptic, 3 mm . long.
21. P. angustifolium.

Primary leaves lanceolate, the secondary leaves flat, lanceolate, exceeding 2 mm . broad.
Culms villous with short hairs, at least below.
Leaves minutely villous beneath.
Culms erect, rigid.
31. P. Columbianum.

Culms weak, finally decumbent and forming mats.
32. P. tsugetorum.

Leaves glabrous beneath.
Spikelets obovoid, I. 5 mm . long.
30. P. Nashianum.

Spikelets elliptic; 2.5 mm . long.
49. P. Ashei.

Culms not villous.
Culms glabrous; spikelets about 1.25 mm . long.
29. P. nitidum.

Culms at base densely pubescent with long stiff, ap pressed hairs; spikelets $2-2.5 \mathrm{~mm}$. long.
Panicle $3-4 \mathrm{~cm}$. long, oblong, dense; spikelets 2 mm . long; leaves naked on the margins.
39. P. Addisonii.

Panicle $5-7 \mathrm{~cm}$. long, broadly ovoid, open ; spikelets 2.5 mm . long; leaves ciliate at the base.
40. P. Commonsianum.
$\dagger \dagger$ Leaves pubescent on both surfaces, especially beneath.
Hairs on the lower surface short, soft, and copious.
Hairs on the upper surface of the leaves long and stiff; spikelets about x .5 mm . long. 37. P. lanuginosum.
Hairs on the upper surface of the leaves short, soft, and copious.
Spikelets nearly 2 mm . long ; panicle dense, oblong; culms slender, glabrous.
26. $P$. annulum.

Spikelets 2.5 mm . long; panicle open, ovoid ; culms stout, densely pubescent. 38. P. viscidum.
Hairs on the lower, as well as the upper, surface stiff and long, sometimes scattered.
Spikelets $\mathbf{x} .5 \mathrm{~mm}$. long.

Culms slender; hairs on the upper surface of the leaves extremely long and copious.
Panicle $2-3 \mathrm{~cm}$. long; culms minutely pubescent above. 34. P. filiculme.
Panicle $4^{-6} \mathrm{~cm}$. long; culms hirsute above, especially in the panicle. 33. P. implicatum.
Culms rather stout; hairs on the upper surface of the leaves shorter and more scattered, sometimes nearly wanting. 35. P. pubescens.
Spikelets a little more than 2 mm . long.
36. P. Atlanticum.
** Spikelets more than 3 mm . long.
Leaves glabrous, or sometimes pubescent beneath.
Panicle narrow, its branches appressed. 44. P. xanthophysum.
Panicle open, its branches spreading.
Sheaths glabrous, except the ciliate margins; spikelets elliptic. 45. P. calliphyllum.

Sheaths papillose-hirsute; spikelets broadly ovoid, turgid. 43. P. Scribnerianum.

Leaves pubescent on both surfaces.
Leaves erect, rigid, thick, 3-4 mm. wide; spikelets pubescent with short hairs. 41. P. Wilcoxianum.

Leaves often spreading, not thick, $5-10 \mathrm{~mm}$. wide; spikelets long. hirsute.
42. P. Liebergii.
$(B)$ Middle leaves of the main culm more than 1.5 cm . wide, often 3 cm . in width, the base cordate and clasping.
Spikelets 2.5 mm . long or less.
Leaves glabrous on both surfaces.
Spikelets about 1.5 mm . long; panicle oblong and dense; culms simple. 47. P. polyanthes.
Spikelets 2.5 mm . long; panicle ovoid and open; culms branched. Sheaths papillose-hispid, especially the short terminal ones on the branches. Sheaths glabrous.
52. P. clandestinum.
48. P. commutatum,

Leaves densely villous.
38. P. viscidum. Spikelets 3 mm . long or more.

Nodes manifestly and copiously barbed; spikelets $4-5 \mathrm{~mm}$. long.
51. P. Porterianum.

Nodes naked.
Sheathis glabrous, or merely pubescent on the margins; panicle open, its branches spreading. 50. P. macrocarpon.
Sheaths hispid; panicle contracted, its branches appressed.
44. P. xanthophysum.

1. Panicum hìans Ell. Gaping Panicum. (I. F. f. 247.) Glabrous; culms erect, $3-7.5 \mathrm{dm}$. tall, generally simple, sometimes creeping at base, smooth. Leaves $7 \cdot 5-\mathbf{1 2 . 5} \mathbf{~ c m}$. long, $2-6 \mathrm{~mm}$. wide, acuminate, generally erect; panicle $7 \cdot 5-20$ cm . long; branches few, generally spreading, the longer ones often drooping, the lower naked below the middle; spikelets about 2 mm . long; fourth scale exceeded by the third and its usually empty palet which is much enlarged, generally forcing the spikelet wide open. In moist ground, N. Car. to Mo., south to Fla. and Tex. Aug.-Sept.
2. Panicum verrucòsum Muhl. Warty Panicum. (I. F. f. 278.) Culms erect or decumbent, slender, generally much branched at base. Sheaths glahrous, much shorter than the internodes; leaves $5-17.5 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, crect or ascending, glabrous, rough on the margins; panicle $7 \cdot 5-30 \mathrm{~cm}$. long, its lower branches ${ }^{\prime} 5-15 \mathrm{~cm}$. long, naked below, strict and ascending, or lax and spreading; spikelets about 1.5 mm . long, elliptic, acutish, borne in pairs along the branches, the first scale about one-quarter as long as the warty second and third, the fourth scale apiculate. Moist soil, Mass. to Fla., west to La., mostly near the coast. July-Sept.
3. Panicum capillàre L. Witch-grass. Tumatif: Wmar. (I. F. f. 274.) Culms erect or decumbent, 3-6 dm. tall, simple or sometimes sparingly banched. Sheaths papillose-hirsute; leaves 1.5-3 dm. long, 616 mm . wide, pubeseent; terminal panicle $2-3.5 \mathrm{dm}$, long, lower branches $1.5-2.5 \mathrm{dm}$. long; lateral pani-
cles, when present, smaller; spikelets $\mathbf{2 - 2 . 5} \mathrm{mm}$. long, acuminate; first scale onefourth to one-half as long as the spikelet; second and third scales nearly equal, very acute, the fourth 1.5 mm . long. In dry soil, common as a weed in cultivated fields, N. S. to Br. Col., south to Fla., Tex. and Nev. July-Sept.

Panicum capillàre Gattingèri Nash. Culms more slender than in the type; terminai panicle rarely over 1.5 dm . long, the lateral ones very numerous. Moist places, N. J. to Tenn., Mo. and southward.
4. Panicum minus (Muhl.) Nash. Wood Panicum. (I. F. f. 277.) Culms erect, or occasionally decumbent, 2-6 dm. long, slender, somewhat branched at base. Sheaths hirsute; leaves $5-10 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, erect, more or less pubescent; panicle $10-22.5 \mathrm{~cm}$. long, its lower branches $7.5-10 \mathrm{~cm}$. long, spreading or ascending; spikelets about I. 5 mm . long, elliptic, acute, smooth, borne in pairs at the extremities of the ultimate divisions of the panicle; first scale about one-third as long as the equal acute second and third ones, the fourth somewhat shorter than the third. In dry woods and thickets, N. B. to Ga., west to Mo. Aug.-Sept.
5. Panicum fléxile (Gattinger) Scribn. Wiry Panicum. (I. F. f. 275.) Culms erect, I.5-4.5 dm. tall, slender, bearded at the nodes. Sheaths papillosehirsute; leaves Io -22.5 cm . long, 4-6 mm. wide, erect, long-acuminate, more or less pubescent; panicle $1-2.25 \mathrm{dm}$. long, narrowly ovoid to oblong in outline, its branches ascending, the lower ones $5-8.5 \mathrm{~cm}$. long; spikelets 3 mm . long, much shorter than the pedicels, acuminate; first scale about one-fourth as long as the spikelet; second and third scales about equal, 5-7-nerved; fourth scale elliptic, somewhat shorter than the third. In moist or dry soil, Penn. to Tenn. and Mo. Aug.-Oct.
6. Panicum cognàtum Schultes. Diffuse Panicum. (I. F. f. 276.) Culms erect or decumbent, 3-6 dm. tall, generally much branched at the base, slender. Lower sheaths sometimes densely pubescent; leaves $3.75-10 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, ascending, acuminate, glabrous; panicle 1.25-3 dm. long, bearded in the axils, the lower branches I-2 dm. long, finally exserted and widely spreading at maturity; spikelets lanceolate, about 3 mm . long, acuminate, glabrous or pubescent, on capillary pedicels of many times their length; first scale minute; second and third equal, acute, glabrous or sometimes villous, the fourth lanceolate, 2.5 mm . long. In dry soil, Ill. to Ga. and Fla., west to Minn., Mo. and Ariz. July-Sept. ( $P$. autumnale Bosc.)
7. Panicum miliàceum L. Millet. (I. F. f. 272.) Culmse rect or decumbent, rather stout, 3 dm . tall or more, glabrous or hirsute. Sheaths papillose-hirsute; leaves 1.25-2.5 dm. long, $8-25 \mathrm{~mm}$. wide, more or less pubescent; panicle rather dense, $1-2.5 \mathrm{dm}$. long; branches erect or ascending; spikelets 5 mm . long, acuminate; first scale about two-thirds as long as the spikelet, acuminate, 5-7nerved; second scale acuminate, 13 -nerved, somewhat exceeding the 7 -13-nerved acuminate third one, which subtends an empty palet; fourth scale shorter than the third, becoming indurated, obtuse. In waste places, Me. to Del. and Penn., west to Neb. Adventive from the Old World. July-Sept.
8. Panicum prolíferum Lam. Spreading Panicum. (I. F. f. 273.) Culms at first erect, 3-6 dm. tall, simple, later decumbent and geniculate, I-I. 5 m . long, branched at all the upper nodes. Sheaths loose, glabrous, somewhat flattened; leaves I. 5-6 dm. long, 4-20 mm. wide, long-acuminate, scabrous on the margins and occasionally on the nerves; panicle pyramidal, $\mathrm{I}-4 \mathrm{dm}$. long; spikelets $2-3 \mathrm{~mm}$. long, crowded, lanceolate, acute, glabrous, sometimes purplish; first scale about one-fourth as long as the spikelet, enclosing its base; second and third scales about equal, acute, $5-7$-nerved; fourth scale elliptic, shining. In wet soil, Me. to Penn. and Neb., south to Fla. and Tex. July-Sept.
9. Panicum virgàtum L. Tall Smooth Panicum. (I. F. f. 270.) Culms erect from a creeping rootstock, 9-15 dm. tall, glabrous. Sheaths smooth and glabrous; leaves elongated, 3 dm . long or more, $6-12 \mathrm{~mm}$. wide, flat, long-acuminate, narrowed toward the base, glabrous, rough on the margins; panicle 1.5-5 dm . long, the lower branches $1-2.5 \mathrm{dm}$. long, more or less widely spreading or sometimes nearly erect; spikelets ovate, acuminate, $4-4.5 \mathrm{~mm}$. long; first scale
acuminate, about one-half as long as the spikelet, 3 - 5 -nerved; second scale generally longer than the others, 5-7-nerved, the third similar and usually subtending a palet and staminate flower. In moist or dry soil, Me. and Ont. to Minn., south to Fla., Kans. and Tex. Aug.-Sept.
10. Panicum amàrum Ell. Sea-beach Panicum. (I. F. f. 271.) Smooth and glabrous, glaucous; culms arising from long branching rootstocks, 3-9 dm. tall, decumbent. Sheaths overlapping; leaves $\mathbf{1} .5-3 \mathrm{dm}$. long, $6-12 \mathrm{~mm}$. wide, long-acuminate, thick and leathery, involute on the margins, at least toward the apex, the uppermost leaf generally exceeding the panicle; panicle linear, less than 3 dm . long, its branches erect; spikelets $5-6 \mathrm{~mm}$. long; first, second, and third scales acuminate, the first one-half to two-thirds as long as the spikelet, the third somewhat longer than the second, usually with a palet and staminate flower, the fourth elliptic. On sea beaches, N. H. to Fla. Sept.-Nov.
II. Panicum agrostoides Spreng. Agrostis-like Panicum. (I. F. f. 249.) Culms erect, 4.5-6 dm. tall, much branched, compressed, smooth. Sheaths compressed, glabrous, or sometimes hairy at the throat; ligule very short, naked; leaves 3 dm . long or more, $4-8 \mathrm{~mm}$. wide, acuminate; panicles pyramidal, $\mathrm{I}-3$ dm . long, terminating the culm and branches; primary branches of the panicle spreading, secondary generally appressed; spikelets 1.5 mm . long, acute, straight; first scale 3 -nerved, acute; second and third scales 5 -nerved, about twice as long as the first and longer than the oval fourth scale. Wet ground, Me. to Minn., south to Fla., Kans. and Tex. July-Sept.
12. Panicum longifòlium Torr. Long-leaved Panicum. (I. F. f. 251.) Culms erect, 3-6 dm. tall, slender, simple, or occasionally with a single lateral panicle. Leaves $2-3 \mathrm{dm}$. long, $2-4 \mathrm{~mm}$. wide, acuminate into a long, slender point, rough, glabrous; ligule short, pilose; panicles $1.25-2.25 \mathrm{dm}$. long; primary branches long and slender, spreading, secondary very short, appressed, generally bearing $\mathbf{I}-3$ spikelets; spikelets 2 mm . long, acuminate; first scale acute, about one-half as long as the acuminate second one; third scale equalling the second, acuminate, one-third longer than the elliptic obtuse fourth one. Moist soil, Conn. to Penn. and D. C. Aug-Sept.
13. Panicum rostràtum Muhl. Beaked Panicum. (I. F. f. 248.) Culms erect from a creeping scaly branched rootstock, $4 \cdot 5-15 \mathrm{dm}$. tall, much branched. Sheaths glabrous, or the lower ones pubescent; leaves 3 dm . long or more, 4-10 mm . wide, acuminate; panicles pyramidal, 1.5-3 dm. long; axis and ascending branches scabrous; spikelets 3 mm . long, crowded, lanceolate, acuminate; first scale less than one-half as long as the spikelet; second scale curved at the apex, scabrous above on the middle nerve; third scale usually subtending a small empty palet. Moist soil, N. J. to Ill. and Kans., south to Fla. and Tex. July-Sept.
14. Panicum stipitatum Nash. Long Panicum. (I. F. f. 250.) Culms erect, $9-\mathbf{1 5 ~ d m}$. tall, much branched. Leaves 3 dm . long or more, $4-8 \mathrm{~mm}$. wide, acuminate, scabrous; panicles pyramidal, $\mathbf{r}-3 \mathrm{dm}$. long; primary branches spreading or ascending, the secondary usually divaricate; spikelets about 2.5 mm . long, crowded, acuminate; first scale acute or acuminate, one-third the length of the equal and acuminate second and third; fourth scale narrowly elliptic, about onehalf as long as the third and raised on a delicate stalk about 0.5 mm . long. Moist soil, N. J. and Penn. to Ky., Tenn. and N. Car, July-Sept. ( $P$. elongatum Pursh. Not Salisb. 1796.)
15. Panicum depauperàtum Muhl. Starved Panicum. (I. F. f. 26S.) Culms erect, 3 dm . tall or less, simple or branched at base. Sheaths glabrous to hirsute; leaves erect, elongated, $\mathbf{I}-4 \mathrm{~mm}$. wide, mostly crowded at base and equalling or one-half as long as the culm, the upper culm-leaf often much exceeding the panicle; primary panicle generally much exserted from the upper sheath, 2.5-7.5 cm . long, usually linear, its branches mostly erect; secondary panicles on very short basal branches and often concealed by the lower leaves; spikelets $3-4 \mathrm{~mm}$. long, glabrous, acute. In dry places N. S. to Manitoba, south to Fla, and Tex. June-Sept.
16. Panicum Énslini Trin. Linear-leaven Panicum. (I. F. f. 268a.) Culms tufted, very slender, erect, smooth and glabrous, simple, $1.5+\mathrm{dm}$. t.ill. Sheaths glabrous or pilose with long white hatirs; leaves clongated, glabrous or more or less pilose, especially upon the lower surface, $7.5-25 \mathrm{~cm}$, long, $2-4 \mathrm{~mm}$.
wide, the uppermost leaf the longest, and often extending beyond the panicle; primary panicle loose and open, $3.75-10 \mathrm{~cm}$. long, its branches ascending; spikelets $2-2.5 \mathrm{~mm}$. long, obtuse or acutish, pubescent with spreading hairs. Dry soil, especially hillsides, N. Y. and N. J. to Mo. ( $P$. linearifolium Scribn.)
17. Panicum Wérneri Scribn. Werner's Panicum. (I. F. f. 268b.) Smooth and glabrous, light green. Culms tufted, erect, slender, simple or later sparingly branched, $2.5-4.5 \mathrm{dm}$. tall; leaves erect, elongated, linear, acuminate, $5-10 \mathrm{~cm}$. long, $3-5 \mathrm{~mm}$. wide, panicle loose and open, $6.2-8.7 \mathrm{~cm}$. long, its branches ascending; spikelets about 2 mm . long on longer hispidulous pedicels, oval, minutely and sparsely pubescent, the first scale orbicular, about one-quarter as long as the spikelet, r-nerved, the second and third scales 7 -nerved, the fourth scale oval, slightly apiculate. Dry knolls in swamps, N. Y. and Ohio. June-July.
18. Panicum Bicknéllii Nash. Bicknell's Panicum. (I. F. f. 268c.) Culms erect or decumbent at the base, slender, $2-4 \mathrm{dm}$. tall, the lower internodes puberulent. Sheaths ciliate on the margins, the lowermost pubescent; leaves elongated, erect, linear-lanceolate, acuminate, narrowed toward the ciliate base, primary leaves $7.5-17.5 \mathrm{~cm}$. long, $5-10 \mathrm{~mm}$. wide; primary panicle $6-7.5 \mathrm{~cm}$. long, its branches ascending, secondary panicles smaller, with appressed branches; spikelets obovate or oval, $2 \cdot 5-3 \mathrm{~mm}$. long, pubescent with short, spreading hairs, the first scale I-nerved, the second and third scales 9 -nerved. Dry wooded hills, N. Y. and Penn. July-Aug.
19. Panicum laxiflòrum Lam. Lax-flowered Panicum. (I. F. f. 262.) Culms erect, 2-4 dm. tall, simple, pubescent, or glabrate. Sheaths shorter than the internodes, hirsute; leaves $6.25-12.5 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, erect, generally narrowed at base, long-acuminate, pubescent or glabrate; panicle $5-10 \mathrm{~cm}$. long, its axis and erect or spreading branches sometimes hirsute; spikelets about 2 mm . long, ellipsoid or narrowly obovoid, strongly pubescent; first scale minute, I-nerved; second and third about equal, 9 -nerved, very pubescent, as long as the shining, obtuse, minutely apiculate fourth one; third scale usually with an empty palet. Moist soil, Va. to Ky., south to Fla. June-Aug.
20. Panicum neuránthum Griseb. Nerved Panicum. (I. F. f. 269a.) Culms tufted, slender, at length much branched, 3-7.5 dm. tall. Sheaths glabrous, or the lower pubescent; leaves smooth and glabrous, the primary erect, acuminate, $2.5-10 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, those on the branches shorter, erect or ascending, usually involute when dry, concealing the small secondary panicles; primary panicle $2.5-10 \mathrm{~cm}$. long, its branches at first erect, at length widely spreading; spikelets numerous, broadly obovate, about 2 mm . long, densely pubescent with short, spreading hairs, the second and third scales 7 -nerved. Dry or moist soil along the coast, Va. to Fla. and La. Also in Cuba. June-Oct.
21. Panicum angustifòlium Ell. Narrow-Leaved Panicum. (I. F. f. 269.) Culms erect, 3-6 dm. tall, glabrous, at first simple, later profusely branched above. Leaves elongated, $2-6 \mathrm{~mm}$. wide, narrowed to the base, firm, glabrous, those of the culm distant, those of the branches shorter and crowded; primary panicle long-exserted, $2.5-7.5 \mathrm{~cm}$. long, its branches ascending or erect; lateral panicles smaller, shorter than the leaves; spikelets few, about 2.5 mm . long, elliptic to obovoid; first scale one-fourth to one-third as long as the spikelet; second and third oval, 9 -nerved, pubescent; fourth oval, minutely pubescent at the apex. Dry soil, N. Car. to Mo., south to Fla. and Tex. June-Aug.
22. Panicum Bríttoni Nash. Britton's Panicum. (I. F. f. 263a.) Smooth and glabrous. Culms coarsely striate, not branched, tufted, slender, erect, rigid, I-2 dm. tall; leaves longer than the sheaths, those on the culm three in number, the middle one the longest, $1.25-3.1 \mathrm{~cm}$. long, $1.5-3 \mathrm{~mm}$. wide, erect, acuminate, $5-7$-nerved; panicle $1.8-3.1 \mathrm{~cm}$. long, its branches spreading or ascending; spikelets one-half as long as the pedicels or less, obovoid, obtuse, 1.5 mm . long, the first scale one-third as long as the spikelet, the second and third scales 7 -nerved, densely pubescent with spreading hairs. Moist sand in the pine barrens of southern N. J. May-June.
23. Panicum dichótomum L. Forked Panicum. (I. F. f. 264.) Smooth and glabrous, or the lower nodes barbed. Culms erect, I.5-6 dm. tall, at first simple, later profusely dichotomously branched at about the middle. Leaves light green, widely spreading, generally much narrowed toward the base, the primary
ones distant, $5-7.5 \mathrm{~cm}$. long, 4-6 mm. wide, those of the branches 2.5 cm . long or less, $\mathbf{I}-\mathbf{2} \mathrm{mm}$. wide, sometimes involute; primary panicle usually long-exserted, $2.5-5 \mathrm{~cm}$. long; branches lax, spreading, bearing few spikelets; secondary panicles smaller, not exceeding the leaves, their branches with very few spikelets; spikelets about 2 mm . long, ellipsoid, glabrous. In woodlands and thickets, N. Y. to Ky., Mo. and southward. June-July.
24. Panicum sphagnícola Nash. Sphagnum Panicum. (I. F. f. 264b.) Culms slender, 4.5-9 dm. long, at length much elongated, dichotomously much branched and declining. Leaves erect, smooth and glabrous on both surfaces, lanceolate, the primary leaves $2.5-6.25 \mathrm{~cm}$. long, $2-10 \mathrm{~mm}$. wide, those on the branches 3.75 cm . or less long; primary panicle loose and open, $3.75-7.5 \mathrm{~cm}$. long, its branches spreading or ascending; spikelets on elongated filiform pedicels, $\mathbf{1 . 7 5 - 2 . 5} \mathrm{mm}$. long, oval to obovoid, the scales glabrous or sparsely pubescent, the first less than one-half as long as the spikelet, I-nerved, the second and third scales 7 -nerved. Sphagnum bogs, D. C. and southern N. J. to Fla., west to Tex. JuneSept.
25. Panicum barbulàtum Michx. Barbed Panicum. (I. F. f. 265.) Culms at first simple, erect, 6-9 dm. tall, later profusely branched for their whole length, 9-12 dm. long, prostrate or leaning, the nodes strongly barbed. Leaves smooth and glabrous, the primary ones $7.5-12.5 \mathrm{~cm}$. long, about 1.25 cm . wide, widely spreading, the lower ones usually reflexed, those of the branches $1.25-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; primary panicle $7.5-\mathbf{1 2 . 5} \mathrm{cm}$. long, ovoid, its branches ascending, rigid; secondary panicles smaller, lax, the branches bearing few spikelets; spikelets about 1.5 mm . long, ellipsoid, purple, glabrous. Moist soil, Conn. and N. Y. to Tenn., south to Fla, and Tex. June-Aug.
26. Panicum ánnulum Ashe. Culms single, sometimes somewhat tufted, slender, $4^{-8} \mathrm{dm}$. tall, glabrous, the nodes densely barbed with long hairs. Sheaths, especially the lower ones, pubescent; leaves softly and densely pubescent on both surfaces, spreading; panicle oblong, dense, $5-11 \mathrm{~cm}$. long; spikelets nearly 2 mm . long, elliptic, pubescent. In dry rocky woods, Md. (according to Ashe) to Ga. June-July.
27. Panicum Èatoni Nash. Eaton's Panicum. (I. F. f. 267c.) Smooth and glabrous. Culms $4.5-10.5 \mathrm{dm}$. tall, erect, at length dichotomously branched and swollen at the nodes; leaves erect, lanceolate, acuminate, $3.75-10 \mathrm{~cm}$. long, 3-10 mm . wide; panicle finally long-exserted, dense and contracted, $7.5-12.5 \mathrm{~cm}$. long, 3.2 cm . or less broad, its branches erect-ascending ; spikelets oval, about 1.5 mm . long, acutish, the first scale 1-nerved, the second and third scales 7 -nerved, densely pubescent with spreading hairs. Along the coast, in damp or wet places, Me. to N. J. May-Aug.
28. Panicum boreàle Nash. Northern Panicum. (I. F. f. 26i.) Culms at first erect and simple, $3-6 \mathrm{dm}$. tall, later decumbent and somewhat branched, smooth and glabrous. Leaves $7 \cdot 5-12.5 \mathrm{~cm}$. long, 6-13 mm. wide, erect, sparsely ciliate at the base, acuminate; panicle $5-10 \mathrm{~cm}$. long, ovoid, its branches $2.5-5$ cm . long, spreading or ascending ; spikelets 2 mm . long, about equalling the pedicels, ellipsoid, somewhat pubescent; first scale ovate, obtuse; second and third scales oblong-ovate, 7 -nerved, pubescent, equalling the fourth, which is oval, acute, and slightly more than $\mathbf{I} .5 \mathrm{~mm}$. long. Moist soil, Newf, and Ont. to N. Y.. Vt. and Minn. June-Aug.
29. Panicum nítidum Lam. Shining Panicum. (I. F. f. 263.) Culms at first simple, $3-4.5 \mathrm{dm}$. tall, later profusely dichotomously branched, o-0 dm. long. Sheaths glabrous to pubescent; leaves glabrous, the primary ones $2.5-7.5 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide, erect, those of the branches $1.25-2.5 \mathrm{~cm}$. long. 2 mm . wide or less; primary panicle long-exserted, $2.5-5 \mathrm{~cm}$. long, ovoid, those of the branches smaller; spikelets about I mm. long, obovoid, pubescent, usually purple; second and third scales broadly oval or orbicular, 7 -nerved. Common in dry sandy soil, N. E. to N. Car. June-Aug.
30. Panicum Nashiànum Scribn. Nash's Panicum, (I. F. f. 20ta.) Culms tufted, glabrous or puberulent, slender, 1.5-3.75 dm. tall, at length much branched. Leaves erect or ascending, lanceolate, acuminate, smooth and glabrous, ciliate, at least at the base, $\mathbf{I} .8-5 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, the leaves of the branches smaller; primary panicle $2.5-5 \mathrm{~cm}$. long, the branches widely spreading; spikelets about 2
mm . long, obovate, the second and third scales 7 -nerved, densely pubescent with short, spreading hairs. Pine lands, Va. to Fla. March-July.
31. Panicum Columbiànum Scribn. (I. F. f. 267 b .) Culms tufted, erect, softly pubescent, $2-6 \mathrm{dm}$. tall, at length dichotomously branched, the branches erect. Lower sheaths pubescent, the upper glabrous; leaves lanceolate, erect, thickish and firm, glabrous above, the lower ones more or less pubescent beneath, the primary $3.75-5 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide, those on the branches smaller; panicle small, ovate, $2.5-3.75 \mathrm{~cm}$. long, its branches ascending; spikelets broadly obovoid, a little more than 1.5 mm . long, the outer 3 scales densely pubescent with spreading hairs. Fields and open woods, Mass. to N. Car., west to Tenn. and Ala. June-Sept.
32. Panicum tsugetòrum Nash. Hemlock Panicum. (I. F. f. 267d.) Culms and sheaths pubescent with short appressed or ascending hairs intermixed toward the base with longer ones. Culms tufted, 4.5 dm . or less tall, at length much branched and decumbent or prostrate; leaves erect or ascending, firm, lanceolate, minutely appressed-pubescent beneath, smooth and glabrous above, the primary leaves $3.75-7.5 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. wide, those on the branches smaller; primary panicles broadly ovoid, $3 \cdot 75-6.25 \mathrm{~cm}$. long, the branches spreading-ascending; spikelets broadly obovoid, about 1.75 mm . long, the outer 3 scales pubescent, with short spreading hairs. Dry soil in hemlock woods, Conn. and N. Y. to Ohio.
33. Panicum implicàtum Scribn. Hairy-panicled Panicum. (I. F. f. 267a.) Culms tufted, erect, $2.5-4.5 \mathrm{dm}$. tall, very slender, more or less pubescent, at length much branched. Sheaths densely papillose-hirsute, at least the lower ones; leaves erect, lanceolate, $\mathbf{I} .25-5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, at least the lower ones papillose-hirsute on both surfaces, especially beneath; panicle open, ovate, $2.5-6.25 \mathrm{~cm}$. long, its branches widely spreading; spikelets broadly obovoid, obtuse, purplish, about 1.5 mm . long, the outer 3 scales pubescent with short, spreading hairs, the first scale nearly one-half as long as the spikelet, broadly ovate, obtuse. Dry soil, Me. to Conn., N. Y. and N. J.
34. Panicum filicùlme Ashe. Culms densely tufted, slender, finally much branched, $2-3 \mathrm{dm}$. tail, minutely pubescent above. Sheaths hirsute with strongly very long hairs; leaves erect, the primary ones $1.5-3 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, papillose-pubescent on both surfaces or sometimes glabrous beneath, the hairs on the upper surface exceedingly long and copious; primary panicle long-exserted, $2-3 \mathrm{~cm}$. long; spikelets broadly obovoid, 1.5 mm . long, pubescent. In dry soil, N. J. to Ga. June-Aug.
35. Panicum pubéscens Lam. Hairy Panicum. (I. F. f. 267.) Culms at first erect and simple, later profusely branched and leaning or ascending, glabrous or pubescent. Sheaths hirsute, often papillose; leaves more or less hirsute, especially beneath, generally more or less spreading, those of the culm $5-7.5 \mathrm{~cm}$. long, those of the branches much shorter; primary panicles less than 7.5 cm . long, ovoid, their branches ascending; lateral panicles much smaller; spikelets hardly 2 mm . long, pubescent. In dry soil, common, Me. and Quebec to Br . Col., south to Ga ., Ind. Terr. and Ariz. June-Aug.
36. Panicum Atlánticum Nash. Atlantic Panicum. (I. F. f. 267f.) Papillose-hirsute with long, white, spreading hairs. Culms tufted, at length branched, $3-5 \mathrm{dm}$. tall, erect or ascending, a smooth ring below the nodes which are barbed with spreading hairs; leaves erect, rigid, thickish, linear-lanceolate, $3.75-10 \mathrm{~cm}$. long, $4-7 \mathrm{~mm}$. wide, middle leaves the longest; panicle $3 \cdot 75-6.25$ cm . long, $3-6 \mathrm{~cm}$. wide; spikelets numerous, obovoid, a little over 2 mm . long, 1.5 mm . wide, obtuse, the outer 3 scales densely pubescent with short spreading hairs. Dry soil, N. Y. to Ohio and Va. June-Aug.
37. Panicum lunuginòsum Ell. Woolly Panicum. (I. F. f. 266a.) Culms, sheaths and leaves villous with spreading hairs, those on the leaves and the upper part of the culm shorter. Culms leafy, tufted, $3-7.5 \mathrm{dm}$. tall, erect, at length branched, a smooth ring below each barbed node; leaves erect, lanceolate, $3.75-12.5 \mathrm{~cm}$. long, $4-9 \mathrm{~mm}$. broad; panicle ovoid, $3.75-10 \mathrm{~cm}$. long, the axis pubescent, the branches ascending, the larger $2.5-5 \mathrm{~cm}$. long; spikelets numerous, broadly obovoid, about 1.75 mm . long, the first scale orbicular, the second and third scales nearly orbicular, densely pubescent with spreading hairs. Dry sandy soil, southern N. J. to Fla. and Ala.
38. Panicum víscidum Ell. Velvety Panicum. (1. F. f. 266.) Culms erect, 6-12 dm. tall, simple, or at length much branched above, villous. Sheaths villous; leaves softly pubescent, those of the culm $10-17.5 \mathrm{~cm}$. long, $\mathbf{1 0}-16 \mathrm{~mm}$. wide, distant, those of the branches $2.5-6.25 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, crowded; primary panicles $7.5-15 \mathrm{~cm}$. long, ovoid, branches ascending; secondary panicles much smaller; spikelets ovoid to oval, about 2.5 mm . long, pubescent; fourth scale oval, apiculate, 2 mm . long. Moist soil, N. J. to Ind. and the Ind. Terr., south to Fla. and Tex. Not viscid. June-Aug.
39. Panicum Addisònii Nash. Rigid Panicum. (I. F. f. 267e.) Culms 2.5-3.75 dm. tall, rigid, tufted, erect, or decumbent at the base, at length much branched, the branches erect, pubescent with long, nearly appressed hairs. Sheaths appressed-pubescent, at least the lower ones; leaves erect, lanceolate, thickish, smooth and glabrous on both surfaces, acuminate, $2.5-7.5 \mathrm{~cm}$. long, $3-6 \mathrm{~mm}$. wide; panicle ovoid to oblong, $1.8-5.6 \mathrm{~cm}$. long, its branches spreading or ascending; spikelets obovoid, 2 mm . long; second and third scales densely pubescent with long, spreading hairs. Sandy soil, southern N. J. May-June.
40. Panicum Commonsiànum Ashe, Commons' Panicum. Culms tufted, erect, 2.5-5 dm. tall, densely appressed-hirsute below and puberulent above, or rarely somewhat hirsute. Sheaths, especially the lower ones, appressed-hirsute; leaves erect or nearly so, firm, glabrous on both surfaces, ciliate toward the base, 4-10 cm. long, 3-6 mm. wide; panicle open, $5-7 \mathrm{~cm}$. long, broadly ovate, its branches spreading; spikelets 2.5 mm . long, obovate, pubescent. On dry, sandy ridges along the coast, Del. to N. Car. June-July.
41. Panicum Wilcoxiànum Vasey. Wilcox's Panicum. (I. F. f. 260.) Culms erect, $\mathbf{I} .5-2.5 \mathrm{dm}$. tall, sparingly pubescent. Sheaths papillose-pubescent; leaves $3.75-7.5 \mathrm{~cm}$. long, less than 4 mm . wide, long-acuminate, strongly pubescent with long hairs; panicle about 3.75 cm . long, oblong to ovoid, compact; branches less than 2.5 cm . long, ascending, flexuous; spikelets about 2.5 mm . long, ellipsoid; first scale about one-quarter as long as the spikelet; second and third scales about equal, pubescent; fourth scale about as long as the third, obtuse. In dry soil, Neb. (and Kans. ?). July-Aug.
42. Panicum Liebérgii (Vasey) Scribn. Lieberg's Panicum. (I. F. f. 259a.) Culms erect, slender, glabrous, roughish, especially near the nodes, $3-6 \mathrm{dm}$. tall, at length branched. Sheaths papillose-hirsute with spreading hairs; leaves erect or ascending, lanceolate, $5-10 \mathrm{~cm}$. long, 6-12 mm. wide, acuminate at the apex, papillose-hispid beneath and sometimes sparingly so on the rough upper surface; panicle oblong, $5-10 \mathrm{~cm}$. long, its branches erect or ascending; spikelets $3-4 \mathrm{~mm}$. long, oval, the outer three scales papillose-hirsute with long, spreading hairs. Dry soil, Ohio to Minn. and S. Dak., south to Mo. and Neb. June-July.
43. Panicum Scribneriànum Nash. Scribner's Panicum. (I. F. f. 259.) Culms erect, $1.5-6 \mathrm{dm}$. tall, simple, or late in the season dichotomously branched above, sparingly pubescent. Sheaths strongly papillose-hispid; leaves $5-10 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. wide, more or less spreading, smooth above, scabrous beneath; panicles small, the primary one ovoid, $3 \cdot 75-7.5 \mathrm{~cm}$. long, the secondary ones much smaller and more or less included; branches of the primary panicle spreading. I. $6-3.7 \mathrm{~cm}$. long, often flexuous; spikelets turgid, obovoid, about 3 mm . long. In dry or moist soil, Me. and Ont. to Minn., south to Va., Kans. and Ariz. June-Aur.
44. Panicum xanthóphysum A. Gray. Slender Panicum. (I. F. f. 258.) Culms erect, 3-6 dm. tall, simple. Sheaths sparingly papillose-hirsute; le:aves $7 \cdot 5-15 \mathrm{~cm}$. long, $8-18 \mathrm{~mm}$. wide, long-acuminate, erect, smooth and glabrous; panicle long-exserted, linear, $3.75-10 \mathrm{~cm}$. long, its branches appressed; spikelets few, about 3 mm . long, obovoid, pubescent or glabrate; first scale about one-half as long as the nearly equal obtuse second and third; fourth scale indurated and shining. elliptic or oval. Dry soil, Me. and Ont. to Manitoba, south to N. I. and Penn. Plant light green, becoming yellowish in drying. June-Aug.
45. Panicum calliphýllum Ashe. Plant yellowish-green. Culms single or a little tufted, simple, $4-5 \mathrm{dm}$. tall, minutely pubescent; sheaths glabrous, excepting the ciliate margins; leaves ascending, $9-11 \mathrm{~cm}$. long, $9-12 \mathrm{~mm}$. wide, lancenlate, smooth and glabrous, ciliate at the base; panicle $6-0 \mathrm{~cm}$. lons, its ascending scabrous branches $3-4 \mathrm{~cm}$. long; spikelets few, 3 mm . long. elliptic, pubescent. In dry soil, central N. Y. June-Aug.
46. Panicum sphaerocàrpon Ell. Round-fruited Panicum. (I. F. f. 252.) Culms generally erect, simple or somewhat branched at base, 2.5-6 dm. tall, smooth, or the nodes sometimes pubescent. Sheaths usually shorter than the internodes, glabrous, the margins ciliate; leaves $5-10 \mathrm{~cm}$. long, $4-14 \mathrm{~mm}$. wide, acuminate, scabrous above. smooth beneath, the margins cartillaginous and minutely serrulate, ciliate towards the base; panicle ovoid, $5-10 \mathrm{~cm}$. long; spikelets less than 2 mm . long, nearly spherical or somewhat longer than thick, obtuse, purple; first scale broadly ovate, obtuse. Dry soil, southern Ont., N. Y. and Mo. to Fla., Tex. and Mex. July-Sept.
47. Panicum polyánthes Schult. Small-fruited Panicum. (I. F. f. 253.) Culms generally erect, 6-9 dm. tall. simple, smooth. Sheaths smooth, glabrous, longer than the internodes; ligule none; leaves $1.25-2 \mathrm{dm}$. long, $1.25-2.5 \mathrm{~cm}$. wide, long-acuminate, smooth, cordate-clasping and sparingly ciliate at the base; panicle $7.5-20 \mathrm{~cm}$. long, ovoid to oblong in outline; branches slender, ascending; spikelets 1.5 mm . long, obovoid to nearly spherical, numerous; first scale minute, second and third about equal, 7 -nerved. puberulent, the fourth white and shining. Woods and along thickets, southern N. Y. to Penn. and Mich., south to Fla., La., Neb. and Tex. July-Sept. (P. microcarpon Muhl.)
48. Panicum commutàtum Schultes. Variable Panicum. (I. F. f. 255.) Culms erect. 3-8 dm. tall, glabrous or nearly so, simple, finally dichotomously branched above. Sheaths glabrous or puberulent, generally ciliate on the margins; primary leaves 7 -II cm. long, $1.5-2.5 \mathrm{~cm}$. wide, sparingly ciliate at the base, glabrous, those of the branches generally broader and more crowded than those of the main stem; panicle $7-12.5 \mathrm{~cm}$. long, the branches spreading; spikelets 2.5 mm . long. elliptic; second and third scales equal, 7 -nerved, pubescent. In dry woods and thickets, N. Y. to Ky., south to Fla. and Tex. June-Aug.
49. Panicum Áshei G. Pearson. Ashe's Panicum. Culms tufted, 2-4 dm. tall, finally sparingly branched, minutely pubescent. Sheaths glabrous or minutely pubescent, ciliate on the margins; leaves distant on the main culm, in the branched state crowded at the end of the few branches, spreading or ascending, lanceolate to ovate-lanceolate, glabrous on both surfaces, ciliate at the base, those on the main culm $4-7 \mathrm{~cm}$. long, $6-10 \mathrm{~mm}$. wide, those on the branches smaller; panicle $4-6 \mathrm{~cm}$. long, open, its branches ascending; spikelets about 2.5 mm . long and about I mm . broad. elliptic, obtusish, more or less pubescent with spreading hairs. In dry woods, N. Y. to Tenn. and Ga.; also in Mo. July-Sept.
50. Panicum macrocàrpon Le Conte. Large-fritited Panicum. (I. F. f. 256.) Culms 3-9 dm. tall, erect, simple or somewhat branched above, smooth, the nodes. at least the upper ones, naked. Sheaths smooth and glabrous, ciliate; leaves $7.5-17.5 \mathrm{~cm}$. long. $1.8-3.7 \mathrm{~cm}$. wide. cordate-clasping at base, acuminate, smooth and glabrous or nearly so on both surfaces, ciliate; panicles $7.5-15 \mathrm{~cm}$. long, generally long-exserted. rarely included. its branches more or less ascending; spikelets $3-4 \mathrm{~mm}$. long, turgid, oval to obovoid; second and third scales broadly oval, obtuse, 9 -nerred, pubescent. Usually on dry hillsides, N. H. to N. Car., west to Iowa and Kans. July-Aug.
51. Panicum Porteriànum Nash. Porter's Panicum. (I. F. f. 254.) Culms erect, 3-6 dm. tall. simple or somewhat dichotomously branched above, the nodes densely barbed. Sheaths generally softly pubescent; leaves ovate to broadly lanceolate, $5-10 \mathrm{~cm}$. long, $1.25-3.7 \mathrm{~cm}$. wide, cordate-clasping at base, acute, glabrous, at least below; panicle included or somewhat exserted. the branches spreading or ascending, bearing few elliptic short-pedicelled appressed spikelets $4-5 \mathrm{~mm}$. long; first scale one-third to one-half as long as the pubescent and equal second and third ones; fourth scale about as long as the third. In woods, Me. and Ont. to Minn., south to Fla. and Tex. June-Aug.
52. Panicum clandestìnum L. Hispid Panicum. (I. F. f. 257.) Culms erect or ascending, $4.5-12 \mathrm{dm}$. tall, rather stout, simple at first, much branched later in the season. Sheaths longer than the internodes, much crowded on the branches, papillose-hispid. especially the upper ones; leaves $5-20 \mathrm{~cm}$. long. 1.2-3.7 cm . wide, cordate-clasping at base, acuminate. smooth and glabrous, the margins ciliate at base; primary panicle sometimes long-exserted; panicles of the branches included in the sheaths, rarely slightly exserted; spikelets $2-2.5 \mathrm{~mm}$. long, ellipsoid. In thickets, Quebec to Mich., south to Ga., Mo. and Tex. June-July.

## 17. SACCIOLÉPIS Nash, n. gen.

A perennial grass with flat leaves and a terminal contracted panicle. Spikelets numerous, readily deciduous when mature, I-flowered, articulated to the pedicel below the empty scales. Scales 4 , the outer 3 membranous, the first scale small, the second one much larger than the rest, many-nerved, strongly saccate at the base; fourth scale much shorter than the third, chartaceous, enclosing a palet of similar texture and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. Grain free. [Greek, in reference to the large saccate second scale of the spikelet.] Species I, native of the southern U. S. Also in Cuba.
I. Sacciolepis gíbba (Ell.) Nash. (I. F. f. 279.) Culms erect from a creeping base, $6-\mathbf{I} 8 \mathrm{dm}$. long, dichotomously branched below. Lower sheaths densely hirsute, the upper generally glabrous; leaves $7 \cdot 5-17.5 \mathrm{~cm}$. long, $4-20 \mathrm{~mm}$. wide, usually spreading, more or less pubescent; panicle $7 \cdot 5-22.5 \mathrm{~cm}$. long, dense and
 somewhat acute; first scale about one-quarter as long as the spikelet; second scale gibbous at base, II-nerved; third scale about equalling the second, 7 -nerved, empty, the fourth one shorter than the second. Swamps, Va. to Tenn., south to Fla. and La. Also in Cuba. July-Sept.

## 18. CHAETÓCHLOA Scribn. (Setaria Beauv. 1812. Not Ach., 1798.)

Mostly annual grasses with erect culms and flat leaves, the inflorescence in spike-like clusters. Spikelets I-flowered, or rarely with a second staminate flower, the basal bristles single or in clusters below the articulation of the rachilla, and therefore persistent. Scales of the spikelet 4, the three outer membranous, the third often subtending a palet and rarely a staminate flower; the inner or fourth scale chartaceous, subtending a palet of similar texture and a perfect flower. Stamens 3. Styles distinct, elongated. Stigmas plumose. Grain free, enclosed in the scales. [Greek, in reference to the bristles of the inflorescence.] Species about 20, in temperate and tropical regions.
Bristles downwardly barbed.

1. C. verticillata.
Bristles upwardly barbed.

Spike-like inflorescence racemose; second scale much shorter than the spikelet.
Annual; spikelets exceeding 3 mm . long; upper surface of the lower leaves hirsute.
2. C. glauca.

Perennials; spikelets less than 3 mm . long; leaves glabrous.
Culms tufted; spikelets nearly 3 mm . long, the second scale usually 5nerved.
3. C. occidentalis.

Culms not tufted; spikelets 2.5 mm . long, the second scale usually 3 -nerved, the fourth scale purple, at least at the tip. 4. C. versicolor.
Spike-like inflorescence paniculate, sometimes nearly racemose in some forms of No. 5 ; second scale as long as the spikelet or nearly so.
Flowering scales dull, faintly rugose, obtuse, rather thin in fruit.
Inflorescence $2.5-8.5 \mathrm{~cm}$. long, 1.25 cm . or less thick; spikelets about 2 mm . long; bristles green. 5. C. viridis.
Inflorescence $1-2 \mathrm{dm}$. long, $1.25-5 \mathrm{~cm}$. thick; spikelets about 3 mm . long; bristles usually purple. 6. C. Italica.
Flowering scales shining, perfectly smooth, very acute, hard in fruit.

> 7. C. magna.

1. Chaetóchloa verticillàta (L.) Scribn. Fox-tail Grass. (I. F. f. 2So.) Culms erect or decumbent, 3-6 dm. tall. Sheaths glabrous; leaves $5-20 \mathrm{~cm}$. long. scabrous above; spikes $5-7.5 \mathrm{~cm}$. long; spikelets about 2 mm . long. equalled or exceeded by the downwardly barbed bristles; first scale less than one-half as long as the spikelet, $\mathbf{I}$-nerved; second and third scales 5 -7-nerved, equalling the owal fourth one. About dwellings and in waste places, N. S. and Ont. to N. J., Ky. and Neb. Naturalized from Europe. July-Sept.
2. Chaetochloa glaùca (L.) Scribn. Yellow Fox-tall. Plienon (irass. (I. F. f. 281.) Culms 3-12 dm. tall. Sheaths glabrous; leaves $5-15 \mathrm{~cm}$. long, pilose above near the base; spikes $2.5-10 \mathrm{~cm}$. long; spikelets 3 mm . long, much shorter than the bristles; first scale 1 -3-nerved, somewhat shorter than the 5 -neeved second; third scale 5 -nerved, equalling the fourth, which is 1 -shaped in cross-section, about twice as long as the second. In waste places and cultivated grounds,
throughout N. Am., except the extreme north. Often a troublesome weed. Naturalized from Europe. July-Sept.
3. Chaetochloa occidentàlis Nash, $n$. $s p$. Western Fox-tail Grass. Culms tufted, from a branching rootstock, 3-8 dm. tall. Sheaths compressed, keeled, smooth and glabrous; leaves erect, firm, 1.6 dm . or less long, $5-7 \mathrm{~mm}$. wide, glabrous; spike-like racemes $3-5 \mathrm{~cm}$. long, $1.5-2 \mathrm{~cm}$. thick, the bristles green; spikelets a little less than 3 mm . long, the first scale about one-half as long as the spikelet, 3-nerved, the second scale a little longer, 3-5-nerved, the fourth scale strongly transverse-rugose, elliptic. In meadows, Kans. and Ind. Terr. July.
4. Chaetochloa versícolor Bicknell. Seacoast Fox-tail Grass. Perennial. Culms 6-12 dm. long, ascending; sheaths smooth and glabrous, compressed and keeled; leaves long and narrow, $\mathbf{1}-3.5 \mathrm{dm}$. long, $2-6 \mathrm{~mm}$. wide, pale green or glaucous, smooth or nearly so; spike-like panicle long-exserted, rather slender, 2.5-7 cm . long, about 1.5 cm . thick; spikelets usually single, about 2.5 mm . long and 1.25 mm . wide, the first scale ovate, 3 -nerved, about one-half as long as the spikelet, the second scale acute, 3 -nerved, the third scale 5 -nerved, the fourth scale rather pointed, purple-tipped; bristles in two nearly equal clusters of 5 each, very slender, $6-10 \mathrm{~mm}$. long. Borders of salt and brackish marshes, Conn. to Fla.
5. Chaetochloa víridis (L.) Scribn. Green Fox-tail Grass. (I. F. f. 282.) Culms 3-9 dm. tall. Sheaths glabrous; leaves $7 \cdot 5-25 \mathrm{~cm}$. long, 4-12 mm. wide; spikes compound, $2.5-10 \mathrm{~cm}$. long; spikelets about 2 mm . long, elliptic, rnuch shorter than the green, or sometimes yellowish, bristles; first scale less than one-half as long as the spikelet, 1 -3-nerved; second and third scales 5 -nerved; fourth scale equalling or slightly exceeding the second. In waste places and cultivated grounds throughout N. Am., except the extreme north, and often a troublesome weed. Naturalized from Europe. July-Sept.
6. Chaetochloa Itálica (L.) Scribn. Italian Millet. Hungarian Grass. (I. F. f. 283.) Culms 6 - 18 dm. tall. Sheaths smooth or scabrous; leaves 1.5-3 dm. or more in length, $6-36 \mathrm{~mm}$. wide, generally scabrous; spikes $\mathbf{I}-2.25$ dm. long, $1.25-5 \mathrm{~cm}$. thick, usually very compound; spikelets about 3 mm . long, elliptic, equalled or exceeded by the purplish bristles; first scale less than one-half as long as the spikelet, 1 -3-nerved; second and third $5-7$-nerved, fourth scale equalling or somewhat exceeding the second. In waste places, escaped from cultivation, Quebec to Minn., south to Fla. and Tex. Native of the Old World. July-Sept.
7. Chaetochloa màgna (Griseb.) Scribn. Giant Fox-tail Grass. Culms 1.5-5 m. tall, stout. Sheaths densely hirsute on the margins, otherwise glabrous; leaves 8 dm . or less long, $2-4 \mathrm{~cm}$. wide, very rough on both surfaces; panicle 2-6 dm. long, $3-6 \mathrm{~cm}$. thick, nodding above; spikelets 2 mm . long, the first scale about one-half as long as the spikelet, 3 -nerved, the second scale as long as the spikelet, 7 -nerved, the fourth scale oval, very acute, smooth and shining. In swamps, Del. (according to Scribner) to Fla. and Tex. July-Aug.

## 19. CÉNCHRUS L.

Annual or perennial grasses, with usually flat leaves. Inflorescence spikelike. Spikelets subtended by a spiny involucre which is deciduous with them at maturity. Scales 4; the first hyaline; the second and third membranous, the latter sometimes having a palet and staminate flower in its axil; the fourth chartaceous, subtending a palet of similar structure which encloses a perfect flower. Stamens 3. Styles united below. Stigmas plumose. Grain free, enclosed in the scales. [Ancient Greek name for some grass, probably Millet.] About 12 species, in tropical and temperate regions. Besides the following, some 4 others occur in the southern parts of N. Am.
I. Cenchrus tribuloides L. Bur Grass. Hedgehog Grass. (I. F. f. 284.) Culms erect or decumbent from an annual root, 2-9 dm. long. Sheaths usually loose, compressed, smooth; leaves $6.25-12.5 \mathrm{~cm}$. long; spikes $2.5-6.25 \mathrm{~cm}$. long, sometimes partially included in the upper sheath; involucres crowded on the scabrous rachis, 2 -flowered, globose, pubescent except at the base, forming spiny burs, the spines stout; spikelets about 6 mm . long. On sandy shores and in waste places, Me. and Ont. to Minn., south to Fla. and Tex. Sometimes a noxious weed. Apparently perennial in the Southern States. Aug.-Sept.
20. ZIZANıÓPSIS. Doell and Aschers.

Tall aquatic monocious grasses, with long flat leaves and paniculate inflorescence. Spikelets I-flowered, the pistillate borne at the top of the branches, the staminate at the base. Scales 2 , nearly equal, membranous, the outer one in the pistillate spikelets broad, acute, and bearing an awn. Stamens 6. Styles united. Grain nearly globose, the pericarp readily separable. [Name in allusion to the resemblance of this grass to Zizania.] A monotypic genus, of temperate and tropical America.
r. Zizaniopsis miliàcea (Michx.) Doell. and Aschers. Zizaniopsis. (I. F. f. 285.) Culms $\mathbf{1}-4.5 \mathrm{~mm}$. tall, from a long rootstock. Sheaths loose, glabrous; ligule $8-14 \mathrm{~mm}$. long, thin-membranous; leaves 3 dm . long or more, $1.25-2.5 \mathrm{~cm}$. wide; panicle $3-4.5 \mathrm{dm}$. long, narrow; branches erect; staminate spikelets 6-8 mm . long, the outer scale 5 -nerved, the inner 3 -nerved; pistillate spikelets about 6 mm . long, the outer scale bearing an awn 2-6 mm. long, 5 -nerved; inner scale 3-nerved. Swamps, Ga. to Ohio (according to Riddell), south to Fla. and Tex. June-July.

## 21. ZIZÀNIA L.

A tall, aquatic monœcious grass, with long flat leaves and an ample panicle. Spikelets I-flowered, the pistillate borne on the upper branches of the panicle, the staminate on the lower. Scales 2, membranous, the outer somewhat longer, acute in the staminate, long-awned in the pistillate spikelets. Stamens 6. Styles nearly distinct. Grain linear. [From an ancient Greek name for Darnel.] A monotypic genus of N. Am. and Asia.
i. Zizania aquática L. Wild Rice. Indian Rice. Water Oats. Reed. (I. F. f. 286.) Culms erect from an annual root, 9-30 dm. tall. Sheaths loose, glabrous; ligule about 6 mm . long, thin-membranous; leaves 3 dm . or more long; panicle 3-6 dm. long, the upper branches erect, the lower widely spreading; staminate spikelets $6-12 \mathrm{~mm}$. long, outer 5 -nerved, the inner 3 -nerved; scales of the pistillate spikelets $8-24 \mathrm{~mm}$. long, the outer one 5 -nerved, with an awn $2.5-5$ cm . long, the inner narrower, 3-nerved, awn-pointed; grain $1-3 \mathrm{~cm}$. long. In swamps, N. B. to Manitoba, south to Fla. and Tex. June-Oct.

## 22. HOMALOCÉNCHRUS Mieg.

Marsh grasses with flat narrow, generally rough leaves and paniculate inflorescence. Spikelets I-flowered, perfect, strongly flattened laterally, and usually more or less imbricated. Scales 2, chartaceous, the outer one broad and strongly conduplicate, the inner much narrower. Stamens I-6. Styles short, distinct. Stigmas plumose. Grain ovoid, free. [Greek, in reference to the supposed resemblance of these grasses to Millet.] About 5 species, natives of temperate and tropical countries. Besides the following, 2 others occur in the southern U. S.

Spikelets oblong, their width less than one-half their length, somewhat imbricated.
Spikelets $2.5-3 \mathrm{~mm}$. long; panicle-branches usually rigid. I. H. Virginicus.
Spikelets $4-5 \mathrm{~mm}$. long; panicle-branches generally lax. ${ }^{2}$ 2. H. oryzoides.
Spikelets oval, their width more than one-half their length, much imbricated.
3. H. lenticularis.
x. Homalocenchrus Virginicus (Willd.) Britton. White Grass. (I. F. f. 287.) Culms 3-9 dm. long, much branched, slender. Leaves $5-15 \mathrm{~cm}$. long. 2-16 mm. wide, scabrous; terminal panicle finally open and long-exserted, 7.5-20 cm . long; lateral panicles smaller and usually included ; spikelets $2.5-3 \mathrm{~mm}$. long. about I mm. wide; outer scale hispid on the keel and margins; stamens 1 or 2 . Swamps or wet woods, Me. to Ont. and Minn., south to Fla. and Tex. Aug.-scpt.
2. Homalocenchrus oryzoìdes (L.) Poll. Rice, Cut-grass. (I. F. f. 28S.) Culms 3-12 dm. long, much branched, rather stout. Leaves $7.5-25 \mathrm{~cm}$. long, 4-10 mm . wide; terminal panicle 1.25-2.25 dm. long, finally long-exserted, its branches lax, and later widely spreading; lateral panicles generally included; spikelets $4-5 \mathrm{~mm}$. long, about 1.5 mm . wide, elliptic; scales pubescent, the outer one hispid on the keel and on the margins; stamens .3. In swamps and aloner streams, often forming dense tangled masses, N. S. to western Ont., south to Fla and Tex. Also in the temperate parts of Europe and Asia. Aug.-Sept.
3. Homalocenchrus lenticulàris (Michx.) Scribn. Catch-fly Grass. (I. F. f. 289.) Culms 6-12 dm. tall, usually simple. Leaves $1-3 \mathrm{dm}$. long, 8-20 mm. wide; panicle 1.12-2.25 dm. long, finally exserted, its branches lax, and later spreading; spikelets much imbricated, $4-5 \mathrm{~mm}$. long, $2-3.5 \mathrm{~mm}$. wide ; scales smooth or sparingly hispid-scabrous, the outer one strongly 3 -nerved, hispid on the keel and margins, the inner much narrower, strongly i-nerved, hispid on the keel; stamens 2. Wet grounds, Va. to Ill. and Mo., south to Fla. and Tex. July-Sept.

## 23. PHÁLARIS L.

Annual or perennial grasses with flat leaves, the inflorescence spike-like, capitate or a narrow panicle. Spikelets crowded, I-flowered. Scales 5, the first and second about equal in length, strongly compressed laterally, usually wing-keeled; third and fourth scales much smaller or reduced to mere rudiments; fifth scale subtending a palet similar to itself and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, smooth, enclosed in the indurated scales. [Greek, alluding to the shining grain.] About io species, mostly natives of southern Europe. Besides the following, 3 others occur in the U. S.
Outer scales not winged; inflorescence a narrow panicle. I. P. arundinacea. Outer scales broadly winged; inflorescence a spike or spike-like panicle.

Spikelets narrow ; third and fourth scales much reduced, rigid, subulate, hairy.
2. P. Caroliniana.

Spikelets broad; third and fourth scales thin-membranous, broadly lanceolate, glabrous or sparingly hairy.
3. P. Canariensis.

1. Phalaris arundinàcea L. Reed Canary-grass. (I. F. f. 290.) Glabrous, $6-15 \mathrm{dm}$. tall. Leaves $8.75-25 \mathrm{~cm}$. long, $6-16 \mathrm{~mm}$. wide; panicle 7.5-20 cm . long, dense and contracted; spikelets $5-6 \mathrm{~mm}$. long; outer scales 3 -nerved; third and fourth scales less than one-half as long as the fifth; fifth scale about three-fourths as long as the spikelet, pubescent with long appressed silky hairs. In moist or wet soil, N. S. to Br. Col., south to N. J., Ky., Kans. and Nev. Also in Europe and Asia. July-Aug. The Ribbon-grass or Painted-grass of cultivation, the so-called variety picta, has leaves variegated with green and white stripes, is a derivative of this species, and sometimes escapes from gardens.
2. Phalaris Caroliniàna Walt. Carolina Canary-grass. (I. F. f. 291.) Culms 3-10.5 dm. tall. Leaves $5-15 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide; spike-like panicle oblong, $2.5-10 \mathrm{~cm}$. long; spikelets 5 mm . long, 3-nerved; third and fourth scales less than one-half as long as the fifth; fifth scale about two-thirds as long as the spikelet, acuminate, pubescent with long appressed hairs. In moist soil, S. Car. to Mo. and Cal., south to Fla. and Tex. June-Aug.
3. Phalaris Canariénsis L. Canary-grass. (I. F. f. 292.) Culms 3-9 dm . tall. Leaves $5-30 \mathrm{~cm}$. long, 4-12 mm. wide, strongly scabrous; spikes $1.25-$ 3.75 cm . long, ovoid; spikelets $6-8 \mathrm{~mm}$. long; outer scales whitish with green nerves; third and fourth scales about half the length of the fifth, broadly lanceolate, thin-membranous, sparingly hairy; fifth scale about two-thirds as long as the spikelet, pubescent with appressed hairs. In waste places, N. S. to Ont., Va. and Neb. Naturalized from Europe. The grain is the common food of canary birds. JulyAug.

## 24. ANTHOXÁNTHUM L.

Fragrant annual or perennial grasses, with flat leaves and spike-like panicles. Spikelets I-flowered, narrow, somewhat compressed. Scales 5; the two outer acute or produced into a short awn, the first shorter than the second; third and fourth scales much shorter, 2-lobed, awned on the back; the fifth scale shorter than the others, obtuse. Stamens 2. Styles distinct. Stigmas elongated, plumose. Grain free, enclosed in the scales. [Greek, referring to the yellow hue of the spikelets in some species.] A genus of 4 or 5 species, natives of Europe.
I. Anthoxanthum odoratum L. Sweet Vernal-Grass. (I. F. f. 293.) Culms 3-6 dm. tall. Leaves $1.25-15 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, glabrous or nearly so; panicles $2.5-6.25 \mathrm{~cm}$. long; spikelets 8 mm . long, crowded; outer scales glabrous or pubescent; the third and fourth very hairy, the former with an awn nearly twice
its length inserted about the middle, the fourth scale bearing near the base an awn more than twice its length. In fields and meadows throughout nearly the whole of N. Am. Very fragrant in drying. Naturalized from Europe. June-July.

## 25. SAVASTÀNA Schrank.

Aromatic perennial grasses, with flat leaves and contracted or open panicles. Spikelets 3 -flowered, the terminal flower perfect, the others staminate. Scales 5; the first and second nearly equal, acute, glabrous; the third and fourth somewhat shorter, obtuse, entire, emarginate, 2 -toothed or 2 -lobed, with or without an awn, enclosing a palet and stamens; fifth scale often produced into a short awn, enclosing a palet and perfect flower. Stamens in the staminate flowers 3, in the perfect 2. Styles distinct. Stigmas plumose. Grain free, enclosed in the scales. [Name unexplained.] About 8 species, natives of temperate and cold regions.

Third and fourth scales unawned;
Entire ; culms 3-10 dm. tall.
Panicle I dm. long or less, its branches short, 5 cm . long or less ; leaves short and broad. I. S. odorata.
Panicle r.5-5 dm. long, its branches capillary, drooping, $\mathrm{I}-2 \mathrm{dm}$. long; leaves long and narrow.
Erose-truncate; culms r .5 dm . tall or less. 3. S. paucifora. Third and fourth scales awned.
4. S. alpina.
I. Savastana odoràta (L.) Scribn. Holy-grass. Seneca Grass. (I. F. f. 294.) Sheaths smooth; lower leaves elongated, $\mathbf{I}-2 \mathrm{dm}$. long, $2-6 \mathrm{~mm}$. wide, the upper ones $\mathbf{I} .25-5 \mathrm{~cm}$. long; panicle $5-10 \mathrm{~cm}$. long, its branches $2.5-5 \mathrm{~cm}$. long, usually spreading; spikelets yellowish-brown and purple, 4-6 mm. long; first and second scales acute; third and fourth villous and strongly ciliate, awn-pointed. Newf. to Alaska, south to N. J., Wis. and Colo. Also in northern Europe and Asia. June-July. This and other sweet-scented grasses are strewn before the churches in northern Europe, whence the name Holy-grass. Also known as Vanilla-grass.
2. Savastana Náshii Bicknell. Nodding Vanilla-grass. (I. F. f. 294a.) Plant smooth, glabrous and shining. Culms erect, slender, 6-9 dm. tall. Sheaths overlapping, striate; leaves erect or ascending, elongated, the culm leaves 5 or 6, 5-20 cm. long, 4-6 mm, wide, acuminate ; panicle long-exserted, loose and open, 1.74.5 dm . long, its apex nodding, the capillary branches drooping, the larger 7.5-17.5 cm . long, in pairs; spikelets $5-8 \mathrm{~mm}$. long, on capillary pedicels; scales 5 , the outer 2 abruptly long-acuminate; the third and fourth scales about 5 mm . long, rough, ciliate on the margins with ascending hairs. Along brackish marshes, N. Y. City. July-Aug.
3. Savastana pauciflòra (R. Br.) Scribn. Arctic Holy-grass. (I. F. f. 295.) Glabrous; culms I. 5 dm. high or less, erect, simple, smooth, sheaths mostly at the base of the culm, overlapping; leaves smooth, the basal ones $2.5-5 \mathrm{~cm}$. long, I mm . wide, involute at least when dry; culm leaves 1.25 cm . long or less. 2 mm . wide, flat; panicle less than 2.5 cm . long, contracted; spikelets few, $3-4 \mathrm{~mm}$. long : first and second scales $3-4 \mathrm{~mm}$. long, smooth and glabrous; third and fourth shorter. scabrous. Arctic America. Summer.
4. Savastana alpìna (Sw.) Scribn. Alpine Holy-grass. (I. F.f. 206.) Culms I.5-4.5 dm. tall. Lower leaves elongated, $7 \cdot 5-15 \mathrm{~cm}$. long, about 2 mm . wide, the upper much shorter, $1.25-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide: panicke $1.8-3.7 \mathrm{~cm}$. long, contracted; spikelets $5-7 \mathrm{~mm}$. long, crowded; third and fourth shorter, ciliate on the margins, the former bearing an awn about 2 mm . long, the latter with a more or less bent awn about 6 mm . long; fifth scale acute, usually awn-puinted. Greenland to Alaska, south to the high mountains of N. E. and N. V. Also in northern Europe and Asia. July-Aug.

## 26. ARÍSTIDA L.

Grasses varying greatly in habit and inflorescence. Leaves narrow, often in volute-setaceous. Spikelets narrow, I-flowered. Scales s. narmw, the two outer carinate; the third rigid and convolute, bearing thee awns occasionally united at the base, the lateral awns rarely wanting or reduced to rudiments. Palet 2-nerved.

Stamens 3. Styles distinct. Stigmas plumose. Grain free, tightly enclosed in the scale. [Latin, from arista, an awn.] About 100 species, in the warmer regions of both hemispheres. Besides the following, some 25 others occur in the southern and western parts of N. Am. The English name Three-awned Grass is applied to all the species.
Awns not articulated to the scale.
Central awn coiled at the base.
First scale usually equalling or sometimes slightly shorter than the second scale, which is generally $7-9 \mathrm{~mm}$. long.
I. A. dichotoma.

First scale much shorter than the second (often but little more than one-half as long), which is $10-15 \mathrm{~mm}$. long.
Lateral awns short, straight and erect, $\mathrm{x}-2 \mathrm{~mm}$. long, the central awn usually more than five times their length, its straight portion $5-8 \mathrm{~mm}$.
$\ddagger$ long. 2. A. Curtissii.

Lateral awns more or less spreading, usually a little spiral at the base, the central awn from one-half again to twice their length, its straight portion $10-15 \mathrm{~mm}$. long.
3. A. basiramea.

Central awn not coiled at the base.
Panicle narrow, linear to oblong, the branches short (sometimes long in No. 12), erect or ascending.
Central awn and sometimes the lateral ones also strongly reflexed, the bend semicircular.
4. A. ramosissima.

Central awn from erect to spreading with no semicircular bend at the base. First scale much shorter than the second, usually about one-half as long.

Spikelets crowded, 4-6 on the short branches, which are spikeletbearing to the base or nearly so. 5. A. fasciculata.
Spikelets not crowded, usually I-3 on branches naked at the base.
Second scale of the spikelet 1.5 cm . or less long, usually equalling or slightly exceeding the flowering scale.
6. A. Fendleriana.

Second scale of the spikelet 2 cm . or more long, from one-half sagain as long as to nearly twice the length of the flowering scale. 7. A. longiseta.
First scale from a little shorter than to exceeding the second. Spikelets exceeding 2 cm . long; first scale $5-7$-nerved.
8. A. oligantha.

Spikelets less than 1.5 cm . long; first scale I-3-nerved.
Sheaths glabrous, or pubescent only at the apex.
Leaves strongly involute, densely villous at the base
9. A. stricta.

Leaves flat, at least not villous at the base.
First scale generally shorter than or equalling the second. 10. A. gracilis.
First scale usually exceeding the second.
ir. A. purpurascens.
Sheaths, at least the lower ones, densely woolly.
12. A. lanosa.

Panicle diffuse and open, the branches very long and widely spreading.
13. A. divaricata.

Awns articulated to the scale, united at the base into a spiral column.

$$
\text { Column conspicuous, } 6 \mathrm{~mm} \text {. long or more. }
$$

14. A. tuberculosa.

Column inconspicuous, 2 mm . long or less.
15. A. desmantha.

1. Aristida dichótoma Michx. Poverty-grass. (I. F. f. 297.) Culms 1. 5-6 dm. tall, dichotomously branched. Leaves $2.5-7.5 \mathrm{~cm}$. long, less than 2 mm . wide, involute, usually scabrous; spike-like racemes or panicles $5-\mathbf{1 2 . 5} \mathrm{cm}$. long, slender; spikelets about 6 mm . long; outer scales nearly equal, usually awnpointed; third scale shorter than the second, the middle awn horizontal, the terminal straight portion 4-6 mm. long, the lateral awns 2 mm . long or less, erect. Dry sandy soil, Me. to Ont., Neb. and the Ind. Terr., south to Ga. and Tex. Aug.Sept.
2. Aristida Curtíssii (A. Gray) Nash. Curtiss' Aristida. Culms tufted, $2-5 \mathrm{dm}$. tall, branching. Leaves $4-16 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide; panicle $5-9 \mathrm{~cm}$. long, the branches erect; spikelets generally $10-12 \mathrm{~mm}$. long, rarely longer, the first scale much shorter than the second, which usually about equals the flowering scale; the flowering scale $7-11 \mathrm{~mm}$. long; the lateral awns very short, $\mathrm{I}-2 \mathrm{~mm}$.
long, straight and erect. In dry soil, Mo. and Kans, to the Ind. Terr.; also in Va. Sept.-Oct.
3. Aristida basiràmea Engelm. Forked Aristida. (I. F. f. 299.) Culms tufted, rather slender, $2-6 \mathrm{dm}$. tall, branching. Leaves $3-15 \mathrm{~cm}$. long, 1.5 mm . wide or less; panicle 3-9 cm. long, the branches erect; spikelets $10-15 \mathrm{~mm}$. long, the first scale much shorter than the second; the flowering scale 7-II mm. long, considerably shorter than the second scale; the lateral awns more or less spreading, usually a little spiral at the base, one-half to two-thirds as long as the central awn, which is strongly spiral at the base. In dry places, Minn. to Neb., south to IIl. and Kans.
4. Aristida ramosíssima Engelm. Branched Aristida. (I. F. f. 300.) Culms i.5-6 dm. tall, branched. Leaves $3 \cdot 5-7.5 \mathrm{~cm}$. long, 2 mm . wide or less, flat, smooth beneath, scabrous above; spikelets few, borne in loose spikes, $5-10 \mathrm{~cm}$. in length; first scale awn-pointed; second scale $1.6-2 \mathrm{~cm}$. in length, exceeding the first, terminated with an awn $2-6 \mathrm{~mm}$. long; third scale as long as the second; middle awn about 2.5 cm . long, forming a hook, the lateral awns erect. In dry soil, Ill. to Ky. and Mo. July-Sept.
5. Aristida fasciculàta Torr. Bushy Aristida. (I. F. f. 306.) Culms 3-6 dm . tall, branched. Leaves $5-15 \mathrm{~cm}$. long, 2 mm . wide or less, flat; panicle 7.517.5 cm . long, at first strict, the branches finally more or less spreading; first scale of spikelet I-nerved, shorter than the second scale; third scale equalling or longer than the second; awns divergent, the middle one $8-16 \mathrm{~mm}$. long, the lateral ones shorter. Dry soil, Kans. to Cal., south to Mex. Aug.-Sept. (Aristida dispersa Trin. and Rupr.)
6. Aristida Fendleriàna Steud. Fendler's Aristida. (I. F. f. 304.) Culms densely tufted, $1.5-2.5 \mathrm{dm}$. tall, erect, rigid, simple. Sheaths smooth, confined to the base of the culm; leaves involute, at least when dry, often curved, 0.5 mm . in diameter; panicle $7-10 \mathrm{~cm}$. long, strict, its branches short and appressed and usually bearing a single spikelet; spikelets $\mathbf{1 . 2 - 1 . 5} \mathrm{cm}$. long, the flowering scale 9-12 mm. long, the central awn $2-3.5 \mathrm{~cm}$. long, the lateral ones a little shorter. In dry sandy soil, Black Hills to Neb. and Utah, south to Tex. and N. Mex. (Aristida purpurea Nutt. in part.)
7. Aristida longisèta Steud. Long-awned Aristida. Culms tufted, 2-4 $d m$. tall, simple. Leaves $3-10 \mathrm{~cm}$. long, involute, at least when dry; panicle $\mathbf{1} \mathbf{- 2}$ dm. long, its branches usually bearing but a single spikelet; spikelets $2-2.5 \mathrm{~cm}$. long, the flowering scale $1.2-1.6 \mathrm{~cm}$. long, from a little over one-half to two-thirds as long as the second scale, the central awn $6-11 \mathrm{~cm}$. long, the lateral ones equalling it or a little shorter. In dry sandy soil, Neb. to Mont. and Wash., south to Tex. and Mex. (Aristida purpurea Nutt. in part.)
8. Aristida oligántha Michx. Few-flowered Aristida. (I. F. f. 303.) Culms 3-6 dm. tall, dichotomously branched. Leaves $2.5-15 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide, smooth; spikelets few, in a lax spike-like raceme or panicle; first scale 5 nerved, occasionally 7 -nerved at base, equalling or somewhat shorter than the second, which bears an awn $4-8 \mathrm{~mm}$. long; third scale shorter than the first, awns divergent or spreading, the middle one $3.7-6.2 \mathrm{~cm}$. long, the lateral somewhat shorter. Dry soil, N. J. to Neb., south to La. and Tex. Aug.-Sept.
9. Aristida strícta Michx. Erect Aristida. (I. F. f. 305.) Culms 6-12 dm. tall. Leaves involute-filiform, the basal 3 dm . or more in length, those of the culm 2-3 dm. long, or the upper shorter; panicle spike-like, strict, or the top sometimes nodding, $\mathbf{r} .5-6 \mathrm{dm}$. long; outer scales of the spikelet awn-pointed, the first I-nerved, shorter than the second; third scale equalling the first or a little shorter; middle awn I- 2 cm . long, horizontal when old, the lateral ones shorter, erect or divergent. Dry soil, Va. (according to S. Watson), south to Fla. July-sept.
10. Aristida grácilis Ell. Slender Aristida. (I. F. f. 208.) Culms 1.5-6 dm. tall. Leaves $2.5-10 \mathrm{~cm}$. long, 2 mm . wide or less, flat, or involute when dry; panicle spike-like, $7.5-\mathbf{1 7 . 5} \mathrm{cm}$. long, slender; spikelets about 0 mm . long; outer scales about equal; third scale about equalling the second, generally mottled, middle awn horizontal, the lateral awns $2-6 \mathrm{~mm}$. long, erect. Dry soil, N. H. and Mass. to Ill. and Neb., south to Fla. and Tex. Aug.-Sept.
11. Aristida purpuráscens Poir. Purplish Aristid. (I. F.f. joi.) C'ulms $3-7.5 \mathrm{dm}$. tall. Leaves $\mathrm{I}-2 \mathrm{dm}$. long, about 2 mm . wide, flat, or becoming invo-
lute in drying; spike-like panicles 1.25-4.5 dm. long, strict, or sometimes nodding; outer scales of spikelet awn-pointed, the first longer than the second; third scale from two-thirds to three-quarters as long as the first, middle awn $1.8-2.4 \mathrm{~cm}$. long, horizontal, the lateral awns somewhat shorter, erect or divergent. In dry soil, Mass. to Minn., south to Fla, and Tex. Sept.-Oct.
12. Aristida lanòsa Muhl. Woolly Aristida. (I. F. f. 302.) Culms 6-12 dm . tall. Leaves 3 dm . long or more, about 4 mm . wide, attenuate into a long, slender point; panicle 3-6 dm. long, strict; outer scales of the spikelet awn-pointed, the first $\mathrm{I}-\mathrm{I} .4 \mathrm{~cm}$. long, exceeding the second; third scale slightly shorter than the second, middle awn $1.6-2.4 \mathrm{~cm}$. long, usually horizontal, the lateral awns about two-thirds as long, erect or divergent. Dry sandy soil, Del. to Fla. west to Tex. Aug.-Sept. (Aristida lanata Poir.)
13. Aristida divaricàta H. \& B. Spreading Aristida. (I. F. f. 306a.) Culms $4.5^{-9} \mathrm{dm}$. tall, tufted, erect. Sheaths overlapping, rough ; culm leaves, r.5-3 dm. long, $2-4 \mathrm{~mm}$. wide; the sterile shoots from one-third to one-half as long as the culm, the leaves narrower; panicle comprising one-half of the plant, or more, often included at the base, its branches rigid, at length widely spreading; spikelets, exclusive of the awns, about 1.25 cm . long; empty scales acuminate, usually awn-pointed; flowering scale commonly slightly shorter than the empty ones, firm; the lateral awns shorter than the central, which is $1.2-2 \mathrm{~cm}$. long. Dry sandy soil, Kans. to Ariz. and N. Mex., south to Mex.
14. Aristida tuberculòsa Nutt. Sea-beach Aristida. (I. F. f. 307.) Culms 1.5-6 dm. tall, dichotomously branched. Leaves I.25-2.25 dm. long, about 2 mm . wide, smooth beneath, scabrous above; panicle 1.25-2 dm. long, branches slender, ascending; outer scales of the spikelet about equal, awned, the third scale shorter; awns divergent or reflexed, more or less coiled. Sandy soil, especially on seabeaches, N. H. to Minn., south to Ga. Also in the interior in Ill., Wis., Minn. and Neb. Aug.-Sept.
15. Aristida desmàntha Trin. \& Rupr. Western Aristida. (I. F. f. 308.) Culms 3-6 dm. tall, branched. Leaves I. 5-3 dm. long, less than 2 mm . wide, smooth beneath, scabrous above; panicle about 1.5 dm . long, the branches slender, ascending; outer scales of the spikelet about equal, the third one shorter; awns spreading or reflexed, somewhat coiled. In dry soil, Kans. (?), the Ind. Terr. and Tex. Aug.-Sept.

Generally tall grasses, the leaves usually convolute, rarely flat, the inflorescence paniculate. Spikelets I-flowered, narrow. Scales 3 ; the two outer narrow, acute or rarely bearing an awn, the third rigid, convolute, with a hairy callus at the base, and bearing a more or less bent awn, which is spiral at the base, and articulated to the scale. Palet 2-nerved. Stamens 3, rarely fewer. Styles short, distinct. Stigmas plumose. Grain narrow, free, tightly enclosed in the scale. [Greek, in allusion to the tow-like plumes of some species.] A genus of about 100 species, distributed throughout the temperate and tropical zones. Besides the following, some 20 others occur in the southern and western parts of N. Am.

Outer scales of the spikelet 4-12 mm. long :
Obtuse or blunt-pointed, 4 mm . in length.
i. S. Macounii.

Acute, $8-12 \mathrm{~mm}$. in length.
Awn less than five times the length of the scale. $\quad$ 2. S. viridula.
Awn more than seven times the length of the scale.
3. S. avenacea.

Outer scales of the spikelet 2 cm . long or more.
Base of panicle usually included in the upper sheath; third scale $8-12 \mathrm{~mm}$. long; awn slender, curled.
4. S. comata.

Panicle exserted from the upper sheath; third scale 1.4-2.4 cm. long, awn bent.
5. S. spartea.

1. Stipa Macoùnii Scribn. Macoun's Stipa. (I. F. f. 309.) Culms $3-6 \mathrm{dm}$. tall. Leaves $5-12.5 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide, flat, becoming involutesetaceous in drying, scabrous; panicle 5-12.5 cm. long, contracted, the branches 2.5-5 cm . long; spikelets borne at the ends of the branches; third scale pubescent with long, appressed silky hairs, callus obtuse; awn 8-Io mm. long, contorted. N. B, to the N. W. Terr., south to Me., N. H., Lake Superior, and Mont. July.
2. Stipa virídula Trin. Green Stipa. (I. F. f. 310.) Culms 4.5-9 dm. tall. Leaves smooth or scabrous, the basal ones involute-filiform, one-third to one-half as long as the culm, those of the culm $7 \cdot 5-22 \mathrm{~cm}$. long, broader; panicle spike-like, strict and erect; outer scales of spikelet $6-8 \mathrm{~mm}$. long, long-acuminate; third scale shorter, more or less pubescent with long appressed silky hairs, callus acute; awn I. $8-3.2 \mathrm{~cm}$. long, bent, loosely spiral at base. Minn. to Br . Col., south to Kans., N. Mex. and Cal. July-Aug.
3. Stipa avenàcea L. Black Oat-grass. (I. F. f. 3II.) Culms 3-7.5 dm. tall. Leaves involute-filiform, smooth beneath, scabrous above, the basal one-third to one-half the length of the culm, those of the culm $7 \cdot 5-12.5 \mathrm{~cm}$. long; panicle $1.25-2 \mathrm{dm}$. long, loose, the branches lax, finally spreading; outer scales of the spikelet 8 -10 mm . long; third scale a little shorter, black, pilose at base, and with a ring of short hairs at the top; callus hard, acute; awn 3.75-6.25 cm. long, bent, loosely spiral below. In dry woods, R. I. to Fla., mostly near the coast; also in western Ont. and Wis. May-June.
4. Stipa comàta Trin. and Rupr. Western Stipa. (I. F. f. 312.) Culms 3-6 dm. tall. Uppermost sheaths very long and inflated, enclosing the base of the panicle; basal leaves involute-filiform, one-quarter to one-half as long as the culm, the culm leaves $7.5-1.5 \mathrm{~cm}$. long, a little broader than the basal ones, involute; panicle $1.5-2.25 \mathrm{dm}$. long, loose, the branches erect-ascending; outer scales of the spikelet r. $8-2.4 \mathrm{~cm}$. long, acuminate into an awn $4-8 \mathrm{~mm}$. in length; callus acute; awn I-2 dm. in length, spiral and pubescent below. On prairies, Alberta to Br. Col., south to Neb., N. Mex. and Cal. June-July.
5. Stipa spàrtea Trin. Porcupine-grass. (I. F. f. 313.) Culms 6-I2 dm. tall. Basal leaves one-third to one-half as long as the culm, 2 mm . wide or less, usually involute, those of the culm 1.5-3 dm. long, about 4 mm . wide, generally flat; panicle 1-2.5 dm. in length, its branches erect; outer scales of spikelet 2.53.6 cm . long, acuminate into a long slender point; callus acute; awn $\mathrm{I}-2 \mathrm{dm}$. long, stout, usually twice bent, tightly spiral and pubescent below, doubly spiral about the middle. On prairies, Manitoba to Br. Col., south to Ill. and Kans. June-July.

## 28. ORYZÓPSIS Michx.

Usually tufted grasses, with flat or convolute leaves and paniculate inflorescence. Spikelets I-flowered, broad. Scales 3; the two lower about equal, obtuse or acuminate; the third scale shorter or a little longer, broad, bearing a terminal awn which is early deciduous, the callus at the base of the scale short and obtuse, or a mere scar. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, tightly enclosed in the convolute scale. [Greek, in allusion to the supposed resemblance of these grasses to rice.] About 24 species, distributed through temperate and subtropical regions, rarely extending into the tropics. Besides the following, some 7 others occur in the western parts of N. Am.
Spikelet, exclusive of awn, 2.5-4 mm. long.
Awn less than 2 mm . long, much shorter than the scale; outer scales $3-4 \mathrm{~mm}$. in length.

1. O. juncea.

Awn $6-8 \mathrm{~mm}$. long, more than twice as long as the scale; outer scales about 2.5 mm . in length.
2. O. micrantha.

Spikelet, exclusive of awn, $6-8 \mathrm{~mm}$. long.
Culms nearly naked, leaves all crowded at the base; panicle $5-7.5 \mathrm{~cm}$. long, its branches 2.5 cm . in length or less, erect.
3. O. asperifolia.

Culms leafy to the top; panicle $1.5-3 \mathrm{dm}$. long; branches $5-10 \mathrm{~cm}$. in lensth, more or less spreading.
4. O. melanocarpa.
i. Oryzopsis júncea (Michx.) B. S. P. Slender Mountain rice. (I. F. f. 314.) Culms glabrous, $1.5-6 \mathrm{dm}$. tall, erect. Sheaths usually crowded at the hise of the culm; leaves smooth or scabrous, erect, involute, the basal about onehalf the length of the culm, occasionally equalling it, filiform, those of the culm $2.5-10 \mathrm{~cm}$. long; panicle $2.5-6.25 \mathrm{~cm}$. long, the branches $1.25-2.5 \mathrm{~cm}$, in length, erect or ascending, the lower half naked; spikelets 34 mm . long. the third scale pubescent with short appressed silky hairs, the awn less than 2 mm . long. In dry rocky places, Quebec to Br . Col., south to Mass., Penn. and Wis. May-June.
2. Oryzopsis micrántha (Trin. and Rupr.) Thurb. Smali-Flowfkfin MơNtain Rice. (I. F. f. 315.) Culms glabrous, $3-7.5 \mathrm{dm}$. tall, erect, slender.

Leaves erect, scabrous, the basal one-half the length of the culm, less than I mm. wide, usually more or less involute, the culm leaves $5-20 \mathrm{~cm}$. long, $\mathbf{I}-2 \mathrm{~mm}$. broad; panicle $7 \cdot 5-15 \mathrm{~cm}$. long, the branches finally spreading, the lower ones $2.5-5 \mathrm{~cm}$. long, naked for about two-thirds their length; spikelets $2-2.5 \mathrm{~mm}$. long, the third scale glabrous, bearing an awn $6-8 \mathrm{~mm}$. long. S. Dak. to Neb., N. Mex. and Ariz. June-July.
3. Oryzopsis asperifòlia Michx. White-grained Mountain Rice. (I. F. f. 316.) Culms 2.5-5 dm. tall, erect, smooth or scabrous. Sheaths crowded at base ; leaves erect, rough, especially above, the basal ones elongated, often equalling or exceeding the culm, $4-8 \mathrm{~mm}$. wide, the I or 2 culm leaves much reduced, less than 1.25 cm . long; panicle $5-7.5 \mathrm{~cm}$. long, contracted, the branches 2.5 cm . in length or less, erect ; spikelets, exclusive of awn, $6-8 \mathrm{~mm}$. long ; third scale whitish, equalling the second or a little shorter, sparingly pubescent, the awn $7-10 \mathrm{~mm}$. long. In woods, N. S. to Br. Col., south to N. J., Penn., Minn., and in the Rocky Mts. to N. Mex. May-June.
4. Oryzopsis melanocàrpa Muhl. Black-fruited Mountain Rice. (I. F. f. 317.) Glabrous; culms 4.5-9 dm. tall, erect, simple, roughish. Sheaths smooth or scabrous, the lower ones usually longer, the upper slightly shorter than the internodes; leaves $1.25-3 \mathrm{dm}$. long, 4-14 mm. wide, narrowed toward the base, acuminate at apex into a long slender point, scabrous, especially above ; panicle branched or nearly simple, $7 \cdot 5-30 \mathrm{~cm}$. long, its branches $5-10 \mathrm{~cm}$. long, spreading or ascending, the lower half naked; outer scales of the spikelet about equal, $6-8 \mathrm{~mm}$. in length, acute ; third scale shorter, acute, dark colored, sparingly pubescent, the awn $1.6-2.4 \mathrm{~cm}$. long. Rocky woods, Vt. and Ont. to Minn., south to Mass., N. J., Ky. and Mo. July-Aug.

## 29. ERIOCÒMA Nutt.

Perennial tufted grasses, with usually involute leaves and a contracted or open panicle. Spikelets I-flowered. Scales 3; outer two membranous, glabrous; third scale firmer, becoming hard in fruit, densely pubescent with long silky hairs; and bearing a terminal readily deciduous awn, the callus at the base of the scale short and obtuse. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale. [Greek, referring to the copious silky hairs of the flowering scale.] A small genus of 2 or possibly more species, natives of western N. Am.
I. Eriocoma cuspidàta Nutt. Silky Oryzopsis. (I. F. f. 318.) Culms 3-6 dm . tall, erect, rigid, simple, smooth. Leaves $1.5-3 \mathrm{dm}$. long, less than 2 mm . wide, involute, stiff, smooth or somewhat scabrous; panicle 1.5-3 dm. long, diffuse, generally partially included in the upper sheath, its branches widely spreading and many times forked, the ultimate divisions flexuous; outer scales of the spikelet 6-8 mm . in length, long-acuminate, glabrous; third scale about one-half as long, acute, densely pubescent with long silky erect hairs nearly twice its own length, the awn 4-6 mm. long. On prairies, Alberta to Wash., south to Kans., Ariz. and Mex. May-July. (Oryzopsis cuspidata Vasey.)

## 30. MÍLIUM L.

Annual or perennial grasses, with flat leaves and terminal lax panicles. Spikelets I-flowered. Scales 3, obtuse, not awned; the outer about equal; the third thinmembranous, at length rigid, glabrous or pubescent; palet scarcely shorter. Stamens 3. Styles short, distinct. Stigmas plumose. Grain ovoid or oblong, free, tightly enclosed in the rigid and shining scale and palet. [Latin name for Millet.] Species 5 or 6, chiefly in Europe and Asia.
I. Milium effùsum L. Tall Millet-grass. (I. F. f. 3I9.) Glabrous throughout; culms 6-18 dm. tall, erect, simple, smooth. Leaves $7 \cdot 5-22.5 \mathrm{~cm}$. long, $6-16 \mathrm{~mm}$. wide, narrowed toward the base, acuminate, smooth or scabrous; panicle $7.5-25 \mathrm{~cm}$. in length, lax, its branches $5-7.5 \mathrm{~cm}$. long, slender, somewhat flexuous, naked at base and dividing above the middle, at length widely spreading; spikelets $2.5-3 \mathrm{~mm}$. long; outer scales equal, smooth or scabrous, the third scale shorter, smooth, white. In woods, Cape Breton Isl. and Quebec to western Ontario, south to Mass., Penn. and Mich. Also in Northern Europe and Asia. June-July.

## 31. MUHLENBÉRGIA Schreb.

Mostly perennial grasses, with flat or convolute leaves and paniculate inflorescence. Rootstocks often scaly. Spikelets I-flowered, very rarely 2 -flowered. Scales 3, very rarely 4; the outer ones empty, membranous or hyaline, acute and sometimes awned; third scale 3 - 5 -nerved, subtending a palet and perfect flower, obtuse. acute, or very often produced into a capillary awn; palet 2 -keeled. Stamens often 3. Styles distinct. Stigmas plumose. Callus minute. Grain narrow, free, tightly enclosed in the scale. [In honor of Henry Muhlenberg, 1756-1817, North American botanist.] About 60 species, chiefly natives of America, a few Asiatic.

Panicle contracted, narrow, spike-like, the short branches rarely spreading.
Flowering scales not awned but sometimes awn-pointed.
Outer scales not awned, about half as long as the flowering scale, acute.
Outer scales long-acuminate, awn-pointed or awned.
Outer scales about equal in length to the flowering scale, sharp-pointed, about 3 mm . long. 2. M. Mexicana.
Outer scales exceeding the flowering scale, generally twice its length, awned, about 5 mm . long.
Flowering scale long-awned; awn usually twice the length of the scale, sometimes shorter.
Outer scales about equalling the flowering scale.
Basal hairs not more than one-half the length of the flowering scale. Spikelets consisting of 3 scales and I perfect flower. 4. M. sylvatica. Spikelets consisting of 4 scales, the third with a perfect flower, the fourth empty and awned.
Basal hairs as long as the flowering scale.
5. M. ambigua.

Basal hairs as ing comata.
Outer scales one-half to two-thirds as long as the flowering scale.
7. M. tenuiflora.

Outer scales less than one-third the length of the flowering scale.
First scale minute, often wanting; flowering scale with an awn less than twice its length.
8. M. diffusa.

First scale about two-thirds as long as the second.
Panicle contracted, its branches closely appressed; awn about three times as long as the flowering scale.
9. M. palustris.

Panicle open, its branches finally spreading; awn four times or more as long as the flowering scale.

1. M. microsperma.

Panicle open, its branches long and spreading.
Culms 4.5 dm . tall or more; panicle diffuse; leaves elongated, not rigid.
11. M. capillaris.

Culms 3 dm . tall or less; leaves 5 cm . long or less, rigid.
Secondary branches of the panicle single; basal leaves short, numerous, strongly recurved. 12. M. gracillima.
Secondary branches of the panicle fascicled; basal leaves few, not recurved.
13. M. pungens.
I. Muhlenbergia sobolífera (Muhl.) Trin. Rock Muhlenbercila. (I. F. t. 320.) Glabrous; culms 3-9 dm. tall, erect, slender, simple, or sparingly hranched above, smooth. Leaves rough, those of the culm I-I.5 dm. long. 2-6 mm. wide. those of the branches $2.5-7.5 \mathrm{~cm}$. long, about 2 mm . wide; panicle $7.5-15 \mathrm{~cm}$. in length, slender, its branches $1.8-2.5 \mathrm{~cm}$. long; outer scales about I mm. longs, half to two-thirds the length of the spikelet; the third scale scabrous, obtuse, 3 -nerved. the middle nerve usually excurrent as a short tip. Rocky woods, N. H. and Mass. to Minn., south to Va., Tenn. and the Ind. Terr. Sept.-Oct.
2. Muhlenbergia Mexicàna (L.) Trin. Meanow Mimbenbergia. (I. F. t. 32I.) Glabrous; culms $6-\mathbf{1 2} \mathrm{dm}$. long, erect, or often prostrate. much hranched. smooth. Leaves scabrous, those of the culm I-r. 5 dm . long. 20 mm . wike the branch leaves smaller; panicle $5-15 \mathrm{~cm}$. long, contracted, its branches spuke-like. $2.5-5 \mathrm{~cm}$. long, erect or appressed; spikelets 2.53 mm . long: outer scales somewhat unequal, exceeding the flowering one, or slightly shorter, acuminate or shortawned, scabrous, especially on the keel; third scale acuminate. scabrous, particularly toward the apex. In swamps and horders of fichls. N. B. to western Ont.. south to N. Car., Tenn., Neb. and the Ind. Terr. Aug.-Sept.
 F. f. 322.) Culms 3-9 dm. tall, erect, usually much branched, smooth and L. of 0 .
glabrous. Leaves $5-\mathbf{1 2 . 5} \mathrm{cm}$. long, 2-6 mm. wide, scabrous; panicle $5-11.25 \mathrm{~cm}$. in length, usually dense and interrupted, the branches $1.25-2.5 \mathrm{~cm}$. long, erect or appressed, the spikelets much crowded; outer scales of the spikelet acuminate, 4-6 mm . long, including the awn, smooth, or scabrous, especially on the keel; third scale one-half to two-thirds as long, acuminate, the strongly scabrous midrib excurrent in a short point. In wet places, Newf. to Br. Col., south to N. J., Mo. and N. Mex. Aug.-Sept.
4. Muhlenbergia sylvática Torr. Wood Muhlenbergia. (I. F. f. 323.) Culms 3-9 dm. tall, erect, branched. Leaves $5-17.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, rough; panicle $7.5-17.5 \mathrm{~cm}$. in length, somewhat lax, the branches $2.5-7.5 \mathrm{~cm}$. long, erect or ascending; outer scales of the spikelet $2.5-3 \mathrm{~mm}$. long, awn-pointed, scabrous; third scale equalling or somewhat exceeding the outer ones, strongly scabrous, attenuate into a slender awn 2-4 times its length. In moist woods and along streams, N. B. to Ont. and Minn., south to N. Car., Tenn., Neb. and the Ind. Terr. Aug.-Sept.
5. Muhlenbergia ambígua Torr. Minnesota Muhlenbergia. (I. F. f. 324.) Glabrous; culms 3 dm . tall or lower, erect, branched, smooth. Sheaths shorter than the internodes; leaves $2.5-7.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, scabrous; panicle $2.5-7.5 \mathrm{~cm}$. long, rigid, its branches $1.25-2.5 \mathrm{~cm}$. long, dense, appressed; outer scales of the spikelet awn-pointed, unequal, the longer about 4 mm . in length and exceeding the body of the third scale, which is scabrous, villous, and attenuate into an awn 2-3 times its length; a fourth narrow awned scale is nearly always present. Along a lake shore in Minn.
6. Muhlenbergia comata (Thurb.) Benth. Hairy Muhlenbergia. (I. F. f. 325.) Culms $3-7.5 \mathrm{dm}$. tall, erect, slender, smooth and glabrous. Sheaths shorter than the internodes, smooth or slightly scabrous; leaves $6.2-12.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, erect, flat, rough; panicle often tinged with purple, $5-10 \mathrm{~cm}$. in length, dense, branches $1.25-3.75 \mathrm{~cm}$. long, erect; outer scales of the spikelet equal, or the second a little the longer, smooth, scabrous on the keel; third scale shorter, smooth and glabrous, bearing an awn $2-3$ times its length, the basal hairs silky, erect, fully as long as the scale. On prairies, Kans. (?) and Colo. to Cal. Aug.-Sept.
7. Muhlenbergia tenuifòra (Willd.) B. S. P. Slender Muhlenbergia. (I. F. f. 326.) Culms 6-9 dm. tall, erect, slender, simple or sparingly branched, smooth. Sheaths usually shorter than the internodes; leaves $6.25-17.5 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, narrowed toward the base, acuminate, scabrous; panicle 1.25-2.25 dm . long, slender, its branches $2.5-8.75 \mathrm{~cm}$. long, appressed; outer scales of the spikelet unequal. half to two-thirds the length of the third one, awn-pointed, scabrous; third scale $2.5-3 \mathrm{~mm}$. long, scabrous, bearing an awn 2-4 times its length. In rocky woods, Mass. to southern Ont. and Minn., south to Ala. and Tex. Aug.Sept.
8. Muhlenbergia diffùsa Willd. Nimble Will. Dropseed-grass. (I. F. £. 327.) Culms 3-9 dm. long, decumbent, or often prostrate or creeping and ascending, very slender, diffusely branched. Sheaths shorter than the internodes, loose; leaves $3.75-8.75 \mathrm{~cm}$. long, I-4 mm . wide, scabrous; panicle $5-20 \mathrm{~cm}$. long, slender, somewhat lax, its branches $2.5-5 \mathrm{~cm}$. long, erect, outer scales of the spikelet minute, the lower one often wanting; the third scale, exclusive of the awn, about 2 mm . long, strongly scabrous, particularly upon the nerves; the awn $1-4 \mathrm{~mm}$. in length. On dry hills and in woods, Me, and southern Ont. to Minn., south to Fla., Kans. and Tex. Aug.-Sept.
9. Muhlenbergia palùstris Scribn. Swamp Muhlenbergia. Culms slender, weak, $6-10 \mathrm{dm}$. long. Sheaths smooth and glabrous; leaves erect, $3-5 \mathrm{~cm}$. long, about 2 mm . wide, smooth beneath and rough above; panicle slender, contracted, $\mathbf{I}-\mathbf{1} .5 \mathrm{dm}$. long, its branches appressed; spikelets, exclusive of the awn. $2.5-2.8 \mathrm{~mm}$. long, the first scale shorter than the second, which is about one-third as long as the spikelet; the flowering scale $2.3-2.5 \mathrm{~mm}$. long, shortly 2 -toothed at the apex, bearing an awn between the teeth $5 \cdot 5-8 \mathrm{~mm}$. long, the callus hairy. In a swamp at Washington, D. C. Sept.
10. Muhlenbergia microspérma (DC.) Trin. Small-seeded MuhlenberGIA. (I. F f. 328.) Culms 1.5-4.5 dm. tall, erect, finally decumbent or somewhat prostrate at base. slender, diffusely branched. Leaves $1.25-6.25 \mathrm{~cm}$. long, 2 mm . wide or less, scabrous; panicle $5-10 \mathrm{~cm}$. in length, slender, open, the branches 2.5
cm . long or less, ascending or erect; outer scales of the spikelet unequal, obtuse or rounded at apex, about one-third the length of the third scale, which is $2.5-3 \mathrm{~mm}$. long, exclusive of the awn, and strongly scabrous; awn $1.2-2.4 \mathrm{~cm}$. in length. In dry soil, Kans. to Cal.,- south to Mex.
II. Muhlenbergia capillàris (Lam.) Trin. Long-awned Hair-grass. (I. F. f. 329.) Culms 4.5-12 dm. tall, erect, simple, smooth or nearly so. Sheaths smooth, the lower short and overlapping, the upper ones much longer; leaves I.5-3 dm . long, $2-4 \mathrm{~mm}$. wide, scabrous; panicle $1.75-3 \mathrm{dm}$. in length or more, diffuse, the capillary branches $\mathbf{1}-2 \mathrm{dm}$. long, at length widely spreading; spikelets on long hair-like pedicels which are clavate-thickened at the apex; outer scales unequal, acute or short-awned, slightly scabrous; third scale, exclusive of the awn, 4 mm . long, about twice as long as the first one, scabrous, the awn $6-18 \mathrm{~mm}$. in length. In dry sandy or rocky soil, Mass. to N. J. and Mo., south to Fla. and Tex. Panicle usually light purple. Sept.-Oct.
12. Muhlenbergia gracílima Torr. Filiform Muhlenbergia. (I. I.f. 330.) Culms I-3.5 dm. tall, from a slender creeping rootstock, erect, slender, simple, rigid. Leaves $2.5-5 \mathrm{~cm}$. long, involute-setaceous, smooth or somewhat scabrous, rigid, the basal numerous, usually strongly recurved, the $1-3$ culm leaves erect or ascending; panicle $5-22.5 \mathrm{~cm}$. in length, open, the branches finally widely spreading, $2.5-7.5 \mathrm{~cm}$. long, filiform; spikelets about as long as the filiform pedicels, which are clavate-thickened at the apex; outer scales unequal, usually awnpointed or short-awned, slightly scabrous; third scale $2.5-3 \mathrm{~mm}$. long, longer than the outer ones, sometimes twice as long, scabrous; awn 2-4 mm. long. On prairies, Kans. to Colo., south to Tex. and N. Mex. Sept.-Oct.

13 Muhlenbergia púngens Thurb. Prairie Muhlenbergia. (I. F. f. 33I.) Culms $1.5-3.75 \mathrm{dm}$. tall, from a creeping rootstock, erect from a decumbent branching base, rigid, minutely pubescent. Sheaths crowded at the base of the culm, scabrous; leaves $2.5-5 \mathrm{~cm}$. long, involute-setaceous, rigid, scabrous; panicle $7.5-15 \mathrm{~cm}$. in length, open, the branches $5-6.25 \mathrm{~cm}$. long, single, distant, much divided from near the base, the divisions apparently fascicled; spikelets on long pedicels, which are clavate-thickened at the apex; outer scales, when mature, equalling or often shorter than the body of the third one, scabrous, especially on the keel; third scale, when mature, $1.5^{-2} \mathrm{~mm}$. long, scabrous, the awn shorter than its body. On prairies, Neb. to Utah, south to Tex. and Ariz. Aug.-Sept.

## 32. BRACHYÉLYTRUM Beauv.

A tall grass with flat leaves and a narrow panicle. Spikelets I-flowered, narrow, the rachilla produced beyond the flower, and sometimes bearing a minute scale at the summit. Scales 3 ; the outer small and inconspicuous, the lower often wanting; the third much longer, rigid, 5 -nerved, acuminate into a long awn; palet scarcely shorter, rigid, sulcate on the back, 2-nerved. Stamens 2. Styles short, distinct. Stigmas plumose, elongated. Grain oblong, free, enclosed in the scale and palet. [Greek, in allusion to the minute outer scales.] A monotypic genus of eastern N. Am.

1. Brachyelytrum eréctum (Schreb.) Beauv. Brachyelytrum. (I. F. f. 332.) Culms 3-9 dm. tall, pubescent at and near the nodes. Sheaths more or less villous, especially at the throat; leaves $5-\mathbf{1 2 . 5} \mathrm{cm}$. long, $6-18 \mathrm{~mm}$. wide, scabrous; panicle $5-15 \mathrm{~cm}$. in length, slender, branches $2.5-7.5 \mathrm{~cm}$. long, erect or appressed; outer scales of the spikelet unequal, the upper less than one-third as long as the flowering scale, the lower minute or wanting; third scale, exclusive of the awn, $9-12 \mathrm{~mm}$. long, scabrous, especially on the midnerve, the awn erect, I. $8-2.4 \mathrm{~cm}$. long. Moist places, Newf. to western Ont. and Minn., south to N. Car., Tenn. and Kans. July-Aug.

## 33. HELEÓchloA Host.

Perennial tufted grasses with flat leaves and spicate or paniculate inflorescence. Spikelets I-flowered. Scales 3 ; the 2 outer empty, somewhit uncepual. membranous, acute, ciliate-keeled; the third scale similar, a litthe honger: palet shorter. hyaline, 2-nerved. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, loosely enclosed in the scale. [Circek, signifying meadow-gras:. ]

About 8 species, chiefly natives of the Mediterranean region, one or two also widely distributed through middle Europe and Asia.
I. Heleochloa schoenoìdes (L.) Host. Rush Cat-tail Grass. (I. F. f. 333.) Glabrous. Culms $1-4.5 \mathrm{dm}$. tall, branched, smooth; sheaths about half the length of the internodes, the upper loose, the one immediately below the spike inflated and usually partially enclosing it ; leaves $2.5-7.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, flat, acuminate, smooth beneath, scabrous above; spikelets 2.5 mm . long, the empty scales acute, compressed, ciliate-keeled, I-nerved; third scale equalling or longer than the second, acute, compressed, ciliate-keeled, otherwise glabrous, I-nerved. In waste places, southern N. Y. to Del. Naturalized from Europe. July-Aug.

## 34. PHLÈUM L.

Annual or perennial grasses with flat leaves and spicate inflorescence. Spikelets 1 -flowered. Scales 3 ; the 2 outer empty, membranous, compressed, keeled, the apex obliquely truncate, the midnerve produced into an awn ; the third scale much shorter, broader, hyaline, truncate, denticulate at the summit ; palet narrow, hyaline. Stamens 3. Styles distinct, somewhat elongated. Stigmas plumose. Grain ovoid, free, enclosed in the scale and palet. [Name Greek, taken from Pliny ; originally applied to some very different plant.] About io species, inhabiting the temperate zones of both hemispheres. The following only are natives of N. Am. The English name Cat-tail Grass is applied to all the species.

Spikes usually elongated, cylindric; awns less than one-half the length of the outer scales ; upper sheath not inflated. I. P. pratense.
Spikes not elongated, ovoid to oblong and cylindric ; awns about one-half the length of the outer scales; upper sheath inflated.
2. P. alpinum.
I. Phleum praténse L. Timothy. Herd-grass. (I. F.f. 334.) Glabrous and smooth or very nearly so throughout. Culms 3-12 dm. tall, erect, simple; sheaths usually exceeding the internodes, sometimes shorter, the upper one long and not inflated, or very slightly so ; leaves $7 \cdot 5-22.5 \mathrm{~cm}$. long, $4^{-6} \mathrm{~mm}$. wide; smooth or scabrous; spike usually elongated, cylindric, $3.75-17.5 \mathrm{~cm}$. in length, $5-8 \mathrm{~mm}$. in diameter ; outer scales of the spikelet, exclusive of the awn, $2-5 \mathrm{~mm}$. long, ciliate on the keel, the awn less than half their length. In fields and meadows nearly throughout N. Am. Also in Europe and Asia. Widely cultivated for hay. The scales are sometimes modified into small leaves. July-Aug.
2. Phleum alpìnum L. Mountain Phleum. (I. F. f. 335.) Glabrous. Culms I.5-4.5 dm. tall, erect or sometimes decumbent at the base. simple, smooth; sheaths often much shorter than the internodes, sometimes longer, the upper one usually much inflated; leaves smooth beneath, scabrous above, the lower 5-7.5 cm . long, $2-8 \mathrm{~mm}$. wide ; upper leaf generally very short, less than 2.5 cm . long ; spike short, ovoid to oblong and cylindric, $1.25-5 \mathrm{~cm}$. in length, $6-12 \mathrm{~mm}$. in diameter ; outer scales of the spikelet, exclusive of the awn, 3 mm . long, strongly ciliate on the keel, the awn about one-half their length. Lab. to Alaska, south to the mountains of N. H., Vt., Ariz. and Cal. Also in northern Europe and Asia and in Patagonia. Summer.

## 35. ALOPECÛRUS L.

Annual or perennial grasses with erect or decumbent culms, usually flat leaves and spicate inflorescence. Spikelets I-flowered, flattened: scales 3, the 2 lower empty, acute, sometimes short-awned, more or less united below, compressedkeeled ; keel ciliate or somewhat winged ; third scale truncate or obtuse, hyaline, 3 -nerved, awned on the back, subtending a perfect flower and usually a palet; palet hyaline, acute, sometimes wanting. Stamens 3. Styles distinct or rarely united at the base. Stigmas elongated, hairy. [Greek, signifying Fox-tail Grass, in allusion to the spikes.] About 20 species, principally natives of the north temperate zone. Besides the following, some 4 others occur in western N. Am.
Outer scales of the spikelet united for one-half their length, smooth to hispid on the keel. 1. A. agrestis.

Outer scales of the spikelet united for one-quarter their length or less, long-ciliate on the keel.

## Scales $4-6 \mathrm{~mm}$. in length.

Spike $3.75-6.25 \mathrm{~cm}$. long ; outer scales glabrousior sparingly pubescent on the lateral nerves.
Spike 3.75 cm . long or less; outer scales villous.
3. A. pratensis.
4. A. alpinus.
I. Alopecurus agréstis L. Slender Foxtail. (I. F. f. 336.) Smooth or slightly scabrous; culms $3-6 \mathrm{dm}$. tall, erect, simple. Sheaths shorter than the internodes; leaves $3.75-17.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, scabrous, especially above; spike $3.75-10 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. thick; outer scales of the spikelet united at the base for about half their length, narrowly wing-keeled, 4-5 mm. long, the nerves smooth or scabrous, sometimes hispid below, especially on the keel ; third scale equalling or slightly exceeding the outer ones, smooth and glabrous, the awn inserted near the base, about twice its length, bent. In waste places and ballast, southern N. Y. and N. J. Adventive trom Europe. Native also of Asia. JulyAug.
2. Alopecurus geniculàtus L. Marsh Foxtail. (I. F. f. 337.) Glabrous or very nearly so. Culms $1.5-4.5 \mathrm{dm}$. tall, erect, or sometimes decumbent at the base ; sheaths usually shorter than the internodes, loose or somewhat inflated; leaves $2.5-\mathbf{I} 5 \mathrm{~cm}$. long, $\mathrm{I}-4 \mathrm{~mm}$. wide, scabrous, especially above; $2.5-7.5 \mathrm{~cm}$. in length, $4-8 \mathrm{~mm}$. thick; outer scales of the spikelet slightly united at the base, $2-2.5 \mathrm{~mm}$. long, obtuse or subacute, smooth, glabrous except on the pubescent lateral nerves and strongly ciliate keel; third scale somewhat shorter, obtuse, smooth and glabrous, the awn inserted at or below the middle, equalling or exceeding it. In wet soil, Newf. to Br. Col., south to Fla., Tenn., Ariz. and Cal. Also in Europe and Asia. July-Sept.
3. Alopecurus praténsis L. Meadow Foxtail. (I. F. f. 338.) Nearly or quite glabrous. Culms $3-6.25 \mathrm{dm}$. tall, erect, simple; sheaths usually much shorter than the internodes, loose or somewhat inflated; leaves $3.75-8.75 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, scabrous, at least above; spikes $3.75-6.25 \mathrm{~cm}$. in length, $8-12 \mathrm{~mm}$. thick; outer scales of the spikelet uniting at the base for about one-quarter their length, 4-6 mm. long, acute, glabrous except the sparingly pubescent lateral nerves and the strongly ciliate keel; third scale slightly shorter, obtuse, smooth and glabrous, the awn inserted about quarter way up the scale and exceeding it. In meadows, N. S. to southern N. Y. and Ohio. Naturalized from Europe. June-July.
4. Alopecurus alpìnus J. E. Smith. Alpine Foxtail. (I. F. f. 339.) Culms glabrous and smooth or nearly so, $\mathbf{1 . 2 5 - 6 ~ d m}$. tall, erect, sometimes decumbent at the base, simple. Sheaths generally shorter than the internodes, loose. often inflated; leaves $2.5-17.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, smooth beneath, slightlyscabrous above; spike 3.75 cm . in length or less, $6-12 \mathrm{~mm}$. thick; outer scales of thelspikelet united only at the base, 4 mm . long, obtuse, villous and ciliate; third scale about equalling the outer ones, obtuse, glabrous except at the villous apex. the awn inserted about one-third the way up, a little exceeding the scale. Greenland and Lab, to Alaska. Also in arctic and alpine Europe and Asia. Summer.

## 36. PHİPPSIA R. Br.

A low annual tufted grass, with flat leaves and spike-like panicles. Spikelets I-flowered; scales 3 ; the 2 outer empty, minute, the first often wanting; the third scale thin-membranous, keeled. Palet somewhat shorter, 2 -keeled. Stamen I. rarely 2 or 3. Styles short, distinct. Stigmas plumose. Grain oblong, enclosed in the scale and palet, which readily split and allow it to drop out. [In homor of John Constantine Phipps, 1744-1792, arctic navigator.] A monotypic scrus of the arctic regions.

1. Phippsia álgida (Soland.) R. Br. PhippsiA. (I. F. f. 340.) Smonth and glabrous throughout. Culms $2.5-\mathbf{1 2 . 5} \mathrm{cm}$. tall, erect, simple ; leaves 2.5 cm . in length or less, $0.5^{-2} \mathrm{~mm}$. wide, obtuse ; panicle $6-35 \mathrm{~mm}$. in length, contractel: branches $6-18 \mathrm{~mm}$. long, erect or appressed; spikelets $1-1.5 \mathrm{~mm}$. long: wuter scales minute, unequal, acutish, the first often wanting; third scale broad. i-nerval. obtuse, or subtruncate and somewhat erose, the palet about iwo-thirds as loms. broad, 2 -keeled, erose-truncate. Arctic regions of both the ()hd Workd and the New. Summer.

## 37. SPORÓBOLUS R. Br.

Perennial or rarely annual grasses, with flat or convolute leaves and open or contracted panicles. Spikelets generally small, I-flowered, occasionally 2-3flowered. Scales in the I-flowered spikelets 3 , membranous; the 2 outer empty, the first somewhat shorter ; the third scale equalling or longer than the empty ones; palet 2 -nerved. Stamens 2-3. Styles very short, distinct. Stigmas plumose. (irain free, and often early deciduous. [Greek, referring to the deciduous grain.] About 80 species, in tropical and temperate regions, very numerous in America. Besides the following, 4 or 5 others occur in the southern and western U. S.

Panicle contracted, spike-like.
Spikelets more than 3.5 mm . in length.
Panicle terminal; upper sheaths 7.5 cm . long or more.
Leaves glabrous or very nearly so.
Third scale of the spikelet acuminate, much longer than the second and usually greatly exceeded by the palet. I. S. asper.
Third scale of the spikelet acutish or obtuse, somewhat exceeding the second and equalling or a little shorter than the palet.
2. S. longifolius.

Leaves, at least the lower, papillose-hirsute. 3. S. pilosus.
Panicles terminal and lateral ; sheaths 3.75 cm . long or less.
4. S. vaginaeflorus.

Spikelets 3 mm . long or less.
Sheaths inflated, the uppermost usually enclosing the base of the panicle.
5. S. neglectus.

Sheaths not inflated ; panicle exserted.
Branches of the panicle not crowded; third scale acuminate.
Outer scales of the spikelet obtuse or abruptly acute, less than half as long as the third scale; ligule about 2 mm . long, acutish.
6. S. brevifolius.

Outer scales of the spikelet acuminate and awn-pointed, more than half as long as the third scale; ligule less than 0.5 mm . long, erosetruncate.
7. S. cuspidatus.

Branches of the panicle densely crowded; third scale acute.
Culms decumbent and branched at the base, from a stout horizontal rootstock; panicle short. 8. S. Virginicus.
Culms erect, simple, tufted; panicle usually elongated.
9. S. Indicus.

Panicle open, its branches more or less spreading, at least at maturity.
First scale one-half as long as the second or less.
Branches of the panicle verticillate.
Spikelets 1.5 mm . long, green. 10. S. argutus.
Spikelets $2.5-3 \mathrm{~mm}$. long, purple.
11. S. ejuncidus.

Branches of the panicle alternate or sometimes subverticillate.
Spikelets about 2 mm . long; first scale lanceolate.
Pedicels equalling or shorter than the spikelets; first scale acute.
Sheaths naked or sparingly ciliate at the throat; panicle usually exserted. 12. S. airoides.

Sheaths densely pilose at the throat; base of the panicle generally included.
13. S. cryptandrus.

Pedicels much longer than the spikelets; firstscale narrow, acuminate.
17. S. Texanus.

Spikelets 4-5.5 mm. long ; first scale subulate, usually awned.
14. S. heterolepis.

First scale about equalling the second.
Perennials ; culms from long rootstocks.
Culms erect, simple ; leaves elongated. .. 15. S. Torreyanus.
Culms decumbent and branched below ; leaves short.
16. S. asperifolius.

Annuals ; roots fibrous, no rootstocks.
Empty scales but little shorter than the flowering scale, usually pubescent.
18. S. confusus.

Empty scales one-half as long as the flowering scale, glabrous.
19. S. serotinus.
I. Sporobolus ásper (Michx.) Kunth. Rough Rush-grass. (I. F. f. 341.)

Culms $6-15 \mathrm{dm}$. tall, erect. Leaves $7.5 \cdot 35 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide at the base,
attenuate into a long slender involute tip, smooth and glabrous beneath, scabrous above, or somewhat hairy at the base; panicle $5-\mathbf{1 2 . 5} \mathrm{cm}$. in length, linear, strict, its branches $2.5-5 \mathrm{~cm}$. long, appressed; spikelets $6-8 \mathrm{~mm}$. long, the outer scales unequal, acute ; third scale pubescent at the base, much longer than the second and greatly exceeded by the long-acuminate almost awned palet. In dry soil, Del. to Ill., south to Fla. and Tex. Aug.-Sept.
2. Sporobolus longifòlius (Torr.) Wood. Long-Leaved Rush-grass. (I. F. f. 342.) Culms $4 \cdot 5-$ Io dm. tall, erect, occasionally branched. Leaves I4.5 dm . long, $2-4 \mathrm{~mm}$. wide at the base, attenuate into a long slender involute tip, smooth and glabrous beneath, scabrous and hairy at the base above; panicle more or less included in the upper sheath, $7 \cdot 5-25 \mathrm{~cm}$. in length, linear, strict, the branches $2.5-5 \mathrm{~cm}$. long, erect; spikelets $4-5 \mathrm{~mm}$. long; outer scales unequal, acutish, glabrous, the lower shorter; third scale glabrous, acutish or obtuse, exceeding the second and equalling or a little shorter than the obtuse palet. In dry soil, Me. to Penn., Neb. and Kans., south to Fla. and Tex. Aug. -Sept.
3. Sporobolus pilòsus Vasey. Hairy Rush-grass. (I. F. f. 343.) Culms $3-4.5 \mathrm{dm}$. tall, erect, rigid, stout. Leaves $7 \cdot 5^{-1} 5 \mathrm{~cm}$. long, $z-4 \mathrm{~mm}$. wide at base, erect, rigid, attenuate into a slender involute tip, the lower papillose-hirsute on both sides, the upper usually glabrous beneath, scabrous above and somewhat hairy near the base; panicle $5-7.5 \mathrm{~cm}$. in length, included at the base, erect, strict, its branches $1.25-2.5 \mathrm{~cm}$. long, erect; spikelets 5 mm . long, the outer scales unequal, glabrous, obtuse, the lower shorter; third scale obtuse, glabrous, somewhat exceeding the second and equalling or a little longer than the obtuse palet. In dry soil, Kans. and Mo. Aug.-Sept.
4. Sporobolus vaginaeflòrus (Torr.) Wood. Sheathed Rush-grass. (I. F. f. 344.) Culms $2-4.5 \mathrm{dm}$. tall, erect, slender. Sheaths usually inflated; leaves 2 mm . wide or less, smooth and glabrous beneath, scabrous and hairy near the base above, attenuate into a slender involute point, the lower elongated, the upper $2.5-7.5 \mathrm{~cm}$. long, setaceous; panicles $1.8-5 \mathrm{~cm}$. in length, the terminal one exserted or sometimes partially included, strict, the branches $\mathbf{I}_{2} 25 \mathrm{~cm}$. long or less, erect, the lateral ones enclosed in the sheaths; spikelets $3 \cdot 5-4.5 \mathrm{~mm}$. long, the outer scales unequal, acuminate, the third scale scabrous, sparingly appressed-pubescent, about as long as the second and equalling or slightly exceeded by the very acute palet. In dry soil, N. H. to N. Y., Ill. and Neb., south to Ga. and Tex. Aug.Sept.
5. Sporobolus negléctus Nash. Small Rush-grass. (I. F. f. 345.) Culms 1.5-3 dm. tall, erect from a usually decumbent base, slender. Sheaths inflated; leaves 2 mm . wide or less at the base, smooth and glabrous beneath, scabrous and hairy near the base above, attenuate into a slender point, the lower elongated, the upper $2.5-7.5 \mathrm{~cm}$. long, setaceous; terminal panicle $2.5-6.25 \mathrm{~cm}$. in length, usuallymore or less included in the upper sheath, strict; lateral panicles enclosed in the sheaths; spikelets about 3 mm . long, the outer scales acute, the third scale acute. glabrous, a little longer than the second and about equalling the acute palet. In dry soil, Mass. to Ky., Neb. and Kans. Aug.-Sept.
6. Sporobolus brevifolius (Nutt.) Nash. Short-leaved Rush-griss. I. F. f. 346.) Smooth and glabrous; culms $1.5-4.5 \mathrm{dm}$. tall, arising from a horizontal rootstock, erect, slender, decumbent and branching at the base. Leaves
 3.75 cm ., linear, its branches $6-12 \mathrm{~mm}$. long, erect or appresscit; spikelets $2.5-3$ mm . long, the outer scales unequal, less than half as long as the thitd, obtusce or abruptly acute, scabrous on the keel and at the apex; third scale long-acuminate. sometimes cuspidate, scabrous toward the apex. Anticosti Lsl. and Me. to Dr. Col.. south in the mountains to N. Mex. and Cal. Summer.
7. Sporobolus cuspidàtus (Torr.) Wood. Prairie RI'shlikiss. (1. F. f. 347.) Smooth and glabrous; culms 3-6 dm. tall. erect. simple or somewhat branched. Leaves $2.5-10 \mathrm{~cm}$. long, less than 2 mm . wide at the base. erect. in-volute-setaceous, at least when dry; panicle $3.75-12.5 \mathrm{~cm}$. in lensth, slemder. its branches 6-25 mm . long, appressed; spikelets $2.5-3 \mathrm{~mm}$. long. the outer seales half to three-quarters as long, acuminate or cuspidate, scaboms on the keel; third scalce long-acuminate and cuspidate, sparingly scabrous. In dry soil, Mantoba to the N. W. Terr., south to Mo. and Kans. Aug.-Sept.
8. Sporobolus Virginicus (L.) Kunth. Seashore Rush-grass. (I. F. f. 348.) Culms $1.5-6 \mathrm{dm}$. tall, erect or sometimes decumbent, from a stout rootstock. Sheaths numerous, short, overlapping and crowded at the lower part of the culm, smooth, glabrous or sometimes pilose on the margins and at the throat; leaves 2.520 cm . long, 4 mm . wide or less at the base, distichous, acuminate into a long point, involute on the margins and at the apex, smooth beneath, scabrous above or sometimes sparingly hairy; panicle $2.5-7.5 \mathrm{~cm}$. long, 4-10 mm. thick, dense and spikelike, usually exserted; spikelets $2-2.5 \mathrm{~mm}$. long, the outer scales about equal, acute, smooth and glabrous; third scale smooth and glabrous, acute, slightly shorter than the second and about equalling the obtuse palet. On sandy shores, Va. to Fla., west to Tex. and Mex., Also in Cuba. Aug.-Sept.
9. Sporobolus Indicus (L.) R. Br. India Rush-grass. Smut-grass. (I. F f. 349.) Glabrous and smooth throughout. Culms 3-12 dm. tall, erect, tufted; leaves $2-6 \mathrm{~mm}$. wide, attenuate into a long slender point, the lower $2-3 \mathrm{dm}$. long, the upper shorter; panicle $1-4 \mathrm{dm}$. in length, usually elongated, narrow, spike-like; spikelets $1.5-2 \mathrm{~mm}$. long, the outer scales unequal, about half as long as the third, obtuse, smooth and glabrous, the lower one shorter, and often erose-truncate; third scale acute, somewhat exceeding the obtuse or acutish palet. In meadows and waste places, Va. to Fla., west to Ark. and Cal. Naturalized from tropical regions; very abundant in Cent. and S. Am. July-Sept.
10. Sporobolus argùtus (Nees) Kunth. Pointed Dropseed-Grass. (I. F. f. 350.) Culms 3 dm . tall or less, erect, or somewhat decumbent at the base. Sheaths shorter than the internodes, their margins sometimes hirsute at the top; leaves $2.5-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide at the base, acuminate, smooth and glabrous beneath, scabrous, and often sparingly hairy at the base above; panicle 3.75-7.5
 finally widely spreading; spikelets 1.5 mm . long; outer scales smooth and glabrous, the first rounded or obtuse, one-quarter the length of the acute second one; third scale about equalling the second, acute. Kans., the Ind. Terr. and Colo., south to Tex. and Mex. Also in the West Indies. July-Sept.
ir. Sporobolus ejúncidus Nash. Purple Dropseed-grass. Wiregrass. (I. F. f. 35I.) Glabrous and smooth throughout. Culms $3-6 \mathrm{dm}$. tall, tufted, erect, slender, simple; leaves filiform or setaceous, the basal 1.5-3 dm. long, numerous, those of the culm few, $2.5-7.5 \mathrm{~cm}$. long; panicle $7.5-17.5 \mathrm{~cm}$. in length, open, the branches verticillate, the lower $2.5-5 \mathrm{~cm}$. long, widely spreading; spikelets $2.5-3 \mathrm{~mm}$. long, purple, the outer scales very unequal, the first obtuse or acutish, one-fourth to one-third the length of the acute second one; third scale subacute or blunt, equalling the second and the obtuse palet. Dry sandy soil, Va. to Fla., west to Tex. Aug.-Sept. (Sporobolus junceus (Mx.) Kth.; not Agrostis juncea Lam.).
12. Sporobolus airoìdes Torr. Hair-grass Dropseed. (I. F. f. 352.) Culms 4.5-9 dm. tall, erect, simple. Leaves smooth beneath, scabrous above and sometimes sparingly hairy near the base, $1-3 \mathrm{~mm}$. wide at the base, attenuate into a long slender involute point, the basal about one-half as long as the culm, the upper culm leaves $5 \mathbf{- 1 2 . 5} \mathrm{~cm}$. in length; panicle $\mathbf{1 . 2 5 - 4 ~ d m}$. long, usually exserted, the branches alternate or the upper verticillate, at length widely spreading, the lower $7.5-17.5 \mathrm{~cm}$. long; spikelets $\mathrm{I} .5-2 \mathrm{~mm}$. long, the scales acute, glabrous, the outer unequal, the lower one about half as long as the upper; third scale equalling the second and the palet. Prairies, Neb. to Cal., south to Tex. and Ariz. Aug.Sept.
13. Sporobolus cryptándrus (Torr.) A. Gray. Sand Dropseed. (I. F. f. 353.) Culms 4.5-10.5 dm. tall, erect. Sheaths with a dense pilose ring at the summit, the lower short, crowded and overlapping, the upper much longer, generally enclosing the base of the panicle; leaves $7 \cdot 5-15 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, flat, glabrous beneath, scabrous above, long-acuminate; panicle $\mathbf{1} .5-2.5 \mathrm{dm}$. in length, the branches spreading or ascending, alternate, the lower $3.75-7.5 \mathrm{~cm}$. long; spikelets $2-2.5 \mathrm{~mm}$. long, the scales acute, glabrous, the outer scabrous on the keel, the luwer one-third as long as the upper; third scale somewhat longer or shorter than the second. In sandy soil, coast of N. E., along all the Great Lakes, west to Dak., south in the interior to Mo., Tex. and Mex. Aug.-Oct.
14. Sporobolus heterólepis A. Gray. Northern Dropseed. (I. F. f. 354.)

Culms 3-9 dm. tall, erect. Leaves involute-setaceous, glabrous, the margins and upper part of the midrib very rough, the basal about three-fourths the length of the culm, occasionally equalling it, those of the culm shorter; panicle $7.5-25 \mathrm{~cm}$. in length, its branches erect or ascending, alternate or subverticillate, the lower 3.758.75 cm . long; spikelets $4-5.5 \mathrm{~mm}$. long, the scales smooth and glabrous, the outer unequal, acuminate, the lower subulate, about half the length of the broad second one, often awn-pointed; third scale obtuse or acute, shorter than the second or occasionally equalling it. In dry soil, Quebec to Assiniboia, south to Penn., Ill., Neb. and Ark. Aug.-Sept.
15. Sporobolus Torreyànus (R. \& S.) Nash. Flat-stemmed Dropseed. (I. F. f. 356.) Culms 3-6 dm. tall, from a horizontal rootstock, stout, simple, much compressed, smooth and glabrous. Sheaths compressed, overlapping, sometimes scabrous at the summit; leaves $\mathbf{I} .25-2.5 \mathrm{dm}$. long, 2 mm . wide or less, folded, slightly rough; panicle $\mathbf{I}-2.5 \mathrm{dm}$. in length, the branches erect or ascending, the lower $5-7.5 \mathrm{~cm}$. long; spikelets about $\mathbf{1} .75 \mathrm{~mm}$. long; outer scales subequal, obtuse or somewhat acute, smooth and glabrous; third scale obtuse and apiculate, strongly scabrous, slightly exceeding the outer ones. In bogs, L. I. and in the pine barrens of N. J. Sept.-Oct. (Sporobolus compressus (Torr.) Kth. Not Agrostis compressa Willd.)
16. Sporobolus asperifòlius Nees \& Meyen. Rough-Leaved Dropseed. (I. F. f. 357.) Culms I.5-4.5 dm. tall, erect from a decumbent and branched base. Sheaths short, crowded and overlapping; leaves numerous, $2.5-8.75 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide at the base, acuminate, strict, often erect, flat, glabrous, smooth beneath, very rough above; panicle $7.5-20 \mathrm{~cm}$. in length, included at the base, rarely entirely exserted, the capillary branches spreading or ascending, the lower $5-10 \mathrm{~cm}$. long; spikelets occasionally 2 -3-flowered, 1.5 mm . long; outer scales subequal, acute, glabrous, sparingly scabrous; third scale obtuse or acute, glabrous, somewhat exceeding the second. Dry soil, Assiniboia to Br. Col., south to Mo., Neb., Cal. and Mex. Aug.-Sept.
17. Sporobolus Texànus Vasey. Texas Dropseed. Culms 3-6 dm. tall, branching below. Sheaths crowded, the lower ones papillose-hirsute; leaves erect, firm, $4^{-1} 5 \mathrm{~cm}$. long, $3-5 \mathrm{~mm}$. wide, smooth beneath, very rough above; panicle included at the base, the upper branches finally widely spreading, $5-10 \mathrm{~cm}$. long; spikelets a little exceeding 2 mm . long, on long slender pedicels; scales smooth and glabrous, the first scale narrow, acuminate, less than one-half as long as the second, which equals the third scale. Kans. (according to B. B. Smyth) to Tex. and N. Mex. Aug.
18. Sporobolus confùsus Vasey. Culms tufted, I-3 dm. tall, slender, from an annual root. Leaves $1-4 \mathrm{~cm}$. long, $\mathbf{I} .5 \mathrm{~mm}$. or less wide ; panicle open, $3-20 \mathrm{~cm}$. long, its slender branches spreading or ascending, the longer $1.5-4 \mathrm{~cm}$. long; spikelets $\mathbf{I} .25-\mathbf{I} .5 \mathrm{~mm}$. long, on capillary pedicels which are abruptly thickened at the apex, the empty scales shorter than the flowering scale, glabrous or pubescent, the flowering scale usually pubescent, sometimes glabrous. Neb. (according to Rydberg) and Colo. to Tex,, Ariz. and Mex. July-Sept.
19. Sporobolus serótinus (Torr.) A. Gray. Late-flowering I)ropsken. (I. F. f, 355.) Glabrous and smooth or very nearly so. Culms 1.5-4.5 dm. tall, from an annual root, erect, slender; sheaths short, confined to the lower part of the culm; leaves 1 mm . wide or less, slightly scabrous above, flat, the hasal one-third to half the length of the culm, those of the culm 5-10 cm . long : panick $7.5-22.5 \mathrm{~cm}$. in length, the branches capillary, erect or ascending. the hower 2.5-6.25 cm. long; spikelets about 1.25 mm . long, the outer scales sulwepu.1. obtuse, smooth or sometimes sparingly scabrous ; third scale twice the length of the outer ones, acuminate. In wet sandy soil, Maine to Mich., south tu N. J. Sept.-Oct.

## 38. POLYPȮGON Desf.

Mostly annual grasses, with decumbent or rarely crect culms, flat leaves and spike-like panicles. Spikelets $x$-flowered ; scales 3 : the 2 outer emper, each ex tended into an awn ; third scale smaller, generally hyaline. shom-awned from the. l.w the apex, subtending a palet and perfect flower : palet shoter than the sale. Stamens 1-3. Styles short, distinct. Stigmas plumesed. (irain frot. entheral in
the scale and palet. [Greek, in allusion to the many long awns which resemble a beard.] About 10 species, widely distributed in temperate and warm regions. rare in the tropics.

1. Polypogon Monspeliénsis (L.) Desf. Beard-grass. (I. F. f. 358.) Culms 6 dm . tall or less, erect from a usually decumbent base. Leaves 3.75-15 cm . long, 3-6 mm. wide, scabrous, especially above; panicle $2.5-10 \mathrm{~cm}$. in length, dense and spike-like, the branches $\mathbf{I} .25 \mathrm{~cm}$. in length, ascending; spikelets crowded; outer scales about 2 mm . long, obtuse, slightly bifid, scabrous, bearing a more or less bent awn 4-6 mm. long; third scale much shorter, erose-truncate, hyaline, bearing a delicate awn about 0.5 mm . long, inserted below the apex. In waste places, N. H. to S. Car., mostly near the coast. Very abundant in western N. Am., from Br. Col. to Mex. Naturalized from Europe. Native also of Asia. July-Sept.

## 39. ARCTAGRÓSTIS Griseb.

A perennial grass with flat leaves and contracted panicle. Spikelets I-flowered. Scales 3; the 2 outer empty, unequal, somewhat acute, membranous; the third scale exceeding the second, subtending a palet and perfect flower, obtuse; palet obtuse, 2 -nerved. Stamens 2 or 3. Styles distinct, short. Stigmas plumose. Grain oblong, free, enclosed in the scale and palet. Seed adherent to the pericarp. [Latin, signifying an arctic Agrostis-like grass.] A monotypic genus of arctic and subarctic regions.

1. Arctagrostis latifòlia (R. Br.) Griseb. Arctagrostis. (I. F. f. 359.) Culms I.5-6 dm. tall, erect, or sometimes decumbent at the base, simple, smooth and glabrous. Sheaths shorter than the internodes; leaves $2.5-17.5 \mathrm{~cm}$. long, $2-8$ mm . wide, usually erect, scabrous; panicle $3.75-20 \mathrm{~cm}$. long, narrow, its branches $1.25-5 \mathrm{~cm}$. in length, ascending or erect; spikelets $3-4 \mathrm{~mm}$. long; outer scales unequal, acutish, the lower about two-thirds to three-fourths the length of the upper; third scale obtuse, exceeding the second, hispid on the keel. Greenland to Hudson Bay and Alaska. Also in arctic Europe and Asia. Summer.

## 40. CÍNNA L.

Tall grasses with flat leaves and panicled spikelets. © Spikelets I-flowered. Scales 3; the 2 outer empty, keeled, acute; the third scale similar, but usually shortawned on the back, subtending a palet and a stalked perfect flower; palet a little shorter, I-nerved. Stamen I. Styles short, distinct. Stigmas plumose. Grain narrow, free, enclosed in the scale and palet. Seed adherent to the pericarp. [Greek, taken from Dioscorides.] Four known species, inhabiting the temperate regions of Europe and N. Am. Besides the following, another occurs in the western U. S.

Panicle narrow at maturity, its filiform branches erect or drooping; spikelets $4-5 \mathrm{~mm}$. long; first scale much shorter than the second.
I. C. arundinacea.

Panicle open, its capillary branches flexuous and drooping; spikelets 3 mm . long; first scale about equalling the second.
2. C. latifolia.
I. Cinna arundinàcea L. Wood Reed-grass. (I. F. f. 360.) Culms 6-15 dm. tall, erect. Leaves I.5-3 dm. long, 4-14 mm. wide, scabrous; panicle I. 5-3 dm. in length, usually contracted, sometimes purple. the filiform branches erect or drooping, the lower $3.75-\mathbf{I I} .25 \mathrm{~cm}$. long; spikelets $4-5 \mathrm{~mm}$. in length, the scales acute, scabrous. especially on the keel, the first one shorter than the second; third scale slightly exceeded or equalled by the second, usually bearing an awn about 0.5 mm . long from the 2 -toothed apex. In moist woods and swamps, Newf. to the N. W. Terr., south to N. Car., La., Mo. and Tex. Aug.-Sept.
2. Cinna latifòlia (Trev.) Griseb. Slender Wood Reed-grass. (I. F. f. 361.) Culms 6-12 dm. tall, erect. Leaves $\mathbf{I}-2.5 \mathrm{dm}$. long, $4-\mathbf{1 2} \mathrm{mm}$. wide, scabrous; panicle $1.25-2.5 \mathrm{dm}$. in length, open, the capillary branches generally spreading, flexuous and often drooping, the lower $3.75-12.5 \mathrm{~cm}$. in length; spikelets 3 mm . long; scales scabrous, the outer acute, strongly hispid on the keel, the first about equalling the second; third scale usually exceeded by the second and bear-
ing a rough awn 1-2 mm. long from the 2 -toothed apex. In damp woods, Newf. to Br. Col., south to N. J., in the Alleghanies to N. Car., to Wis., and in the Rocky Mts. to Colo. and Utah. Also in Northern Europe. Aug.-Sept.

## 41. AGRÓSTIS L.

Annual or perennial tufted grasses with flat or bristle-like leaves and paniculate inflorescence. Spikelets I -flowered. Scales 3 ; the 2 outer empty, membranous, keeled, acute; the third shorter, obtuse, hyaline, sometimes bearing a dorsal awn, subtending a perfect flower; palet shorter than the scale, sometimes minute or wanting. Stamens usually 3. Styles distinct, short. Stigmas plumose. Grain free, enclosed in the scale. Seed adherent to the pericarp. [Name Greek, referring to the field habitat of many species.] A genus of about 100 species, widely distributed throughout the world, particularly numerous in temperate regions. Besides the following, some 15 others are found in western N. Am.

Palet conspicuous, at least one-third as long as the scale.
Panicle open, its branches long and usually spreading.

1. $A$. alba.

Panicle dense and contracted, spike-like, its branches short and appressed.
2. A. coarctata.

Palet inconspicuous, minute or wanting.
Branches of the contracted panicle short, spikelet-bearing to the base; third scale

> awnless.

Branches of the panicle slender, naked below, spikelet-bearing from about the middle to the end.
Third scale awned.
Awn very finely filiform, barbellate, at least twice the length of the spikelet.
4. A. Elliottiana.

Awn stouter, glabrous, rigid, usually bent, less than twice the length of the spikelet.
Branches of the panicle generally ascending; spikelets 2 mm . long.
Culms r. 5 dm . or less tall ; panicle 2.5 cm . or less long; a tufted alpine grass. 5. A. rupestris. Culms $3^{-6} \mathrm{dm}$. tall ; panicle exceeding 5 cm . long.
6. A. canina.

Branches of the panicle usually spreading; spikelets $2.5-3 \mathrm{~mm}$. long.
7. A. rubra.

Third scale not awned, or very rarely bearing a short awn.
Culms weak, usually decumbent and often prostrate at base; leaves lax; spikelets I .5 mm . long.
8. A. perennans.

Culms and leaves erect.
Branches of the panicle capillary, elongated, usually dividing above the middle, the spikelets crowded at the extremities.
Spikelets $\mathrm{I} 5^{-2} \mathrm{~mm}$. long ; leaves short. 9. A. hyemalis.
Spikelets $2.5-3 \mathrm{~mm}$. long ; leaves elongated.
1о. A. altissima.
Branches of the panicle not elongated, dividing at or below the middle. Spikelets about 2 mm . long; a grass of low elevations.
11. A. intermedia.

Spikelets 2.5-3 mm. long; a high-mountain grais.
12. A. Norae-Angliar.

1. Agrostis álba L. Red-top. Fiorin. Herd-grass. (I. F. f. 3(6z.) Culms $2-7.5 \mathrm{dm}$. tall, erect or decumbent at the base, often stoloniferons. simple. smooth and glabrous. Leaves $5-20 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, scabrous: panicke $5-22.5 \mathrm{~cm}$. in length, usually open, or sometimes contracted after flowering. green or purplish, the branches ascending or erect, the lower $2.5-7.5 \mathrm{~cm}$. lome: spikelets $2-2.5 \mathrm{~mm}$. long; outer scales about equal, acute. smoth and glahrons, exiept on the hispid or scabrous keel; third scale shorter, ohtuse or acute, the palet at least one-third its length. A most variable species, occurring in tields and meadows nearly throughout N. Am., extensively cultivated for fodder. Naturalized from Europe, and perhaps also native northward. July-Sept.
2. Agrostis coarctàta Ehrh. I)ensk-flowfrei brix-grass. (I. F. f. 362 a .) Glabrous. Culms tufted, erect, or decumbent at the base and offen roeting at the lower nodes, $3-5 \mathrm{dm}$. tall, at length branching; leaves erect, rough on
both surfaces, $3.75-8.75 \mathrm{~cm}$. long, 3 mm . or less wide; panicle dense and contracted, $3.75-10 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. thick, its branches erect, the longer 3.1 cm . long or less; spikelets $2-2.5 \mathrm{~mm}$. long; empty scales acute, the flowering scale about three-quarters as long as the spikelet, denticulate at the truncate or rounded apex; palet about one-half as long as the scale. Me. to N. J. Also in Europe. July-Sept.
3. Agrostis asperifòlia Trin. Rough-Leaved Bent-Grass. (I. F. f. 363.) Culms 3-9 dm. tall, erect, or sometimes decumbent at the base. Leaves $2.5-20 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, generally erect, flat, very rough; panicle contracted, $6.25-25 \mathrm{~cm}$. in length, often interrupted or glomerate, the branches $3.75-7.5 \mathrm{~cm}$. in length, erect, spikelet-bearing to the base; spikelets crowded, $2-2.5 \mathrm{~mm}$. long, the outer scales scabrous, especially on the keel; third scale about three-fourths the length of the second; palet minute. Manitoba to Wash., south to Wis., Neb., Tex. and Cal. Aug.-Sept. (A. exarata Trin. in part.)
4. Agrostis Eliottiana Schultes. Elliott's Bent-grass. (I. F. f. 364.) Culms $1.25-3.5 \mathrm{dm}$. tall, erect, slender. Leaves rough, $\mathbf{I} .25-5 \mathrm{~cm}$. long, 2 mm . wide or less; panicle $5-12.5 \mathrm{~cm}$. in length, usually narrow, sometimes open, the branches slender, naked below, erect or ascending, the lower $2.5-3.75 \mathrm{~cm}$. long; spikelets $\mathbf{I} .5 \mathrm{~mm}$. long; outer scales subequal, scabrous on the keel, acute; third scale about three-quarters as long as the first, erose-truncate, acute or 2 -toothed, bearing a very finely filiform flexuous barbellate awn, 2-4 times its length, inserted just below the apex; palet short. In dry soil, S. Car. to Ky. and Kans., south to.Fla. and Tex. May-July.
5. Agrostis rupéstris Allioni. Rock Bent-grass. (I. F. f. 365a.) Culms tufted, I. 5 dm . tall or less, slender, erect, or decumbent at the base. Leaves smooth and glabrous, those on the culm 2.5 cm . or less long, the basal leaves from one-third to one-half as long as the culms; panicle contracted, 2.5 cm . or less long, its axis and branches smooth, the latter erect or nearly so, spikelet-bearing above the middle; spikelets about 2 mm . long; flowering scale hyaline, denticulate at the obtuse or truncate apex, bearing about the middle a dorsal scabrous awn a little over 2 mm . long; palet wanting. Lab. and the high mountains of Nev. Also in Europe. Summer.
6. Agrostis canina L. Brown Bent-grass. (I. F. f. 365.) Culms $3-6$ dm. tall, erect, slender, simple. Leaves $2.5-7.5 \mathrm{~cm}$. in length, 2 mm . wide or less, scabrous; panicle $5-17.5 \mathrm{~cm}$. in length, contracted in fruit, the branches slender, naked below, ascending or spreading in flower, the lower $2.5-6.25 \mathrm{~cm}$. long; spikelets 2 mm . long, on appressed pedicels, the outer scales subequal, acute, strongly scabrous on the keel; third scale about two-thirds the length of the first, obtuse, smooth and glabrous, bearing a straight or somewhat bent dorsal awn $2-4 \mathrm{~mm}$. long, inserted just above the middle; palet minute or none. In meadows, Newf. to Alaska, south to Penn. and Tenn. Native northward; naturalized from Europe southward. A variable species. July.-Sept.
7. Agrostis rùbra L. Red Bent-grass. (I. F. f. 366.) Smooth or very nearly so, glabrous. Culms I.5-6 dm. tall, erect or sometimes decumbent at the base, simple; leaves $5-10 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide ; panicle $6.25-\mathbf{I 2} .5 \mathrm{~cm}$. in length, open, the branches generally widely spreading and more or less flexuous, rarely erect, the lower $2.5-6.25 \mathrm{~cm}$. long; spikelets $2.5-3 \mathrm{~mm}$. long, the outer scales acute, scabrous on the keel; third scale shorter than the first, obtuse, bearing a usually bent dorsal awn $4-5 \mathrm{~mm}$. long, inserted below the middle. Summits of the highest mountains of N. E., N. Y. and N. Car. The American plant may be specifically different from the European. Summer.
8. Agrostis perénnans (Wait.) Tuckerm. Thin-grass. (I. F. f. 367.) Culms $3-7.5 \mathrm{dm}$. long from a decumbent or prostrate base, weak, slender, simple or sparingly branched above, smooth and glabrous. Leaves 5-15 cm. long, 2-4 mm . wide, lax. scabrous; panicle $\mathrm{I}-2 \mathrm{dm}$. in length, open, the branches $2.5-5 \mathrm{~cm}$. long, widely spreading, the branchlets and pedicels divergent; spikelets I.5-2 mm . long, the outer scales acute, scabrous on the keel; third scale about threequarters the length of the first, smonth and glabrous, not awned; palet small or wanting. In shaded, damp places, Quebec and Ont. to Wis., south to S. Car. and Kans. Panicle usually light green, sometimes purplish. July-Sept.
9. Agrostis hyemàlis (Walt.) B. S. P. Rough Hair-grass. (I. F. f. 368.)

Culms 3-6 dm. tall, erect, slender. Leaves $5-12.5 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~mm}$. wide, usually erect, roughish; panicle $1.5-6 \mathrm{dm}$. long, usually purplish, the capillary scabrous branches ascending, sometimes widely spreading, or often drooping, the lower $7 \cdot 5-15 \mathrm{~cm}$. long, dividing above the middle, the divisions spikelet-bearing at the extremities; spikelets $\mathbf{I} .5^{-2} \mathrm{~mm}$. long, the outer scales acute, scabrous toward the apex and on the keel; third scale two-thirds the length of the first or equalling it. obtuse, rarely bearing a short awn; palet usually very small. In dry or moist suii throughout nearly the whole of N. Am. except the extreme north. July-Aug.
10. Agrostis altíssima (Walt.) Tuckerm. Tall Bent-Grass. (I. F. f. 369.) Culms 6-12 dm. tall, erect. Leaves elongated, $\mathbf{1} .5-3 \mathrm{dm}$. in length, $2-3 \mathrm{~mm}$. wide. scabrous; panicle 1.75-2.25 dm. long, the branches ascending or erect, somewhat scabrous, the lower $5-10 \mathrm{~cm}$. in length, spikelet-bearing at the extremities; spikelets $2.5-3 \mathrm{~mm}$. long, the outer scales acute, scabrous on the keel; third scale shorter. obtuse, scabrous, occasionally bearing a short awn; palet small or wanting. In sandy swamps, N. J. to Fla. and Ala. Panicle usually purplish. Aug.-Oct.
II. Agrostis intermèdia Scribn. Upland Bent-grass. (I. F. f. 370.) Culms 3-9 dm. tall, erect. Sheaths smooth, those at the base of the culm often crowded and overlapping; leaves $\mathbf{I}-2.25 \mathrm{dm}$. long, 2-6 mm. wide, scabrous; panicle $1-2.25 \mathrm{dm}$. in length, the branches $3.75-7.5 \mathrm{~cm}$. long, ascending, dividing at the middle or below, the divisions divergent, the pedicels appressed; spikelets about 2 mm . long, the outer scales acute or acuminate, scabrous on the keel; third scale about three-fourths the length of the first, smooth; palet small or wanting. In dry soil, Mass. to N. Y., Tenn. and Mo. Aug.-Oct.
12. Agrostis Nòvae-Ángliae Tuckerm. New England Bent-grass. (I. F. f. 371.) Culms 2-4 dm. tall, erect. Sheaths longer than the internodes, generally overlapping; leaves $2.5-8.75 \mathrm{~cm}$. long, 2 mm . wide or less, erect, usually involute, scabrous; panicle $1-2 \mathrm{dm}$. in length, open, the branches spreading or ascending, dividing at or below the middle, the divisions divergent, the pedicels often appressed; spikelets $2.5-3 \mathrm{~mm}$. long, the outer scales acute, strongly scabrous on the keel; third scale somewhat shorter, obtuse. Newf., south to the high mountains of N. E., N. Y. and N. Car.

## 42. CALAMAGRÓSTIS Adans.

Generally perennial grasses, various in habit, with flat leaves and paniculate inflorescence. Spikelets I-flowered, the rachilla usually prolonged beyond the flower and pubescent. Scales 3 ; the 2 outer empty, carinate, membranous; the third scale hyaline, shorter than the outer, obtuse, usually copiously long-hairy at the base, or rarely the hairs scanty or short, and bearing a straight, bent, or twisted dorsal awn ; palet shorter, 2-nerved. Stamens 3. Styles short, distinct. Stigmas plumose. Grain free, enclosed in the scale. Seed adherent to the pericarp. [Greek, signifying Reed-grass.] A genus of about 130 species, widely distributed throughout temperate and mountainous regions, and particularly numerous in the Andes. Besides the following, some 20 others occur in the western parts of $\mathcal{N} . \mathrm{Am}$. The English name Small-reed is applied to any of the species.

Prolongation of the rachilla hairy its whole length.
Awn strongly bent, manifestly exserted, the hairs of the callus much shorter than the scale.
Sheaths usually naked at the summit, rarely bearded; panicle tinged with purple; empty scales rather thick.

1. C. breziseta.

Sheaths bearded at the summit; panicle pale; empty scales thin.
Spikelets $4^{-6} \mathrm{~mm}$. long; callus-hairs sparse; palet equalling the siate or nearly so. .
2. C. Porteri.

Spikelets $3.5-4 \mathrm{~mm}$. long; callus-hairs rather copious: palet considerably shorter than the scale.
3. C. nemoralis.

Awn straight or nearly so, included, the hairs of the callus equalling or but little shorter than the scale.
Panicle open, the lower rays widely spreading.
Spikelets $4^{-6} \mathrm{~mm}$. long, very acuminate. 4. C. /.ansinn
Spikelets 3-4 mm. long ; panicle usually lonsely flowered.
5. C. Cimbadinsis.

Spikelets $2-2.5 \mathrm{~mm}$. long; panicle rather densely flowered.
6. C. Matumiana.

Panicle more or less contracted.
Culms and almost filiform leaves soft, not rigid.
7. C. neglecta.

Culms and wider leaves hard, more or less rigid.
Panicle elongated, rather loosely flowered; culms not tufted or but little so.
8. C. inexpansa.

Panicle short, dense and spike-like; culms strongly tufted.
Panicle narrow, much interrupted below; awn much shorter than the scale.
9. C. Labradorica.

Panicle thick, continuous or but little interrupted; awn about equalling the scale.
10. C. hyperborea.

Prolongation of the rachilla hairy only at the summit.
11. C. cinnoides.
I. Calamagrostis brevisèta (A. Gray) Scribn. Pickering's Reed-grass. (I. F. f. 376 .) Culms $3-4.5 \mathrm{dm}$. tall, erect, rigid, simple, scabrous below the panicle. Sheaths smooth and glabrous, the lower overlapping, the upper one elongated; leaves $3.75-10 \mathrm{~cm}$. long, 4 mm . wide, erect, smooth beneath, rough above; panicle $7.5-11.25 \mathrm{~cm}$. in length, the branches ascending or erect, the lower $2.5-3.75 \mathrm{~cm}$. long; spikelets $3-4 \mathrm{~mm}$. long, purple tinged, the outer scales acute, scabrous on the keel; third scale shorter than the second, obtuse, scabrous, the basal hairs very short; awn bent, not twisted, equalling or slightly exceeding the scale. In wet places, Cape Breton Isl. to N. H. and Mass. Occurs in the alpine regions of the White Mts. Aug.-Sept.

Calamagrostis breviseta débilis Kearney. Differs from the above in its softer texture, usually lower and more slender culms, thinner leaves, smaller panicles and the narrower and thinner empty scales. Newf. to Mass.

Calamagrostis breviseta lacústris Kearney. Differs from the species in its stouter rootstock and taller culms, which are usually $5-10 \mathrm{dm}$, tall, in its often longer panicle, its shorter palet and the copious and longer callus hairs of the flowering scale. Mountains of N. E.; also along the Great Lakes from Ont. to Minn.
2. Calamagrostis Pòrteri A. Gray. Porter's Reed-grass. (I. F. f. 375.) Culms 6-I2 dm. tall, erect, simple, smooth and glabrous. Sheaths slightly scabrous, with a villous ring at the summit; leaves $1.5-3 \mathrm{dm}$. long, 4-8 mm . wide, rough; panicle $1-2 \mathrm{dm}$. in length, the branches erect, the lower $2.5-5 \mathrm{~cm}$. long; spikelets 4-6 mm . long, the outer scales strongly scabrous, acute; third scale shorter than or equalling the second, obtuse, scabrous, the basal hairs less than one-half the length of the scale, sparse; awn bent, about equalling the scale, the lower part much twisted. In dry woods, Penn. and southern N. Y. Aug.-Sept.
3. Calamagrostis nemoràlis Kearney. Wood Reed-Grass. Slightly glaucous. Culms IO-15 dm. tall, rather slender; sheaths loosely embracing the culm, usually tomentose at the apex, glabrous; leaves $3-6 \mathrm{~mm}$. wide, flat, very rough on both surfaces, the lower ones and those on the innovations $2-3.5 \mathrm{dm}$. long; panicle I-1. 5 dm . long, contracted; spikelets numerous, $3.5-4 \mathrm{~mm}$. long, the empty scales acuminate, the awn of the flowering scale attached about one-fifth above the base, slightly exceeding the scale, stout, bent near the middle, the palet about threefifths as long as the scale. Woods, Me. and western N. Y.
4. Calamagrostis Langsdórfii (Link) Trin. Langsdorf's Reed-Grass. (I. F. f. 374.) Culms 3-6 dm. tall, erect, simple, smooth or roughish. Sheaths shorter than the internodes; leaves $\mathbf{I}-3 \mathrm{dm}$. long, $4-8 \mathrm{~mm}$. wide, scabrous; panicle $5-15 \mathrm{~cm}$. in length, the branches ascending or sometimes erect, the lower $2.5-5 \mathrm{~cm}$. long, naked at the base; spikelets $4-6 \mathrm{~mm}$. long, the outer scales acuminate, strongly scabrous; the third scale equalling or shorter than the second, scabrous, the stout awn as long as or a little exceeding the copious basal hairs which are usually somewhat shorter than the scale. Newf. to Alaska, south to the mountains of N. E. and N. Y., and to Manitoba and Wash. Also in northern Europe and Asia. Summer.
5. Calamagrostis Canadénsis (Michx.) Beauv. Blue Joint-Grass. (I. F. f. 373.) Culms 6-15 dm. tall, erect, simple, smooth or somewhat scabrous. Sheaths shorter than the internodes; leaves $1.5-3 \mathrm{dm}$. long or more, $2-8 \mathrm{~mm}$. wide, rough; panicle $1-2 \mathrm{dm}$. in length, open, usually purplish, the branches spreading or ascending, the lower $3.75-7.5 \mathrm{~cm}$. long, naked at the base; spikelets 3 mm . long, the outer scales equal or subequal, acute, strongly scabrous; the third scale equalling.
or slightly shorter than the second, scabrous, the awn delicate and equalling the copious basal hairs which are about as long as the scale or some of them shorter. In swamps and wet soil, Newf. to Alaska, south to N. Car., N. Mex. and Cal. Ascends to 1500 m . in the Adirondacks. July-Sept.

Calamagrostis Canadensis acuminàta Vasey. Differs from the species in its usually smaller panicle, larger (3.5-4 mm. long) spikelets with the empty scales sharply acuminate, and more scabrous and longer awn of the flowering scale. Lab. and Newf. to Alaska, south in the Mountains to N. Car., N. Mex. and Cal.
6. Calamagrostis Macouniàna Vasey. Macoun's Reed-Grass. (I. F. f. 372.) Culms 6-9 dm. tall, erect, simple, smooth and glabrous. Sheaths shorter than the internodes; leaves $7 \cdot 5-17.5 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, erect, acuminate, scabrous; panicle open, $7.5-11.25 \mathrm{~cm}$. in length, the branches ascending, or sometimes erect, the lower $2.5-3.75 \mathrm{~cm}$. long, naked at the base; spikelets 2 mm . long, the outer scales acute, scabrous, the first shorter than the second; third scale equalling the second, the awn a little exceeding it; basal hairs about as long as the scale. Manitoba and Mont. to Wash., south to Mo. Summer.
7. Calamagrostis neglècta (Ehrh.) Gaertn. Narrow Reed-grass. (I. F. f. 378.) Glabrous and smooth throughout. Culms $4 \cdot 5-6.25 \mathrm{dm}$. tall, erect, simple, slender. Sheaths shorter than the internodes; leaves narrow, involute in drying, the basal one-third as long as the culm, those of the culm $5-12.5 \mathrm{~cm}$. long, erect; panicle contracted, $6.25-10 \mathrm{~cm}$. in length, the branches 2.5 cm . long or less, erect; spikelets 4 mm . long, the scales scabrous, the outer acute; third scale obtuse, about three-fourths as long as the second, the awn exceeding the scale. Lab. to Alaska, south to northern Me., Wis., Mont., Colo., and Ore. Also in Europe and Asia. Summer.

Calamagrostis neglecta borealis. Differs from the species in its shorter culms (2-3 dm . tall) and leaves, smaller and denser panicle ( $3-5 \mathrm{~cm}$. long), and the spikelets but 3 mm . long. Lab. and Hudson Bay. Also in northern Europe.
8. Calamagrostis inexpánsa A. Gray. Bog Reed-grass. Culms but little tufted, 8-12 dm. tall. Sheaths smooth and glabrous; leaves rough, $2-3 \mathrm{dm}$. long, 4 mm . wide or less; panicle $1.5-2 \mathrm{dm}$. long, usually nodding at the summit, its branches rather long, nearly erect; spikelets $4-4.5 \mathrm{~mm}$. long, numerous, the empty scales scabrous, hispid on the keel, acute, the flowering scale scabrous, the callushairs from three-fourths as long to equalling the scale, the awn from shorter to exceeding the scale. Bogs and sandy banks, N. J. and western N. Y. to S. Dak. and Colo.
9. Calamagrostis Labradòrica Kearney. Labrador Reed-grass. Culms $3.5-5 \mathrm{dm}$. tall, rigid. Sheaths tightly embracing the culm; leaves $5-20 \mathrm{~cm}$. long, 2.5 mm . or less wide, strongly involute, thick, scrabrous above, smooth beneath; panicle spike-like and dense, $6-9 \mathrm{~cm}$. long, strict; spikelets about 4 mm . long, the empty scales acute, nearly glabrous excepting on the hispidulous keels, firm, thick, dark purple, the flowering scales about 3.5 mm . long, scabrous, the awn much shorter than the scale, usually slender, the callus-hairs from somewhat shorter to nearly equalling the scale. Among rocks on the seashore, Lab. July.
10. Calamagrostis hyperbòrea Lange. Northern Reed-grass. Culms densely tufted, rigid, stout, 4-IO dm. tall. Sheaths smooth and glabrous; leaves very rough on both surfaces, flat, or often involute toward the apex, stiff. 1-3 dm. long, 5 mm . or less wide; panicle contracted, $7-14 \mathrm{~cm}$. long, its branches short. usually erect, sometimes ascending; spikelets $3-4 \mathrm{~mm}$. long, the empty scales scabrous, acute, the flowering scale with the callus-hairs from a little shorter than to nearly equalling it, the awn shorter than or longer than the scale. Meadows and swamps, Greenland to Alaska, south to Penn., Colo. and Cal. June-Aus. Very variable. The var. elongata Kearney has the panicle very long and rather loose, with usually longer branches, and the spikelets $3-4 \mathrm{~mm}$. long; the zar. Anmericana (Vasey) Kearney has the panicle usually very dense and the spikelets about 3 mm . long.
II. Calamagrostis cinnoides (Muhl.) Scribn. Nuttalis Remb-grass. (I. F. f. 379.) Culms 9-15 dm. tall, erect. Sheaths smooth or rough, the lower
sometimes sparingly hirsute, and rarely with a villous ring at the summit; leaves I-3 dm. long or more, 4-10 mm. wide, scabrous, occasionally sparingly hirsute; panicle $7.5-17.5 \mathrm{~cm}$. in length. contracted, the branches erect. the lower $2.5-5 \mathrm{~cm}$. long; spikelets 6 -8 mm . long; scales strongly scabrous, the outer about equal, acuminate and awn-pointed; third scale shorter, obtuse, the basal hairs one-half to two-thirds its length; awn stout, exceeding or equalling the scale. In moist soil, N. H. and Mass. to Penn., south to Ga. July-Aug.

## 43. AMMÓPHILA Host.

Tall perennial grasses with flat leares, convolute above, and dense spike-like panicles. Spikelets I-flowered, the rachilla prolonged beyond the flower and hairy. Scales 3, rigid, chartaceous, acute, keeled; the 2 outer empty, the lower I-nerved, the upper 3 -nerved; third scale 5 -nerved, with a ring of short hairs at the base, subtending a chartaceous 2 -nerved palet and a perfect flower. Stamens 3. Styles distinct. Stigmas plumose. Grain free, loosely enilosed in the scale and palet. [Greek, signify ing sand-loving, in allusion to the habitat of these grasses.] Two species, the following widely distributed along the fresh and salt-water shores of the northern hemisphere, the other European.
I. Ammophila arenària (L.) Link. Sea Said-reed. Sea Mat-iteed. Marthr. (I. F.f. 380.) Glabrous; culms 6-12 dm. tall, erect, rigid, stout, arising from a long horizontal hranching rootstock. Sheaths smooth. the lower short, crowded and overlapping, the upper longer; leaves I.5-3 dm. long or more, rigid, attenuate into a long slender involute point, smooth beneath. scabrous above; spikelike panicle dense. I-3 dm. in length, I. $2-1.6 \mathrm{~cm}$. thick, its branches 3.75 cm . long or less, appressed; spikelets $\mathbf{I - 1 . 2 ~ c m . ~ l o n g . ~ t h e ~ s c a l e s ~ s c a b r o u s , ~ a b o u t ~ e q u a l ~ i n ~}$ length, the third usually with the rudiment of an awn just below the apex; basal hairs $2-4 \mathrm{~mm}$. long. In sands of the seacoast from N. B. to Va.. and inland along the shores of the Great Lakes. Also on the coasts of northern Europe. Aug.-Sept.

## 44. CALAMOVÍLFA Hack.

Tall grasses with stout horizontal rootstocks, elongated leaves. which are involute at the apex. and paniculate inflorescence. Spikelets I-flowered. the rachilla not prolonged beyond the flower. Scales 3. I-nerved, acute, the 2 outer unequal, empty; third scale longer or shorter than the second, with a ring of hairs at the base; palet strongly 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. Grain free. Seed adherent to the pericarp. [Greek. signifying a reed-like grass.] Three known species, natives of the temperate and subtropical regions of N. Am.

Spikelets $4-5 \mathrm{~mm}$. long, the basal hairs less than half the length of the third scale.

1. C. brevipilis. Spikelets $6-8 \mathrm{~mm}$. long, the basal hairs more than half the length of the third scale. 2. C. Iongifolia.
I. Calamovilfa brevípilis (Torr.) Hack. Short-haired Reed-Grass. (I. F. f. 38 I.) Glabrous and smooth or very nearly so. Culms 6-12 dm. tall. erect. simple; leaves $1.5-3 \mathrm{dm}$. long. 3 mm . wide or less, attenuate into a long slender involute tip. smooth beneath, slightly scabrous above; panicle open. $1.25-2.5 \mathrm{~cm}$. in length, the branches ascending, the lower $5-10 \mathrm{~cm}$. long; spikelets $4-5 \mathrm{~mm}$. long; scales acute, scabrous toward the apex, the outer unequal. the first one-half as long as the second; third scale exceeding the second. pubescent on the lower half of the keel; basal hairs one-third the length of the scale; palet nearly equalling the scale, pubescent on the lower half of the keel. In swamps. pine barrens of $\mathbb{N}$. J. Local. Aug.-Sept.
2. Calamovilfa longifolia (Hook.) Hack. Losg-leaved Reed-grass. (I. F. f. 382.) Culms 3-9 dm. tall, erect. simple, stout, smooth and glabrous. Sheaths crowded and overlapping. glabrous or rarely pilose; leaves $2-3 \mathrm{dm}$. long or more, panicle narrow, often 3 dm . long or more, pale, the branches erect or ascending, the lower I-2.5 dm. long; spikelets $6-8 \mathrm{~mm}$. long; scales acute. smooth, the first shorter than the second; the third a little longer or slightly shorter than the second, and nearly twice the length of the copious basal hairs; palet slightly
shorter than the third scale. On sandy shores, western Ont. and Manitoba to the Rocky Mts., south to Ind., Kans. and Colo. July-Sept.

## 45. APÈRA Adans.

Annual grasses, with narrow flat leaves, and ample open or contracted panicles. Spikelets I-flowered, small, the rachilla prolonged beyond the flower into a bristle. Scales 3; the 2 outer empty, unequal, thin, membranous, keeled, acute; the third scale a little shorter, membranous, bearing a long slender awn inserted just below the shortly 2 -toothed apex; palet a little shorter than the scale, 2 -keeled, 2 -toothed. Stamens 3. Styles distinct, short. Stigmas plumose. Grain narrow, free, included in the scale. Seed adherent to the pericarp. [Greek, signifying not mutilated, whole or entire; application uncertain.] Two species, natives of Europe and western Asia.
i. Apera Spica-vénti (L.) Beauv. Silky Bent-grass. Windlestraw. (I. F. f. 383.) Culms 3-6 dm. tall, erect, simple, slender, smooth and glabrous. Sheaths usually longer than the internodes, the upper one generally including the base of the panicle; leaves $2.5-\mathbf{1 7 . 5} \mathrm{cm}$. long, I-4 mm. wide, scabrous; panicle $7.5-22.5 \mathrm{~cm}$. in length, the branches erect or ascending, capillary, $3.75-7.5 \mathrm{~cm}$. long; outer scales of the spikelet $2-2.5 \mathrm{~mm}$. long, acute, smooth and shining; third scale hairy or nearly smooth, bearing a dorsal scabrous awn $6-8 \mathrm{~mm}$. long; rudiment at the end of the rachilla less than 0.5 mm . long. In waste places and on ballast, Me. to southern N. Y. and Penn. Adventive from Europe. June-July.

## 46. HÓLCUS L.

Annual or perennial grasses with flat leaves and spike-like or open panicles. Spikelets deciduous, 2 -flowered; lower flower perfect, upper staminate. Scales 4; the 2 lower empty, membranous, keeled, the first I-nerved, the second 3 -nerved and often short-awned; flowering scales chartaceous, that of the upper flower bearing a bent awn. Palet narrow, 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, enclosed in the scale. [Greek, taken from Pliny.] About 8 species, natives of the Old World.

1. Holcus lanàtus L. Velvet-grass. Meadow Soft-grass. (I. F. f. 384.) Softly and densely pubescent, light green. Culms $4.5-9 \mathrm{dm}$. tall, erect, often decumbent at the base, simple; sheaths shorter than the internodes; leaves $2.5-15 \mathrm{~cm}$. long, 4-12 mm . wide; spikelets 4 mm . long, the empty scales whitevillous, the upper awn-pointed; flowering scales 2 mm . long, smooth, glabrous and shining, the lower sparsely ciliate on the keel, somewhat obtuse, the upper 2-toothed and bearing a hooked awn just below the apex. In fields, meadows and waste places, N. S. to Ont. and Ill. ; south to N. Car. and Tenn. Also on the Pacific Coast. Naturalized from Europe. June-Aug.

## 47. AÌRA L.

Mostly annual grasses with narrow leaves and contracted or open panicles. Spikelets small, 2 -flowered, both flowers perfect. Scales 4; the 2 lower empty, thin-membranous, acute, subequal, persistent; the flowering scales usually contiguous, hyaline, mucronate or 2 -toothed, deciduous, bearing a delicate dorsal awn inserted below the middle; palet a little shorter than the scale, hyaline, 2 -nerved. Stamens 3. Stigmas plumose. Grain enclosed in the scale and palet, and oftern adhering to them. [Greek name for Lolium temulentum.] Four or five species, natives of Europe.

Panicle open ; flowering scales about 2 mm . long ; plants $\mathbf{x} .25-2.5 \mathrm{dm}$. tall. 1. A. caryophyllea.

Panicle contracted ; flowering scales about 3 mm . long ; plants $5^{-10} \mathrm{~cm}$. t.111. 2. A praecox.

1. Aira caryophýllea L. Silvery Thir-grass. (T. F. f. 3S5.) Smenth and glabrous throughout. Culms $1.25 \cdot 2.5 \mathrm{dm}$. tall, crect from an ammal ront, sim. ple, slender; sheath mostly basal; leaves $1.25-5 \mathrm{~cm}$. long. involute-setacous: panicle $2.5-10 \mathrm{~cm}$. in length, open, the branches spreading or ascending, the lewer 2.5 cm . long or less ; spikelets $2-2.5 \mathrm{~mm}$. long, the cmpty scales acute: thowering
scales very acute, 2 -toothed, 2 mm . long, bearing an awn $3-4 \mathrm{~mm}$. long. In fields and waste places, eastern Mass. to Va. Also on the Pacific Coast. Local. Naturalized from Europe. Panicle silvery, shining. May-July.
2. Aira praècox L. Early Hair-grass. (I. F. f. 386.) Glabrous and smooth throughout. Culms $5-10 \mathrm{~cm}$. tall, erect, from an annual root, simple, rigid; sheaths clothing the whole culm, the upper one often enclosing the base of the panicle; leaves 2.5 cm . long or less, involute-setaceous; panicle contracted, strict, I.25-2.5 cm. in length; spikelets about 3 mm . long, the empty scales acute; the flowering scales acuminate, 2 -toothed, about 3 mm . long, bearing an awn $3-4 \mathrm{~mm}$. long. In dry fields, southern N. J. and Penn. to Va. Naturalized from Europe. May-July.

## 48. DESCHÁMPSIA Beauv.

Perennial grasses with flat or involute leaves, and contracted or open panicles. Spikelets 2 -flowered, both flowers perfect, the hairy rachilla extended beyond the flowers or rarely terminated by a staminate one. Scales 4 (rarely more), the 2 lower empiy, keeled, acute, membranous, shining, persistent ; the flowering scales of about the same texture, deciduous, bearing a dorsal awn, the apex toothed. Palet narrow, 2-nerved. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, enclosed in the scale. [In honor of J. C. A. Loiseleur-Deslongchamps, 1774-1849, French physician and botanist.] About 20 species, inhabiting cold and temperate regions, a few occurring in the high mountains of the tropics. Besides the following, some 6 others occur in the western parts of N. Am.

Upper flowering scales reaching or extending beyond the apex of the empty scales. Flowering scales about 2.5 mm . long, erose-truncate; leaves flat. 1. D. caespitosa Flowering scales about 4 mm . long, acute or obtuse ; leaves involute.

Empty scales extending much beyond the upper flowering scale.
3. D. atropurpurea.
I. Deschampsia caespitòsa (L.) Beauv. Tufted Hair-grass. (I. F. f. 387.) Culms 6-12 dm. tall, erect, simple. smooth and glabrous. Leaves flat, $2-3 \mathrm{~mm}$. wide, smooth beneath, strongly scabrous above, the basal ones numerous, one-quarter to one-half as long as the culm. those of the culm $5-15 \mathrm{~cm}$. long ; panicle open, $7.5-22.5 \mathrm{~cm}$. in length, the branches widely spreading or ascending, often somewhat flexuous, naked at the base, the lower $5-\mathbf{1 2 . 5} \mathrm{cm}$. long ; spikelets $3.5-$ 4 mm . long ; flowering scales about 2.5 mm . long, erose-truncate at the apex, the awns somewhat shorter or a little longer, the upper scale reaching to or extending beyond the apices of the empty ones. Newf. to Alaska, south to N. J., Ill., Minn. and in the Rocky Mts. and Sierra Nevada to N. Mex. and Cal., mostly in wet soil. Also in Europe and Asia. July-Aug.
2. Deschampsia flexuòsa (L.) Trin. Wavy Hair-grass. (I. F. f. 388.) Glabrous throughout. Culms $3-7.5 \mathrm{dm}$. tall, erect, slender, simple, smooth ; leaves involute-setaceous, smouth beneath, scabrous above, the basal very numerous, onefifth the length of the culm or less, those of the culm $2.5-7.5 \mathrm{~cm}$. long; panicle open, $5-20 \mathrm{~cm}$. in length, the branches ascending or erect, sometimes widely speading, naked at the base, flexuous, the lower $3.75-12.5 \mathrm{~cm}$. long; spikelets $4.5-5 \mathrm{~mm}$. long; flowering scales about 4 mm . long, acutely toothed at the apex; awns bent and twisted, much exceeding the scale. In dry soil, Greenland and Newf. to Ont. and Mich., south to N. Car. and Tenn. Ascends to 1500 m . in the Adirondacks. Also in Europe. July-Aug.
3. Deschampsia atropurpùrea (Wahl.) Scheele. Mountain Hair-grass. (I. F. f. 389.) Glabrous and smooth or very nearly so. Culms 1.5-4.5 din. tall, erect, simple, rigid; leaves $2-4 \mathrm{~mm}$. wide, erect, sometimes slightly scabrous above, the basal $6.25-12.5 \mathrm{~cm}$. long, those of the culm shorter; panicle contracted, usually purple or purplish, $2.5-5 \mathrm{~cm}$. in length, the branches erect, or sometimes ascending, the lower $1.25-3.75 \mathrm{~cm}$. long; spikelets 5 mm . long; flowering scales about 2.5 mm . long, erose-truncate at the apex; awis bent and much longer than the scales; upper scale much exceeded by the very acute outer ones. On alpine
summits of N. Y., N. E., Mont., Ore. and Wash., north to Lab. and Alaska. Also in Europe. July-Aug.

## 49. TRISÈTUM Pers.

Mostly perennial tufted grasses, with flat leaves and spike-like or open panicles. Spikelets 2-4-flowered, the flowers all perfect, or the uppermost staminate; rachilla glabrous or pilose, extended beyond the flowers. Scales 4-6, membranous, the 2 luwer empty, unequal, acute, persistent; flowering scales usually shorter than the empty ones, deciduous, 2 -toothed, bearing a dorsal awn below the apex, or the lower one sometimes awnless. Palet narrow, hyaline, 2-toothed. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale. [Latin, referring $t$, the three bristles (one awn and two sharp teeth) of the flowering scales in some species.] About 50 species, widely distributed in temperate or mountainous regions. Besides the following, about 8 others occur in the western parts of N. Am.
Flowering scales all bearing long dorsal awns.
Panicle contracted, dense ; flowering scales 5 mm . long or less.
I. T. subspicatum.

Panicle open, loose; flowering scales 5 mm . long or more. 2. T. flavescens. Lower flowering scale not bearing a long dorsal awn, a rudiment sometimes present.
3. T. Pennsylvanicum.

1. Trisetum suspicàtum (L.) Beauv. Narrow False-oat. (I. F. f. 390.) Softly pubescent or glabrous. Culms 1.5-6 dm. tall, erect, simple ; leaves $2.5-10$ cm . long, $\mathbf{I}-4 \mathrm{~mm}$. wide; panicle spike-like, $2.5-\mathbf{1 2 . 5} \mathrm{cm}$. in length, often interrupted below, its branches 3.75 cm . or less long, erect; spikelets $2-3$-flowered, the empty scales hispid on the keel, shining, the second about 5 mm . long, the first shorter; flowering scales $4-5 \mathrm{~mm}$. long, acuminate, scabrous, each bearing a long bent and somewhat twisted awn. In rocky places, Lab. to Alaska, south on the mountains to N. Car., N. Mex. and Cal. Also in Europe and Asia. Aug.-Sept.
2. Trisetum flavéscens (L.) R. \& S. Yellow False-oat. (I. F. f. 39I.) Culms 4.5-7.5 dm. tall, erect, simple, smooth, glabrous. Sheaths more or less pubescent; leaves $3.75-\mathbf{I 2} .5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, scabrous, sometimes sparingly hairy; panicle open, $5 \mathbf{- 1 2 . 5} \mathrm{~cm}$. in length, the branches ascending or erect, somewhat flexuous, naked below, the lower $2.5-5 \mathrm{~cm}$. long; spikelets $3-4$-flowered; empty scales smooth and glabrous, the second acute, 5 mm . long, the first about half as long, narrower, acuminate; flowering scales $5-6 \mathrm{~mm}$. long, scabrous, bearing a long bent and twisted awn. Introduced into Mo. and Kans. Native of Europe and Asia. Panicle yellow, turning dull brown. July-Aug.
3. Trisetum Pennsylvánicum (L.) Beauv. Marsh False-oat. (I. F. f. 392.) Culms 3-9 dm. tall, erect, simple, slender and often weak, smooth and glabrous. Sheaths shorter than the internodes, sometimes scabrous; leaves $2.5^{-1} 5$ cm . long, $2-6 \mathrm{~mm}$. wide, rough; panicle $5-20 \mathrm{~cm}$. in length, yellowish, narrow. the branches ascending, the lower $2.5-5 \mathrm{~cm}$. long; spikelets 2 -flowered; outer scales smooth, shining, subequal, the second $4-5 \mathrm{~mm}$. long; flowering scales $4-5 \mathrm{~mm}$. long, scabrous, the lower not long-awned, but a rudimentary awn sometimes present, the upper with a long bent and twisted awn. In swamps and wet meadows. N. Y. to Ill., south to Fla. and La. Ascends to 1050 m . in Va. Panicle sometimes loose and nodding. June-July.

## 50. AVÈNA L.

Annual or perennial grasses, with usually flat leaves and panicled spikelets. Spikelets 2-many-flowered, or rarely I-flowered; lower flowers pertect, the upper often staminate or imperfect. Scales 4-many (rarely 3); the two lower cmpty, somewhat unequal, membranous, persistent; flowering scales deciduous, rounded on the back, acute, generally bearing a dorsal awn, the apex often z-toothed. Palet narrow, 2 -toothed. Stamens 3. Styles short, distinct. Stigmas plumese. Cirain oblong, deeply furrowed, enclosed in the scale and palet, free or sometimes atherent to the latter. [Old Latin name for the oat.] About 50 specie's, widely dis. tributed in temperate regions, chiefly in the Old World. (), its (Atcha sation l..) sometimes appear in waste places or in fields where it h.ts hecn cultivated.

> Empty scales of the spikelet 1.2 cm . in length or less, shorter than the flowering scales. Flowering scales with a ring of short hairs at the base; awn nearly as long as the scale. Flowering scales naked at the base; awn not over one-half as long as the striata. Empty scales $1.2-1.8 \mathrm{~cm}$. in length, enclosing the flowering scales. 2. A. Smithii. 3. A. fatua.
I. Avena striàta Michx. Purple Oat. (I. F. f. 393.) Culms 3-6 dm. tall, erect, simple, slender, smooth and glabrous. Leaves erect, $2.5-15 \mathrm{~cm}$. long, 2-6 mm . wide, smooth beneath, usually scabrous above; panicle $6.25-12.5 \mathrm{~cm}$. in length. lax, the branches erect or ascending, naked below, the lower $2.5-6.25 \mathrm{~cm}$. long; spikelets 3 - 6 -flowered, the empty scales smooth, the second $6-7 \mathrm{~mm}$. in length, $3-$ nerved, the first two-thirds to three-quarters as long, 1 -nerved; flowering scales 6-8 mm . long, with a ring of short hairs at the base, strongly nerved, scabrous; awns as long as the scales or longer. In woods, N. B. to Br. Col., south to northern Penn., Minn. and Neb. Spikelets reddish purple. July-Aug.
2. Avena Smíthii Porter. Smith's OAt. (I. F. f. 394.) Culms 7.5-15 dm. tall, erect, simple, scabrous. Sheaths shorter than the internodes. very rough; leaves 1-2 dm. long, 6-12 mm. wide, scabrous; panicle 1.5-3 dm. in length, the branches finally spreading; spikelets $3-6$-flowered; empty scales smooth, the second $6-8 \mathrm{~mm}$. in length, 5 -nerved, the first shorter, obscurely 3 -nerved; flowering scales 1 cm . long, naked at the base, strongly nerved, scabrous, bearing an awn one-fourth to one-half their length. Northern Mich. and Isle Royal. Summer.
3. Avena fátua L. Wild Oat. (I. F. f. 395.) Culms 3-12 dm. tall, erect, simple, stout, smooth and glabrous. Sheaths smooth, or scabrous at the summit, sometimes sparingly hirsute, the lower often overlapping; leaves $7.5-20 \mathrm{~cm}$. long, 2-8 mm. wide; panicle open, I-3 dm. in length, the branches ascending; spikelets $2-4$-flowered, drooping; outer scales $1.8-2.5 \mathrm{~cm}$. in length, smooth, enclosing the flowering scales; flowering scales $\mathbf{I} .2-1.8 \mathrm{~cm}$. long, with a ring of stiff brown hairs at the base, pubescent with long rigid brown hairs, bearing a long bent and twisted awn. In fields and waste places, N. Dak. and Minn.; abundant on the Pacific Coast. Naturalized from Europe or Asia. July-Sept.

## 51. ARRHENATHERUM Beauv.

Tall perennial grasses, with flat leaves and contracted or open panicles. Spikelets 2 -flowered; lower flower staminate, upper perfect; rachilla extended beyond the flowers. Scales 4. the 2 lower empty, thin-membranous, keeled, very acute or awn-pointed, unequal, persistent; flowering scales rigid, 5-7-nerved, deciduous, the first bearing a long bent and twisted dorsal awn inserted below the middle, the second unawned; palet hyaline, 2-keeled. Stamens 3. Styles short, distinct. Stigmas plumose. Grain ovoid, free. [Greek, referring to the awn of the staminate scale.] Six species, natives of the Old World.
I. Arrhenatherum elàtius (L.) Beauv. Oat-grass. (I. F. f. 396.) Glabrous. Culms 6-I2 dm. tall, erect, simple; lower sheaths longer than the internodes; leaves $6.25-30 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, scabrous; panicle $1-3 \mathrm{dm}$. in length, contracted, the branches erect, the lower $2.5-5 \mathrm{~cm}$. long; empty scales finely roughened, the second 8 mm . long, the first shorter; flowering scales about 8 mm . long. In fields and waste places, Me. and Ont. to Ga., Tenn. and Neb. Also on the Pacific Coast. Naturalized from Europe. June-Aug.

## 52. DANTHONIA DC.

Mostly perennial grasses, with flat or convolute leaves and contracted or open panicles. Spikelets 3 -many-flowered, the flowers all perfect, or the upper staminate; rachilla pubescent, extending beyond the flowers. Scales 5-many, the 2 lower empty, keeled, acute, subequal, persistent, generally extending beyond the uppermost flowering one; flowering scales rounded on the back, 2-toothed, deciduous, the awn arising from between the acute or awned teeth, flat and twisted at base, bent; palet hyaline, 2-keeled near the margins, obtuse or 2-toothed. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale. [Name in honor of Etienne Danthoine, a Marseilles botanist of the last century.] A genus of about 100 species, widely distributed, chiefly in South Africa.

Empty scales 125 cm . long or less ; sheaths glabrous or sometimes sparingly pubescent at the base.
Teeth of the flowering scale about 1 mm . long, acute; culm leaves short; panicle contracted.

1. D. spicata.

Teeth of the flowering scale $2-3 \mathrm{~mm}$. long, awned; culm leaves elongated; panicle usually open.
2. D. compressa.

Empty scales more than 1.25 cm . long.
Sheaths and flowering scales villous.
3. D. sericea.

Sheaths glabrous; flowering scales pilose on the margins.
4. D. epilis.
I. Danthonia spicàta (L.) Beauv. Common Wild Oat-grass. (I. F. f. 397.) Culms $3-7.5 \mathrm{dm}$. tall, erect, nearly terete. Sheaths glabrous or often sparingly pubescent below; leaves rough, 2 mm . wide or less, usually involute, the lower I-1.5 dm. long, the upper $2.5-5 \mathrm{~cm}$. long; inflorescence racemose or paniculate, $2.5-5 \mathrm{~cm}$. in length, the pedicels and branches erect or ascending; spikelets 5 -8-flowered; empty scales $8-10 \mathrm{~mm}$. long, glabrous; flowering scales broadly oblong, sparingly pubescent with appressed silky hairs, the teeth about 1 mm . long, acute or short-pointed, the bent and widely spreading awn closely twisted at the base, loosely so above. In dry soil, Newf. to Quebec and N. Dak., south to N. Car., Kans., and La. Ascends to 900 m . in Va. July-Sept.
2. Danthonia compréssa Austin. Flattened Wild Oat-grass. (I. F. f. 398.) Culms 4.5-9 dm. tall, erect, flattened. Leaves 2 mm . wide or less, rough, lax, the basal from one-third to one-half the length of the culm; lower culm leaves $1.5-2 \mathrm{dm}$. long, the upper $7.5-15 \mathrm{~cm}$.; panicle open, $6.25-10 \mathrm{~cm}$. in length, the lower branches generally spreading; spikelets 5 -10 flowered; empty scales 1-1. 2 cm . long, glabrous; flowering scales oblong, with a ring of short hairs at base, pubescent with appressed silky hairs, the awn erect or somewhat bent, strongly twisted below, slightly so above, the teeth $2-3 \mathrm{~mm}$. long, acuminate, awned. In woods, Me. and Vt. to N. Car. and Tenn. Ascends to 1800 m . in N. Car. JulySept.
3. Danthonia serícea Nutt. Silky Wild Oat-grass. (I. F. f. 399.) Culms 4.5-9 dm. tall, simple, glabrous. Sheaths shorter than the internodes, villous; leaves rough and more or less villous, $2-3 \mathrm{~mm}$. wide, the basal one-quarter to onehalf the length of the culm, usually flexuous, those of the culm $2.5-10 \mathrm{~cm}$. long, erect; panicle $6.25-11.25 \mathrm{~cm}$. in length, contracted, the branches erect or ascending; spikelets $4-\mathbf{I O}$-flowered; empty scales $\mathbf{I} .4-\mathbf{I} .6 \mathrm{~cm}$. long, glabrous; flowering scales oblong, strongly pubescent with long silky hairs, the awn erect or somewhat bent, closely twisted below, loosely so above, the teeth $2-3 \mathrm{~mm}$. long, acuminate, awned. In dry sandy soil, Mass. to N. J., south to Fla. May-July.
4. Danthonia epilis Scribn. Smooth Wild Oat-grass. (I. F. f. 398a.) Glabrous. Culms erect, tufted, 4-7 dm. tall, slightly roughened just below the panicle and puberulent below the brown nodes; leaves smooth excepting at the apex, $2-4 \mathrm{~mm}$. wide, erect, those on the sterile shoots $\mathbf{I} 5 \mathrm{dm}$. or more long, the culm leaves $5-10$ cm . long; panicle $5-7.5 \mathrm{~cm}$. long, contracted; spikelets, including awns, $1 . S_{-2}$ cm . long, 5-10-flowered; empty scales acuminate; flowering scales $5-6 \mathrm{~mm}$. long to the base of the teeth, pilose on the margins below and sometimes sparingly so on the midnerve at the base, the teeth, including the awns, $2-3 \mathrm{~mm}$. long, the central awn 9-12 mm. long, more or less spreading. In swamps, southern N. J. to Ga. May-July.

## 53. CAPRİOLA Adans.

Perennial grasses with short flat leaves and spicate inflorescence, the spikes digitate. Spikelets I-flowered, secund. Scales 3; the 2 lower empty, keeled: flowering scale broader, membranous, compressed; palet a little shorter than the scale. hyaline, 2-keeled. Stamens 3. Styles distinct. Stigmas short, plumose. (irain free. [Name medireval Latin for the wild goat, that feeds on this grass in waste rocky places.] Four known species, of which three are Australian, the following widely distributed.

1. Capriola Dáctylon (L.) Kuntze. Bermuda-grass. Scutch-grass. Docis. tooth Grass. (I. F. f. 400.) Culms $\mathrm{x}-3 \mathrm{dm}$. tall, erect, from hong creeping and branching stolons, smooth and glahrous. Sheaths glahous or somewhat hairy, crowded at the bases of the culms and along the stolons; leaves $2.5-5 \mathrm{~cm}$.
long, 2-4 mm. wide, flat, rigid, smooth beneath, scabrous above; spikes 4-5, 1.25-5 cm . in length, digitate; rachis flat; spikelets 2 mm . long; outer scales hispid on the keel, narrow, the first shorter than the second, about two-thirds as long as the broad and strongly compressed third one. In fields and waste places, southern N. Y. to Penn. and Tenn., south to Fla. and Tex. Abundant in the Southern States. Cultivated for pasture. Naturalized from Europe. July-Sept.

## 54. SPARTİNA Schreb.

Perennial glabrous grasses, with long horizontal rootstocks, flat or involute leaves, and an infiorescence of one-sided spreading or erect alternate spikes. Spikelets I-flowered, narrow, deciduous, borne in two rows on the rachis, articulated with the very short pedicels below the scales. Scales 3; the two outer empty, keeled, very unequal; the third subtending a perfect flower, keeled, equalling or shorter than the second; palet often longer than its scale, 2-nerved. Stamens 3. Styles filiform, elongated. Stigmas filiform, papillose or shortly plumose. Grain free. [Greek, referring to the cord-like leaves of some species.] About 7 species, widely distributed in saline soil, a few in fresh-water marshes.

First scale awn-pointed, equalling the third; second long-awned.
x. S. cynosuroides.

First scale acute, shorter than the third, usually one-half as long.
First scale strongly scabrous-hispid on the keel.
Leaves 1.25 cm . wide or more, flat. 2. S. polystachya. Leaves 6 mm . wide or less.

Spikes ascending or erect; leaves narrow, involute; coast plant.
3. S. patens.

Spikes appressed; leaves usually flat at the base; western species.
4. S. gracilis.

First scale smooth on the keel or occasionally slightly scabrous. 5. S. stricta.
I. Spartina cynosuroìdes (L.) Willd. Tall Marsh-grass (I. F. f. 401.) Culms 6-18 dm., tall, erect, simple, smooth. Leaves 3 dm . long or more, 6-14 mm . wide, scabrous on the margins, becoming involute in drying, attenuate into a long slender tip; spikes $5-30,5-12.5 \mathrm{~cm}$. long, often on peduncles $\mathbf{1 . 2 5 - 2 . 5} \mathrm{cm}$. in length, ascending or erect; rachis rough on the margins; spikelets much imbricated, I.2-I. 4 cm . long; outer scales awn-pointed or awned, strongly hispid-scabrous on the keel; third scale as long as the first, the scabrous midrib terminating just below the emarginate or 2 -toothed apex; palet sometimes exceeding the scale. In swamps and streams of fresh or brackish water, N. S. to Assiniboia, N. J. and Tex. Sometimes glaucous. Called also Fresh-water Cord-grass. Aug.-Oct.
2. Spartina polystàchya (Michx.) Ell. Salt Reed-grass. (I. F. f. 402.) Culms I-3 m. tall, erect, stout, simple, smooth. Leaves 3 dm . long or more, I.252.5 cm . wide, flat, scabrous at least on the margins, attenuate into a long slender tip; spikes 20-50, ascending, often long-peduncled, $5-10 \mathrm{~cm}$. in length, the rachis rough on the margins; spikelets much imbricated, 8 -10 mm . long, the outer scales acute, strongly scabrous-hispid on the keel, the first half the length of the second; third scale scabrous on the upper part of the keel, obtuse, longer than the first and exceeded by the palet. In salt and brackish marshes, Me. to N. J. and Fla. Called also creek-thatch. Aug.-Oct.
3. Spartina pàtens (Ait.) Muhl. Salt-meadow grass. (I. F. f. 403.) Culms 3-9 dm. tall, erect, or decumbent at base, smooth. Leaves 1.5-3 dm. long, 2-4 mm. broad, involute, attenuate into a long tip, smooth and glabrous beneath; spikes $2-10,2.5-5 \mathrm{~cm}$. long, usually ascending, more or less peduncled, the rachis slightly scabrous; spikelets $6-8 \mathrm{~mm}$. long; outer scales acute, scabrous-hispid on the keel, the first usually rather less than one-half as long as the second; third scale somewhat scabrous on the upper part of the keel, emarginate or 2 -toothed at the apex, longer than the first and exceeded by the palet. On salt meadows, Newf. and N. S. to Fla., west to Tex. This and Juncus Gerardi, the "Black-grass," furnish most of the salt-meadow hay of the Atlantic Coast. Aug.-Oct.
4. Spartina gracilis Trin. Inland Cord-Grass. (I. F. f. 404.) Culms 3-9 dm. tall, erect, simple, smooth. Sheaths overlapping, those at the base of the culm short and crowded; leaves 3 dm . long or less, $2-6 \mathrm{~mm}$. wide, fiat or involute, attenuate into a long tip; spikes $4-8,2.5-5 \mathrm{~cm}$. long, appressed, more or less pe-
duncled; spikelets $6-8 \mathrm{~mm}$. long; outer scales acute, scabrous-hispid on the keel, the first half the length of the second; third scale obtuse, slightly shorter than the second and about equalling the obtuse palet. In saline soil, Assiniboia and Br. Col. to Neb. and Nev. Aug.-Sept.
5. Spartina strícta (Ait.) Roth. Smooth Marsh-grass. (I. F. f. 405.) Culms 3-9 dm. tall, erect, simple, smooth. Sheaths overlapping, those at the base shorter and looser, much crowded ; leaves $7 \cdot 5-30 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide at the base, involute, at least when dry ; spikes $3-5$, erect or nearly so, $2.5-5 \mathrm{~cm}$. long ; spikelets 1.2-1. 6 cm . long, loosely imbricated; empty scales acute or acutish, I-nerved, the first shorter than the second, which exceeds or equals the third; palet longer than the third scale.

Spartina stricta maritima (Walt.) Scribn. Culms taller, sometimes 3 m . high, and leaves longer ; spikes more numerous, usually appressed.

Spartina stricta alternifiora (Lois.) A. Gray. Culms $12-18 \mathrm{dm}$. tall; spikes slender, appressed, $7.5-12.5 \mathrm{~cm}$. long, the spikelets barely overlapping.

Very variable. Common in some one of its forms, along the coast from Me , to Fla. and Tex. Also on the coast of Europe. Our plant does not appear to be satisfactorily identified with the European. Aug.-Oct.

## 55. CAMPULÒSUS Desv.

Tall pungent-tasted grasses, with flat or convolute narrow leaves and a curved spicate inflorescence. Spikelets borne pectinately in two rows on one side of the flat curved rachis, 1 -flowered. Lower 4 scales empty, the first very short, hyaline ; the second, third, fourth and fifth awned on the back, the latter subtending a perfect flower and palet, the uppermost scales empty. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, loosely enclosed in the scale. [Greek, in allusion to the curved spike.] Seven known species, four of them American, the others in the eastern hemisphere.
I. Campulosus aromáticus (Walt.) Scribn. Toothache-grass. (I. F. f. 406.) Culms 9-12 dm. tall, erect, simple, smooth or somewhat scabrous. Leaves ${ }^{2} .5-15 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, flat or involute, smooth; spike terminal, solitary, curved, $5-10 \mathrm{~cm}$. long, the rachis extended into a point ; spikelets about 6 mm . long ; second scale thick and rigid, awn-pointed, bearing just above the middle a stout horizontal or recurved awn ; third fourth and fifth scales membranous, scabrous, awned from below the 2 -toothed apex, the fifth subtending a perfect flower, the others empty. In wet soil, especially in pine barrens, Va. to Fla. July-Sept.

## 56. CHLÒRIS Sw.

Mostly perennial grasses with flat leaves and spicate inflorescence, the spikes few or numerous, verticillate or approximate. Spikelets I-flowered, arranged in two rows on one side of the rachis. Scales 4 ; the 2 lower empty, unequal, keeled, acute ; third and fourth usually awned, the former subtending a perfect flower ; palet folded and 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. (irain free, enclosed in the scale. [Greek, greenish-yellow, referring to the color of the herbage.] About fifty species, mostly natives of warm and tropical regions. Besides the following some io others occur in the southern U.S.
Spikes slender, naked at the base; nerves of the third scale all pilose with short appressed hairs.

1. C. verticillata.

Spikes stout, spikelets crowded to the very base; lateral nerves of the third scale with a tuft of very long hairs at the summit.
2. C. elegans.
I. Chloris verticillàta Nutt. Prairie Chloris. (I. F. f. 407.) Culms 1.5-4.5 dm. tall, erect, or decumbent and rooting at the lower nodes. Leaves 2.57.5 cm . long, $2-4 \mathrm{~mm}$. wide, obtuse, often apiculate, scabrous; spikes shader, usually spreading, 5-11.25 cm. long, in one or two whorls, or the upper ones approximate; spikelets, exclusive of the awns, about 3 mm . Wong, the third scale 2 mm . long, obtuse, ciliate on the nerves, especially on the lateral ones, hearing just below the apex a scabrous awn about 5 mm . long; fourth scale as long as or shorter than the third, awned near the usually truncate apex. On prairies, Kans. to Tex. May-July.
2. Chloris elegans H. B. K. Culms 1.5-9 dm. tall, finally branched. Sheaths compressed, keeled; leaves usually less than I dm. long, sometimes longer, $2-6 \mathrm{~mm}$. wide, smooth beneath, generally very rough above ; inflorescence silvery-white, often tinged with purple, consisting of 3-12 erect spikes $2-8 \mathrm{~cm}$. long; spikelets, exclusive of the awns, about 4 mm . long, usually 2 -flowered, the third scale with the midnerve abruptly contracted a short distance below the awn, the awn 5-10 mm. long. Sandy soil, Kans. (according to Hitchcock) to Ariz., south to Mex.

## 57. GYMNOPÒGON Beauv.

Perennial grasses with flat and usually short rigid leaves, and numerous slender alternate spikes. Spikelets I-flowered, almost sessile, the rachilla extended and bearing a small scale which is usually awned. Scales 3 or 4 ; the 2 lower empty; unequal, narrow, acute; third broader, fertile, 3 -nerved, slightly 2 -toothed at the apex, bearing an erect awn; the fourth empty, small, awned; palet 2 -keeled. Stamens 3. Styles distinct. Stigmas plumose. Grain linear, free, enclosed in the rigid scale. [Greek, naked-beard, referring to the prolongation of the rachilla.] Six known species, all but one of them natives of America.

Spikes bearing spikelets their whole length; awn longer than flowering scale.
I. G. ambiguus.

Spikes bearing spikelets above the middle ; awn shorter than flowering scale.
2. G. brevifolius.

1. Gymnopogon ambíguus (Michx.) B.S.P. Broad-leaved Gymnopogon.
(I. F. f. 408.) Culms 3-4.5 dm. tall, erect, or decumbent at the base, simple or sometimes sparingly branched. Sheaths short, with a villous ring at the summit, crowded at the base of the culm; leaves $2.5-10 \mathrm{~cm}$. long, $4-12 \mathrm{~mm}$. wide, lanceolate, acute, cordate at the base, spreading, smooth or a little scabrous above; spikes slender, spikelet-bearing throughout their entire length, at first erect, the lower I-2 dm . long, at length widely spreading; spikelets, exclusive of awns, $4-5 \mathrm{~mm}$. long; first scale shorter than the second; third scale exceeded by the second, the callus at the base hairy, the awn $4^{-6} \mathrm{~mm}$. long. In dry sandy soil, southern N. J. to Kans., south to Fla. and Tex. Aug.-Oct.
2. Gymnopogon brevifolius Trin. Short-leaved Gymnopogon." (I. F. f. 409.) Culms 3-6 dm. long, from a decumbent base, simple, slender. Sheaths sometimes crowded near the middle of the culm; leaves $2.5-5 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, usually spreading, lanceolate, acute, cordate at the base; spikes very slender, spikelet-bearing above the middle, the lower 1.5 dm . long, at first erect, finally widely spreading; spikelets, exclusive of the awns, 3 mm . long; first scale shorter than the second; third scale equalling or exceeded by the second, short-awned, sparingly villous or glabrous, the callus hairy. In dry soil, N. J. to Fla., west to Miss. Aug.-Oct.

## 58. SCHEDONNÀRDUS Steud.

An annual grass with branching culms, narrow leaves and slender spikes arranged along a common axis. Spikelets I-flowered, sessile and alternate on the rachis. Scales 3 ; the 2 lower empty, narrow, membranous, acuminate; the flowering scale longer, of similar texture; palet narrow, shorter. Stamens 3. Styles distinct. Stigmas plumose. Grain linear, free, enclosed in the rigid scale. [Greek, in allusion to the resemblance of this grass to the genus Nardus.] A monotypic genus of central N. Am.
I. Schedonnardus paniculàtus (Nutt.) Trelease. Schedonnardus. (I. F. f. 4 io.) Culms $2-4.5 \mathrm{dm}$. tall, erect, slender, rigid, branching at the base, scabrous. Sheaths crowded at the base of the culm, compressed, smooth and glabrous; leaves $2.5-5 \mathrm{~cm}$. long, 2 mm . wide or less, flat, usually erect; spikes numerous, rigid, widely spreading, alternate, the lower $5-10 \mathrm{~cm}$. long, the axis and branches triangular; spikelets $2.5-3 \mathrm{~mm}$. long, sessile and appressed, alternate; scales hispid on the keel, the second longer than the first and exceeded by the acute third one. Manitoba and Assiniboia, south to Ill., Tex. and N. Mex. July-Sept.

## 59. BOUTELOƯA Lag.

Annual or perennial grasses with flat or convolute leaves and numerous spikelets in few one-sided spikes. Spikelets 1-2-flowered, arranged in two rows on one side of a flat rachis, the rachilla extended beyond the base of the flowers, bearing I-3 awns and I-3 rudimentary scales. Two lower scales empty, acute, keeled; flowering scale broader, 3 -toothed, the teeth awn-pointed or awned; palet hyaline, entire or 2 -toothed. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free. [In honor of Claudius Boutelou, a Spanish botanist.] About 30 species, particularly numerous in Mexico and in the southwestern U. S.

Rachilla bearing the rudimentary scales and awns glabrous; second scale strongly papillose-hispid on the keel. 1. B. hirsuta.

Rachilla bearing the rudimentary scales and awns with a tuft of long hairs at the apex; second scale scabrous and sparingly long-ciliate on the keel.
2. B. oligostachya.
I. Bouteloua hirsùta Lag. Hairy Mesquite-grass. (I. F. f. 4ir.) Culms I. 5-5 dm. tall, erect, simple or sometimes sparingly branched at the base. Sheaths mostly at the base of the culm; leaves $2.5-12.5 \mathrm{~cm}$. long, 2 mm . wide or less, erect or ascending, flat, scabrous, sparingly papillose-hirsute near the base, especially on the margins; spikes $1-4$, I.25-5 cm. long, usually erect or ascending, the rachis extending beyond the spikelets into a conspicuous point; spikelets numerous, 5-6 mm . long, pectinately arranged; second scale strongly papillose-hirsute on th:e keel; third scale pubescent, 3-cleft to the middle, the nerves terminating in awns; rachilla without a tuft of hairs under the rudimentary scales and awns. In dry soil, especially on prairies, Ill. to Dak., Tex. and Ariz. July-Sept.
2. Bouteloua oligostàchya (Nutt.) Torr. Grama-Grass. Mesquite-Grass. (I. F. f. 412.) Culms I.5-4.5 dm. tall, erect, simple. Leaves $2.5-10 \mathrm{~cm}$. long, 2 mm . wide or less, involute, at least at the long slender tip, smooth or scabrous; spikes $\mathbf{I}-3,2.5-5 \mathrm{~cm}$. long, often strongly curved, the rachis terminating in a short inconspicuous point; spikelets numerous, pectinately arranged, about 6 mm . long; second scale scabrous and sometimes long-ciliate on the keel, sometimes with a few papillae; third scale pubescent, 3 -cleft, the nerves terminating in awns; rachilla with a tuft of long hairs under the rudimentary scales and awns. On prairies, Manitoba to Alberta, south to Wis., Tex. and Mex. July-Sept.

## 60. ATHEROPÒGON Muhl.

Perennial grasses with narrow flat leaves and an inflorescence composed of numerous short scattered few-flowered one-sided spreading or frequently reflexed spikes. Spikelets I-flowered, crowded in 2 rows, sessile, imbricated, the rachilla articulated above the empty scales and extending beyond the flower, its summit bearing scales or awns. Scales 3 or more, the lower 2 empty, unequal, acute, narrow, keeled, the third scale thicker and broader, enclosing a narrow 2 -toothed hyaline palet and a perfect flower, 3 -toothed at the apex, the teeth more or less awned; the small upper scales minute, awned. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale. [Greek, in reference to the awns of the flowering scales.] Species about $\mathbf{1 5}$, natives of temperate and tropical regions.

1. Atheropogon curtipéndulus (Michx.) Fourn. Rackime Bowtind.A. (I. F. f. 4I3.) Culms 3-9 dm. tall, erect, simple, smooth and glabrous. I caves $5-30 \mathrm{~cm}$. long, 4 mm . wide or less, flat or involute, rough, especially above: spikes numerous, $6-16 \mathrm{~mm}$. long, widely spreading or reflexed; spikelets +-12 , divergent from the rachis, $7-\mathbf{1 2} \mathrm{mm}$. long; scales scabrous, especially on the kecl, the first shorter than or equalling the second; the third 3 -toothed, the nerves extended into short awns; rachilla bearing at the summit a small awned scale, or sometimes a larger 3-nerved scale, the nerves extended into awns; anthers vermillion or cinna-bar-red. In dry soil, Ont. to Manitoba, south to N. J., Ky... Tex. and Mex. JulySept. (Bouteloua curtipendula (Michx.) Torr.)

## 61. BECKMÁNNIA Host.

A tall erect grass with flat leaves and erect spikes borne in a terminal panicke. Spikelets 1-2-flowered, globose, comprescol. Scales 3 or $f$ : the 2 lower smpty, membranous, saccate, obtuse or abruptly atute; the flowering soales narrow; thin-
membranous; palet hyaline, 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. Grain oblong, free, enclosed in the scale and palet. [In honor of Johann Beckmann, i739-181 I, teacher of Natural History at St. Petersburg.] A monotypic genus of the north temperate zone.
I. Beckmannia erucaefórmis (L.) Host. Beckmannia. (I. F. f. 4I4.) Glabrous. Culms 4.5-9 dm. tall, erect, simple, smooth; sheaths longer than the internodes, loose; leaves 7.5-22.5 cm. long, 4-8 mm. wide, rough; panicle I-2.5 dm. in length, simple or compound, the spikes about 1.25 cm . long; spikelets $2-3 \mathrm{~mm}$. long, $\mathbf{I}-\mathbf{2}$-flowered, closely imbricated in two rows on one side of the rachis; scales smooth, the outer saccate, obtuse or abruptly acute; flowering scales acute, the lower generally awn-pointed, the upper rarely present. In wet places, western Ont. to Br. Col., south to Iowa, Colo. and Cal. July-Sept.

## 62. ELEUSİNE Gaertn.

Tufted annual or perennial grasses, with flat leaves and spicate inflorescence, the spikes digitate or close together at the summit of the culm. Spikelets several-flowered, sessile, closely imbricated in two rows on one side of the rachis, which is not extended beyond them; flowers perfect or the upper staminate. Scales compressed, keeled; the 2 lower empty; the others subtending flowers, or the upper empty. Stamens 3. Styles distinct. Stigmas plumose. Grain loosely enclosed in the scale and palet. [From the Greek name of the town where Ceres was worshipped.] Species 6, natives of the Old World. Besides the following, two others have been found in ballast fillings about the eastern seaports.
I. Eleusine Índica (L.) Gaertn. Wire-grass. Crab-grass. Yard-grass. (I. F. f. 415.) Culms I.5-6 dm. tall, tufted, erect, or decumbent at the base. Sheaths loose, overlapping and often short and crowded at the base of the culm, glabrous or sometimes sparingly villous; leaves $7.5-30 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, smooth or scabrous; spikes $2-10,2.5-7.5 \mathrm{~cm}$. long, whorled or approximate at the summit of the culm or one or two sometimes distant; spikelets 3-6-flowered, $3-4 \mathrm{~mm}$. long; scales acute, minutely scabrous on the keel, the first $\mathrm{I}-\mathrm{merved}$, the second 3-7nerved, the others 3 - 5 -nerved. In fields, dooryards and waste places all over N. Am. except the extreme north. Naturalized from the warmer regions of the Old World. June-Sept.

## 63. DACTYLOCTENIUM Willd.

An annual grass, with flat leaves and spicate inflorescence, the spikes in pairs or digitate. Spikelets several-flowered, sessile, closely imbricated in two rows on one side of the rachis, which is extended beyond them into a sharp point. Scales compressed, keeled, the 2 lower and the uppermost ones empty, the others subtending flowers. Stamens 3. Styles distinct, short. Stigmas plumose. Grain free, rugose, loosely enclosed in the scale. [Greek, referring to the digitately spreading spikes.] A monotypic genus of the warmer parts of the Old World.
I. Dactyloctenium Aegýptium (L.) Willd. Egyptian Grass. (I. F. f. 416.) Culms 1.5-6 dm. long, usually decumbent and extensively creeping at the base. Sheaths loose, overlapping and often crowded, smooth and glabrous; leaves 1.5 dm . in length or less, $2-6 \mathrm{~mm}$. wide, smooth or rough, sometimes pubescent, ciliate toward the base; spikes in pairs, or 3-5 and digitate, $1.25-5 \mathrm{~cm}$. long; spikelets 3 - 5 -flowered; scales compressed, scabrous on the keel, the second awned, the flowering ones broader and pointed. In waste places and cultivated ground, southern N. Y., Penn. and Va. to Ill. and Cal., south to Fla. and Mex. Widely distributed in tropical America. Naturalized from Asia or Africa. July-Oct.

## 64. LEPTÓCHLOA Beauv.

Usually tall annual grasses, with flat leaves and numerous spikes forming a simple panicle. Spikelets usually 2-many-flowered, flattened, alternating in two rows on one side of the rachis. Scales 4 to many; the 2 lower empty, keeled, shorter than the spikelet; the flowering scales keeled, 3-nerved. Palet 2 -nerved. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale and palet. [Greek, in allusion to the slender spikes.] About 12 species, natives of the warmer regions of both hemispheres. Besides the following, 3 others occur in the southern U. S.

Flowering scales r .5 mm . long, the pubescence on the nerves long and copious.

> - 1. L. mucronata. Flowering scales less than $\mathbf{I} \mathrm{mm}$. long, the pubescence on the nerves short and scant. 2. L. attenuata.
I. Leptochloa mucronata (Michx.) Kunth. Northern Leptochloa. (I. F. f. 417.) Culms 3-12 dm. tall, finally branching. Sheaths, at least the lower ones, commonly more or less hirsute ; leaves $6-25 \mathrm{~cm}$. long, $\mathbf{I} \mathrm{cm}$. or less wide, rough ; inflorescence $1.5-5 \mathrm{dm}$. long; spikes generally elongated, ascending, $5-15 \mathrm{~cm}$. long ; spikelets $2.5-3 \mathrm{~mm}$. long ; scales usually 5, the outer empty 2 acute, equal, or the first somewhat shorter than the second, the first scale usually a little shorter than the first flowering scale. In fields, Va. to Fla., west to Cal. June-Aug.
2. Leptochloa attenuata Nutt. Sharp-scaled Leptochloa. Culms tufted, branching at the base, $2-4 \mathrm{dm}$. tall, rarely taller. Lower sheaths sparingly pilose ; leaves $4-8 \mathrm{~cm}$. long, sometimes longer, $3-5 \mathrm{~mm}$. wide, sparingly pilose beneath ; inflorescence $1.5-2 \mathrm{dm}$. long ; spikes numerous, finally spreading, $2-5 \mathrm{~cm}$. long, rarely longer ; spikelets $1.6-2 \mathrm{~mm}$. long ; scales 5 or 6 , the outer 2 subulate, acuminate, awn-pointed, usually about equal, or the first shorter than the second, which reaches or extends beyond the apex of the second flowering scale. In sandy river bottoms, Ill. to Ind. Terr. Sept.-Oct.

## 65. BÚLBILIS Raf.

A perennial stoloniferous monœcious or apparently diœcious grass with flat leaves and spicate inflorescence. Staminate spikelets borne in two rows on one side of the rachis, the spikes at the summit of the long and exserted culms. Pistillate spikelets in spike-like clusters of 2 or 3 , on very short culms, scarcely exserted from the sheath. Stamens 3. Styles distinct, long. Stigmas elongated, short-plumose. Grain ovate, free, enclosed in the scale. [Name apparently from the supposed bulb-like base of old plants.] A monotypic genus of central N. Am.
I. Bulbilis dactyloides (Nutt.) Raf. Buffalo-grass. (I. F. f. 418.) Culms bearing staminate flowers I-3 dm. tall, erect, slender, naked above ; those bearing pistillate flowers $\mathbf{I} .25-7.5 \mathrm{~cm}$. long, much exceeded by the leaves; leaves 2 mm . wide or less, more or less papillose, those of the staminate culms $2.5-10 \mathrm{~cm}$. long, erect, those of the stolons and pistillate culms 2.5 cm . long or less, spreading ; staminate spikes 2 or 3, approximate; spikelets $4-5 \mathrm{~mm}$. long, flattened, $2-3$-flowered, the empty scales I-nerved, the flowering 3 -nerved; pistillate spikelets ovoid, the outer scales indurated. On plains and prairies, Minn. to Dak., south to Ark., Tex. and Mex. A valuable fodder-grass. June-July.

## 66. MUNRÒA Torr.

A low diffusely branched grass, with flat pungently pointed leaves crowded at the nodes and the ends of the branches. Spikelets in clusters of 3-6, nearly sessile in the axils of the floral leaves, $2-5$-flowered, the flowers perfect. Two lower scales empty, lanceolate, acute, I-nerved, hyaline; flowering scales larger, 3-nerved; 1 or 2 empty scales sometimes present above the flowering ones; palet hyaline. Stamens 3. Styles distinct, elongated. Stigmas barbellate or short-plumose. Grain free, enclosed in the scale and palet. [In honor of Gen. William Munro, English agrostologist.] Three known species, the following of the plains of N. Am., the others in S. Am.
I. Munroa squarròsa (Nutt.) Torr. Munro's (irass. (I. F. f. +10.) C'ulms 5-20 dm. long, tufted, erect, decumbent or prostrate, much branched, smowth or rough. Sheaths short, crowded at the nodes and ends of the branches, smonth. pilose at the base and throat, sometimes ciliate on the margins; leaves 2.5 cm . longr or less, $\mathbf{I}-2 \mathrm{~mm}$. wide, rigid, spreading, scabrous, pungently pointed: spiletets 2-5 flowered, the flowers perfect; empty scales I-nerved, shorter than the flower ing scales, which are about 5 mm . long, 3 -twothed, the nerves excurrent as short points or awns, with tufts of hair near the middle ; palets ohtuse. Ondey phains. S. Dak. to Alberta, south to Neb., Tex. and Ariz. Aug.-Oct.

## 67. PHRAGMİTES Trin.

Tall perennial reed-like grasses, with broad tlat leaves and ample pamikes. Spikelets 3 -several-flowered, the first flower often staminite, the others perfect:
rachilla articulated between the flowering scales, long-pilose. Two lower scales empty, unequal, membranous, lanceolate, acute, shorter than the spikelet; the third scale empty or subtending a staminate flower; flowering scales glabrous, narrow, long-acuminate, much exceeding the short palets. Stamens 3. Styles distinct, short. Stigmas plumose. Grain free, loosely enclosed in the scale and palet. [Greek, referring to its hedge-like growth along ditches.] Three known species, the following of the north temperate zone, one in Asia, the third in S. Am.
I. Phragmites Phragmites (L.) Karst. Reed. (I. F. f. 420.) Culms $1.5-5 \mathrm{~m}$. tall, erect, stout, from long horizontal rootstocks, smooth and glabrous. Sheaths overlapping, loose ; leaves $\mathbf{I} .5-3 \mathrm{dm}$. long or more, $8-50 \mathrm{~mm}$. wide, flat, smooth, glabrous; panicle I.5-3 dm. long or more, ample; spikelets crowded on the ascending branches; first scale 1 -nerved, half to two-thirds as long as the 3 nerved second one; flowering scales $\mathrm{I}-\mathrm{I} .2 \mathrm{~cm}$. long, 3-nerved, long-acuminate, equalling the hairs of the rachilla. In swamps and wet places nearly throughout the U. S., extending north to N. S., Manitoba and Br. Col. Also in Europe and Asia. Rarely ripening seed. Aug.-Oct.

## 68. SIEGLINGIA Bernh.

A perennial tufted grass with flat leaves and a narrow simple panicle. Spikelets few, 3-5-flowered, the rachilla internodes short. Scales 5-7, the lower 2 empty, equalling or nearly as long as the spikelet, the flowering scales very firm, rounded on the back, obscurely 9 -nerved, the nerves more prominent at the shortly 3 -toothed summit, pilose near the margins, the callus short and obtuse, pilose; palet 2 -keeled, ciliate on the keels. Stamens 3. Styles short, distinct. Stigmas plumose. Grain free, enclosed in the scale. [Named in honor of Prof. Siegling, German botanist.] A monotypic genus of the Old World.
I. Sieglingia decúmbens (L.) Kuntze. Heather-Grass. (I. F. f. 423.) Culms $1.5-4.5 \mathrm{dm}$. tall, erect, often decumbent at the base, simple, smooth and glabrous. Sheaths villous at the summit; leaves smooth beneath, usually scabrous above, $\mathrm{I}-3 \mathrm{~mm}$. wide, the basal $7 \cdot 5^{-1} \mathrm{I} \mathrm{cm}$. long, those of the culm $2.5-7.5 \mathrm{~cm}$. long; panicle $2.5-5 \mathrm{~cm}$. long, contracted, the branches 2.5 cm . long or less, erect; spikelets $3-5$-flowered, $6-10 \mathrm{~mm}$. long, the joints of the rachilla very short; lower scales equalling the spikelet, acute; flowering scales broadly oval, ciliate on the margins below, obtusely 3 -toothed, with two tufts of hair on the callus. Introduced into Newf. Native of Europe and Asia. Summer.

## 69. TRICÚSPIS Beauv.

Usually perennial grasses with flat or involute leaves and an open or contracted sometimes spike-like panicle. Spikelets 3-many-flowered, the flowers perfect or the upper ones staminate, the rachilla articulated above the empty scales and between the flowers. Scales 5-many, membranous, sometimes firmer, the lower 2 empty, keeled, obtuse to acuminate, usually shorter than the rest, sometimes longer, the flowering scales 3 -nerved, the midnerve or all the nerves excurrent, thie midnerve and the lateral nerves or the margins pilose, the apex shortly 2 -toothed, rarely entire, the teeth obtuse or acute, the callus shcrt and obtuse; palet shorter than the scale, compressed, 2-keeled. Stamens 3. Styles short, distinct. Stigmas plumose. Grain free, enclosed in the scale. [Named in reference to the teeth of the flowering scale of most of the species.] Species about 30, natives chiefly of temperate regions. (Sieglingia Bernh. in part.)
Panicle open, the branches long and more or less spreading, often drooping at the apex.

1. 2. seslerioides.

Panicle contracted, the branches short and erect or appressed.
Panicle spike-like, $\mathrm{I}-3 \mathrm{dm}$. long; spikelets numerous; leaves long and flat. Second empty scale i-nerved; flowering scales $3.5-4 \mathrm{~mm}$. long.
2. T. stricta. Second empty scale 3-5-nerved ; flowering scales $5-6 \mathrm{~mm}$. long.
3. T. elongata.

Panicle $1-3 \mathrm{~cm}$. long, almost raceme-like ; spikelets few ; leaves thick, folded.
4. T. pilosa.
I. Tricuspis seslerioìdes (Michx.) Torr. Tall Red-top. (I. F. f. 42 I.) Culms 6-15 dm, tall, erect, somewhat flattened, often viscid above. Sheaths some-
times villous at the summit, the lower short, overlapping and crowded, the upper longer, equalling or shorter than the internodes; leaves i-3 dm. long or more, $6-12$ mm . wide, flat, attenuate into a long tip, smooth beneath, scabrous above; panicle 1.5-4.5 dm. long, the branches finally ascending or spreading, the lower $\mathbf{I}-2.5 \mathrm{dm}$. long, usually dividing above the middle; spikelets $4-8$-flowered, $6-8 \mathrm{~mm}$. long, purple; empty scales glabrous, obtuse, generally slightly 2 -toothed; flowering scales oval, the nerves pilose, excurrent as short tips. In fields, Conn. to Kans., south to Fla. and Tex. July-Sept. (Sieglingia seslerioides (Michx.) Scribn.)
2. Tricuspis strícta (Nutt.) A. Gray. Narrow Tricuspis. (I. F. f. 422.) Culms 4.5-12 dm. tall, erect, a little compressed. Leaves $1.5-3 \mathrm{dm}$. long or more, flat, long-acuminate, smooth beneath, scabrous above; spike-like panicle 1.25-3 dm . in length, the branches appressed, the lower $2.5-5 \mathrm{~cm}$. long; spikelets 4-10flowered, 4-6 mm. long; lower scales usually about two-thirds as long as the spikelet, rarely extending beyond the flowering scales, acute, glabrous; flowering scales ovate, the nerves pilose for more than half their length, the middle and often the lateral excurrent as short tips. Moist soil, Miss. to Kans. and Tex. July-Oct. (Sieglingia stricta (Nutt.) Kuntze.)
3. Tricuspis elongàta (Buckley) Nash. Long-panicled Tricuspis. (I. F. f. 422b.) Cuims 3-9 dm. tall, tufted, erect, rough, the sterile shoots about onehalf as long as the culms. Sheaths rough, a ring of hairs at the apex; leaves rough, usually involute when dry, $7.5^{-2.5} \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; panicle narrow, $\mathbf{1 . 2 5 - 2 . 5 d m}$. long, $\mathbf{I} .25 \mathrm{~cm}$. wide, its branches erect, 3.75 cm . long or less; spikelets $10-12$-flowered, $9-12 \mathrm{~mm}$. long, the empty scales scabrous, the first Inerved, the second 3 -nerved; flowering scales about 6 mm . long, obtuse at the scabrous apex, 3-nerved, the lateral nerves vanishing at or below the apex, the midnerve usually excurrent as a short tip. Prairies, Kans. to Ariz. and Tex. June-Aug. (Sieglingia elongata (Buckley) Nash.)
4. Tricuspis pilòsa (Buckley) Nash. Sharp-scaled Tricuspis. (I. F. f. 422 c .) Culms tufted, $6.25-30 \mathrm{~cm}$. tall, the sterile shoots I dm. tall or less. Sheaths smooth, a tuft of hairs on each side of the apex, much shorter than the internodes; leaves strict or curved, thick, linear, obtuse, I-nerved, the margins white, serrulate, 3.75 cm . long, or less, less than 2 mm . wide, folded, at least when dry, pubescent with long hairs, especially beneath; panicle almost raceme-like, long-exserted, 1.25-3.75 cm. long; spikelets 3-10, crowded, 8-12-flowered; empty scales, acuminate, I-nerved; flowering scales $6-6.5 \mathrm{~mm}$. long, acuminate, 3 -nerved, the midnerve generally excurrent as a short tip, all the nerves pilose (the lateral at the top and bottom, the midnerve below the middle). Dry soil, Kans. to Colo., Tex. and N. Mex. April-Sept. (Sieglingia pilosa (Buckley) Nash.)

## 70. TRIPLÀSIS Beauv.

Perennial (?) grasses, with narrow flat or involute leaves and contracted or open somewhat branched panicles. Spikelets shortly pedicelled, 2-6-flowered, the glabrous rachilla articulated between the flowers, the internodes very long. Scales $4^{-8}$, membranous, the lower 2 empty, keeled, the flowering scales dorsally rounded at the base, 3 -nerved, the lateral nerves pilose, deeply 2 -lobed at the apex. longawned between the lobes, the callus long and subulate, pubescent on the outer surface; palet 2 -keeled, the keels long-ciliate. Stamens 3. Styles short, distinct. Stigmas plumose. Grain free, enclosed in the scale. [Greek, referring to the 3 divisions of the flowering scales.] Species 3 , natives of the eastern and southern parts of N. Am. Besides the following, two others occur in the southern L. S.

1. Triplasis purpùrea (Walt.) Chapm. Sand-GRass. (1. F. f. 424.) Culms 3-9 dm. tall, erect, prostrate or decumbent. Leaves 1.25 .0 .25 cm . long, 2 mm . wide or less, rigid, scabrous, sometimes sparsely ciliate; panicle 2.57 .5 cm . hong. the branches rigid, finally widely spreading, the lower $1.8-3.75 \mathrm{~cm}$. lons: spikelets $2-5$-flowered, $5-8 \mathrm{~mm}$. long, the jonts of the rachilla half as long as the flowering scale; flowering scales oblong, 2 -lobed at the apex, the lohes crose trumate, the nerves strongly ciliate, the middle one excument ats a shom prim. In samd, especially on sea-beaches, Me. to Tex. and along the Great Lakes. Also from Neh, to N. Mex. Plant acid. Aug.-Sept.

## 71. REDFIELDIA Vasey.

A tall perennial grass, with long narrow leaves and an ample panicle. Spikelets 1-3-flowered, the flowers all perfect. Empty scales 2, about equal, shorter than the spikelet, I-nerved; flowering scales membranous, 3 -nerved, with a ring of hairs at the base. Palet 2-nerved, shorter than the scale. Stamens 3. Styles long, distinct. Stigmas short, plumose. Grain oblong, free. [In honor of John H. Redfield, 1815-1895, American naturalist.] A monotypic genus of the western U. S.

1. Redfieldia flexuòsa (Thurb.) Vasey. Redfieldia. (I. F. f. 425.) Culms 4.5-12 dm. tall, erect from a long horizontal rootstock. Sheaths smooth, the lower short and overlapping, often crowded, the upper much longer; leaves 3-6 dm . long, $2-4 \mathrm{~mm}$. wide, involute; panicle ample and diffuse, $2-5.5 \mathrm{dm}$. in length, the branches finally widely spreading, flexuous, the lower $7.5-20 \mathrm{~cm}$. long; spikelets about 6 mm . long, $\mathbf{I}-3$-flowered, the empty scales acute, glabrous; flowering scales with a ring of hairs at the base, minutely scabrous, twice the length of the empty ones, acute, the middle nerve usually excurrent as a short tip. On prairies, Neb. and Wyo. to Colo. and the Ind. Terr. Aug.-Sept.

## 72. DIPLÁCHNE Beauv.

Tufted grasses, with narrow flat leaves and long slender spikes arranged in an open panicle, or rarely only one terminal spike. Spikelets several-flowered, narrow, sessile or shortly pedicelled, erect. Two lower scales empty, membranous, keeled, acute, unequal; flowering scales I-3-nerved, 2 -toothed and mucronate or short-awned between the teeth. Palet hyaline, 2 -nerved. Stamens 3. Styles distinct. Stigmas plumose. Grain free, loosely enclosed in the scale and palet. [Greek, referring to the 2 -toothed flowering scales.] About 15 species, natives of the warmer regions of both hemispheres. Besides the following species, about 6 others occur in the southern and western parts of N. Am.
Awn less than one-third as long as the flowering scale.
Spikelets $4^{-8} \mathrm{~mm}$. long, the flowering scales acute or obtuse at the 2-toothed apex, lateral nerves often excurrent.

1. D. fascicularis.

Spikelets $10-12 \mathrm{~mm}$. long, the flowering scales acuminate at the usually entire apex, the lateral nerves rarely excurrent.
2. D. acuminata.

Awn one-half as long as the flowering scale or more.
3. D. procumbens.
I. Diplachne fasciculàris (Lam.) Beauv. Salt-meadow Diplachne. (I. F. f. 426.) Culms tufted, finally branching, 3-8 dm. tall. Leaves erect, I-2 dm . long, 3 mm . or less wide, involute when dry, rough; racemes 8 or more, erect or ascending, the larger ones $4-8 \mathrm{~cm}$. long; spikelets $4-8 \mathrm{~mm}$. long; scales 10-12, the flowering scales, exclusive of the awn, $3-4 \mathrm{~mm}$. long, the midnerve extending into an awn I mm. long or less. Along the coast. Fla. to Tex., and extending up the Miss. Valley to Ill. and Mo. July-Sept.
2. Diplachne acuminàta Nash, n. sp. Sharp-scaled Diplachne. Culms tufted, 3-6 dm. tall, finally branching. Leaves erect, $1-3 \mathrm{dm}$. long, 4.5 mm . or less wide, usually involute when dry, very rough; racemes numerous, erect or ascending, the larger $7-15 \mathrm{~cm}$. long; spikelets $\mathbf{1 0}-\mathbf{1 2} \mathrm{mm}$. long; scales $8-\mathbf{I r}$, the flowering scales $6-7 \mathrm{~mm}$. long, acuminate at the entire or occasionally slightly 2 toothed apex, the lateral nerves rarely slightly excurrent, the midnerve extending into an awn $0.75-\mathrm{I} .3 \mathrm{~mm}$. long. Wet or moist soil, Ark. to Neb. and Colo. JuneAug.
3. Diplachne procúmbens (Muhl.) Nash. Long-awned Diplachne. Culms tufted, finally branching, $2-4 \mathrm{dm}$. tall. Leaves erect, $8-20 \mathrm{~cm}$. long, 4 mm . or less wide, involute when dry; racemes numerous, erect, the larger $5-7 \mathrm{~cm}$. long; spikelets about I cm. long; scales $8-10$, the empty ones usually awned or awn-pointed, the flowering scales, exclusive of the awn, $4 \cdot 5-5 \mathrm{~mm}$. long, acuminate at the slightly 2 toothed apex, the midnerve extending into an awn one-half or more as long as the scale. Brackish marshes, N. Y. to S. Car. Aug.-Oct.

## 73. MOLÍNIA Schrank.

A perennial tufted grass, with narrow flat leaves and paniculate inflorescence. Spikelets 2-4-flowered; two lower scales empty, somewhat obtuse. or acute, une-
qual, shorter than the spikelet; flowering scales membranous, rounded on the back, 3 -nerved; palets scarcely shorter than the scales, obtuse, 2 -keeled. Stamens 3. Styles short. Stigmas short, plumose. Grain oblong, free, enclosed in the scale and palet. [Name in honor of Joh. Ignaz Molina, Chilian missionary and naturalist.] A monotypic genus of Europe and Asia.

1. Molinia coerùlea (L.) Moench. Molinia. (I. F. f. 427.) Culms 3-Io dm. tall, erect. simple, smooth and glabrous. Sheaths overlapping, and confined to the lower part of the culm, smooth and glabrous; leaves $1-3 \mathrm{dm}$. long or more, $2-6 \mathrm{~mm}$. wide, erect, acuminate, smooth beneath, slightly scabrous above; panicle $7.5-25 \mathrm{~cm}$. in length, green or purple, the branches usually erect, $2.5-10 \mathrm{~cm}$. long; spikelets $2-4$-flowered, $5-8 \mathrm{~mm}$. long; empty scales acute, unequal; flowering scales about 4 mm . long, 3 -nerved, obtuse. Introduced on ballast and into waste places, Me. to N. Y. Adventive from Europe. Aug.-Sept.

## 74. RHOMBOLỲTRUM Link.

Perennial grasses, with usually flat leaves, and a narrow contracted spike-like panicle. Spikelets numerous. Scales several, the outer two empty ones I-nerved, the flowering scales broad, rounded at the apex, 3-nerved, the nerves glabrous, the lateral ones vanishing below the margin, the midnerve at the margin or sometimes excurrent as a short tip, the callus pilose; palet 2 -keeled. Stamens 3. Styles short, distinct. Stigmas plumose. Grain free, enclosed in the scale. [Greek, in reference to the round flowering scales.] Species 4 or 5, natives of warm or tropical countries. (Sieglingia Bernh. in part.)
I. Rhombolytrum albéscens (Vasey) Nash. (I. F. f. 422a.) Culms tufted, $3-5 \mathrm{dm}$. tall, the sterile shoots one-half as long as the culm or more. Leaves smooth beneath, roughish above, acuminate, $6.25-27.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide; panicle dense and contracted, white, $6.25-12.5 \mathrm{~cm}$. long, $6-18 \mathrm{~mm}$. broad, its branches erect or ascending, 2.5 cm . or less long; spikelets $7-$ II-flowered, $4-5 \mathrm{~mm}$. long, the empty scales white, I-nerved, about equal; flowering scales about 3 mm . long, 3 -nerved, the lateral nerves vanishing below the apex, the midnerve excurrent in a short scabrous point. Prairies, Kans. to Tex. Aug.-Sept. (Sieglingia albescens (Vasey) Kuntze.)

## 75. ERAGRÓSTIS Beauv.

Annual or perennial grasses, rarely diœcious, from a few inches to several feet in height, the spikelets in contracted or open panicles. Spikelets 2-many-flowered, more or less flattened. Two lower scales empty, unequal, shorter than the flowering ones, keeled, I-nerved, or the second 3-nerved; flowering scales membranous, keeled, 3 -nerved ; palets shorter than the scales, prominently 2 -nerved or 2 -keeled, usually persisting on the rachilla after the fruiting scale has fallen. Stamens 2 or 3. Styles distinct, short. Stigmas plumose. Grain free, loosely enclosed in the scale and palet. [Greek etymology doubtful, perhaps signifying a low grass, or Love-grass, an occasional English name.] A genus of about 100 species, widely distributed throughout all warm and temperate countries. Besides the following. some 15 others occur in the southern and western parts of N . Am.
Culms often decumbent at the base and generally much branched, 4.5 dm . tall or less : usually annuals.
Spikelets 2-5-flowered, $2-3 \mathrm{~mm}$. long.
Culms branched only at the very base ; pedicels and branches of the panicle long and capillary. I. E. capillaris.
Culms branched above the base ; pedicels and branches of the panicle short.
2. E. Frankii.

Spikelets 5-many-flowered, $3-16 \mathrm{~mm}$. long.
Spikelets 1.5 mm . wide or less.
Flowering scales thin, usually bright purplish, the lateral nerves faint or wanting; spikelets about 1 mm . wide. 3. E. pilosa.

Flowering scales firm, usually dull purple or green, the lateral nerves very prominent; spikelets about 1.5 mm . wide.
4. E. Purshiz.

Spikelets 2 mm . wide or more.
Lower flowering scales about 1.5 mm . long ; spikelets 2 mm . wide.
5. E. Eragrostis.

Lower flowering scales $2-2.5 \mathrm{~mm}$. long ; spikelets $2.5-3 \mathrm{~mm}$. wide.

Culms erect or ascending, simple, rigid, 4.5-16 dm. tall ; usually perennials. Spikelets not clustered.

Branches of the open panicle widely spreading, at least when old. Spikelets closely sessile. 7. E. sessilis̈pica.

Spikelets more or less pedicelled.
Pedicels long, commonly at least the length of the spikelets.
9. E. pectinacea.

Pedicels commonly much shorter than the spikelets.
Leaves elongated; branches of the panicle long and slender; spikelets scattered, $6-25$-flowered. 10. E. refracta.

Leaves not clongated; branches of the panicle short and stout, rigid, spikelets crowded, 5-12-flowered. 8. E. curtipedicellata.
Branches of the elongated paniclc erect or ascending, capillary, somewhat flexuous. II. E. trichodes. Spikelets clustered on the very shori erect or ascending branches.

Culms extensively creeping; flowers diœcious. 12. E. secundiflora. 13. E. hypnoides.
I. Eragrostis capillàris (L.) Nees. Capillary Eragrostis. (I. F. f. 428.) Culms $2-4.5 \mathrm{dm}$. tall, erect, slender, sparingly branched at the base. Sheaths glabrous or sparingly hairy, the upper enclosing the base of the panicle; leaves $7 \cdot 5-25 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, long-acuminate, smooth beneath, scabrous above and sparingly hirsute near the base; panicle diffuse, $1-4 \mathrm{dm}$. in length, the branches capillary, spreading or ascending, $3.75-12.5 \mathrm{~cm}$. long; spikelets ovate, $2-4$-flowered, little flattened, $2-3 \mathrm{~mm}$. long ; empty scales about equal, acute; flowering scales acute, the lower 1.5 mm . long. In dry places, N. H. and R. I. to N. Y. and Mo., south to Ga. and Tex. Aug.-Sept.
2. Eragrostis Fránkii Steud. Frank's Eragrostis. (I. F. f. 429.) Culms I.5-4 dm. tall, tufted, erect, or often decumbent at the base. Sheaths loose, shorter than the internodes; leaves $5-\mathbf{1 2 . 5} \mathrm{cm}$. long, $2-4 \mathrm{~mm}$. wide, smooth beneath, scabrous above; panicle $5-15 \mathrm{~cm}$. in length, open, the branches ascending, the lower $2.5-3.75 \mathrm{~cm}$. long; spikelets ovate, $3-5$-flowered, $2-3 \mathrm{~mm}$. long; empty scales acute, the first shorter than the second; flowering scales acute, the lower I. 5 mm . long. In moist places, southeastern N. Y. and northern N. J. to Minn., south to Miss., La. and Kans. Sept.-Oct.
3. Eragrostis pilòsa (L.) Beauv. Tufted Eragrostis. (I. F. f. 430.) Culms I.5-4.5 dm. tall, tufted, erect, slender, branched. Sheaths sometimes pilose at the throat; leaves $2.5-12.5 \mathrm{~cm}$. long, 2 mm . wide or less, smooth beneath, scabrous above; panicle $5^{-15} \mathrm{~cm}$. in length, the branches at first erect, finally widely spreading, $2.5-3.75 \mathrm{~cm}$. long. often hairy in the axils; spikelets $5-12$-flowered, $3^{-6} \mathrm{~mm}$. long, about 1 mm . wide; lower scales acute, the first one-half as long as the second; flowering scales acute, the lower 1.5 mm . long, thin, usually purplish. Waste places or cultivated ground, southern N. E. to Ill. and Kans., south to Fla. and Tex. Naturalized from Europe. Aug.-Sept.
4. Eragrostis Púrshii Schrad. Pursh's Eragrostis. (I. F. f. 43I.) Culms I. 5-4.5 dm. tall, tufted, usually decumbent at the base and much branched, smooth. Leaves $3.75-8.75 \mathrm{~cm}$. long, 2 mm . wide or less, smooth beneath, rough above; panicle open, $7 \cdot 5^{-20} \mathrm{~cm}$. long, the branches spreading, $2.5-6.25 \mathrm{~cm}$. long, naked in the axils; spikelets $5-15$-flowered, dull purple or green, $3-8 \mathrm{~mm}$. long, about 1.5 mm . wide; empty scales acute, the lower about two-thirds as long as the upper, scabrous on the keel; flowering scales acute, firm, the lower ones $\mathbf{I} .5 \mathrm{~mm}$. long. In dry places, apparently throughout the U. S., extending into Ont. Aug.-Sept.
5. Eragrostis Eragróstis (L.) Karst. Low Eragrostis. (I. F. f. 432.) Culms seldom over 4 dm . tall, tufted, usually decumbent and much branched. Sheaths sparingly pilose at the throat; leaves $2.5-6.25 \mathrm{~cm}$. long, $\mathrm{I}-4 \mathrm{~mm}$. wide, smooth beneath, rough above and somewhat pilose near the base; panicle 5-11.25 cm . in length, the branches spreading or ascending, $1.8-3.75 \mathrm{~cm}$. long; spikelets 8-18-flowered, 6-10 mm . long, about 2 mm . wide; empty scales acute, the first twothirds as long as the second; flowering scales obtuse, $\mathbf{I} .5 \mathrm{~mm}$. long, the lateral nerves prominent. In waste places or cultivated ground, Ont. to N. E., N. Y. and Penn. Locally naturalized from Europe. July-Sept.
6. Eragrostis màjor Host. Strong-scented Eragrostis. (I. F. f. 433.) Culms I.5-6 dm. tall, erect, or decumbent at the base, usually branched. Sheaths
sparingly pilose at the throat; leaves $5-17.5 \mathrm{~cm}$. long, 2-6 mm. wide, flat, smocth beneath, scabrous above; panicle $5-15 \mathrm{~cm}$. in length, the branches spreading or ascending, $2.5-5 \mathrm{~cm}$. long; spikelets $8-35$-flowered, $5-16 \mathrm{~mm}$. long, about 3 mm . wide, very flat; empty scales acute, the first slightly shorter than the second; flowering scales obtuse, $2-2.5 \mathrm{~mm}$. long, the lateral nerves prominent. In waste and cultivated places nearly throughout the U. S., and in Ont. Naturalized from Europe. Unpleasantly scented, handsome. Aug.-Sept.
7. Eragrostis sessilispìca Buckley. Prairie Eragrostis. (I. F. f. 434.) Culms $2-10.5 \mathrm{dm}$. tall, erect, simple. Sheaths crowded at the base of the culm, pilose at the summit; leaves $5-15 \mathrm{~cm}$. long, $1.5-3 \mathrm{~mm}$. wide, rough above, glabrous or sparingly pilose beneath; panicle $2-4 \mathrm{dm}$. in length, the branches stout, rigid, widely diverging; spikelets scattered, closely sessile, a ppressed, 5 -12-flowered, 8 -14 mm . iong; empty scales about equal in length, acute; flowering scales very acute, about 4 mm . long, the lateral nerves very prominent. Prairies, Kans. to Tex. Aug.-Sept.
8. Eragrostis curtipedicellàta Buckley. Short-stalked Eragrostis. (I. F. f. 435.) Culms 1.5-9 dm. tall, erect, rigid, simple. Sheaths overlapping, pilose at the summit; leaves $5-20 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, smooth beneath, scabrous above; panicle $\mathrm{I}-3 \mathrm{dm}$. in length, the branches widely spreading, 3.75-11.25 cm . long; spikelets $5-\mathbf{1 2}$-flowered, $3-6 \mathrm{~mm}$. long, on pedicels of less than their own length; scales acute, the empty ones somewhat unequal, the flowering ones about 1.75 mm . long, scabrous on the midnerve, their lateral nerves prominent. Prairies, Kans. to Tex. Aug.-Sept.
9. Eragrostis pectinàcea (Michx.) Steud. Purple Eragrostis. (I. F. f. 436.) Culms $3-7.5 \mathrm{dm}$. tall, erect or ascending, rigid, simple. Sheaths overlapping, glabrous or villous, the upper one often enclosing the base of the panicle; leaves $1.25-3 \mathrm{dm}$. long, 4-8 mm. wide, smooth beneath, scabrous above and sparingly villous at the base; panicle 1.5-6 dm. in length, purple or purplish, the branches $7.5-25 \mathrm{~cm}$. long, strongly bearded in the axils, widely spreading or the lower often reflexed; spikelets 5-15-flowered, $3-8 \mathrm{~mm}$. long, on pedicels of at least their own length; scales acute, the empty ones about equal, the flowering ones about r. 75 mm . long, their lateral nerves very prominent. In dry soil, N. H. to Ill. and S. Dak., south to Fla. and Tex. Aug.-Sept.
10. Eragrostis refrácta (Muhl.) Scribn. Meadow Eragrostis. (I. F. f. 437.) Culms $3-9 \mathrm{dm}$. tall, erect, slender, simple. Sheaths overlapping, smooth and glabrous; leaves $1.25-3 \mathrm{dm}$. long, $2-4 \mathrm{~mm}$. wide, smooth beneath, rough above. and villous toward the base; panicle $2-5 \mathrm{dm}$. long; branches slender, $1-2.5 \mathrm{dm}$. long, at length widely spreading, the axils often bearded; spikelets 6-25-flowered, 5-12 mm . long, longer than their pedicels; empty scales acute, the first somewhat shorter than the second; flowerirg scales very acute, I.5-2 mm. long, the lateral nerves prominent. In moist soil, Del. and Md. to Fla., west to Tex. Aug.Sept.
II. Eragrostis trichòdes (Nutt.) Nash. Hair-like Eragrostis. (I. F. f. 438.) Culms 6-12 dm. tall, erect, simple. Sheaths overlapping, pilose at the throat; leaves $1.5-6.5 \mathrm{dm}$. long, $2-4 \mathrm{~mm}$. wide, smooth beneath, slightly scabroms above, attenuate into a long slender tip; panicle $2.25-6.5 \mathrm{dm}$. in length, narrow and elongated, the branches erect or ascending, capillary, subdividing, somewhat flex. uous, $7.5-17.5 \mathrm{~cm}$. long; lower axils sometimes bearded; spikelets usually pale. 3 -1o-flowered, $5-9 \mathrm{~mm}$. long; lower scales very acute, about equal; flowering sial:s acute, the lower ones $2.5-3 \mathrm{~mm}$. long, their lateral nerves manifest. In dry samly soil, Ohio and Ill. to Neb., south to Ark. and Tex. Aug.-Sept.
12. Eragrostis secundiflòra Presl. Ciusterkid Erdiroostis. (I. F. f. 439.) Smooth and glabrous. Culms $1.5-9 \mathrm{dm}$. tall, crect. simple: leaves 5-30 cm . long, $2-4 \mathrm{~mm}$. wide; panicle $3.75-15 \mathrm{~cm}$. in length, the branches $1.25-3.75$ cm . long, erect or ascending; spikelets crowded or clustered, sissile or nearly so, strongly flattened, 8-40-flowered, $6-20 \mathrm{~mm}$. hong, $2-5 \mathrm{~mm}$. whit: hower sales acute, about equal; flowering scales $3-3.5 \mathrm{~mm}$. long, acute, usualle purple-bord. ered, the lateral nerves prominent. In dry soil. Kans, and Mo.. south to Tex. and La. Aug.-Sept.
 440.) Culms $2.5-45 \mathrm{~cm}$. long, extensively ereeping, branched, the branches erect
or ascending, $2.5-15 \mathrm{~cm}$. high. Sheaths villous at the summit; leaves 5 cm . long or less, I-2 mm. wide, flat, smooth beneath, rough above; spikelets diœcious, Io35 -flowered, $4-\mathrm{I} 6 \mathrm{~mm}$. long; lower scales unequal, the first one-half to two-thirds as long as the second; flowering scales about 2.5 mm . long, the lateral nerves prominent; scales of the pistillate flowers more acute than those of the staminate. On sandy or gravelly shores, Vt. and Ont. to Ore., south to Fla. and Mex. Also in the West Indies. Aug.-Sept.

## 76. EATÒNIA Raf.

Tufted perennial grasses, with flat or involute leaves and usually contracted panicles. Spikelets $2-3$-flowered; the rachilla extended beyond the flowers. Two lower scales empty, shorter than the spikelet. the first linear, acute, I-nerved, the second much broader, 3-nerved, obtuse or rounded at the apex, or sometimes acute, the margins scarious; flowering scales narrower, generally obtuse. Palet narrow, 2-nerved. Stamens 3. Styles distinct, short. Stigmas plumose. Grain free, loosely enclosed in the scale and palet. [In honor of Amos Eaton, 1776-1842, American botanist.] A genus of 4 or 5 species, confined to N. Am.

Empty scales unequal, the first shorter and about one-sixth as wide as the second.
Second scale obovate, often almost truncate.
Second scale oblanceolate, obtuse or abruptly acute - I. E. Pennsylv.
Empty scales equal, the first not less than one-third as wide as the second.
3. E. nitida.
I. Eatonia obtusàta (Michx.) A. Gray. Blunt-scaled Eatonia. (I. F. f. 44 I .) Culms $3-7.5 \mathrm{dm}$. tall, erect, simple, often stout. Sheaths usually more or less rough, sometimes pubescent; leaves $2.5-22.5 \mathrm{~cm}$. long, $\mathbf{I}-8 \mathrm{~mm}$. wide, scabrous; panicle $5-15 \mathrm{~cm}$. in length, dense and generally spike-like, strict, the branches 3.75 cm . long or less, erect; spikelets crowded, $2.5-3 \mathrm{~mm}$. long; empty scales unequal, often purplish, the first narrow, shorter than and about one-sixth as wide as the obtuse or almost truncate second one; flowering scales narrow, obtuse, I.5-2 mm . long. In dry soil, Mass. and Ont. to Assiniboia, Fla. and Ariz. June-Aug.
2. Eatonia Pennsylvànica (DC.) A. Gray. Pennsylvania Eatonia. (I. F. f. 442.) Culms 3-9 dm. tall, erect, simple, slender. Leaves $6.25-17.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, rough; panicle $7 \cdot 5-17.5 \mathrm{~cm}$. in length, contracted, often nodding, lax, its branches $2.5-6.5 \mathrm{~cm}$. long; spikelets $3-3.5 \mathrm{~mm}$. long, usually numerous, somewhat crowded and appressed to the branches; empty scales unequal, the first narrow, shorter than and about one-sixth as broad as the obtuse or abruptly acute second one, which is smooth, or somewhat rough on the keel; flowering scales narrow, acute, 2.5 mm . long. In hilly woods or moist soil, N. B. to Br. Colo., south to Ga., La. and Tex. June-July.

Eatonia Pennsylvanica màjor Torr. Culms taller ; panicle longer and more compound; leaves longer and broader. Range apparently nearly that of the typical form.
3. Eatonia nítida (Spreng.) Nash. Slender Eatonia. (I. F. f. 443.) Culms 3-6 dm. tall, erect, very slender. Sheaths pubescent; leaves $\mathbf{I} .25-7.5 \mathrm{~cm}$. long, 2 mm . wide or less, often pubescent, the uppermost very short; panicle $5-\mathbf{1 5}$ cm . in length, lax, the branches spreading at flowering time, afterwards erect, $2.5^{-}$ 6.25 cm . long; spikelets not crowded, 3 mm . long; empty scales smooth, the first about one-third as wide as and equalling the second, which is obtuse or almost truncate, often apiculate; flowering scales narrow, $2-2.5 \mathrm{~mm}$. long, obtuse or acutish, smooth. In dry woods, Conn. to southern N. Y., N. J., Ga. and Ala. MayJune.

## 77. KoElèria Pers.

Tufted annual or perennial grasses, with flat or setaceous leaves and mostly spike-like panicles. Spikelets 2 - 5 -flowered. Two lower scales empty, narrow, acute, unequal, keeled, scarious on the margins; the flowering scales 3 - 5 -nerved. Palet hyaline, acute, 2-keeled. Stamens 3. Styles very short. Stigmas plumose. Grain free, enclosed in the scale and palet. [In honor of Georg Ludwig Koeler, German botanist.] About 15 species of wide geographic distribution. The following, which may contain two forms, occurs in N. Am.

1. Koeleria cristàta (L.) Pers. Koeleria. (I. F. f. 444.) Culms 3-7.5 dm . tall, often pubescent just below the panicle. Leaves $2.5-30 \mathrm{~cm}$. long, $\mathrm{I}-3 \mathrm{~mm}$. wide, erect, flat or involute, smooth or rough, often more or less hirsute; panicle $2.5-17.5 \mathrm{~cm}$. in length, pale green, usually contracted or spike-like, the branches erect or rarely ascending, 2.5 cm . long or less; spikelets $2-5$-flowered, $4-6 \mathrm{~mm}$. long, the scales rough, acute, the empty ones unequal; flowering scales $3-4 \mathrm{~mm}$. long, shining. In dry sandy soil, especially on prairies, Ont. to Br. Col., south to Penn., Neb., Tex. and Cal. Also in Europe and Asia. Very variable. JulySept.

## 78. CATABRÒSA Beauv.

A perennial grass, with soft flat leaves and an open panicle. Spikelets usually 2 -flowered. Two lower scales empty, thin-membranous, much sporter than the flowering ones, unequal, rounded or obtuse at the apex; flowering scales membranous, erose-truncate. Palet barely shorter than the scale. Stamens 3. Styles distinct. Stigmas plumose. [Greek, in allusion to the erose top of the flowering scales.] A monotypic genus of arctic and mountainous regions of the northern hemisphere.
I. Catabrosa aquática (L.) Beauv. Water Whorl-grass. (I. F. f. 445.) Smooth and glabrous. Culms I-6 dm. tall, erect, from a creeping base, bright green, flaccid; sheaths usually overlapping, loose; leaves $3.75-12.5 \mathrm{~cm}$. long, ${ }_{2}-6 \mathrm{~mm}$. wide, flat, obtuse; panicle $2.5-20 \mathrm{~cm}$. in length, open, the branches whorled, spreading or ascending, very slender, $1.25-5 \mathrm{~cm}$. long; spikelets $2.5-3.5$ mm . long, the empty scales rounded or obtuse, the first about half as long as the second, which is crenulate on the margins; flowering scales $2-2.5 \mathrm{~mm}$. long, 3 -nerved, erose-truncate at the apex. In water or wet soil, Lab. and Quebec to Alaska, south to Neb., Colo. and Utah. Also in Europe and Asia. Summer.

## 79. MÉLICA L.

Perennial grasses, with usually soft flat leaves and contracted or open panicles. Spikelets I-several-flowered, often secund, the rachilla extended beyond the flowers and usually bearing 2-3 empty club-shaped or hooded scales, convolute around each other. Two lower scales empty, membranous, 3 - 5 -nerved; flowering scales larger, rounded on the back, 7-I 3 -nerved, sometimes bearing an awn, the margins more or less scarious; palets broad, shorter than the scales, two-keeled. Stamens three. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale and palet. [Name used by Theophrastus for sorghum; said to be in allusion to the sweet culms of some species.] About 30 species, inhabiting temperate regions. Besides the following, some 15 others occur in the Rocky Mts. and on the Pacific Coast.
Second scale much shorter than the 3-5-flowered spikelet.
Spikelets few ; branches of the panicle spreading or ascending.
Spikelets usually numerous; branches of the panicle erect.
Second scale nearly equalling the 2 -flowered spikelet.

1. M. diffusa.
2. M. parviflora.
3. M. mutica.
I. Melica diffùsa Pursh. Tall Melic-grass. (I. F. f. 446.) Culms $4.5-$ 12 dm . tall. Leaves I-2 dm. long, 4-8 mm. wide, rough; panicle $1.5-2 \mathrm{dm}$. in length, open, the branches spreading or ascending, the lower $3.75-7.5 \mathrm{~cm}$. long ; spikelets usually numerous, about 3 -flowered, $9-1$ I mm . long, nodding, on slender. more or less flexuous, pubescent pedicels; empty basal scales very broad, obtuse or acutish, the second generally much exceeded by the spikelet; flowering seale's 7-0 mm . long, acute or obtuse, scabrous. Penn. to Neb., south to Va.. Ky, and Tex. May-June.
4. Melica parvifiòra (Porter) Scribn. Small Melic-cirass. (l. F. f. 447.) Culms 4.5-7.5 dm. tall. Sheaths more or less rough; leaves $1.25-2.25 \mathrm{dm}$. hong. 2-4 mm. wide, rough; panicle $1.25-1.75 \mathrm{dm}$. in length, contracted, the branches erect, the lower $2.5-5 \mathrm{~cm}$. long; spikelets few, $4-5$-flowered, 1-1. 3 cm. long, nodding, on somewhat flexuous strongly pubescent pedicels; lower scales obtuse or acutish, the second much exceeded hy the spikelet; flowering salas $7-8$ mm. hong, acutish, scabrous. Prairies, Kans. and Colo. to Ariz. and Tex.
5. Melica mùtica Walt. Narbow Mrlic-tikass. (1. F. f. 44 8.) Culms

3-9 dm. tall, erect, usually slender. Sheaths rough; leaves rough, $1-2.25 \mathrm{dm}$. long, $2-10 \mathrm{~mm}$. wide; panicle $8-26 \mathrm{~cm}$. in length, narrow, the branches spreading or ascending, $2.5-5 \mathrm{~cm}$. long; spikelets about 2 -flowered, $7-9 \mathrm{~mm}$. long, nodding, on more or less flexuous pubescent pedicels; empty scales very broad, acutish to obtuse, the second nearly as long as the spikelet or sometimes equalling it; flowering scales $6-8 \mathrm{~mm}$. long, generally very obtuse, scabrous. In rich soil, Penn. to Wis., south to Fla. and Tex. June-July.

## 80. KORYCÀRPUS Zea.

Erect grasses, with long flat leaves and narrow paniculate or racemose inflorescence. Spikelets 3 - 5 -flowered, the rachilla readily disarticulating between the flowers. Upper scales empty, convolute. Two lower scales empty, the first narrow, 3-nerved, acute, the second broader, 5 -nerved; flowering scales broader than the lower ones, acuminate or mucronate, rounded on the back, finally coriaceous and shining, 3-nerved. Palet 2 -keeled. Stamens 2, rarely 1. Styles short, distinct. Stigmas plumose. Grain beaked, free. [Greek, in allusion to the beaked grain.] Two known species, the following North American, the other Japanese.
I. Korycarpus diándrus (Michx.) Kuntze. American Korycarpus. (I. F. f. 449.) Culms 4.5-12 dm. tall, very rough below the panicle. Sheaths overlapping, confined to the lower part of the culm; leaves $2-6 \mathrm{dm}$. long, $\mathbf{I - 1 . 8 \mathrm { cm } \text { . wide, }}$ long-acuminate at the apex, usually scabrous; panicle often reduced to a raceme, $5-18 \mathrm{~cm}$. in length, the branches erect, $2.5-5 \mathrm{~cm}$. long; spikelets $3-5$-flowered, $1.2-$ 1.6 cm . long, the lower scales unequal, the second much exceeded by the spikelet; flowering scales somewhat abruptly acuminate; palets shorter than the scales and exceeded by the beaked grain. In rich woods, Ohio to Neb., south to Ga., Tenn. and the Ind. Terr. Aug.-Sept.

## 8r. PLEUROPÒGON R. Br.

Erect grasses with flat leaves and racemose inflorescence. Spikelets 5-I4-flowered; flowers perfect. or the upper staminate. Two lower scales empty, unequal, thin-membranous, I-nerved, or the second imperfectly 3 -nerved; flowering scales longer, membranous, 7 -nerved, the middle nerve excurrent as a short point or awn. Palet scarcely shorter than the scale, 2 -keeled, the keels winged or appendaged. Stamens 3. Styles short. Stigmas plumose. Grain free, enclosed in the scale and palet. [Greek, side-beard, from the appendages to the palets.] Three known species, the following arctic, the others Californian.
t. Pleuropogon Sabínii R. Br. Sabine's Pleuropogon. (I. F. f. 450.) Smooth. Culms I.5 dm. or less tall ; sheaths one or two; leaves $6-25 \mathrm{~mm}$. long, erect, glabrous; raceme $2.5-5 \mathrm{~cm}$. in length; spikelets 3-6, $5-8$-flowered, about I cm . long, on spreading or reflexed pedicels 2 mm . in length or less; lower scales smooth, the first acute, shorter than the obtuse second; flowering scales oblong, 4-5 mm . long, erose-truncate at the scarious summit, scabrous, the midnerve sometimes excurrent as a short point; palet bearing an awn-like appendage on each keel near the middle. Arctic regions of both the Old World and the New. Summer.

## 82. UNİOLA L.

Erect and often tall grasses with flat or convolute leaves and paniculate inflorescence. Spikelets 3 -many-flowered, flat, 2-edged, the flowers perfect, or the upper staminate. Scales flattened, keeled, sometimes winged, rigid, usually acute ; the lower 3-6 empty, unequal; the flowering scales many-nerved, the uppermost scales often smaller and empty; palets rigid, 2 -keeled. Stamens 1-3. Styles distinct. Stigmas plumose. Grain compressed, free, loosely enclosed in the scale and palet. [Name diminutive of umus, one, of no obvious application.] About 8 species, natives of America. Besides the following, 2 others occur in the southeastern U. S.

Panicle strict, the branches erect, rigid; spikelets on short stout pedicels.
3. U. paniculata.

1. Uniola láxa (L.) B.S.P. Slender Spike-grass. (I. F. f. 45r.) Culms $4.5-12 \mathrm{dm}$. tall ; leaves $1.25-4 \mathrm{dm}$. long, $2-6 \mathrm{~mm}$. wide, usually erect, flat, attenuate into a long tip, smooth or slightly rough ; panicle spike-like, $1-3 \mathrm{dm}$. in lenyth, erect, strict, or nodding at the summit, the branches erect, $2.5-5 \mathrm{~cm}$. long ; spikelets short-stalked or nearly sessile, 3-6-flowered, about 6 mm . long; flowering scales 3-4 mm. long, acuminate, spreading in fruit ; palet arched, about two-thirds as long as the scale ; stamen I. Sandy soil, L. I. to Penn. and Ky., south to Fla. and Tex., mostly near the coast. Ascends to 270 m . in N. Car. Aug.-Sept.
2. Uniola latifòlia Michx. Broad-Leaved Spike-grass. (I. F. f. 452.) Culms 6-15 dm. tall ; leaves $\mathbf{I}-2.25 \mathrm{dm}$. long, $6-25 \mathrm{~mm}$. wide, flat, narrowed into a somewhat rounded, often ciliate base, acuminate at the apex, smooth, excepting the margins; panicle lax, $1.25-2.5 \mathrm{dm}$. in length, its branches fliform and pendulous, the lower $5-12.5 \mathrm{~cm}$. long; spikelets many-flowered, oblong to ovate, $1.8-3$ cm . long, on long capillary pendulous pedicels ; flowering scales $9-12 \mathrm{~mm}$. long, ciliate-hispid on the winged keel ; stamen I. In moist places, Penn. to Ill. and Kans., south to Fla. and Tex. Ascends to 600 m . in N. Car. Aug.-Sept.
3. Uniola paniculàta L. Sea Oats. (I. F. f. 453.) Culms 9-24 dm. tall. Leaves 3 dm . long or more, about 6 mm . wide, involute when dry, attenuate into a long slender tip; panicle $2.25-3 \mathrm{dm}$. in length or more, the branches erect or ascending, strict, rigid, the lower $6-12.5 \mathrm{~cm}$. long; spikelets many-flowered, shortpedicelled, ovate to oval when mature, $\mathbf{1 . 2 5 - 2 . 5} \mathbf{~ c m}$. long; flowering scales $8-10 \mathrm{~mm}$. long and scabrous on the keels; stamens 3. In sands of the seacoast, Va. to Fla. and west to Tex. Also in the West Indies and S. Am. Spikelets persistent into the winter. Oct.-Nov.

## 83. DISTICHLIS Raf.

Diœcious grasses, with rigid culms creeping or decumbent at the base, flat or convolute leaves and spike-like paniculate inflorescence. Spikelets flattened, more numerous on the staminate plants than on the pistillate, 6-16-flowered; rachilla continuous in the staminate spikelets, articulated in the pistillate. Two lower scales empty, narrow, keeled, acute, shorter than the flowering ones; flowering scales broader, many-nerved, acute, rigid; palets 2 -keeled. Stamens 3. Styles thickened at the base, rather long, distinct. Stigmas long-plumose. Grain free, enclosed in the scale and palet. [Greek, signifying two-ranked, probably in reference to the spikelets.] Four known species, natives of America, inhabiting the seacoast or alkaline soil; one of them is also found in Australia.
I. Distichlis spicàta (L.) Greène. Marsh Spike-grass. (I. F. f. 454.) Culms $7 \cdot 5-60 \mathrm{~cm}$. tall, erect from a horizontal rootstock, or often decumbent at the base. Sheaths overlapping and often crowded; leaves $\mathbf{1 . 2 5 - 1 5} \mathrm{cm}$. long, $2-4 \mathrm{~mm}$. wide, flat or involute; panicle dense and spike-like, $1.8-6 \mathrm{~cm}$. in length, the branches 2.5 cm . long or less, erect ; spikelets $6-16$ flowered, $8-18 \mathrm{~mm}$. long, pale green; empty scales acute, the first I-3-nerved, two-thirds as long as the 3 - 5 -nerved second one; flowering scales $3-5 \mathrm{~mm}$. long, acute or acuminate. On salt meadows along the Atlantic coast from Me. to Fla., in saline soil throughout the interior, and on the Pacific Coast north to Br . Col. June-Aug.

## 84. BRİZA L.

Annual or perennial grasses, with flat or convolute leaves and open or rarely contracted panicles. Spikelets large, flattened, tumid, many-flowered, nodding, the flowers perfect. Scales thin-membranous, strongly concave, the 2 lower empty, 3-5-nerved, somewhat unequal; flowering scales imbricated, broader than the empty ones, 5-many-nerved; uppermost scales often empty; palets much shorter than the scales, hyaline, 2 -keeled or 2-nerved. Stamens 3. Styles distinct. Stigmas plumose. (irain usually free, enclosed in the scale and palet. [Greek name for some grain, perhaps rye.] About 12 species, natives of the Old Workd and temperate S . Am.

Perennial ; ligule 1 mm . long or less, truncate; spikelets $5-12$-fowered, $4-5 \mathrm{~mm}$. long.

1. R. media.

Annual; ligule 2 mm . long or more, acute; spikelets 3 - 6 -flowered, $2-3 \mathrm{~mm}$, long.
2. $\bar{E}$. minur.

1. Briza mèdia L. Quake-grass. Quaking-Grass. (I. F. f. 455.) Culms 1.5-6 dm. tall, erect, from a perennial root, simple. Ligule $\mathbf{I} \mathrm{mm}$. long or less, truncate; leaves $2.5-7.5 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide; panicle $3.75-12.5 \mathrm{~cm}$. in length, the capillary branches spreading or ascending, $2.5-6 \mathrm{~cm}$. long; spikelets $4-5 \mathrm{~mm}$. long, orbicular to deltoid-ovate, 5-12-flowered; scales scarious-margined, the lower ones about 2 mm . long; flowering scales $2-3 \mathrm{~mm}$. long, broader than the lower ones, widely spreading. In fields and waste places, Ont. to Mass. and R. I. Naturalized from Europe. Native also of Asia. June-July.
2. Briza minor L. Lesser Quaking-grass. (I. F. f. 456.) Culms $\mathbf{I}-4 \mathrm{dm}$. tall, erect from an annual root, simple. Ligule $2-6 \mathrm{~mm}$. long, acute; leaves $2.5-12.5 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, sometimes scabrous; panicle $5-12.5 \mathrm{~cm}$. in length, open, the capillary branches spreading or ascending, $2.5-6 \mathrm{~cm}$. long; spikelets $3-6$-flowered, $2-3 \mathrm{~mm}$. long, about 4 mm . broad, truncate at the base; scales scarious-margined, the lower ones about 2 mm . long; flowering scales much broader and deeply saccate, about 1.5 mm . long. In ballast and waste places about Camden, N. J.; common in Cal., and widely distributed in tropical America. Adventive or naturalized from Europe. June-July.

## 85. DÁCTYLIS L.

A tall perennial grass, with flat leaves and paniculate inflorescence. Spikelets 3-5-flowered, short-pedicelled, in dense capitate clusters, the flowers perfect or the upper staminate. Two lower scales empty, thin-membranous, keeled, unequal, mucronate; flowering scales larger than the empty ones, rigid, 5 -nerved, keeled, the midnerve extended into a point or short awn ; palets shorter than the scales, 2-keeled. Stamens 3. Styles distinct. Stigmas plumose. Grain free, enclosed in the scale and palet. [Name used by Pliny for some grass with finger-like spikes.] A monotypic genus of Europe and Asia.
I. Dactylis glomerata L. Orchard Grass. (I. F. f. 457.) Culms 6-12 dm . tall, tufted. Leaves $7 \cdot 5-22.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, flat, scabrous; panicle $7.5-20 \mathrm{~cm}$. in length, the branches spreading or ascending in flower, erect in fruit, the lower $2.5-6 \mathrm{~cm}$. long, spikelet-bearing from above or below the middle ; spikelets in dense capitate clusters, 3 - 5 -flowered ; lower scales 1-3-nerved, the flowering scales 4-6 mm. long, rough, pointed or short-awned, ciliate on the keel. In fields and waste places, N. B. to Manitoba, south to S. Car. and Kans. Naturalized from Europe and cultivated for fodder. June-July.

## 86. CYNOSÙRUS L.

Annual or perennial tufted grasses, with flat leaves and dense spike-like inflorescence. Spikelets of two kinds, in small clusters; lower spikelets of the clusters consisting of narrow empty scales, with a continuous rachilla, the terminal spikelets of 2-4 broader scales, with an articulated rachilla and subtending perfect flowers. Two lower scales in the fertile spikelets empty, I-nerved, the flowering scales broader, I-3-nerved, pointed or short-awned ; upper scales narrower, usually empty. Scales of the sterile spikelets pectinate, spreading, all empty, linear-subulate, I-nerved. Stamens 3. Styles distinct, short. Stigmas loosely plumose. Grain finally adherent to the palet. [Greek, signifying dog's-tail, referring to the spike.] About 5 species, natives of the Old World.
I. Cynosurus cristàtus L. Dog's-tail Grass. (I. F. f. 458.) Culms $3-7.5 \mathrm{dm}$. tall. Leaves $3.75-12.5 \mathrm{~cm}$. long, $1-4 \mathrm{~mm}$. wide, smooth, glabrous ; spike-like panicle $5-10 \mathrm{~cm}$. in length, $5-12 \mathrm{~mm}$. wide, long-exserted ; spikelets arranged in clusters, the terminal fertile, the lower larger and sterile; scales of the former about 3 mm . long, pointed or short-awned, the scales of the sterile spikelets very narrow, pointed, strongly scabrous on the keel. In fields and waste places, Quebec and Ont. to southern N. Y. and N. J. Adventive from Europe. June-Aug.

## 87. PÒA L.

Annual or perennial grasses, with flat or convolute leaves and contracted or open panicles. Spikelets 2-6-flowered, compressed, the rachilla usually glabrous; flowers perfect, or rarely diœcious. Scales membranous, keeled; the 2 lower empty, I-3nerved; the flowering scales longer than the empty ones, generally with a tuft of cobwebby hairs at the base, 5 -nerved. the marginal nerves usually pubescent, often
also the dorsal one; palets a little shorter than the scales, 2 -nerved or 2 -keeled. Stamens 3. Styles short, distinct. Stigmas plumose. Grain free, or sometimes adherent to the palet. [Name Greek, for grass or herbage.] A genus of about 150 species, widely distributed in all temperate and cold regions. The English name Meadow-grass is often applied to most of the species. Besides the following, some 75 others occur in the western parts of N. Am.:

Annuals or biennials; culms low and densely tufted, commonly less than 2 dm . long. Flowering scale distinctly 5 -nerved, not webby at the base. I. P. annua. Flowering scale 3 -nerved, or obscurely 5 -nerved, webby at the base.

Perennials; culms tall, usually exceeding 2 dm . long (shorter in Nos. 3 and 4).
$A$. Culms tufted, usually densely so.
a. Panicle open, loose.

1. Rootstocks slender; often stoloniferous.

Culms less than 2 dm . tall; low arctic or alpine grasses.
Flowering scales pubescent all over. 3. P. abbreviata .
Flowering scales glabrous or slightly pubescent.
Culms exceeding 2 dm . in height.
Basal leaves much shorter than the culms.
Flowering scales not webby at the base.
Panicle with short stiff branches; flowering scales glabrous below between the nerves. 8. P. glauca .
Panicle with long slender flexuous branches; flowering scales pubescent below between the nerves.

> 12. P. autumnalis.

Flowering scales webby at the base.
Flowering scales glabrous; culms manifestly compressed.
10. P. debilis.

Flowering scales pubescent on one or more of the nerves; culms round or but little compressed.
Lateral nerves of the flowering scale glabrous.
Plant yellowish green; flowering scales 2.5 mm .
long. 9. P.trivialis.
Plant green; flowering scales 3.5 mm . long. 13. P. alsodes.

Lateral nerves of the flowering scales pubescent.
Lower half of the flowering scale densely villous between the nerves; arctic grass.
16. $P$. cenisia.

Lower half of the flowering scale glabrous between the nerves; sometimes somewhat pubescent in No. II.
Panicle-branches dividing and spikelet-bearing usually at and above the middle; spikelets 4 mm . long or less.
Intermediate nerves of the flowering scale obscure.
Culms usually rigid and 4 dm . or less tall, the panicle generally less than 1.5 dm . long.
5. P. nemoralis.

Culms usually 6 -1o dm. tall, the panicle commonly $2-4 \mathrm{dm}$. long.
6. P. flaz'a.

Intermediate nerves prominent.
Spikelets crowded on the spreading or ascending branches; midnerve of the flowering scale pubescent only below. 7. P. pratensis.
Spikelets scattered on the spreading often reflexed branches: midnerve pubescent its whole length.
11. P. sylvestris.

Panicle-branches very long, dividing and spikelet-bearing only at the end: spikelets 5 mm . long.
i4. $P$. Wolfio,

Basal leaves very long, the early ones frequently as long as the culms.
15. P. brevifolia.
2. Rootstocks short and stout; no stolons.

Ligule acute, 4 mm . long; flowering scales lanceolate, 3 mm . long.
17. P. pseudopratensis.

Ligule truncate, 2 mm . long; flowering scales ovate, 4 mm . long.
18. P. alpina.
b. Panicle contracted or spike-like.

Internerves of the flowering scale very pubescent below with long appressed hairs, the remainder appressed-hispidulous.
Flowering scale erose-truncate at the apex, the nerves strongly silky pubescent below.
22. $P$. arida.

Flowering scale obtuse or acute at the apex, the nerves not silky pubescent.
Innovations short, usually less than 6 cm . long; culms generally 4 dm. or less tall.
23. P. Buckleyana.

Innovations long, usually exceeding 2 dm . long; culms commonly 6 dm. or more tall. 24. P. lucida.
Internerves of the flowering scale appressed-hispidulous all over.
25. P. laevigata.
$B$. Culms not tufted; rootstocks long, creeping.
Flowering scales naked or with short hairs at the base.
Culms compressed, slender; plant bluish green; spikelets $3-6 \mathrm{~mm}$. long.
19. P. compressa.

Culms not compressed, stout; spikelets about 1 cm . long.
21. Y. glumaris.

Flowering scales with webby hairs at the base longer than the scale.
20. $P$. arachnifera.

1. Poa ánnua L. Annual Meadow-grass. Low Spear-gráss. (I. F. f. 459.) Culms $5-30 \mathrm{~cm}$. tall, from an annual root, erect or decumbent at the base, somewhat flattened, smooth. Sheaths loose, usually overlapping; leaves $1.25-10 \mathrm{~cm}$. long, I.5-3 mm. wide, smooth; panicle $1.25-10 \mathrm{~cm}$. in length, open, branches spreading, $6-35 \mathrm{~mm}$. long, naked at the base; spikelets $3-5$-flowered, $3-5 \mathrm{~mm}$. long; lower scales smooth, the first narrow, acute, I-nerved, about two thirds as long as the broad and obtuse 3 -nerved second one; flowering scales $2.5-3 \mathrm{~mm}$. long, distinctly 5 -nerved, the nerves pilose below. In waste and cultivated places nearly throughout N. Am. Naturalized from Europe. Native also of Asia. MayOct.
2. Poa Chapmaniàna Scribn. Chapman's Spear-grass. (I. F. f. 460 .) Culms $7.5-15 \mathrm{~cm}$. tall, erect, from an annual root, simple, rigid, smooth and glabrous. Sheaths tight, mostly at the base of the culm; leaves $1.25-2.5 \mathrm{~cm}$. long, 2 mm . wide or less, smooth; panicle $2.5-5 \mathrm{~cm}$. in length, the branches usually erect, sometimes spreading or ascending, 1.8 cm . long or less, naked at the base; spikelets 3-7-flowered, $2.5-3 \mathrm{~mm}$. long; lower scales about equal, 3 -nerved, acute; flowering scales webbed at the base, obtuse, 3-nerved, sometimes with two additional obscure nerves, the prominent ones sometimes pilose for three-fourths their length. In dry soil, Ky. and Tenn. to Fla. and Ala. April-Miay.
3. Poa abbreviàta R. Br. Low Spear-Grass. (I. F. f. 462.) Culms I-5 dim. tall or less. Sheaths and leaves crowded at the base of the culm ; leaves $1.25-$ 2.5 cm . long, I mm. wide ; panicle contracted, $1.25-2.5 \mathrm{~cm}$. long, branches very short and erect; spikelets $3-5$-flowered, 5 mm . long; lower scales acute, smooth and glabrous; flowering scales about 3 mm . long, obtuse, strongly pubescent all over, the intermediate nerves very obscure. Arctic America from Greenland and Lab, to the Pacific. Summer.
4. Poa láxa Haenke. Wavy Meadow-grass. Mountain Spear-grass. (I. F. f. 463 .) Culms 3 dm . tall or less, erect, simple. Leaves $2.5-7.5 \mathrm{~cm}$. long, I--2 mm . wide, acuminate ; panicle $2.5-7.5 \mathrm{~cm}$. in length, the branches usually erect, sometimes ascending, 2.5 cm . long or less; spikelets $3-5$-flowered, $4-5 \mathrm{~mm}$. long; lower scales usually 3 -nerved, acute, glabrous, rough on the keel at its apex; flowering scales $3-3.5 \mathrm{~mm}$. long, obtuse, 3 -nerved, or sometimes with an additional pair of obscure nerves, the midnerve pilose on the lower half, rough above, the lateral ones pilose for one-third their length. Greenland to Alaska, south to the mountains of N. E., to Manitoba and in the Rocky Mts. to Colo. Also in Europe and Asia. Summer.
5. Poa nemoràlis L. Wood Meadow-grass. Northern Spear-grass. (I. F. f. 470.) Culms I.5-6 dm. tall, erect, slender, sometimes rigid. Leaves 2.510 cm . long, 2 mm . wide or less, erect, smooth or rough; panicle $5-12.5 \mathrm{~cm}$. in length, open, the branches erect or ascending, rarely spreading, $2.5-5 \mathrm{~cm}$. long; spikelets $2-5$-flowered, $3-5 \mathrm{~mm}$. long; lower scales acute or acuminate, I -3-nerved; flowering scales obtuse or acute, $2-2.5 \mathrm{~mm}$. long, faintly 5 -nerved, somewhat webby at base, the midnerve and the marginal nerves silky-pubescent on the lower half. Anticosti Isl. to Br. Col., south to Me., Minn., S. Dak., and in the Rocky Mts. to Colo. Also in Europe and Asia. Summer.
6. Poa flàva L. False Red-top. Fowl Meadow-grass. (I. F. f. 47 I.) Culms 4.6-15 dm. tall. Leaves $5-15 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, smooth or rough; panicle 1.5-3 dm. in length, open, the branches spreading or ascending, 5-12.5 cm . long, divided and spikelet-bearing above the middle ; spikelets 3 - 5 -flowered, $3-4 \mathrm{~mm}$. long, exceeding their pedicels; lower scales acute, the flowering scales obtuse, somewhat webby at the base, $2-3 \mathrm{~mm}$. long, silky-pubescent on the lower half of the marginal nerves and the midnerve, the intermediate nerves obscure or wanting. In swampy places, N. S. and N. B. to Vancouver Isl., south to N. J., Ill. and Neb. Also in Europe and Asia. July-Aug.
7. Poa praténsis L. Kentucky Blue-grass. June-grass. (I. F. f. 466.) Culms $3-12 \mathrm{dm}$. tall, from long running rootstocks; leaves smooth or rough, $1-6$ mm . wide, those of the culm $5-15 \mathrm{~cm}$. in length, the basal much longer; panicle $6-20 \mathrm{~cm}$. in length, usually pyramidal, the branches spreading or ascending, sometimes flexuous, $2.5-7.5 \mathrm{~cm}$. long, divided and spikelet-bearing above the middle; spikelets $3-5$-flowered, 4-5 mm. long, exceeding their pedicels; scales acute; flowering scales 3 mm . long, webbed at the base, 5 -nerved, the marginal nerves and midnerve silky-pubescent below, the intermediate ones naked. In meadows, fields, and woods, almost throughout N. Am. Widely cultivated for hay and pasture. Also in Europe and Asia. In N. Am. probably indigenous only in the northern and mountainous regions. Variable. Juné-Aug.
8. Poa glaùca Vahl. Glaucous Spear-grass. (I. F. f. 469.) Cuims I.5-6 dm. tall, rigid, somewhat glaucous. Sheaths overlapping, confined to the lower half of the culm ; leaves $2.5-5 \mathrm{~cm}$. long, 2 mm . wide or less, smooth beneath, scabrous above ; panicle $2.5-7.5 \mathrm{~cm}$. in length, open, the branches erect or ascending, $1.25-3.75 \mathrm{~cm}$. long; spikelets $2-4$-flowered, $5-6 \mathrm{~mm}$. long; empty basal scales acute, 3 -nerved, glabrous, rough on the upper part of the keel; flowering scales $3-3.5 \mathrm{~mm}$. long, obtuse or acutish, rough, not webbed at the base, the lower half of the midnerve and marginal nerves silky-pubescent, the intermediate nerves obscure and occasionally sparingly pubescent at the base. White Mts. of N. H. Also in Europe. Summer.
9. Poa triviàlis L. Roughish Meadow-Grass. (I. F. f. 468.) Culms 3-9 dm . tall, usually more or less decumbent at the base. Sheaths rough; leaves $5-17.5 \mathrm{~cm}$. in length, $2-4 \mathrm{~mm}$. wide, generally very rough; panicle $1-1.5 \mathrm{dm}$. long, open, the branches usually spreading or ascending, $2.5-5 \mathrm{~cm}$. long; spikelets 2- or sometimes 3 -flowered, 3 mm . long, exceeding their pedicels; scales acutc; flowering scales $2-3 \mathrm{~mm}$. long, webbed at the base, 5 -nerved, the midnerve silkypubescent below, the lateral nerves naked, the intermediate ones prominent. In meadows and waste places, N. B. to Mich. and Va. Naturalized from Europe. June-Aug.
10. Poa débilis Torr. Weak Spear-grass. (I. F. f. 472.) Culms 3-7.5 dm. tall, slender, flattened. Sheaths compressed; leaves $2.5-11 \mathrm{~cm}$. long. 2 mm . wide or less, erect, smooth beneath, rough above; panicle $5-15 \mathrm{~cm}$. in lensth. open. often nodding at the top, the branches erect or ascending, sometimes spreatins. $3.75-7.5 \mathrm{~cm}$. long; spikelets $2-4$-flowered. $3-4 \mathrm{~mm}$. long, their perlicels longer; flowering scales 3 mm . long, obtuse, sparingly webbed at the base. 5 -nerved, the nerves naked. In woods, N. S. and N. B. to Ont. and Minn., south to R. I., Penn. and Wis. June-Aug.
ir. Poa sylvéstris A. Gray. Sylvan Spata-ikass. (I. F. f. fił.) Culms 3-9 dm. tall, slender, slightly flattened. Leaves smooth betueath, rough above. $2-6 \mathrm{~mm}$. wide, those of the culm 3.75 cm . in length, the hanal much longer: panicle $7.5-\mathbf{1 7 . 5} \mathrm{cm}$. in length, the branches spreading or asconding. sometimes reflexed when ohd, $3.75-7.5 \mathrm{~cm}$. long, spikelethearing at the extremities; spikelen-

2-4-flowered, $2-4 \mathrm{~mm}$. long; flowering scales about 2.5 mm . long. webbed at the base, obtuse, often pubescent below, 5 -nerved, the midnerve pubescent nearly its entire length and the marginal nerves below the middle. In thickets and meadows, N. Y. to Wis. and Neb., south to N. Car., La. and Kans. June-July.
12. Poa autumnàlis Muhl. Flexuous Spear-grass. (I. F. f. 473.) Culms 3-9 dm. tall. Leaves 2 mm . wide or less, smooth beneath, rough above, those of the culm $3 \cdot 75^{-1} 5 \mathrm{~cm}$. long, the basal much longer; panicle $7 \cdot 5-22 \mathrm{~cm}$. in length, the branches long and slender, spikelet-bearing at the extremities, $5-12.5 \mathrm{~cm}$. long; spikelets 3 - 5 -flowered, 5-6 mm. long ; empty basal scales acute, the first I-nerved, narrow, shorter than the broad 3 -nerved second; flowering scales rounded or retuse at the apex, 3-4 mm. long, not webbed at the base, pubescent on the lower part, 5 -nerved, the midnerve silky-pubescent for three-fourths its length. In woods, N. J. and Penn. to Ky., south to Fla. and Tex. March-May.
13. Poa alsòdes A. Gray. Grove Meadow-Grass. (I. F. f. 475.) Culms $2-7.5 \mathrm{dm}$. tall. Leaves usually rough, $2-4 \mathrm{~mm}$. wide, those of the culm $5-20 \mathrm{~cm}$. in length, the basal longer ; panicle $8-20 \mathrm{~cm}$. in length, the branches spreading or ascending, $3 \cdot 5-7.5 \mathrm{~cm}$. long, spikelet-bearing at the ends; spikelets $2-3$-flowered, about 5 mm . long; flowering scales acute, about 4 mm . long, webbed at the base, the midnerve pubescent near the base, the marginal nerves naked, the intermediate ones very faint. In woods and thickets, N. S. to Ont. and Minn., south to N. Car. and Tenn. May-June.

I4. Poa Wòlfii Scribn. Wolf's Spear-grass. (I. F. f. 476.) Culms 3-9 dm. tall. Leaves 2 mm . wide or less, smooth beneath, rough above, those of the culm $5-10 \mathrm{~cm}$. in lenigth, the basal much longer; panicle $7.5-15 \mathrm{~cm}$. in length, lax, its branches erect or ascending, flexuous, $3.75-6 \mathrm{~cm}$. long; spikelets 2-4flowered, $5-6 \mathrm{~mm}$. long; scales acute; flowering scales about 4 mm . long, copiously webbed at the base, 5 -nerved, the marginal and midnerves silky-pubescent for more than half their length, the intermediate nerves prominent, naked. Ill., Tenn. and Kans.
15. Poa brevifòlia Muhl. Short-Leaved Spear-grass. (I. F. f. 477.) Culms 3-9 dm. tall, erect. Leaves smooth beneath, rough above, $2-4 \mathrm{~mm}$. wide, abruptly acute, those of the culm $1.25-10 \mathrm{~cm}$. long, the uppermost sometimes almost wanting; basal leaves usually equalling or nearly as long as the culm; panicle 6-12.5 cm. in length, open, the branches ascending, widely spreading or often reflexed, $3.75-7.5 \mathrm{~cm}$. long, spikelet-bearing at the ends; spikelets 3-6-flowered, 5-7 mm . long; flowering scales slightly webbed at the base, $4-5 \mathrm{~mm}$. long, obtuse, 5 -nerved, the keel and marginal nerves sparingly pubescent, the intermediate nerves prominent, naked. In rocky woods, N. J. and Penn. to Ill., south to N. Car. and Tenn. April-June.
16. Poa cenisia All. Arctic Spear-grass. (I. F. f. 465.) Smooth and glabrous. Culms I-4 dm. tall, erect, slender; leaves $2.5-10 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~mm}$. wide; panicle $2.5-10 \mathrm{~cm}$. in length, open, the branches generally widely spreading and more or less flexuous, $2.5-6 \mathrm{~cm}$. long ; spikelets $3-5$-flowered, $5-7 \mathrm{~mm}$. long ; lower scales acute or acuminate, 1 -3-nerved; flowering scales about 4 mm . long, faintly 5 -nerved, the nerves short-pilose on the lower half, minutely pubescent between the nerves, somewhat webbed at the base. Greenland and Lab. to Alaska. Also in Europe. Summer.
17. Poa pseudopraténsis Scribn, and Rydb. Prairie Meadow-grass. (I. F. f. 467 .) Culms $3-6.5 \mathrm{dm}$. tall. Ligule 4 mm . long, acute, decurrent; leaves $2-6$ mm . wide, smooth beneath, a little rough above and on the margins, those of the culm $2.5-8 \mathrm{~cm}$. long, the basal $1.5-2.5 \mathrm{dm}$. in length ; panicle $5-12.5 \mathrm{~cm}$. long, open, the branches spreading or ascending, $2.5-5 \mathrm{~cm}$. long; spikelets $3-5$-flowered, 6-8 mm. long, exceeding their pedicels; lower scales nearly equal, acute, 3 -nerved; flowering scales acutish, about 3 mm . long, rough above, 5 -nerved, pubescent between the nerves below, the marginal nerves and midnerve silky-pubescent about half their length. Manitoba and Assiniboia to Neb. and Colo.
18. Poa alpìna L. Alpine Spear-grass. (I. F. f. 464.) Smooth and glabrous. Culms $1-4.5 \mathrm{dm}$. tall; ligule 2 mm . long, truncate; leaves $2.5-7.5$ cm . long, $2-4 \mathrm{~mm}$. wide, abruptly acute; panicle $2.5-7.5 \mathrm{~cm}$. in length, the branches generally widely spreading, 2.5 cm . long or less; spikelets $3-5$-flowered, 5-6 mm. long; lower scales broad, glabrous, rough on the keel, acute; flowering
scales about 4 mm . long, obtuse, pilose for half their length, pubescent between the nerves toward the base. Lab. to Alaska, south to Quebec, Lake Superior, and in the Kocky Mts. to Colo. Also in Europe and Asia. Summer.
19. Poa compréssa L. Wire-grass. Flat-stemmed Meadow-grass. English Blue-Grass. (I. F. f. 461.) Pale bluish green, glabrous. Culms 1.5-6 dm. tall, decumbent at the base, from long horizontal rootstocks, much flattened; sheaths loose, flattened, shorter than the internodes; leaves $2.5-10 \mathrm{~cm}$. long, about 2 mm . wide, smooth beneath, rough above; panicle usually contracted, the branches erect or ascending, 2.5 cm . long or less, spikelet-bearing nearly to the base; spikelets $3-9$-flowered, $3-6 \mathrm{~mm}$. long; lower scales acute, 3-nerved; flowering scales $2-2.5 \mathrm{~mm}$. long, obscurely 3 -nerved, the nerves sparingly pubescent toward the base. Waste places and cultivated grounds and woods almost throughout N. Am. Ascends to 630 m . in Va. Naturalized from Europe. Native also of Asia. Varies from weak and slender to quite stiff. June-Aug.
20. Poa arachnífera Torr. Texas Blue-Grass. (I. F. f. 479a.) Culms tufted, $3-9 \mathrm{dm}$. tall, from running rootstocks; sterile shoots from one-half as long as the culms to equalling them. Leaves linear, erect, usually folded when dry, smooth beneath, rough above, $3 \cdot 5-22.5 \mathrm{~cm}$. long, $3^{-6} \mathrm{~mm}$. broad, abruptly acute; panicle dense and contracted, sometimes interrupted below, $7 \cdot 5-16 \mathrm{~cm}$. long, $1.25-3.75 \mathrm{~cm}$. broad, its branches ascending or erect; spikelets numerous, 4-7flowered, the scales acuminate; flowering scales $4-5 \mathrm{~mm}$. long, often pointed, pubescent at the base with copious long cobwebby hairs, 5 -nerved, the midnerve and lateral nerves pilose below the middle. Prairies, Kans. to N. Mex., south to La. and Tex. Also introduced in Fla. April-May.
21. Poa glumàris Trin. Large-flowered Spear-grass. (I. F. f. 480.) Culms I.5-9 dm. tall, erect or assurgent. Sheaths loose; leaves $\mathbf{I}-2.5 \mathrm{dm}$. long, $2-8 \mathrm{~mm}$. wide; panicle $\mathbf{I}-2.5 \mathrm{dm}$. in length, the branches erect or ascending, $2.5-5 \mathrm{~cm}$. long; spikelets $3-5$-flowered, $8-12 \mathrm{~mm}$. long; flowering scales $6-8 \mathrm{~mm}$. long, usually acutish, scabrous, 5-7-nerved, pubescent at base and on the lower part of the midnerve and lateral nerves, not webbed. Anticosti Isl. and N. S. to Quebec and Alaska. Summer.
22. Poa àrida Vasey. Prairie Spear-grass. (I. F. f. 478). Culms 3-6 dm . tall, erect, rigid. Sheaths usually overlapping; ligule $2-4 \mathrm{~mm}$. long, acute; leaves smooth beneath, rough above, $\mathbf{I - 2} \mathrm{mm}$. wide, flat or folded, pungently pointed, those of the culm $1.25-2.5 \mathrm{~cm}$. long, erect, the basal leaves $7.5-15 \mathrm{~cm}$. long; panicle contracted, $5-\mathrm{I} 2.5 \mathrm{~cm}$. in length, the branches erect, spikelet-bearing nearly to the base, 3.75 cm . long or less; spikelets $4-7$-flowered, $5-7 \mathrm{~mm}$. long ; flowering scales $3-4 \mathrm{~mm}$. long, erose-truncate at apex, strongly silky-pubescent on the nerves for half their length, the lower part very pubescent between the nerves; intermediate nerves very obscure. Meadows and low grounds, N. W. Terr. to Kans. and Ariz. April-Aug.
23. Poa Buckleyàna Nash. Buckley's Spear-grass. (I. F. f. 470.) Culms $1.5-4 \mathrm{dm}$. tall, rarely taller, erect, rigid. Ligule $4-6 \mathrm{~mm}$. long, acute; leaves $2.5-10 \mathrm{~cm}$. long, about 2 mm . wide, erect, flat, or becoming involute, smonth or rough; panicle $2.5-10 \mathrm{~cm}$. in length, contracted, the branches erect. 3.75 cm . long or less, spikelet-bearing nearly to the base; spikelets $2-5$-flowered, $4-6 \mathrm{~mm}$. long; flowering scales about 4 mm . long, obtuse or acutish, appressed-pubescent below, with long hairs. Usually in dry soil on mountain slopes or elevated prairies, S. Dak. to Br. Col., Colo. and Cal. May-Sept.
24. Poa lùcida Vasey. Culms $6-8 \mathrm{dm}$. tall, erect, the imnovations 2.3 dm . long; sheaths smooth and glabrous; leaves of the culm I dm. or less long, those on the innovations much longer; panicle $\mathbf{I}-2 \mathrm{dm}$. long, its larger branches $i-5 \mathrm{~cm}$. long; spikelets $6-10 \mathrm{~mm}$. long, $4-6$-flowered, the flowering scales about 4.5 mm . long, appressed-pubescent below with long hairs, obtuse or acutish. Moist hillsides and meadcws, Mont. to Neb. and Colo. June-Aug.
25. Poa laevigàta Scribn. Culms densely tufted. ©- \& dm. t.all. erect, slemder. the imovations $\mathbf{x}-2 \mathrm{dm}$. long; sheaths smooth and glabrous; leaves 1 dm. or less long; panicle very slender, $S_{-14} \mathrm{~cm}$. long, its larger branches ; 5 cm . Wme: spihelets $5-7 \mathrm{~mm}$. long, $3-4$-flowered, the flowering scales $3-4 \mathrm{~mm}$. long, hispidulous all over, obtuse to acutish. On dry hills, Mont. to Ncb. and Colo. June-Aug.

## 88. DUPÓNTIA R. Br.

Low grasses, with flat leaves and generally narrow panicles. Spikelets 2-4flowered. the flowers all perfect. Two lower scales empty, extending beyond the flowering scales, membranous; flowering scales entire. membranous. with a tuft of hairs at the base. Stamers 3. Strles distinct. Stigmas plumose. [Name in honor of J. D. Dupont. French botanist.] Two arctic species, both circumboreal.
I. Dupontia Físheri R. Br. Fieher's Dipontla. (I. F. f. 481.) Smooth and glabrous. Culms $1.25-3 \mathrm{~cm}$. tall: leaves $2.5-15 \mathrm{~cm}$. long. $2-4 \mathrm{~mm}$. wide. flat: panicle usually contracted. $3.75-8.5 \mathrm{~cm}$. long, the branches less than 3.75 cm . long. erect. or sometimes ascending; spikelets few. about 2 -flowered. $6-8 \mathrm{~mm}$. long; empty basal scales thin. Generally acute, the first I-nerved. somewhat shorter that. the second. which is usualiy 3 -nerved, the lateral nerves often vanishing at abou: the midale: flowering scales $5-6 \mathrm{~mm}$. long. I-nerved or obscurely 3 -nerved; basal hairs about I mm . long. Arctic regions of nurtheastern America. Also in arctic Europe and Asia. Summer.

## 89. SCOLÓCHLOA Link.

Tall aquatic or marsh grasses, with flat leaves and ample panicles. Spikelets $2-4$-flowered. the flowers perfect. Two lower scales empty. thin-membranous 3-5-nerved: flowering scale sigid, with a tuft of hairs at the base. rounded on the back. $5-\overline{-}$-nerved. some of the nerves usually excurrent as short points; palets about equalling the scales. 2 -nerved. Stamens 3. Styles rery short. Stigmas plumose. Grain hairy at the ap-x. [Greek. referring to the prickle-like projecting nerves of the flowering scales.] Species 2 . in the north temperate zunes of both continents.
I. Scolochloa festucacea, Willd.) Link. Fescte Scolochlot. (I. F. f. 482.) Culms $9-15 \mathrm{dm}$. tall. Sheaths often overlapping : leaves $2-3 \mathrm{dm}$. long or more. $4^{-8} \mathrm{~mm}$. wide, flat. scabrous on the margins; panicle $2-3 \mathrm{dm}$. in length. usually open. the branches ascending, naked at the base, the lower $7 \cdot 5-10 \mathrm{~cm}$. long : spikelets $6-8 \mathrm{~mm}$. lons ; empty basal scales acute, the first shorter than the second; flowering scales scabrous, 7 -nerved. Iowa and Neb., north to Manitoba and Assiniboia. July-Aug.

## go. GRAPHÉPHORUM Desv.

Slender erect grasses, with flat leaves and a usually contracted nodding panicle. Spikelets $2-4$-flowered, flattened. the rachilla hirsute and extending beyond the flowers. Two lower scales emptr. somewhat shorter than the flowering scales, thin-membranous, acute. keeled; flowering scales membranous, obscureiy nerved. entire, sometimes short-awned just below the apex. Stamens 3 . Styles distinct. Stigmas plumose. Grain glabrous. [Grek. pencil-bearing. referring to the tuft of hairs at the end of the rachilla.] Three known species, natives of northern N. Am.
I. Graphephorum melicoìdeum Michx. Beauv. Graphephortm. I. F. f. 483.1 Cuims $3-7.5 \mathrm{dm}$. tall. Sheaths glabrous, or the lower often villous; leaves $3.75-22.5 \mathrm{~cm}$. long. $2-4 \mathrm{~mm}$. Wiae, long-acuminate, rough; panicle $5-15$ cm . in length, the top usually nodding, the branches erect, $2.5-5 \mathrm{~cm}$. long; spikelets $2-\downarrow$-flwered, $5-5 \mathrm{~mm}$. long; scales scabrous on the keel. the empty ones unequal, the first I-nerved or obscurely 3 -nerved. shorter than the 3 -nerved second: flowering scales 3 - 5 -nerved. acute. In wet soil, Anticosti Isl. to Ont., south to Me. and Mich. Aug.-Sept.

## 91. PANICULÀRIA Fabr.

Mostly perennial grasses. often tall. with flat leaves and panicuiate inflorescence. Spikelets few-many-flowered. terete or somewhat flattened. Two lower scales emptr, obtuse or acute. I-j-nerved; flowering scales membrarous, rounded on the back. $5-9$-nerved, the nerves disappearing in the hyaline apex. Palets scarcely shorter than the scales, rarely longer, 2 -keeled. Stamens 2 or 3. Styles distinct. Stigmas plumose. Grain smooth, enclosed in the scale and palet. free. or when cry slightly adhering to the latter. [Latih. referring to the panicled spikelets.] Atou: 20 species, widely distributed in J. Am., a few in Europe and Asia.

SDikelets ovate or oblong, 8 mm . long or less.
Flowering scales very broad, obscurely or at least not sharply nerved.
Panicle open, the branches ascending or spreading, often drooping. Spikelets 3-5-flowered; lowest flowering scale about 2 mm . long.

1. P. laxa.

Spikelets 5-12-flowered ; lowest flowering scale about 3 mm . long.

Scales 2.5-3 mm. [long, truncate andidenticulate at the apex.
7. P. pallida.

Spikelets linear, 12 mm . long or more.
Flowering scales $4-5 \mathrm{~mm}$. long, obtuse, equalling or exceeding the obtuse palet.
Flowering scales firm, hispidulous all over, truncate at the apex.
8. P. fluitans.

Flowering scales thin, hispidulous on the nerves only, obtuse at the apex.
9. P. borealis.

Flowering scales $6-8 \mathrm{~mm}$. long, shorter than the acuminate palet.
Flowering scales obtuse, about 6 mm . long, a little exceeded by the palet.
10. P. brachyphylla.

Flowering scales acute, about 8 mm . long, much exceeded by the palet. II. P. acutifora.
I. Panicularia láxa Scribn. Northern Manna-grass. (I. F. f. 484.) Culms $6-12 \mathrm{dm}$. tall, smooth or slightly scabrous. Sheaths overlapping, rougl; leaves 2-4 dm. long, 4-8 mm. wide, very rough; panicle $17.5-22.5 \mathrm{~cm}$. in length, the branches spreading or ascending, the lower $7 \cdot 5-15 \mathrm{~cm}$. long; spikelets $3-5$-flow. ered, about 4 mm . long; empty scales unequal, scarious, acute, I-nerved, the firs one-half to two-thirds the length of the second; flowering scales broad, about 2 mm . long, twice the length of the second scale, obtuse, obscurely 7 -nerved. In water or wet soil, Me. to Penn. Aug.
2. Panicularia Canadénsis (Michx.) Kuntze. Ratrlesnake-grass. (I. F. f. 485.) Culms 6-9 dm. tall, smooth or slightly scabrous. Sheaths shorter than the internodes, those at the base of the culm overlapping; leaves $1.5-3 \mathrm{dm}$. long or more, $4-8 \mathrm{~mm}$. wide, rough; panicle $\mathbf{1 . 2 5 - 2 . 5 ~ d m}$. in length, the branches spreading, ascending or often drooping, $6.25-\mathbf{1 2 . 5} \mathbf{~ c m}$. long; spikelets $5-\mathbf{1 2}$-flowered, 5-8 mm . long, flattened, turgid; empty scales unequal, acute, I-nerved; flowering scales broad, $3-4 \mathrm{~mm}$. long, obtuse or acutish, obscurely 7 -nerved. In swamps and marshes, Newf. and N. B. to Ont. and Minn., south to N. J.. Ohio and Kans. The handsomest species of the genus. Ascends to 1500 m . in the Adirondacks. July-Aug.
3. Panicularia obtùsa (Muhl.) Kuntze. Blunt Manna-grass. (I. F. t. 486.) Culms 3-9 dm. tall, erect. Sheaths sometimes rough, strongly striate, the lower overlapping; leaves $1.5-4 \mathrm{dm}$. long, $4-8 \mathrm{~mm}$. Wide, usually stiff, crect or ascending, smooth beneath, more or less scabrous above; panicle $7.5-20 \mathrm{~cm}$. in length, contracted, dense, the branches erect; spikelets $3-7$-flowered. $4-0 \mathrm{~mm}$. long; empty scales acute, scarious, r-nerved; flowering scales about 3 mm . long, broad, obtuse, obscurely 7 -nerved. In swamps, N. B. to N. Y. and central Feun., south to Del. and Md. Ascends to 690 m . in the Catskill MIts. July-Aug.
4. Panicularia elongàta (Torr.) Kuntze. Lonc: MiNiNA-tikiss. (I. I. f. 487.) Culms 6-9 dm. tall. Leaves lax, $1.5-3 \mathrm{dm}$. long, 3 -(i) mm. wide, lonsacuminate, smooth beneath, rough above; panicle clongated, contracted, narrow. usually nodding at the summit. $1.5-3 \mathrm{dm}$. in length, the hranches ereet or appressed. $2.5-6 \mathrm{~cm}$. long; spikelets $3-4$-flowered, $3-4 \mathrm{~mm}$. long: empty scales unequal, acute. I-nerved; flowering scales narrow, about 2 mm . long, whtuse or acutish, distinctly 7 -nerved. In wet woods, Newf. to ()ucher and Mini., south to N. Car. and Ky. Ascends to 1200 m . in the Adirondacks. Aug.-Sept.
5. Panicularia nervàta (Willd.) Kuntze. Nerved Manna-grass. (I. F. f. 488.) Culms 3-9 dm. tall. Sheaths usually more or less rough; leaves $1.5-3 \mathrm{dm}$. long, $4-10 \mathrm{~mm}$. wide, acute, smooth beneath, rough above; panicle $7.5-20 \mathrm{~cm}$. in length, often purple, open, the branches filiform, spreading, ascending or often drooping, rarely erect, $5-12.5 \mathrm{~cm}$. long; spikelets $3-7$-flowered, $2-3 \mathrm{~mm}$. long; empty scales obtuse, I-nerved; flowering scales about 1.5 mm . long, obtuse or rounded, with 7 sharp distinct nerves and evident furrows between. In wet places, Newf. to Br. Col., south to Fla. and Mex. Ascends to 1200 m . in Va. June-Sept.
6. Panicularia Americàna (Torr.) MacM. Reed Meadow-grass. Tall Manna-grass. (I. F. f. 489.) Culms 9-15 dm. tall. Sheaths loose, smooth, or sometimes rough; leaves $2-3 \mathrm{dm}$. long or more, $6-16 \mathrm{~mm}$. wide, usually smooth beneath, rough above; panicle $2-4 \mathrm{dm}$. in length, its branches spreading, ascending or rarely erect, $\mathbf{I}-2 \mathrm{dm}$. long; spikelets $4-7$-flowered, $4^{-6} \mathrm{~mm}$. long; empty scales acute, I-nerved; flowering scales about 2 mm . long, obtuse or rounded at the apex, sharply and distinctly 7 -nerved, the furrows between the nerves evident. In wet soil, N. B. to Alaska, south to Tenn., Colo. and Nev. Ascends to 630 m . in Penn. June-Aug.
7. Panicularia pállida (Torr.) Kuntze. Pale Manna-Grass. (I. F. f. 490.) Pale green. Culms 3-9 dm. long, assurgent; leaves $5-15 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, smooth beneath, rough above; panicle $3.75-17.5 \mathrm{~cm}$. in length, the branches spreading, ascending or rarely erect, often flexuous, $2.5-5 \mathrm{~cm}$. long; spikelets $4-8$-flowered, 5-7 mm. long; empty scales unequal, the first I-nerved, obtuse, shorter than the 3nerved and truncate second ; flowering scales $2.5-3 \mathrm{~mm}$. long, truncate and denticulate at the apex, sharply and distinctly 7 -nerved, with plain furrows between the nerves. In shallow water, N. B. to Ont., south to Va., Tenn. and Ind. Ascends to 600 m . in Penn. July-Aug.
8. Panicularia flùitans (L.) Kuntze. Floating Manna-Grass. (I. F. f. 491.) Culms $10-15 \mathrm{dm}$. long, flattened, erect or decumbent, usually stout, often rooting from the lower nodes. Sheaths loose, generally overlapping, smooth or rough; leaves $1.25-3 \mathrm{dm}$. long or more, $4-12 \mathrm{~mm}$. wide, scabrous, often floating; panicle $2.25-4.5 \mathrm{dm}$. long, the branches, at least the lower ones, at first appressed, later ascending, and $7 \cdot 5-15 \mathrm{~cm}$. long; spikelets linear, $7-13$-flowered, $2-2.5 \mathrm{~cm}$. long ; empty scales unequal, I-nerved, the lower acute or obtuse, the upper obtuse or truncate ; flowering scales $4-4.5 \mathrm{~mm}$. long, thick, oblong, rounded or truncate at the erose apex, scabrous, sharply 7 -nerved. In wet places or in water, Newf. to Br. Col., south to N. Car., Ky., Iowa and Cal. Also in Europe. July-Sept.
9. Panicularia borealis Nash. Slender Manna-Grass. (I. F. f. 491a.) Glabrous. Culms erect from a creeping base, $4.5-15 \mathrm{dm}$. tall; sheaths overlapping, smooth or roughish, the uppermost one enclosing the base of the panicle; leaves linear, abruptly acuminate, $1-5 \mathrm{dm}$. long, $2-10 \mathrm{~mm}$. wide; panicle slender, the exserted portion I. $5-5 \mathrm{dm}$. long, its branches appressed or nearly so ; spikelets I-I. 8 cm . long, 7-13-flowered, appressed; outer two scales I-nerved, unequal; flowering scales thin, $4-5 \mathrm{~mm}$. long, 7 -nerved, the nerves only scabrous; palet slightly shorter than the scale. In shallow water, Me. to N. Y., Idaho, Cal., Wash., and northward.
10. Panicularia brachyphylla Nash. Short-leaved Manna-grass. (I. F. f. 492a.) Glabrous. Culms erect from a creeping base, 6-9 dm. tall; sheaths generally longer than the internodes, almost closed, the uppermost one enclosing the base of the panicle; leaves linear, acuminate, $6-12.5 \mathrm{~cm}$. long, $4-5 \mathrm{~mm}$. wide; panicle slender, the exserted portion 3-4 dm. long, its branches appressed or nearly so; spikelets compressed-cylindric, $2-2.8 \mathrm{~cm}$. long, 7-12-flowered; empty scales I-nerved; flowering scales scabrous all over, 7 -nerved, about 5 mm . long, the obtuse apex obscurely and irregularly few-toothed; palet about 6 mm . long, acuminate, a little exceeding the scale. In shallow water, Me. to N. Y. June-July.
II. Panicularia acutifiòra (Torr.) Kuntze. Sharp-scaled Manna-grass. (I. F. f. 492.) Culms 3-6 dm. tall, flattened, erect from a decumbent base, simple. Sheaths loose, generally a little exceeding the internodes. smooth and glabrous; leaves $7.5-15 \mathrm{~cm}$. long, 4-6 mm. wide, smooth beneath, rough above; panicle 1.53 dm . in length, the branches erect or appressed, $5-10 \mathrm{~cm}$. long; spikelets linear, 5-I2-flowered, $2.5-4.5 \mathrm{~cm}$. long; empty scales acute, smooth; flowering scales
about 8 mm . long, lanceolate, acute, scabrous, exceeded by the long-acuminate palets. In wet places, Me. to southern N. Y., Ohio and Tenn. Local. June-Aug.

## 92. PUCCINÉLLIA Parl.

Perennial grasses, with flat or involute leaves and contracted or open panicles. Spikelets 3 -several-flowered. Lower scales empty, obtuse or acute, unequal; flowering scales obtuse or acute, rounded on the back, 5-nerved, the nerves very obscure or almost wanting. Palet about equalling the scale. Stamens 3. Styles wanting. Stigmas sessile, simply plumose. Grain compressed, usually adhering to the palet. [Name in honor of Benedetto Puccinelli, Italian botanist.] About 14 species, in all temperate regions.

Panicle open, its branches spreading or ascending, rarely erect.
Lower flowering scales $3-4 \mathrm{~mm}$. long; plant stoloniferous. I. P. maritima.
Lower flowering scales 2.5 mm . long or less; plants not stoloniferous.
Second empty scale less than half the length of the flowering scales, broad, obtuse or truncate; spikelets crowded.
2. P. distans.

Second empty scale more than half the length of the flowering scales, narrow, obtuse or acute; spikelets not crowded.
3. P. airoides.

F'anicle contracted, its branches erect, rarely ascending ; northern species.
4. P. angustata.

1. Puccinellia marìtima (Huds.) Parl. Goose-grass. Sea Spear-grass. (I. F. f. 493.) Stoloniferous, smooth, glabrous. Culms 1.5-6 dm. tall, erect, or decumbent at the base; leaves $\mathbf{I} .25-\mathbf{1 2 . 5} \mathrm{cm}$. long, 2 mm . wide or less, flat to involute; panicle $5-15 \mathrm{~cm}$. in length, open, the branches ascending, or rarely erect, $2.5-5 \mathrm{~cm}$. long; spikelets $3-10$-flowered, $6-12 \mathrm{~mm}$. long; empty scales unequal, the first usually I-nerved, the second 3 -nerved; flowering scales $3-4 \mathrm{~mm}$. long, broad, obtuse or truncate. In salt marshes and on sea beaches, N. S. to R. I. Also on the Pacific coast, and on the coasts of Europe and Asia. July-Aug.
2. Puccinellia distans (L.) Parl. Spreading Meadow-grass. (I. F. f. 494.) Culms 3-6 dm. tall, erect, or sometimes decumbent at the base, tufted. Leaves $1.25-15 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, flat or folded, usually stiff and erect, smooth beneath; panicle $5-17.5 \mathrm{~cm}$. in length, open, rarely contracted, the branches spreading or ascending, whorled, the lower $2.5-\mathbf{I I} .5 \mathrm{~cm}$. long, sometimes reflexed; spikelets crowded, 3-6-flowered, 3-5 mm. long; empty scales obtuse or acute, I-nerved, the second exceeding the first and less than half the length of the obscurely nerved and obtuse flowering scales, which are $1-2 \mathrm{~mm}$. long. On salt meadows, sea beaches and in waste places, N. S. to N. J. Probably naturalized from Europe. July-Aug.
3. Puccinellia airoides (Nutt.) Wats. \& Coult. Slender Meadow-grass. (I. F. f. 495.) Culms $3-12 \mathrm{dm}$. tall, erect. Leaves $5^{-10} \mathrm{~cm}$. long, 3 mm . wide or less, flat or involute, usually erect, smooth beneath, rough above; panicle open, its branches slender, spreading or ascending, rarely erect, the lower $5-8.5 \mathrm{~cm}$. long and often reflexed; spikelets scattered, $\mathbf{r}-7$-flowered, $3-6 \mathrm{~mm}$. long; empty scales unequal, the first acute, 1 -nerved, the second obtuse or acute, 3 -nerved, more than half the length of the obtuse flowering scales, which are $2-2.5 \mathrm{~mm}$. long. In saline soil, Manitoba to the N. W. Terr., Wash., Neb. and Nev. July-Aug.
4. Puccinellia angustàta (R. Br.) Scribn. Arctic Meadow-Grass. (I. F. f. 496.) Smooth and glabrous. Culms I-3 dm. tall, erect, simple; leaves 1.25-6.5 cm . long, 2 mm . wide or less; panicle $2.5-5 \mathrm{~cm}$. in length, contracted, the branches short and erect or appressed; spikelets $2-7$-flowered, $6-8 \mathrm{~mm}$. long; empty scales obtuse or rounded at the apex, the first I-nerved, the second 3 -nerved; flowering scales $2.5-3 \mathrm{~mm}$. long, usually purplish, rounded at the apex. (ireenland and Hudson Bay to Alaska, south to Me. Also in Europe and Asia. Summer.

## 93. FESTUUCA L.

Mostly tufted perennial grasses, with flat or convolute leaves and paniculate inflorescence. Spikelets 2 -several-flowered. Two lower scales empty, more or less unequal, acute, keeled; flowering scales membranous, narrow, rounded on the back, 5 -nerved, usually acute, and generally awned at the apex. Palet scarcely shorter than the scale. Stamens I-3. Styles very short, distinct. Stigmas plumose. Grain
glabrous, elongated, often adherent to the scale or palet. [Latin, stalk or straw.] A genus of about 80 species, widely distributed, particularly numerous in temperate regions. Besides the following, some 15 others occur in the western parts of N. Am.

Empty scales membranous, firm, the second one 3 - 5 -nerved.
Leaves 2 mm . wide or less, usually involute or folded.
Annuals; flowering scales long-awned.
First scale more than one-half as long as the second; awn not exceeding the length of the flowering scale. i. F. octoflora.
First scale less that one-half as long as the second; awn much longer than the flowering scale.
2. F. Myuros.

Perennials; flowering scales awnless or short-awned.
Culms from a rootstock or with stolons.
3. F. rubra.

Culms densely tufted, no rootstocks.
Flowering scales short-awned; leaves setaceous.
Culms 2-4 dm. tall; culm-leaves long. 4. F. ovina.
Culms I .5 dm . or less tall; culm-leaves very short, usually about I cm . ; an alpine grass.
Flowering scales awnless; leaves filiform. 6. F. capillata.
Leaves 4 mm . wide or more, flat.
Flowering scales awnless or short-awned.
Flowering scales $5-7 \mathrm{~mm}$. long; spikelets 5 -io-flowered.
7. F. elatior.

Flowering scales 4 mm . long or less; spikelets 3 - 6 -flowered.
Spikelets very broad; branches of the panicle spikelet-bearing from the middle or below.
8. F. Shortiz.

Spikelets lanceolate; branches of the panicle elongated, spikelet-bearing at the end.
9. F. nutans.

Flowering scales long-awned. 10. F. gigantea.
Empty scales broad, scarious, with broad hyaline margins, thin, I-nerved; base of the culms clothed with dry leafless sheaths.
Panicle loose and open, usually purple, its branches often widely spreading. i1. F. scabrella.
Panicle narrow, strict, rigid, green, its branches appressed.
12. F. Watsoni.
I. Festuca octofiòra Walt. Slexder Fescle-grass. (I. F. f. 497.) Culms I-4.5 dm. tall. erect, from an annual root, slender, rigid. Leares $3.75-7.5 \mathrm{~cm}$. long. involute. bristle-form; raceme or simple panicle often one-sided. $2.5-15 \mathrm{~cm}$. in length, contracted, its branches erect. or rarely ascending; spikelets 6-13-flowered. 6-10 mm. long; empty scales acute. smooth. the first I-nerved, more than half the length of the 3 -nerved second one; flowering scales, exclusive of awn. $3-5 \mathrm{~mm}$. long, usually very scabrous, acuminate into an awn nearly as long as the body or shorter. or sometimes awnless; stamens 2. Dry sandy soil, Quebec to Br . Col., south to Fla., Tex. and Cal. June-Aug.
2. Festuca Myùros L. Rat's-tail Fescle-grass. (I. F. f. 498.) Culms 3-6 dm. tall, erect from an annual root; leaves $5-12.5 \mathrm{~cm}$. long, subulate. involute. erect; panicle usually one-sided. $1-3 \mathrm{dm}$. in length. contracted. sometimes curved, its branches appressed; spikelets 3 - 6 -flowered; empty scales very unequal. acute, smooth. the first I-nerved, less than half as long as the 3 -nerved second one; flowering scales, exclusive of the awn. 4-6 mm. long. narrow, acuminate into an awn much longer than the body; stamen I. In waste places and fields. N. H. to N. J. and Fla. Also on the Pacific coast. Naturalized from Europe, June-July.
3. Festuca rùbra L. Red Fescte-grass. (I. F. f. 499.) Culms $4.5-7.5 \mathrm{dm}$. tall, from running rootstocks, erect, simple; basal leaves involute-filiform. 7.5-15 cm . long; culm leaves shorter, erect, flat. or involute in drying. minutely pubescent above; panicle $5-12.5 \mathrm{~cm}$. in length. sometimes red, open at flowering time. comtracted in fruit; spikelets 3 -10-flowered. $8-12 \mathrm{~mm}$. long; lower scales acute. unequal. the first I-nerved. shorter than the 3 -nerved second; flowering scales abr,ut 6 mm . long. obscurely 5 -nerved, sometimes scabrous, bearing awns of less than their own length. Lab. to Alaska. south, especially on the mountains, to Va.. Tenn. and Colo. Also in Europe and Asia. Summer.
4. Festuca ovìna L. Sheep's Fescte-grass. (I. F. f. 500.) Culms 1.53.5 dm . tall. erect. tufted. slender. rigid; sheaths usually crowded at the base of the culm: ligule auriculate. short; leaves filiform or setaceous, those of the culm few, $2.5-7.5 \mathrm{~cm}$. long. erect. the basal ones numerous; panicle $3.75-7.5$
cm. long, often one-sided, narrow, its branches short, usually erect or appressed; spikelets 3 - 5 -flowered; empty scales unequal, acute, the first I-nerved, the second 3 -nerved; flowering scales $3-4 \mathrm{~mm}$. long, smooth, acute, usually short-awned. In fields and waste places, Lab. to Br. Col., south to N. J., Colo. and Cal. Variable. Probably indigenous northward, but mostly naturalized from Europe. Native also of Asia. The so-called var. vivipara, a state of this grass with the scales wholly or partly transformed into small leaves, is found on the mountains of N. E. and in arctic America.

Festuca ovina duriúscula (L.) Hack. Culms taller and stouter, the panicle usually more open and the flowering scales about 6 mm . long. Newf. to the Rocky Mts., south to Va. and Colo. Naturalized from Europe.
5. Festuca brachyphylla Schultes. Short-leaved Fescue-grass. (I. F. f. 500 .) Smooth and glabrous. Culms densely tufted, 2 dm . tall or less, slender, erect, much exceeding the short basal leaves; sheaths coarsely striate; leaves very narrow, involute, at least when dry, those on the culm $\mathbf{I} .25 \mathrm{~cm}$. or less long, erect or ascending; panicle 2.5 cm . or less long, nearly simple, its branches appressed; spikelets 2-4-flowered, the empty scales acuminate, the first I-nerved, the second 3 -nerved; flowering scales acute or acuminate, rough toward the apex, $4-5 \mathrm{~mm}$. long, exclusive of the scabrous awn, which is $\mathbf{I}-2.5 \mathrm{~mm}$. long. Newf. to Br. Col., the higher mountains of Vt. and the Rocky Mts. to Colo. Summer.
6. Festuca capillàta Lam. Filiform Fescue-Grass. (I. F. f. 500b.) Densely tufted. Culms erect from a decumbent base, 1.5-4 dm. tall, slender, smooth and glaucous, shining; sheaths confined to the base of the culm; leaves filiform, smooth or rough, the basal ones from one-third to one-half as long as the culm, the culm leaves $2.5-3.75 \mathrm{~cm}$. long; panicle contracted, $\mathbf{I} .25-5 \mathrm{~cm}$. long, its
 scales empty, unequal, the first acuminate, the second acute; flowering scales about 2.5 mm . long, unawned, acute. Fields and roadsides, Me. and N. Y. Also in Miss. Introduced from Europe. June-July.
7. Festuca elàtior L. Tall or Meadow Fescue-grass. (I. F. f. 502.) Culms 6-15 dm. tall, erect, simple; leaves $1-4 \mathrm{dm}$. long, $4-8 \mathrm{~mm}$. wide, flat, smooth beneath, more or less rough above; panicle 1-3.5 dm. in length, often nodding at the top, simple to very compound, the branches ascending or erect, 5-20 cm . long; spikelets $5-9$-flowered, $9-12 \mathrm{~mm}$. long; empty scales acute, the first 1 -3nerved, the second 3-5-nerved; flowering scales acute or short-pointed, smooth and glabrous, $5-6 \mathrm{~mm}$. long, indistinctly 5 -nerved. In fields and waste places, N. S. to Ont., south to N. Car., Tenn. and Kans. Naturalized from Europe and cultivated for hay. Variable. July-Aug.
8. Festuca Shórtii Kunth. Short's Fescue-grass. (I. F. f. 503.) Culms 6-12 dm. tall, erect. Leaves $1.25-2.5 \mathrm{dm}$. long, 2-6 mm. wide, flat, smooth beneath, rough above; panicle $7 \cdot 5-17.5 \mathrm{~cm}$. in length, open, the branches spreading or ascending, rarely erect, spikelet-bearing from the middle or below, the lower $3.75-8.75 \mathrm{~cm}$. long; spikelets broadiy obovate when mature, 3-6-flowered, $5-6 \mathrm{~mm}$. long; empty scales acute, unequal, scabrous on the nerves, the first 1 - 3 -nerved, the second 3 -nerved; flowering scales about 4 mm . long, smooth, obtuse or acutish. faintly nerved. In woods and thickets, Penn. (according to Porter) and Ill. to Kians., south to Miss. and Tex. July-Aug.
9. Festuca nùtans Willd. Nodding Fescue-grass. (I. F. f. 504.) Culms $6-9 \mathrm{dm}$. tall, slender, glabrous or sometimes pubescent; leaves $1-3$ dm. long. +6 mm . wide, rather dark green, flat, smooth beneath, rough above; panicle 1-2.25 dm . in length, its branches at first erect, the lower $0.25-12.5 \mathrm{~cm}$. long, finally spreading and nodding, spikelet-bearing only at the ends; spikelets lanceolate. 3 5flowered, ${ }_{5}-6 \mathrm{~mm}$. long, empty scales acute, scabrous on the keel, the first 1 -nerved. shorter than the 3 -nerved second; flowering scales about +mm . long, smooth, acute, very faintly nerved. In rocky woods, N. S. to Ont. and Neb., south to Fla, and Tex. Ascends to 690 m . in Va. June-Aug.
10. Festuca gigantèa (L.) Vill. Great Fescte-cirass. (I. F. f. 505:) Culms 6-12 dm. tall, erect, simple. Sheaths usually overlappine: $1.25-3$ dm. hus or more, bright green, +12 mm . wide, tlat, rough ; panicke 1.753 dm. in kength. loose, narrow, the branches erect or asconding, the lower 5-10 cm. long : spikelet

3-7-flowered ; empty scales acuminate, smooth and glabrous, the first I-3-nerved, shorter than the 3 - 5 -nerved second; flowering scales, exclusive of awn, about 6 mm . long, faintly 5 -nerved, slightly scabrous, minutely 2 -tonthed at the apex, bearing an awn I.2-I. 6 cm . long. In waste places, Me. to southern N. Y. Adventive from Europe. July-Aug.
11. Festuca scabrélla Torr. Rough Fescue-grass. (I. F. f. 50I.) Culms 3-6 dm. tall, erect, usually rough below the panicle. Sheaths overlapping, smooth ; leaves rough, 2 mm . wide or less, those of the culm $2.5-7.5 \mathrm{~cm}$. long, erect, the basal flat, much longer and readily deciduous from the sheaths, involute in drying; panicle $7 \cdot 5-10 \mathrm{~cm}$. in length, open, its branches ascending or the lower widely spreading ; spikelets 3 - 5 -flowered, about 8 mm . long; empty scales scarious, unequal, smooth, the first I-nerved, the second longer, 3 -nerved ; flowering scales about 6 mm . long, scabrous. often bearing a short awn 2 mm . long or less. Lab. and Quebec to Manitoba and Br. Col. Summer.
12. Festuca Wátsoni Nash. Watson's Fescue-grass. Culms tufted, erect, rigid, the base clothed with dry leafless sheaths. Sheaths smooth and glabrous; leaves erect, stiff, smooth beneath, rough above, 2.5 dm . long or less, 2-4 mm . wide, those on the culm much shorter than those of the innovations; panicle strict, narrow, $\mathbf{I O}-\mathbf{1 2} \mathbf{~ c m}$. long, its branches erect or appressed ; spikelets usually 3 -flowered, $7-8 \mathrm{~mm}$. long, the scales acute, the flowering scales strongly scabrous. Meadows, Mont. to Neb. and Colo. June-July. (Festuca Kingii (S. Wats.) Scribn. Not F. Kingiana Endl.)

## 94. BRÒMUS L.

Annual or perennial grasses, with flat leaves and terminal panicles, the pedicels thickened at the summit. Sheaths sometimes not split. Spikelets few-many-flowered. Two lower scales empty, unequal, acute; flowering scales rounded on the back, or sometimes compressed-keeled, 5-9-nerved, the apex usually 2-toothed, generally bearing an awn just below the summit; palet shorter than the scale, 2 -keeled. Stamens usually 3. Stigmas sessile, plumose, inserted below a hairy cushion-like appendage at the top of the ovary. Grain adherent to the palet. [Greek name for a kind of oats.] About 40 species, most numerous in the north temperate zone. Besides the following, some 14 others occur in the western parts of N. Am.

Lower empty scale I-nerved, the upper 3 -nerved.
Awn shorter than the flowering scale or wanting; perennials $6-12 \mathrm{dm}$. tall.
Flowering scales awnless, or merely awn-pointed.

1. $B$. inermis.

Flowering scales awned.
Sheaths glabrous or softly pubescent, the lower sometimes sparingly hirsute. Leaves $4^{-12} \mathrm{~mm}$. wide; culms stout; branches of the panicle more or less spreading or drooping.
2. B. ciliatus.

Leaves less than 4 mm . wide; culms slender; branches of the panicle erect.
3. B. erecius.

Sheaths strongly retrorse-hirsute.
4. B. asper.

Awn longer than the flowering scale; low annuals $3-6 \mathrm{dm}$. tall.
Flowering scales appressed-hirsute, $8-12 \mathrm{~mm}$. long.
5. B. tectorum.

Flowering scales sparsely appressed-hispidulous.
Spikelets usually single on the long naked spreading branches.
6. B. sterilis.

Spikelets several on the branches which are divided and spikelet-bearing above the middle.
7. B. Madritensis.

Lower empty scale 3 -nerved, the upper $5-9$-nerved (3-nerved in No. 8).
$a$. Flowering scales rounded on the back, at least below.
I. Flowering scales awned.

Flowering scales pubescent.
Pubescence dense, consisting of long silky hairs.
Second empty scale 3-nerved; flowering scales $1-1.2 \mathrm{~cm}$. long.
8. B. Porteri.

Second empty scale 5-7-nerved; flowering scales about 8 mm . long.
9. B. Kalmiz.

Pubescence of short soft appressed hairs, not dense.
10. $B$, hordeaceus,

Flowering scales glabrous or minutely roughened.
Awns straight.
Nerves of the turgid fruiting flowering scales obscure; sheaths glabrous. II. B. secalinus.
Nerves of the flowering scale prominent; sheaths softly and densely pubescent with reflexed hairs.

Spikelets broadly lanceolate, usually 1, or sometimes 2, on the longer branches. 12. B. racemosus.
Spikelets lanceolate, several on the longer branches.
13. $B$. arvensis.

Awns strongly bent near the base, divergent. 14. B. squarrosus.
2. Flowering scales awnless, nearly as broad as long.
15. B. brizaformis.
b. Flowering scales compressed-keeled.

Flowering scales pubescent; awn $4^{-6} \mathrm{~mm}$. long. 16. B. breviaristatus. Flowering scales minutely roughened; awn less than 2 mm . long, or none. 17. B. unioloides.

1. Bromus inérmis Leyss. Hungarian Brome-grass. Culms tufted, 8-i2 dm . tall; sheaths smooth and glabrous; leaves $\mathbf{1} .5^{-2.5} \mathrm{dm}$. long, $4^{-6} \mathrm{~mm}$. wide, smooth and glabrous; panicle 1.5-2.5 dm. long, oblong, the axis scabrous, its scabrous branches ascending, in clusters; spikelets $2-2.5 \mathrm{~cm}$. long, about 5 mm . wide, oblong, erect, the first scale I-nerved, the second scale 3 -nerved, the flowering scales 10-12 mm. long, 5-7-nerved, awnless, or rarely awn-pointed. In fields and waste places, S. Dak. and Ohio. Introduced from Europe. June-July.
2. Bromus ciliàtus L. Fringed Brome-grass. Wood Chess. (I. F. f. 506.) Culms 6-12 dm. tall, glabrous or pubescent. Sheaths often softly pubescent, or the lower sometimes sparingly hirsute ; leaves $\mathbf{I}-3 \mathrm{dm}$. long, $4-\mathrm{I} 2 \mathrm{~mm}$. wide, smooth beneath, scabrous and often pubescent above; panicle open, I-2.5 dm . in length, its branches widely spreading or often drooping; spikelets 5-10flowered, 2.5 cm . long or less; first scale 1-nerved, the second longer, 3-nerved; flowering scales $8-12 \mathrm{~mm}$. long, obtuse or acute, 5-7-nerved, appressed-pubescent on the margins or over the entire surface; awn $4-8 \mathrm{~mm}$. long. In woods and thickets, Newf. to Manitoba and Br. Col.; south to Fla. and Tex. Variable. The form known as var. purgans (B. pubescens Muhl.) with the flowering scales pubescent all over, may be distinct. July-Aug.
3. Bromus eréctus Huds. Upright Brome-grass. (I. F. f. 507.) Culms 6-9 dm. tall. Sheaths glabrous or slightly pubescent; leaves sparingly pubescent, $2-4 \mathrm{~mm}$. wide, those of the culm I-2 dm. long, the basal about 3 dm . long, very narrow; panicle $7 \cdot 5-17.5 \mathrm{~cm}$. in length, the branches erect or ascending, the lower $2.5-7.5 \mathrm{~cm}$. long; spikelets $1.25-3.75 \mathrm{~cm}$. long, sometimes purplish, $5-10$-flowered; empty scales acuminate, the first I-nerved, the second longer, 3 -nerved; flowering scales $\mathbf{I}-1.2 \mathrm{~cm}$. long, acuminate, very rough-pubescent, 5 -nerved, the intermediate nerves faint; awn 4-6 mm. long. In waste places about N. Y. Adventive from Europe. July-Aug.
4. Bromus ásper Murr. Hairy Brome-grass. (I. F. f. 508.) Culms 6-i8 dm. tall, rough. Sheaths strongly retrorse-hirsute, especially the lower; leaves $2-3 \mathrm{dm}$. long or more, $6-12 \mathrm{~mm}$. wide, rough or often hirsute; panicle $1.5-3 \mathrm{dm}$. in length. open, the branches usually drooping; spikelets $5-10$-flowered, $2.5-3.75 \mathrm{~cm}$. loms; empty scales acute, scabrous on the nerves, the first I-nerved, the second longer. 3 -nerved; flowering scales about $\mathbf{I} .2 \mathrm{~cm}$. long, acute, hispid near the margins and on the lower part of the keel; awn 6-8 mm. long. In waste places, N. B. to Nich. and Ky. Naturalized from Europe. July-Aug.
5. Bromus tectòrum L. Downy Brome-grass. (I. F. f. 50n.) Culms I.5-6 dm. tall, erect from an annual root. Sheaths, at least the lower ones, softly pubescent; leaves $2.5-10 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, softly pubestent: panicle $5-$ 15 cm . in length, open, the branches slender and drooping. somewhat one-sided; spikelets numerous, 5-8-flowered, on capillary recurved slemder pedicels: empty scales acuminate, usually rough or hirsute, the first i-nerved, the secomd longer. 3-nerved; flowering scales $8-12 \mathrm{~mm}$. lomg, acuminate, 7 -nerval. usually rough or hirsute; awn I. $2-1.6 \mathrm{~cm}$. long. In fields and waste places, Mass and R. 1. to Ont., south to Md. and Ohio. Naturalized from Europe. Sometimes a trouble. some weed. May-July.
6. Bromus stérilis L. Barren Brome-grass. (I. F. f. 5 \%o.) Culms 3-6 dm. tall; sheaths smooth or rough, the lower sometimes pubescent; leaves $7.5-22.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, usually more or less pubescent; panicle $1.25-$ 2.5 dm . in length, the branches ascending or often widely spreading, not one-sided, stiff; spikelets few, 5-Io-flowered, spreading or pendulous ; empty scales acuminate, glabrous, the first 1 -nerved, the second longer, 3 -nerved; flowering scales $\mathbf{1 . 2 -}$ 1.6 cm . long, acuminate, 7 -nerved, scabrous on the nerves, the awn $1.4-2.4 \mathrm{~cm}$. long. In waste places and ballast, eastern Mass. to Penn. and Ohio. Locally naturalized or adventive from Europe. Native also of Asia. June-July.
7. Bromus Madriténsis L. Compact Chess. (I. F. f. 509a.) Culms 3-6 dm. tall, tufted; sheaths glabrous, or the lower ones pubescent; leaves 6.2520 cm . long, $3-6 \mathrm{~mm}$. wide, rough above, often pubescent on both surfaces; panicle dense, $7 \cdot 5-15 \mathrm{~cm}$. long, its rough branches erect or ascending, the longer $5-7.5 \mathrm{~cm}$. long; spikelets numerous, $3.75-5 \mathrm{~cm}$. long, including the awns ; scales acuminate, scarious on the margins, the first scale I-nerved, the second 3-nerved; flowering scales, exclusive of the awn, I.2-1.4 cm. long, sparsely and minutely appressedpubescent, 5 -nerved, the apex acuminately 2 -toothed, bearing an erect or divergent awn I.2-I. 8 cm . long. Waste places, Mich. and Va.; also in Cal. Locally adventive from Europe. Summer.
8. Bromus Pòrteri (Coulter) Nash. Porter's Chess. (I. F. f. 5 II.) Culms 4.5-9 dm. tall, pubescent below the nodes. Sheaths glabrous or sometimes softly pubescent ; leaves $2-6 \mathrm{~mm}$. wide, rough, those of the culm $1-2.25 \mathrm{dm}$. long, the basal narrow and about one-half the length of the culm; panicle $7 \cdot 5-15 \mathrm{~cm}$. in length, its branches drooping and flexuous, at least when old, the nodes of the axis pubescent ; spikelets $5-10$-flowered, $1.8-3 \mathrm{~cm}$. long, on slender flexuous pedicels; empty scales pubescent, 3-nerved; flowering scales I-I. 2 cm . long, obtuse, 5-7nerved, densely pubescent with long silky hairs; awn $2-4 \mathrm{~mm}$. long. In dry soil, S. Dak. to Mont., south to western Neb., N. Mex. and Ariz. July-Aug.
9. Bromus Kàmii A. Gray. Kalm's Chess. (I. F. f. 512.) Culms 4.5-9 dm . tall. Sheaths more or less pubescent ; leaves $6-17.5 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, sparingly pubescent ; panicle $5-15 \mathrm{~cm}$. in length, open, its branches usually flexuous; spikelets 6-10-flowered, $1.2-2.4 \mathrm{~cm}$. long, on slender flexuous pedicels; empty scales pubescent, the first acute, 3 -nerved, the second obtuse or mucronate, 5-7nerved; flowering scales about 8 mm . long, $7-9$-nerved, densely silky pubescent, the awn $2-3 \mathrm{~mm}$. in length. In woods and thickets, Quebec to Manitoba, south to Mass., Penn., Ill. and Iowa. July-Aug.
10. Bromus hordeàceus L. Soft Chess. (I. F. f. 513.) Culms 2-9 dm. tall, usually pubescent below the panicle. Sheaths mostly pubescent; leaves 2.517.5 cm . long, $2-6 \mathrm{~mm}$. wide, pubescent; panicle generally contracted, its branches erect or ascending, $2.5-5 \mathrm{~cm}$. long; spikelets appressed-pubescent, on short pedicels; empty scales acute, the first 3 -nerved, the second longer, 5-7-nerved; flowering scales broad, obtuse, $7-9 \mathrm{~mm}$. long, $7-9$-nerved, bearing an awn $6-8 \mathrm{~mm}$. in length between the obtuse or acute teeth. In fields and waste places, Conn. and N. Y. to Va. and Neb. Locally adventive from Europe. July-Aug.
II. Bromus secálinus L. Cheat. Chess. (I. F. f. 514.) Culms 3-9 dm. tall; sheaths generally glabrous; leaves $5-22.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, smooth or rough, sometimes hairy; panicle $5-20 \mathrm{~cm}$. in length, open, its branches ascending or drooping; spikelets turgid, glabrous, erect or somewhat pendulous, 6-10flowered; empty scales scabrous toward the apex, the first 3 -nerved, acute, the second longer and broader, 7 -nerved, obtuse; flowering scales $6-8 \mathrm{~mm}$. long, broad, turgid, obtuse, rough toward the apex, the nerves obscure, awnless or bearing a straight awn 8 mm . long or less between the obtuse short teeth. In fields and waste places almost throughout temperate N. Am., often a pernicious weed in grain fields. Naturalized from Europe. Native also of Asia. June-Aug.
11. Bromus racemòsus L. Upright Chess. Smooth Brome-grass. (I. F.f. 515.) Culms 3-9 dm. tall, glabrous or sparingly pubescent below the panicle. Sheaths pubescent; leaves $2.5-22.5 \mathrm{~cm}$. long, I -8 mm . wide, pubescent; panicle $2.5-25 \mathrm{~cm}$. in length, the branches erect or ascending, the lower sometimes 6 cm . long; spikelets erect, 5-II-flowered; empty scales acute, the first 3 -nerved, the second longer and broader, 5-9-nerved; flowering scales broad, $7-9 \mathrm{~mm}$. long, obtuse, smooth and shining, the nerves prominent: awn straight, $6-8 \mathrm{~mm}$. in length. In
fields and waste places all over the eastern U. S. and Br. Am.; also on the Pacific Coast. Naturalized from Europe. Native also of Asia. June-Aug.
i3. Bromus arvénsis L. Field Chess or Brome. (I. F. f. 515a.) Culms erect, 3-9 dm. tall, glabrous except at or near the brown nodes. Sheaths softly and densely pubescent with short reflexed hairs; leaves erect or ascending, more or less hirsute on both surfaces, $7.5-15 \mathrm{~cm}$. long, 4-6 mm . wide; panicle ample, 1.25-2.25 dm . long, its rough branches erect or ascending, rarely spreading, the longer 7.515 cm . long; spikelets, including the awns, $1.8-2.4 \mathrm{~cm}$. long, lanceolate, the scales minutely and sparsely appressed-pubescent toward the acute apex, papillose along the nerves, the first scale 3 -nerved, the second 5 -nerved; flowering scales broadest at the middle, 5 -nerved, $7-8 \mathrm{~mm}$. long, bearing an erectawn of about the same length. Fields and waste places, N. Y., N. J. and Mich. Locally adventive from Europe. Summer.
12. Bromus squarròsus L. Corn Brome. (I. F. f. 516.) Culms 2-4.5 dm . tall. Sheaths softly pubescent; leaves $2.5-12.5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, softly pubescent; panicle $5-15 \mathrm{~cm}$. in length, open, the branches ascending or drooping, often flexuous; spikelets nodding, 6-12-flowered, on slender pedicels; empty scales obtuse or acutish, the first 5 -nerved, the second longer, 7-9-nerved : flowering scales $9-$ II mm . long, obtuse, shining, minutely scabrous; awn inserted below the apex, about as long as the scale, bent at the base and divergent. In ballast and waste places about the eastern seaports. Fugitive or adventive from Europe. July-Aug.
13. Bromus brizaefórmis Fisch. \& Mey. Quake-grass Brome. (I. F. f. 517.) Culms 2-6 dm. tall; sheaths, at least the lower, pubescent with soft villous hairs; leaves $2.5-17.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, pubescent; panicle $3.75-20 \mathrm{~cm}$. in length, open, the branches ascending or often drooping, flexuous; spikelets few, r.25-2.5 cm. long, laterally much compressed; empty scales very obtuse, often purplish, glabrous or minutely pubescent, the first $3-5$-nerved, the second larger, 5-9-nerved; flowering scales 6-8 mm. long, very broad, obtuse, 9-nerved, shining, glabrous or sometimes minutely pubescent, awnless. Introduced into Penn. and Del.; also from Mont. to Cal. Native of northern Europe and Asia. July-Aug.
14. Bromus breviaristàtus (Hook.) Buckl. Short-awned Chess. (I. F. f. 518.) Culms $3-12 \mathrm{dm}$. tall, sometimes pubescent below the panicle. Sheaths pubescent, at least the lower ones; leaves $\mathbf{1} .5-3 \mathrm{dm}$. long or more, $4-\mathbf{I 2} \mathrm{mm}$. wide, rough and often pubescent; panicle I-4 dm. in length, its branches erect or ascending, the lower $5-15 \mathrm{~cm}$. long; spikelets $5-10$-flowered; empty scales acute, pubescent, the first $3-5$-nerved, the second longer, 5-9-nerved; flowering scales compressed, keeled, I.2-I. 4 cm . long, acute, 7-9-nerved, appressed-pubescent; awn 4-6 mm. long. In dry soil, Manitoba to Br. Col., south to Neb., Ariz. and Cal. July-Aug.
15. Bromus unioloìdes (Willd.) H.B.K. Schrader's Brome-grass. Southern Chess. (I. F. f. 519.) Culms I.5-9 dm. tall; sheaths glabrous or frequently pubescent; leaves $7 \cdot 5-32 \mathrm{~cm}$. long, $2-8 \mathrm{~mm}$. wide, usually rough, at least above; panicle $5-25 \mathrm{~cm}$. in length, the branches erect or ascending, or the lower branches of the larger panicles widely spreading; spikelets much compressed. 6 -10-flowered; empty scales acute, the first 3-5-nerved, the second longer, 5-()nerved; flowering scales $\mathbf{I} .2-\mathbf{1} .6 \mathrm{~cm}$. long, very acute, minutely scabrous, bearing an awn less than 2 mm . long or awnless. Kans. (?) to the Ind. Terr., Tex. and Mex. Widely distributed in S. Am. May-July.

## 95. NÀRDUS L.

A low perennial tufted grass, with setaceous rigid leaves and a terminat onesided slender spike. Spikelets I-flowered, narrow, sessile and single in wach motch of the rachis. Scales 2, the lower empty, adnate to the rachis, or almost wanting. the upper flower-bearing, narrow, with involute and hyaline margins; palet narrow. 2-nerved. Stamens 3. Style elongated, undivided. Stigmal elongated, shortpapillose. Grain linear, glabrous, enclosed in the scale, usually frec. [Name Greek, of uncertain application.] A monotypic genus of the old World.

1. Nardus strícta L. Wirebent. Mat-cikass. Nikl) (I. F. f. 520.) Culms 1-4 dm. tall, rigid, roughish. Sheaths usually at the base of the culm:
leaves setaceous, stiff, rough, the 1 or 2 culm leaves about 2.5 cm . long, erect, the basal ones numerous, $5-\mathbf{1 2 . 5} \mathrm{cm}$. long; spike $2.5-7.5 \mathrm{~cm}$. in length, strict; spikelets I -flowered, $6-8 \mathrm{~mm}$. long, arranged alternately in 2 rows on one side of the erect slender rachis, often purplish; lower scale empty, very short, adnate to the rachis, sometimes almost wanting; flowering scale $6-8 \mathrm{~mm}$. long, scabrous, longacuminate or short-awned. Introduced into Newf. and at Amherst, Mass. Adventive from Europe. July-Aug.

## 96. LÒLIUM L.

Annual or perennial grasses, with flat leaves and terminal spikes. Spikelets several-flowered, solitary, sessile and alternate in the notches of the usually continuous rachis, compressed, the edge of the spikelet (backs of the scales) turned toward the rachis. Scales rigid; lower scale empty in the lateral spikelets, and the 2 lower empty in the terminal; flowering scales rounded on the back, 5-7-nerved; palets 2-keeled. Stamens 3. Styles distinct, very short. Stigmas 2, plumose. Grain adherent to the palet. [Latin name for Darnel.] About 6 species, natives of the Old World.

Empty scale shorter than the spikelet.

Flowering scales awnless.
Flowering scales awned.
Empty scale equalling or extending beyond the flowering scales.

1. L. perenne.
2. L. Italicum.
3. L. temulentum.
4. Lolium perénne L. Ray-grass. Rye-grass. (I. F. f. 521.) Smooth and glabrous. Culms $1.5-7.5 \mathrm{dm}$. tall; leaves $5-\mathbf{1 2 . 5} \mathrm{cm}$. iong, $2-4 \mathrm{~mm}$. wide; spike $7.5-20 \mathrm{~cm}$. in length; spikelets $5-10$-flowered, $8-12 \mathrm{~mm}$. long, the empty scale shorter than the spikelet, strongly nerved; flowering scales $4-6 \mathrm{~mm}$. long, obscurely nerved, acuminate, awnless. In waste places and cultivated grounds almost throughout the northern U. S. and southern Br. Am. Naturalized from Europe. Native also of Asia. Erroneously called Darnel, this name belonging to L. temulentum. July-Aug.
5. Lolium Itálicum A. Br. Awned Ray-grass. Culms tufted, 6-10 dm. tall. Sheaths smooth and glabrous; leaves $1-2 \mathrm{dm}$. long, 3-7 mm. wide; spikes $2-3 \mathrm{dm}$. long; spikelets $20-30,1.5-2 \mathrm{~cm}$. long, the flowering scales bearing an awn equalling or a little shorter than themselves. In fields and waste places, N. Y., N. J. and Iowa. June-Aug.
6. Lolium temuléntum L. Darnel. Ivray. (I. F. f. 522.) Glabrous. Culms 6-12 dm. tall; leaves $\mathbf{I}-2.5 \mathrm{dm}$. in length, $2-6 \mathrm{~mm}$. wide, smooth beneath, rough above; spike $1-3 \mathrm{dm}$. in length; spikelets $4-8$-flowered, $\mathbf{I - 1 . 8 \mathrm { cm } \text { . long, the }}$ strongly nerved empty scale equalling or extending beyond the obscurely nerved fowering scales, which are awned or awnless. In waste places and cultivated grounds, locally naturalized or adventive from Europe, N. B. to Mich., Ga. and Kans. Abundant on the Pacific Coast. Locally a troublesome weed. June-Aug.

## 97. LEPTƯRUS R. Br.

Usually low annual grasses, with narrow leaves and strict or curved elongated slender spikes. Spikelets I-2-flowered, sessile and single in alternate notches of the jointed rachis. Empty scales 2, rarely 1, narrow, rigid, acute, 5-nerved; flowering scales much shorter, hyaline, keeled, one side turned to the rachis. Palets hyaline, 2-nerved. Stamens 3, or fewer. Styles short, distinct. Stigmas 2, plumose. Grain narrow, glabrous, free, enclosed in the scale. [Greek, referring to the narrow spikes.]. Species 5 or 6 , natives of the Old World.
I. Lepturus filifórmis (Roth) Trin. Slender Hardgrass. (I. F. f. 523.) Culms $7.5-30 \mathrm{~cm}$. long, decumbent, much branched. Sheaths loose, shorter than the internodes; leaves $1.25-5 \mathrm{~cm}$. long, 2 mm . wide or less, usually involute, smooth beneath, rough above; spikes $2.5-15 \mathrm{~cm}$. in length, slender, strict or curved; spikelets $4-5 \mathrm{~mm}$. long; empty scales acute; flowering scales about 3.5 mm . long, I-nerved. In waste places, southern Penn. to Va., near or along the coast. Adventive from Europe. Summer.

## 98. AGROPỲRON J. Gaertn.

Annual or perennial grasses, with flat or involute leaves and terminal spikes. Spikelets 3-many-flowered, sessile, single and alternate at each notch of the usually continuous rachis, the side of the spikelet turned toward the rachis. Two lower scales empty; flowering scales rigid, rounded on the back, 5-7-nerved, usually acute or awned at the apex; palets 2 -keeled, the keels often ciliate. Stamens 3. Styles very short, distinct. Stigmas plumose. Grain pubescent at the apex, usually adherent to the palet. [Greek, referring to the growth of these grasses in wheat-fields.] About 40 species, in all temperate regions. Besides the following, some twelve others occur in the western parts of N. Am.

Culms tufted, no creeping rootstocks or stolons.
Basal culm-leaves longer than the upper; empty scales awnless.
Flowering scales long-awned.
Culms stout, erect; spikes erect, often one-sided. 1. A. Richardsoniz.
Culms geniculate, ascending; spikes nodding.
2. A. caninum.

Flowering scales with a short awn or awnless.
Spikes slender, $5-12 \mathrm{~cm}$. long; empty and flowering scales broadest below the middle.
3. A. tenerum.

Spikes $2.5-7 \mathrm{~cm}$. long; empty and flowering scales broadest above the middle. 4. A. violaceum.
Basal culm-leaves shorter than the upper; empty scales short-awned

## Culms from creeping rootstocks.

Rachis articulated, finally breaking up; spikes 4 -angled.
Rachis continuous; spikes more or less flattened.
Spikelets compressed, lanceolate to ovate, ascending. 7. A. spicatum.
Spikelets nearly round or but little compressed, linear, erect.
Flowering scales densely pubescent.
Flowering scales glabrous or merely hispidulous.
Leaves very rough throughout. 9. A. pseudorepens.
Leaves smooth beneath, more or less hirsute above.
10. A. repens.

1. Agropyron Richardsònii Schrad. Culms 6-10 dm. tall; sheaths smooth and glabrous; leaves erect, $8-20 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, very rough; spike stout, strict, often one-sided, $9-15 \mathrm{~cm}$. long, $8-10 \mathrm{~mm}$. thick; spikelets crowded, 3-5flowered, the empty scales firm, rough on the nerves, short-awned, the flowering scales glabrous, with an awn usually 2-3 times as long as themselves. From Minn. to the Saskatchewan, south to Neb. and Colo. July-Aug.
2. Agropyron caninum (L.) R. \& S. Awned Wheat-grass. Fibrousrooted Wheat-grass. (I. F. f. 528.) Culms 3-9 dm. tall; sheaths glabrous or the lower sometimes pubescent; leaves $7.5-22.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, smooth beneath, rough above; spike $7 \cdot 5-20 \mathrm{~cm}$. in length, nodding at the top; spikelets 3-6-flowered; empty scales $9-12 \mathrm{~mm}$. long, $3-5$-nerved, acuminate, awn-pointed or bearing an awn $2-6 \mathrm{~mm}$. long; flowering scales $8-10 \mathrm{~mm}$. long, usually scabrous toward the apex, acuminate into an awn sometimes twice their own length. N. B. to Br. Col., south to N. Car., Tenn. and Colo. Also in Europe and Asia. Native northward; southward locally naturalized from Europe. July-Aug.
3. Agropyron ténerum Vasey. Slender Wheat-grass. (I. F. f. 527.) Glabrous; culms $6-9 \mathrm{dm}$. tall. Sheaths glabrous; leaves $7 \cdot 5-25 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, flat or involute, rough; spike $7.5-17.5 \mathrm{~cm}$. in length, usually narrow and slender; spikelets $3-5$-flowered; empty scales $8-12 \mathrm{~mm}$. long, acuminate or shortawned, 3 - 5 -nerved, scarious on the margins; flowering scales $10-12 \mathrm{~mm}$. longr, 5 -nerved, awn-pointed or short-awned, scarious on the margins, often rough toward the apex. In dry soil, Lab. to Br. Col., south to N. H., Vt., Kans., Colo., and Cal. July-Aug.
4. Agropyron violàceum (Hornem.) Vasey. Purplish Wheat-grass. (I. F. f. 526.) Culms I. $5-6 \mathrm{dm}$. tall; leaves $5-15 \mathrm{~cm}$. long, $2-0 \mathrm{~cm}$. wide, that or involute, rough or sometimes smooth beneath; spike $2.5-10 \mathrm{~cm}$. in length, occasionally longer, 4-6 mm. broad; spikelets 3-6-flowered; empty scales hroad. usually purplish, scarious on the margins, $5-7$-nerved, \& 12 mm . long, acute or acuminate, sometimes awn-pointed, rarely long-awned; flowering scales often purplish, 5-7-nerved, scarious on the margins, $\$_{-12} \mathrm{~mm}$. long, acuminate or short-
awned, the awn rarely as long as the body. Lab. to Br. Col. and Alaska, south to the mountains of N. E., N. Y., Penn. and Neb., and in the Rocky Mts. to Colo. Ascends to 1650 m . in the White Mits. Also in northern Europe and Asia. Summer.
5. Agropyron Gmélini Scribn. \& Sm. Gmelin’sWheat-Grass. (I. F. f. 528a.) Culms $4.5-12 \mathrm{dm}$. tall, tufted; leaves erect, $\mathrm{I}-2.5 \mathrm{dm}$. long, $2-6 \mathrm{~mm}$. wide, acuminate, smooth beneath, scabrous on the margins and sometimes also sparsely so above; spike slendcr, long-exserted, 5-20 cm. long; spikelets 6-20, somewhat crowded, appressed to the rachis, more or less compressed, 5-9-flowered ; empty scales I-I. 4 cm . long, shorter than the spikelet, acuminate into a shorter awn; flowering scales $8-12 \mathrm{~mm}$. long, acuminate, bearing at or just below the apex a slender scabrous awn $1.4-3 \mathrm{~cm}$. long. Bottom lands, Wash. to western Neb.
6. Agropyron tetrástachys Scribn. \& Sm. Coast Wheat-grass. (I. F. f. 524c.) Glaucous. Culms rigid, $4 \cdot 5-9 \mathrm{dm}$. tall, from a running rootstock; leaves erect, acuminate, $1.25-20 \mathrm{~cm}$. long, 4 mm . or less wide, smooth beneath, glaucous above, scabrous on the margins; spikes long-exserted, $7.5-12.5 \mathrm{~cm}$. long, 4 -sided; spikelets crowded, $1.2-2 \mathrm{~cm}$. long, $6-11$-flowered, appressed to the 4 -angled articulated rachis, the angles hispidulous; empty scales lanceolate, 1 cm . long, 5-7nerved; flowering scales lanceolate, keeled, rough toward the apex, acute, awnpointed or short-awned. Sandy beaches, coast of Me. July-Aug.
7. Agropyron spicàtum (Pursh) Scribn. \& Sm. Western Wheat-grass. (I. F. f. 524b.) Pale green, glaucous. Culms 4.5-12 dm. tall, from a slender creeping rootstock; leaves erect, $5-20 \mathrm{~cm}$. long, $4-8 \mathrm{~mm}$. wide, acuminate, very scabrous above, smooth beneath, becoming involute when dry; spike strict, I-2 dm . long; spikelets crowded, divergent from the rachis, compressed, lanceolate when closed, $1.25-2.5 \mathrm{~cm}$. long, 6-12-flowered; empty scales acuminate, awnpointed, shorter than the spikelet, hispidulous on the keel; flowering scales I-I. 2 cm . long, acute or awn-pointed, glabrous or sparsely pubescent. Prairies and high plains, Manitoba and Minn. to Ore., south to Mo. and Tex.
8. Agropyron dasystàchyum (Hook.) Vasey. Northern Wheat-grass. (I. F. f. 525.) Glaucous. Culms 3-9 dm. tall, from long running rootstocks; leaves $5-22.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, flat, or becoming involute in drying, smooth beneath, rough above; spike $6.25-17.5 \mathrm{~cm}$. in length; spikelets 4 - 8 -flowered; empty scales 3-5-nerved, lanceolate, acuminate or short-awned, 6-9 mm. long; flowering scales broadly lanceolate, 5 -nerved, 9-12 mm. long, acute, or short-awned, densely villous. Sand-hills and dunes, Hudson Bay to the N. W. Terr. and Wyo., and on the shores of Lakes Huron and Superior. Summer.
9. Agropyron pseudorèpens Scribn. \& Sm. False Couch-Grass. (I. F. f. 524a.) Light green. Culms 3-9 dm. tall, from a running rootstock; leaves erect, prominently nerved, rough on both surfaces, acuminate, the culm leaves 7.5-20 cm . long, 4-6 mm. wide, the basal leaves about one-half as long as the culms; spikes $7.5-20 \mathrm{~cm}$. long, strict; spikelets $\mathbf{1}-1.6 \mathrm{~cm}$. long, 3-7-flowered, a little compressed, appressed to the rachis; empty scales lanceolate, equalling or somewhat shorter than the spikelet, acuminate and often awn-pointed, 5-7-nerved, the nerves hispidulous; flowering scales 5 -nerved, roughish toward the apex, usually awnpointed. Rich river-bottoms, Mont. to Br. Col., south to Neb., Ariz. and Tex. July-Aug.
10. Agropyron rèpens (L.) Beauv. Coutch-Grass. Quitch-grass. (I. F. f. 524.) Culms $3-12 \mathrm{dm}$. tall, from a long-jointed running rootstock. Leaves 7.530 cm . long, 2-10 mm. wide, smooth beneath, hirsute above; spike $5-20 \mathrm{~cm}$. in length, strict; spikelets $3-7$-flowered; empty scales strongly $5-7$-nerved, usually acute or awn-pointed, sometimes obtuse; flowering scales smooth and glabrous, acute or short-awned at the apex. In fields and waste places, almost throughout N. Am. except the extreme north. Naturalized from Europe, and often a troublesome weed. Very variable. Native also of Asia. July-Sept.

## 99. HÓRDEUM L.

Annual or perennial grasses, with flat leaves and terminal cylindric spikes. Spiklets I-flowered, usually in 3's at each joint of the rachis, the lateral generally short-stalked and imperfect; rachilla produced beyond the flower, the lower empty scales often reduced to awns and forming an apparent involucre around the spike-
lets. Empty scales rigid; flowering scales rounded on the back, 5 -nerved at the apex, awned; palet scarcely shorter than the scale, 2 -keeled. Stamens 3 . Styles very short, distinct. Grain usually adherent to the scale, hairy at the summit. [Latin name for barley.] About 20 species, widely distributed in both hemispheres.
Flowering scales, exclusive of awn, $6-8 \mathrm{~mm}$. long.
Awn of the flowering scale 1.25 cm . long or less.
All the empty scales of each cluster bristle-like. 1. H. nodosum.
Four of the empty scales of each cluster dilated above the base.
2. H. pusillum.

## Awn of the flowering scale 2.5 cm . long or more.

 Flowering scales, exclusive of awn, about 1.2 cm . long.3. H. jubatum.
4. H. murinum.
5. Hordeum nodòsum L. Meadow Barley. (I. F. f. 529.) Culms 1.5-6 dm. tall, erect, or sometimes decumbent; leaves $3.75-\mathbf{1 2 . 5} \mathrm{cm}$. long, $2-6 \mathrm{~mm}$. wide, flat, rough; spike $2.5-8.5 \mathrm{~cm}$. in length; spikelets usually in 3 's, the central one containing a palet and perfect flower, the lateral enclosing a staminate or rudimentary flower, or a palet only; empty scales of each cluster awn-like; flowering scale of the central spikelet $6-8 \mathrm{~mm}$. long exclusive of the awn, which is $6-12 \mathrm{~mm}$. long, the corresponding scale in the lateral spikelets much smaller and short-stalked. In meadows and waste places, Ind. to Minn., Br. Col. and Alaska, south to Tex. and Cal. Also in Europe and Asia. June-July.
6. Hordeum pusíllum Nutt. Little Barley. (I. F. f. 530.) Culms I-4 dm . tall, erect, or decumbent at the base; leaves $\mathbf{I} .25-7.5 \mathrm{~cm}$. long, $\mathrm{I}-4 \mathrm{~mm}$. wide, erect, smooth beneath, rough above; spike $2.5-7.5 \mathrm{~cm}$. in length; spikelets usually in 3 's, the central one containing a palet and perfect flower, the lateral imperfect; scales awned, the empty ones scabrous, those of the central spikelet and the lower ones of the lateral spikelets dilated above the base; flowering scales smooth, that of the central spikelet $6-8 \mathrm{~mm}$. long, short-awned, the corresponding scale in the lateral spikelets smaller and very short-stalked. In dry soil, Ont. to Br. Col., south to Neb., Ark., Tex. and Cal.; also sparingly introduced along the coast from Va. to Fla. June-July.
7. Hordeum jubatum L. Squirrel-tail Grass. (I. F. f. 53I.) Culms $2.5-7.5 \mathrm{dm}$. tall; leaves $2.5-\mathbf{1 2 . 5} \mathrm{cm}$. long, $2-4 \mathrm{~mm}$. wide, erect, rough; spike 5-10 cm . in length; spikelets usually in 3's, the central one containing a palet and perfect flower, the lateral imperfect; empty scales consisting of slender rough awns $2.5-6.25 \mathrm{~cm}$. long; flowering scale of the central spikelet $6-8 \mathrm{~mm}$. long, scabrous at the apex, bearing a slender rough awn $2.5-6.25 \mathrm{~cm}$. long; the corresponding scale in the lateral spikelets short-awned, about 6 mm . long including its pedicel, sometimes reduced to a rudiment. In dry soil, Ont. to Alaska, south to Kans., Colo. and Cal. Naturalized in the east from Lab. and Quebec to N. J. and Penn. July-Aug.
8. Hordeum murìnum L. Wall Barley. (I. F. f. 532.) Cums 1.5-6 dm . tall, erect, or decumbent at the base; leaves $2.5-15 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wike, rough; spikes $5-10 \mathrm{~cm}$. in length; spikelets usually in 3 's; scales awned, the empty ones awn-like, scabrous, those of the central spikelet broader and ciliate on the margins, bearing awns $\mathbf{I} .8-2.4 \mathrm{~cm}$. long, those of the lateral spikelets similar. with the exception of the second scale, which is not ciliate; flowering scales scabrous at the apex, bearing an awn about 2.5 cm . long, those of the literal spikelets about $\mathbf{I} .2 \mathrm{~cm}$. long, the corresponding scale in the central spikelet somewhat smaller. On ballast and sparingly in waste places, southern N. V. and N. J. to D. C. Also from Ariz. to Cal. Adventive or naturalized from Europe. JuncJuly.

## 100. SITÀNION Raf.

Tufted grasses with flat or involute leaves and a termmal dense spike with the rachis articulated and readily breaking up. Spikelets numerous. in 2's or 3's at each joint, $\mathbf{x}$ - 5 -flowered; empty scales entire or divided, the divisions extemding often to the base, the scales or their divisions bearing long slender awns; palet $z$ keeled. Stamens 3. Styles distinct, short. Stigmas plumose. (irain adherent to the palet. [Greek, the meaning obscure.] Usually considered a monotypu genus, but probably divisible into a number of species.
r. Sitanion elymoìdes Raf. (I. F. f. 540.) Culms r.5-6 dm. tall; sheaths sometimes hirsute; leaves $5-17.5 \mathrm{~cm}$. long, $1-4 \mathrm{~mm}$. wide. often stiff and erect, usually rough, sometimes hirsute, flat or involute; spike $5-15 \mathrm{~cm}$. in length; spikelets I-5-flowered; empty scales entire or divided, often to the base, the divisions awl-shaped and bearing long unequal slender awns $2.5-8.5 \mathrm{~cm}$. in length; flowering scales 6 -1o mm . long, 5 -nerved, scabrous, at least toward the apex, bearing a long slender divergent awn $2.5-8.5 \mathrm{~cm}$. in length, the apex of the scale sometimes 2 -toothed, the teeth often produced into short awns. In dry soil, S. Dak. to Ore., south to Kans., Tex., Ariz., and Cal. Very variable. July-Aug.

## ror. ÉLYMUS L.

Tall grasses, with usually flat leaves and dense terminal spikes. Spikelets 2-several-flowered (rarely I-flowered) sessile, usually in pairs, occasionally in 3 's or more, in alternate notches of the continuous or jointed rachis, the empty scales forming an apparent involucre to the cluster. Two lower scales empty, narrow, acute, sometimes awned, entire; flowering scales shorter, rounded on the back, 5 -nerved, usually bearing an awn. Palet a little shorter than the scale. 2keeled. Stamens 3. Styles very short, distinct. Stigmas plumose. Grain sparsely hairy at the summit, adherent to the palet. [Greek, to roll up, referring to the involute palet.] About 40 species, natives of temperate regions. Besides the following, some 15 others occur in the western parts of N . Am.

Flowering scales conspicuously awned (rarely awnless in No. 2).
Spikelets divergent from the rachis of the broad spike.
Empty scales narrowly awl-shaped; spike slender.
Empty scales linear-lanceolate to linear; spike stout.
Flowering scales glabrous.

1. E. striatus.

Flowering scales more or less appressed-pubescent, 2. E. Virginicus.
Empty scales linear, thick, firm, bearing generally a much shorter awn.
3. E. hirsutiglumis.

Empty scales narrowly lanceolate, rather thin, bearing commonly an awn equalling or exceeding themselves.
Spike rather loosely flowered, nodding at the summit, usually longexserted. 4. E. Canadensis.
Spike densely flowered, compact, strict, usually included at the base.
5. E. robustus.

Spikelets appressed to the rachis of the narrow spike.
Empty scales narrowly lanceolate, acuminate or awn-pointed.
6. E. glaucus.

Empty scales awl-shaped, bearing an awn equalling or exceeding themselves.
7. E. Macounii.

Flowering scales awnless or awn-pointed.
Flowering scales glabrous.
8. E. condensatus.

Flowering scales villous.
9. E. arenarius.
I. Elymus striàtus Willd. Slender Wild Rye. (I. F. f. 533.) Culms 3-9 dm. tall; sheaths glabrous or hirsute; leaves $1.25-2.25 \mathrm{dm}$. long, $4-10 \mathrm{~mm}$. wide, smooth or slightly rough beneath, pubescent above; spike $6-12 \mathrm{~cm}$. in length, often nodding, broad, slender, dense; spikelets divergent from the rachis, $1-3-$ flowered; empty scales awl-shaped, i. $8-2.4 \mathrm{~cm}$. long, including the slender rough awn, I-3-nerved, the nerves, and often the whole scale, rough, hispid or hirsute ; flowering scales about 6 mm . long, smooth, scabrous or hispid, bearing a slender rough awn $\mathrm{I} .6-3 \mathrm{~cm}$. in length. In woods and on banks, Me. and Ont. to Tenn., Neb. and Kans. June-July.
2. Elymus Virgínicus L. Terrell-grass. Virginia Wild Rye. (I. F. f. 534.) Culms 6-9 dm. tall; sheaths sometimes pubescent, the uppermost often inflated and enclosing the peduncle and the base of the spike; leaves $1.25-3.5 \mathrm{dm}$. long, 4-16 mm. wide, rough; spike $5-17.5 \mathrm{~cm}$. in length, broad, stout, upright; spikelets divergent from the rachis, $2-3$-flowered ; empty scales thick and rigid, lanceolate, $1.6-2.4 \mathrm{~cm}$. long, including the short awn, 5-7-nerved; flowering scales $6-8 \mathrm{~mm}$. long, glabrous, bearing a rough awn 4-18 mm. in length, or rarely awnless. In moist soil, especially along streams, N. S. and N. B. to Manitoba, south to Fla. and Tex. Ascends to 600 m. in N. Car. July-Aug.
3. Elymus hirsutiglumis Scribn. \& Sm. Strict Wild-Rye. (I. F. f. 535a.) Culms erect from a perennial root, 3-9 dm. tall; sheaths longer than the internodes, the uppermost often inflated and enclosing the base of the spike; leaves $2-3 \mathrm{dm}$. long, $8-18 \mathrm{~mm}$. wide, acuminate, very rough on both surfaces; spikes $6-15 \mathrm{~cm}$. long, stout, the rachis pubescent; spikelets crowded, in pairs, $2-5$-flowered; empty scales linear, $\mathrm{I}-\mathrm{I} .2 \mathrm{~cm}$. long, thick, $3-5$-nerved, the nerves hirsute, acuminate into a scabrous awn as long as or shorter than the scale; flowering scales lanceolate. 5 -nerved, appressed-hirsute, 8 -10 mm. long, acuminate into a rough awn 1.2-1.6 cm . long. River banks, Me. to Va., west to IIl. and Neb. July-Aug.
4. Elymus Canadénsis L. Nodding Wild-Rye. (I. F. f. 535.) Culms 6-15 dm. tall; leaves $1-3 \mathrm{dm}$. long or more, $4-20 \mathrm{~mm}$. wide, rough, sometimes glaucous; spike 1-3 dm. in length, rather slender, nodding, its peduncle much exserted; spikelets divergent from the rachis, $3-5$-flowered; empty scales awl-shaped, rigid, $3-5$-nerved, $1.6-3.2 \mathrm{~cm}$. long, including the long slender rough awns; flowering scales $8-14 \mathrm{~mm}$. long, nearly smooth to hirsute, bearing a slender scabrous straight or divergent awn $2-5 \mathrm{~cm}$. in length. On river banks, N. S. and N. B. to Alberta, south to Ga., Tex. and N. Mex. Ascends to 630 m. in Va. July-Aug.
5. Elymus robústus Scribn. \& Sm. Stout Wild-Rye. (I. F. f. 535b.) Culms erect, stout, 9-12 dm. tall; sheaths smooth or slightly roughened; leaves firm, very rough on both surfaces, $1-4 \mathrm{dm}$. long, $8-20 \mathrm{~mm}$. wide, acuminate; spike usually partialiy included at the base, stout, strict, I-2.5 dm. long, compact, the rachis usually glabrous except on the angles; spikelets numerous. crowded, in 2 's4's, 3-4-flowered; empty scales subulate, I-I. 2 cm . long, bearing an awn about twice as long; flowering scales lanceolate, $1-1.2 \mathrm{~cm}$. long, 2 -toothed at the apex, from sparsely to densely appressed-pubescent, bearing a straight or curving awn $3-4.5 \mathrm{~cm}$. long. River banks, Ill. to Mont., south to Kans.
6. Elymus glaùcus Buckl. Smooth Wild-Rye. (I. F. f. 536.) Culms 6-15 dm . tall; sheaths rarely pubescent; leaves $\mathbf{1}-3 \mathrm{dm}$. long, $4-16 \mathrm{~mm}$. wide, smooth beneath, sometimes rough above; spike $7 \cdot 5-20 \mathrm{~cm}$. in length, narrow, slender; spikelets appressed to the rachis, 3-6-flowered : empty scales narrowly lanceolate, $8-12 \mathrm{~mm}$. long, acuminate or awn-pointed, rigid, $3-5$-nerved; flowering scales smooth or slightly rough, $\mathbf{I}-\mathbf{I} .2 \mathrm{~cm}$. long, bearing a slender straight rough awn I. 2-1. 8 cm . in length. In moist soil, Ont. to Br. Col., south to Mich., Ariz. and Cal. June-Aug.
7. Elymus Macoùnii Vasey. Macoun's Wild-Rye. (I. F. f. 537.) Culms 3-9 dm. tall; leaves $5-15 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, rough, especially above; spike $5-12.5 \mathrm{~cm}$. in length, narrow, slender, often somewhat flexuous; spikelets appressed to the rachis, single at each node, or the lower sometimes in pairs, 1 - 3 -flowered; empty scales (occasionally 3) awl-shaped, 3 -nerved, rough, $6-8 \mathrm{~mm}$. long, bearing a slender straight rough awn, $6-10 \mathrm{~mm}$. in length; flowering scales $7-10 \mathrm{~mm}$. long, rough toward the apex, bearing a slender straight awn $6-10 \mathrm{~mm}$. long. Prairies, Manitoba and Assiniboia, south to Neb. and N. Mex. July-Aug.
8. Elymus condensàtus Presl. Smooth Lyme-grass. (I. F. f. 538.) Culms $6-30 \mathrm{dm}$. tall; leaves $\mathbf{I} .5-3 \mathrm{dm}$. long or more, $6-24 \mathrm{~mm}$. wide, scabrous, at least above; spike I-4 dm. in length, usually stout, strict, often interrupted below, sometimes compound at the base; spikelets 3-6-flowered, 2 -several at each node of the rachis; empty scales awl-shaped, $9-12 \mathrm{~mm}$. long, I-nerved, usually rough; flowering scales $8-10 \mathrm{~mm}$. long, generally awn-pointed, usually rough, sometimes smooth. In wet saline situations, Alberta to Br . Col., south to Neb., Ariz. and Cal. July-Aug.
9. Elymus arenàrius L. Downy Lyme-grass. Sea Lime-grass. (I. F. f. 539.) Culms $\mathbf{I}-2.5 \mathrm{~m}$. tall, usually softly pubescent at the summit. Sheathe often glaucous; leaves $7.5-30 \mathrm{~cm}$. long or more, $3-10 \mathrm{~mm}$. wide, flat, or becoming involute, smooth beneath, rough above; spike $7 \cdot 5-25 \mathrm{~cm}$. in length, usually strict; spikelets 3-6-flowered, frequently glaucous; empty scales $1.6-2.8 \mathrm{~cm}$. long. 3-5nerved, acuminate, more or less villous; flowering scales $1.0-2 \mathrm{~cm}$. long, acute or awn-pointed, 5-7-nerved, usually very villous. On shores, Greenland and Lab. to the N. W. Terr. and Alaska, south to N. II., Lake Superior and II.ash. Aso in Europe and Asia. Summer,

## 102. HÝSTRIX Moench.

Usually tall grasses, with flat leaves and terminal spikes. Spikelets 2-severalflowered, in pairs, rarely in 3 's, at each node of the rachis. Empty scales wanting, or sometimes appearing as mere rudiments; flowering scales narrow, convolute, rigid, rounded on the back, 5 -nerved above, terminating in an awn; palet scarcely shorter than the scale, 2 -keeled. Stamens 3. Styles very short, distinct. Stigmas plumose. Grain oblong, adhering to the palet when dry. [Greek name of the Porcupine, referring to the long awns.] Four known species, the following and a Californian one occurring in N. Am.
I. Hystrix Hystrix (L.) Millsp. Bottle-brush Grass. (I. F. f. 541.) Culms 6-12 dm. tall; leaves $1-2.5 \mathrm{dm}$. long, $6-12 \mathrm{~mm}$. wide, smooth beneath, rough above; spike $7.5-17.5 \mathrm{~cm}$. in length; spikelets at length widely spreading, $8-12 \mathrm{~mm}$. long, exclusive of the awns, readily deciduous, even when young; empty scales awn-like, usually present in the lowest spikelet; flowering scales $8-\mathbf{1 2} \mathbf{~ m m}$. long, acuminate into an awn about 2.5 cm . in length. In rocky woods, N. B. to Ont. and Minn. south to Ga., Ill. and Neb. Ascends to 630 m . in Va. June-July.

## 103. ARUNDINÀRIA Michx.

Arborescent or shrubby grasses, with simple or branched culms and flat shortpetioled leaves which are articulated with the sheath. Spikelets borne in panicles or racemes, 2-many-flowered, large, compressed. Empty scales 1 or 2, the first sometimes wanting; flowering scales longer, not keeled, many nerved; palets scarcely shorter than the scales, prominently 2 -keeled. Lodicules 3 . Stamens 3 . Styles 2 or 3. Stigmas plumose. Grain furrowed, free, enclosed in the scale and palet. [From Arundo, the Latin name of the Reed.] About 24 species, natives of Asia and America. Two are found in the southern U. S.

Spikelets borne on radical shoots of the year ; culms 4 m . tall or less.

$$
\begin{array}{ll}
\text { Spikelets borne on the old stems ; culms } 5 \mathrm{~m} \text {. tall or mre. } & \text { I. A. tecta. } \\
\text { 2. A. macro }
\end{array}
$$

I. Arundinaria técta (Walt.) Muhl. Scutch Cane. Small Cane. (I. F. f. 542.) Culms $1-4 \mathrm{~m}$. tall, erect, shrubby, branching at the summit. Sheaths longer than the internodes, smooth or rough, ciliate on the margins; ligules bristly; leaves lanceolate, $8.5-20 \mathrm{~cm}$. long, $8-24 \mathrm{~mm}$. wide, flat, more or less pubescent beneath, glabrous above; racemes on short leafless culms; spikelets 7 -IO-flowered, $2.5-3.75 \mathrm{~cm}$. long, on pedicels 2.5 cm . in length or less, which are sometimes pubescent; empty scales unequal, the first usually very small, sometimes
 pubescent. In swamps and moist soil, Md. to Ind. Mo., Fla. and Tex. MayJuly.
2. Arundinaria mácrosperma Michx. Giant Cane. Culms woody, 6-9 m. tall, finally branched above; sheaths ciliate on the margins, otherwise glabrous; leaves lanceolate, smooth or roughish, 3 dm . or less long, the larger $2-3 \mathrm{~cm}$. wide, those on the ultimate divisions smaller and crowded at the summit of the branches; inflorescence on the old wood, the spikelets $3.5-6 \mathrm{~cm}$. long, on slender more or less leafy branches, the flowering scales glabrous or hirsute, acuminate. Forming "cane brakes" along river banks and swamps, Va. to Fla., west to La.; along the Miss. R. and its tributaries as far north as Ky., Tenn. and Mo. May-July.

## Family 2. CYPERÀCEAE J. St. Hil.

## Sedge Family.

Grass-like or rush-like herbs. Stems (culms) slender, solid (rarely hollow), triangular, quadrangular, terete or flattened. Roots fibrous (many species perennial by long rootstocks). Leaves narrow, with closed sheaths. Flowers perfect or imperfect, arranged in spikelets, one (rarely 2) in the axil of each scale (glume, bract), the spikelets solitary
or clustered, I-many-flowered. Scales 2-ranked or spirally imbricated, persistent or deciduous. Perianth hypogynous, composed of bristles, or interior scales, rarely calyx-like, or entirely wanting. Stamens I-3, rarely more. Filaments slender or filiform. Anthers 2-celled. Ovary i-celled. Ovule i, anatropous, erect. Style $2-3$-cleft or rarely simple or minutely 2 -toothed. Fruit a lenticular, plano-convex, or trigonous achene. „Endosperm mealy. Embryo minute.

About 65 genera and 3000 species, of very wide geographic distribution. The dates given below indicate the time of perfecting fruit.

Flowers of the spikelet all, or at least one of them, perfect ; spikelets all similar.
Scales of the spikelets 2 -ranked.
Perianth none ; spikelets in solitary or umbelled terminal heads.
Spikelets with 2-many perfect flowers; scales several to numerous.

1. Cyperus.

Spikelets with but I perfect flower ; scales 2-4.
2. Kyllinga.

Perianth of $6-9$ bristles; inflorescence axillary.
3. Dulichium.

Scales of the spikelets spirally imbricated all around.
Spikelets with several to many perfect flowers.
Base of the style swollen, persistent as a tubercle on the achene.
Leaves reduced to basal sheaths; bristles of the perianth usually present; spikelet solitary. 4. Eleocharis.
Culm leafy ; perianth-bristles none ; spikelets i-numerous.
Spikelets capitate, involucrate. 5. Dichromena.
Spikelets umbellate or cymose.
Spikelets in terminal and axillary compound cymes; most of the style persistent. 6. Psilocarya.
Spikelets in a terminal umbel, base of style persistent.
7. Stenophyllus.

Base of the style enlarged or narrow, deciduous.
Flowers with no broad sepals nor interior perianth-scales.
Style swollen at the base; bristles none. 8. Fimbristylis.
Style not swollen at the base; bristles usually present.
Spikelets solitary to many ; bristles r-6, rarely none.
9. Scirpus.

Spikelets solitary or few; bristles 6-many, soft, smooth, very long, slender, much exserted. 1о. Eriophorum.
Flowers with a perianth of 3 stalked sepals or of 1 or 2 interior hyaline scales.
Perianth of 3 broad stalked sepals, usually alternating with as many bristles. II. Fuirena.
Perianth of I or 2 hyaline scales (sepals ?) ; bristles none. Perianth of a single minute posterior scale. 12. Hemicarpha. Perianth of 2 scales, convolute around the ovary.
13. Lipocarpha.

Spikelets r-4-flowered, some of the flowers imperfect.
Style, or its base, persistent as a tubercle on the achene. 14. Rynchospora. Style wholly deciduous.
15. Cladium.

Flowers all monoecious or dioecious, usually borne in separate small spikelets.
Achene not enclosed in a utricle (perigynium).
Spikelets clustered or solitary, not in a terminal spike; achene bony.
16. Scleria.

Spikelets forming a terminal spike; arctic genera.
Scales 2-flowered, androgynous.
Scales r-flowered, monoecious.
17. Elyna.
18. Kobresia.

Achene enclosed in a utricle (perigynium).
Axis of the pistillate flower conspicuous, subulate, often exserted beyond the perigynium.
19. Lucinia.

Axis of the pistillate flower rudimentary or none, not exserted.
20. Carex.

## 1. CYPERUS L.

Annual or perennial sedges. Culms in our species simple, triangular, leafy near the base, and with I or more leaves at the summit forming an involucre to the simple or compound, umbellate or capitate inflorescence. Rays of the umblel sheathed at the base, usually very unequal, one or mote of the heads or spikes
commonly sessile. Spikelets flat or subterete, the scales falling away from the rachis as they mature (nos. I-19), or persistent and the spikelets falling away from the axis of the head or spike with the scales attached (nos. 20-32). Scales concave, conduplicate or keeled, 2-ranked, all flower-bearing or the lower ones empty. Flowers perfect. Perianth none. Stamens 1-3. Style 2-3-cleft, deciduous from the summit of the achene. [Ancient Greek name for these sedges.] About 650 species, of wide distribution in tropical and temperate regions. Besides the following, some 40 others occur in the southern U. S.
Style 2-cleft ; achene lenticular, not 3 -angled; scales falling from the rachis; spikelets flat.

Achene one-half as long as the scale; umbel nearly or quite simple.
Spikelets yellow ; superficial cells of the achene oblong. I. C. flavescens. Spikelets green or brown; superficial cells of the achenc quadrate.

Scales obtuse or obtusish, appressed.
Scales membranous, dull; style much exserted. 2. C. diandrus. Scales subcoriaceous, shining ; style scarcely exserted.

Scales acute, somewhat spreading at maturity.
Achene narrowly obovate ; spikelets i-3 cm. long. 4. C. Nuttallii.
Achene linear-oblong; spikelets $0.5^{-2} \mathrm{~cm}$. long. 5. C. microdontus. Achene nearly as long as the scale; umbel sometimes much compound.
A. Scales falling away from the persistent rachis of the flattened spikelets. Wings of the rachis, if present, permanently adnate to it. Scales tipped with recurved awns ; low annual, $2-15 \mathrm{~cm}$. tall.
7. C. inflexus.

Scales acute or obtuse, not awned.
Wings of the rachis none or very narrow.
Stamens 3 ; spikelets linear-oblong, $8-25 \mathrm{~mm}$. long; scales acute Annual ; culms smooth, $5-25 \mathrm{~cm}$. long. 8. C. compressus.
Perennial ; culms rough, $30-85 \mathrm{~cm}$. tall. 9. C. Schweinitziz.
Stamen I; spikelets ovate, $4^{-8} \mathrm{~mm}$. long.
Tall perennial ; achene linear ; scales acutish.

1. C. pseudovegetus.

Low annual ; achene oblong; scale-tips recurved.
II. C. acuminatus.

Wings of the rachis evident.
Low annual, adventive from Europe ; scales brown.
12. C. fuscus.

Tall indigenous perennials (no 13 sometimes annual ?).
Lower leaves reduced to pointed sheaths.
Leaves all elongated-linear.
Scales mucronate, reddish brown or green.
14. C. dentatus.

Scales acute or obtuse, not mucronate.
Scales wholly or partly purple-brown; achene linear. Scales tightly appressed. 15. C. rotundus. Tips of the scales free. r6. C. Hallii. Scales straw-colored; achene obovoid.
17. C. esculentus.

Wings of the rachis separating from it as interior scales; annuals.

Spikes loose; spikelets $6-20 \mathrm{~mm}$. long.
18. C. erythrorlizizos. Spikes dense, cylindric ; spikelets $3-5 \mathrm{~mm}$. long.
19. C. Halei.
B. Spikelets falling away from the axis of the spikes, the lower pair of scales con: monly persistent.

Annuals; spikelets elongated, nearly terete. Scales imbricated; achene obovoid.

Scales thin, dull brown; spikelets very slender. 20. C. speciosus.
Scales rigid, yellow-brown; spikelets stout. 21. C. ferox.
Scales distant, achene linear-oblong.
22. C. Englemanni。

Perennial by hard, tuber-like basal corms; spikelets more or less flattened. Achene narrowly linear-oblong, 3-4 times as long as thick.

Spikelets flat, several-many-flowered. 23. C. strigosus.
Spikelets subterete, few-flowered.
Spikelets $12-25 \mathrm{~mm}$. long, loosely spicate ; lower reflexed.
24. C, refractus.

Spikelets $3-12 \mathrm{~mm}$. long, densely capitate or spicate. Spikelets all reflexed; culms rough. 25. C. retrofractus. Spikelets spreading or only the lower reflexed; culms smooth. Heads oblong or cylindric.

Spikelets 6-10 mm. long, the lower reflexed.
26. C. Lancastriensis.

Spikelets $3-4 \mathrm{~mm}$. long, the lower spreading.
27. C. cylindricus.

Heads globose.
28. C. ovularis. Achene oblong or obovoid, about twice as long as thick.

Rachis wingless or very narrowly winged.
Scales pale green, membranous, dull. 29. C. filiculmis.
Scales chestnut-brown, shining.
30. C. Houghtoni.

Rachis-wings membranous, broad.
Scales firm, not appressed ; spikelets loosely capitate.
31. C. Grayi.

Scales thin, closely appressed ; spikelets densely capitate.
32. C. echinatus.
I. Cyperus flavéscens L. Yellow Cyperus. (I. F. f. 543.) Annual; culms very slender, tufted, leafy below, $7-30 \mathrm{~cm}$. tall, mostly longer than the leaves. Leaves $2-3 \mathrm{~mm}$. wide, smooth, the longer usually exceeding the inflorescence; clusters terminal and sessile, or on 1-4 short rays ; spikelets in 3's-6's, linear, subacute, yellow, many-flowered, flat, $8-18 \mathrm{~mm}$. long, $3-4 \mathrm{~mm}$. broad; scales ovate, obtuse, I-nerved, appressed, twice as long as the orbicular-obovate black obtuse lenticular shining achene ; stamens 3; style deeply 2 -cleft ; superficial cells of the achene oblong. In marshy ground, Me. to Mich., Fla. and Mex. Also in the Old World. Aug.-Oct.
2. Cyperus diándrus Torr. Low Cyperus. (I. F. f. 544.) Annual; culms tufted, slender, 5-40 cm. tall. Leaves about 2 mm . wide, those of the involucre usually 3 ; clusters sessile and terminal, or at the ends of I-3 rays; spikelets 8 -18 mm . long, linear-oblong, acute, flat, many-flowered; scales ovate, green, brown, or with brown margins, obtuse, I-nerved, appressed, membranous, dull; stamens 2 or 3; style 2 -cleft, its branches much exserted; achene lenticular, oblong, gray, not shining, one-half as long as the scale, its superficial cells quadrate, about as long as wide. In marshy places, N. B. to Minn., S. Car. and Kans. Aug.-Oct.
3. Cyperus rivulàris Kunth. Shining Cyperus. (I. F. f. 545.) Similar to the preceding species, culms slender, tufted. Umbel usually simple; spikelets linear or linear-oblong, acutish, $8-20 \mathrm{~mm}$. long; scales green or dark brown, or with brown margins, appressed, firm, subcoriaceous, shining, obtuse; stamens mostly 3 ; style 2 -cleft, scarcely exserted; achene oblong or oblong-obovate, lenticular, somewhat pointed, dull, its superficial cells quadrate. In wet soil, especially along streams and ponds, Me. to S. Ont., Mich. and Neb., Va., N. C. and Mo. Aug.-Oct.
4. Cyperus Nuttàllii Eddy. Nuttall's Cyperus. (I. F. f. 546.) Annual; culms slender, tufted, equalling or longer than the leaves. Leaves of the involucre $3-5$, spreading, the larger often 12 cm . long; umbel 3-7-rayed; spikelets rather loosely clustered, linear, very acute, flat, spreading, $\mathbf{I}-3 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide: scales yellowish-brown with a green keel, oblong, acute; stamens 2 ; style z-cleft. its branches somewhat exserted; achene lenticular, narrowly obovate, obtuse or truncate, dull, light brown, one-third to one-half as long as the scale, its superficial cells quadrate. Salt marshes, Me. to Miss. Aug.-Oct.
5. Cyperus microdóntus Torr. Coast Cyperus. (I. F. f. 547.) Ammal: similar to the preceding species; culms very slender, tufted, sometimes 0.5 m . high. Leaves about 2 mm . wide, those of the involucre much elongated; umbel commonly simple, sessile, capitate, or I-6-rayed; spikelets linear, acute, 6-18 mm. long. less than 2 mm . wide, yellowish-brown; scales ovate, acute, thin; style z-cheft, its branches much exserted; achene lenticular, linear-oblong, short-pointed. light brown, one-half as long as the scale, its superficial cells quadrate. In wet soil, on or near the coast, Va. to Fla. and Tex. Aug.-Oct.
6. Cyperus flavícomus Michx. ElebiNT ('vperts. (I. F. f. 54i̊) Anmal; culms o.3-1 m. tall, leafy below. Leaves $4-6 \mathrm{~mm}$. wide, those of the involucre $3^{-8}$, the longer ones much exceeding the inflorescence; umbels few-several-rayed;
often compound; primary rays $\mathbf{1}-6 \mathrm{~cm}$. long; spikelets numerous, usually densely clustered, linear, acute, $8-20 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide, flat, many-flowered, spreading; scales oblong, obtuse, thin, dull, yellowish-brown; stamens 3; style 2-cleft, little exserted; achene obovate, lenticular, black, mucronate, not shining, nearly as long as the scales and often persistent on the rachis after these have fallen away. In wet or moist sandy soil, Va. to Fla. and La. Aug.-Oct.
7. Cyperus infléxus Muhl. Awned Cyperus. (I. F. f. 549.) Annual; culms slender or almost filiform, tufted, about equalled by the leaves. Leaves 2 mm . wide or less, those of the involucre 2-3, exceeding the umbel; umbel sessile, capitate, or I-3-rayed; spikelets linear-oblong, 6 -Io-flowered, 4-6 mm. long; scales light brown, lanceolate, rather firm, strongly several-nerved, tapering into a long, recurved awn, falling from the rachis at maturity; stamen $\mathbf{1}$; style 3-cleft; rachis winged, the wings persistent; achene 3 -angled, brown, dull. narrowly obovoid or oblong, obtuse, mucronulate. In wet, sandy soil, Vt. to the N. W. Terr. and Ore., south to Fla., Tex., Cal. and Mex. Fragrant in drying. July-Sept.
8. Cyperus compréssus L. Flat Cyperus. (I. F. f. 550.) Annual; culms slender, erect or reclining, smooth, 7-25 cm. long. Leaves light green, about 2 mm . wide, those of the involucre $2-3$, the longer exceeding the spikelets; umbel capitate or with $2-3$ short rays; spikelets narrowly lanceolate, acute, $8-20 \mathrm{~mm}$. long, 3-4 mm. wide, very flat, many-flowered; scales light green with a yellow band on each side, ovate, acuminate, firm, keeled, several-nerved, falling away from the narrowly-winged rachis at maturity; stamens 3 ; style 3 -cleft; achene sharply 3 -angled, obovoid, obtuse, dull, brown, about one-third as long as the scale. In fields, Md. to Fla., west to Mo. and Tex. Also in trop. Amer. and the Old World. Aug.-Oct.
9. Cyperus Schweinítzii Torr. Schweinitz's Cyperus. (I. F. f. 55I.) Perennial by the thickened corm-like bases of the culms; culms rather slender, rough, at least above, $0.3-0.8 \mathrm{~m}$. tall. Leaves $2-5 \mathrm{~mm}$. wide, rough-margined, those of the involucre 3-7, erect; umbel simple, 3-9-rayed, the rays erect, sometimes 10 cm . long; spikelets flat, in rather loose ovoid spikes, which are linearoblong, $6-\mathrm{I} 2$-flowered, $8-\mathrm{I} 6 \mathrm{~mm}$. long; scales convex, light green, ovate, acute or acuminate, 9-13-nerved, falling away from the rachis at maturity; stamens 3 ; style 3 -cleft; achene 3 -angled, oblong, brown, acute at each end, nearly as long as the scale. In sandy soil, especially along lakes and streams, W. N. Y. and S. Ont. to the N. W. Terr., Minn., Iowa and Kans. Aug.-Oct.
io. Cyperus pseudovégetus Steud. Marsh Cyperus. (I. F.f. 552.) Perennial by thickened tuber-like joints of the rootstocks, culm rather stout, $0.3-1.3 \mathrm{~m}$. high, often equalled by the leaves. Leaves $3-4 \mathrm{~mm}$. wide, smooth, nodulose, the midvein prominent; leaves of the involucre 4-6, spreading: umbel severalrayed, compound; spikelets ovate, flat, many-flowered, light green, densely capitate, 4-6 mm. long; scales keeled, conduplicate, I-nerved, curved, acute, longer than the linear 3 -angled slightly stalked achene; stamen 1; style 3-cleft. In marshes, Del. to Fla., west to Kans. and Tex. July-Sept.
ir. Cyperus acuminàtus Torr. \& Hook. Short-pointed Cyperus. (I. F.f. 553.) Annual; culms very slender, tufted, $7-40 \mathrm{~cm}$. tall. Leaves light green, usually less than 2 mm . wide, those of the involucre much elongated; umbel I-4rayed, simple; rays short; spikelets flat, ovate-oblong, obtuse, 4-8 mm. long, manyflowered, densely capitate; scales oblong, pale-green, 3-nerved, coarsely cellular, conduplicate, with a short sharp more or less recurved tip; stamen I; style 3 -cleft; achene sharply 3 -angled, gray, oblong, narrowed at each end, about one-half as long as the scale. In moist soil, Ill. to La., west to Iowa, Kans., Ore., Tex., and Cal. July-Oct.
12. Cyperus fúscus L. Brown Cyperus. (I. F. f. 554.) Annual; culms tufted, $15-40 \mathrm{~cm}$. high, longer than or equalled by the leaves. Leaves rather dark green, about 2 mm . wide, those of the involucre 4-6; umbel several-rayed; spikelets linear, $4-\mathrm{I} 4 \mathrm{~mm}$. long, less than 2 mm . wide, many-flowered, acute; scales ovate, subacute, becoming dark brown, faintly about 3 -nerved, separating from the narrowly winged rachis as they mature; stamens 2 or 3 ; style 3 -cleft; achene 3 -angled, oblong, pointed at each end, nearly as long as the scale. Revere Beach, Mass., and New London, Conn. Adventive or fugitive from Europe. Also in ballast about the eastern seaports. July-Sept.
13. Cyperus Háspan L. Sheathed Cyperus. (I. F. f. 555.) Perennial by short rootstocks (sometimes annual ?), roots fibrous; culms weak, tufted, o.3-I m . high. Lower leaves reduced to membranous acuminate sheaths; leaves of the involucre about 2 , usually less than 2 mm . wide; umbel simple or compound, the longer rays $2-5 \mathrm{~cm}$. long; spikelets few, capitate, linear, acute, many-flowered, 612 mm . long, about I mm. wide; scales oblong or oblong-lanceolate, reddish-brown, acute, mucronulate, keeled, 3-nerved; rachis winged; stamens 3; style 3-cleft; achene 3 -angled, broadly obovoid, obtuse, nearly white, much shorter than the scale. In swamps, Va. to Fla, and Tex., mostly near the coast. Also in tropical America and in the warmer parts of Europe, Asia, and Australia. July-Sept.
14. Cyperus dentàtus Torr. Toothed Cyperus. (I. F. 556.) Perennial by scaly rootstocks which sometimes bear small tubers; culms rather stiff, o.2-0.5 m . tall. Leaves keeled, $2-4 \mathrm{~mm}$. wide, those of the involucre umbel, somewhat compound; longer rays $2.5-7.5 \mathrm{~cm}$. long; spikelets linear, very flat, many-flowered, mostly blunt, $10-20 \mathrm{~mm}$. long, nearly 4 mm . wide; scales light reddishbrown, ovate-lanceolate, thin, keeled, 5-7-nerved, mucronate, separating from the rachis when mature, their tips spreading; causing the spikelet to appear toothed; stamens 3; style 3 -cleft, the branches exserted; achene 3 -angled, obtuse, mucronate, light brown, much shorter than the scale. In sandy swamps and on river shores, Me. to N. N. Y., south to W. Va. and S. Car. Scales often modified into tufts of small leaves. Aug.-Oct.
15. Cyperus rotúndus L. Nut-grass. (I. F. f. 557.) Perennial by scaly tuber-bearing rootstocks; culm rather stout, $0.1-0.5 \mathrm{~m}$. high, usually longer than the leaves. Leaves $3-6 \mathrm{~mm}$. wide, those of the involucre $3-5$; umbel 3-8-rayed, the longer rays $5-\mathbf{I I} \mathrm{cm}$. long; spikelets linear, clustered, few in each cluster, acute, $8-20 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. wide; scales dark purple-brown or with green margins and centre, ovate, acute, appressed when mature, about 3 -nerved on the keel; stamens 3; style 3-cleft, its branches exserted; achene 3-angled, about onehalf as long as the scale. In fields, Va. to Fla., west to Kans. and Tex. Also in tropical Am., and widely distributed in the Old World. July-Sept.
16. Cyperus Hallii Britton. Hall's Cyperus. (İ. F. f. 558.) Perennial by scaly rootstocks; culm rather stout, $0.6-0.9 \mathrm{~m}$. tall, about equalled by the leaves. Basal leaves about $4-6 \mathrm{~mm}$. wide; involucral leaves $3-6$, the longer much exceeding the inflorescence; umbel compound, its longer rays $7-10 \mathrm{~cm}$. long, the raylets sometimes 2.5 cm . long; spikelets numerous, loosely clustered, linear, 7-15flowered, 10- 16 mm . long, $2-3 \mathrm{~mm}$. wide; involucels setaceous; scales ovate, acute, strongly 7-9-nerved, dark reddish-brown or with lighter margins, their tips not appressed; stamens 3 ; style 3-cleft, its branches much exserted; achene linearoblong, 3 -angled, about one-half as long as the scale. Kans. and the Ind. Terr. to Tex. July-Sept.
17. Cyperus esculéntus L. Vellow Nut-grass. (I. F. f. 559.) Peremial by scaly tuber-bearing rootstocks; culm usually stout, $0.3-0.8 \mathrm{~m}$. tall, commonly shorter than the leaves. Leaves light green, $4^{-8} \mathrm{~mm}$. wide, the midvein prominent; those of the involucre $3 \div 6$, the longer much exceeding the inflorescence; umbel 4-Io-rayed, often compound; spikelets numerous in loose spikes, straw-color or yellowish-brown, flat, spreading, $\mathbf{I}-2.5 \mathrm{~cm}$. long, about 3 mm . wide, manyflowered; scales ovate-oblong, subacute, $3-5$-nerved; rachis narrowly winged; stamens 3 ; style 3 -cleft; achene obovoid, obtuse, 3 -angled. In moist fields, N. B. to Minn. and Neb., south to Fla. and Tex. Also on the Pacific Coast from Cal. to Alaska, in tropical America, and widely distributed in the Old World. sometimes a troublesome weed. Aug.-Oct.

Cyperus esculéntus angustispicàtus Britton. Spikelets very slender, 2 mm , wide or less. Mass. to S. Car. and Mo.
18. Cyperus erythrorhizos Muhl. RFD-Rontrn Cipfris. (1. F. f. 5(x).) Annual; culms tufted, stout or slender, $7-50 \mathrm{~cm}$. tall. Leaves $3-8 \mathrm{~mm}$, wide, rough-margined, those of the involucre $3-7$. some of them 3.5 times as hong as the inforescence; umbel mostly compound; spikelets linear, subboute, o 25 mm . hons. less than 2 mm . wide, compressed, man-flowered, clustered in whong, nearly of quite sessile spikes; scales bright chestnut brown, ohboms: lameoblate, mucromulate. appressed, separating from the rachis at maturity, the mombanous wings of the
rachis separating as a pair of hyaline interior scales; stamens 3; style 3-cleft; achene sharply 3 -angled, oblong, pointed at both ends, pale, one-half as long as the scale. In wet soil, S. Ont. to Mass. and Fla., west to Neb., Kans., Tex. and Cal. Aug.-Oct.
19. Cyperus Hàlei Torr. Hale's Cyperus. (I. F. f. 56i.) Annual; culm stout, o. $6-1 \mathrm{~m}$. tall, about equalled by the leaves. Leaves $6-8 \mathrm{~mm}$. wide, very rough-margined, those of the involucre 5-8, much elongated; umbel compound, several-rayed; spikes cylindric, sessile or very nearly so, exceedingly dense, I-2.5 cm . long; spikelets very numerous, linear, $3-5 \mathrm{~mm}$. long, I mm . wide, spreading; scales brown, keeled. indistinctly 5 -nerved, oblong. mucronulate, separating from the rachis at maturity, the wings of the rachis separating as a pair of hyaline scales, as in the preceding species; stamens 3 ; style 3 -cleft; achene 3 -angled, minute. In swamps, S. Mo. to Tenn., La. and Fla. July-Sept.
20. Cyperus speciòsus Vahl. Michaux's Cyperus. (I. F. f. 562.) Annual; culms usually tufted, $10-40 \mathrm{~cm}$. tall, reddish toward the base. Leaves rough-margined, $3-5 \mathrm{~mm}$. wide, the midvein prominent; leaves of the involucre much exceeding the umbel; umbel $3-7$-rayed, the primary rays $2-15 \mathrm{~cm}$. long; involucels narrow; spikelets subterete, very narrowly linear, $8-25 \mathrm{~mm}$. long, less than 2 mm . thick, Io-30-flowered, falling away from the axis at maturity; scales dull brown, thin, appressed, ovate, obtuse, faintly 3 - 5 -nerved on the back; rachiswings broad, clasping the achene, persistent; stamens 3 ; style 3 -cleft, slightly exserted; achene pale, 3 -angled, about one-half as long as the scale. In marshes, E. Mass. and R. I. to Ohio and Minn., Fla., Tex. and Cal. July-Sept.

Cyperus speciòsus ferruginéscens (Boeckl.) Britton. Scales spreading or slightly recurved, reddish. Mo. to Tex. and N. Mex.

Cyperus speciòsus pàrvus (Boeckl.) Britton. Culm 2-7 cm. high; umbel very simple, generally of but a single cluster of short spikelets. Mo. to N. Mex.
21. Cyperus fèrox Vahl. Coarse Cyperus. (I. F. f. 563.) Annual, closely related to the preceding species, but with smooth-margined, shorter and broader leaves, those of the involucre sometimes but little exceeding the inflorescence. Umbel often compact, the rays mostly short; spikelets linear, subterete, $\mathbf{1 0} \mathbf{0} \mathbf{2 0}$ flowered, $16-25 \mathrm{~mm}$. long, about 2 mm . thick, falling away from the axis at maturity; scales ovate-oblong, appressed, imbricated, obtuse, rather firm, green and 7-9-nerved on the back, yellowish on the sides; stamens 3; style 3-cleft; rachis broadly winged; achene 3 -angled, narrowly obovoid, obtuse. In wet soil, Mo. to Cal. and widely distributed in tropical America. Aug.-Oct.
22. Cyperus Engelmánni Steud. Evgelmanis's Cyperus. (I. F. f. 564.) Annual; culms slender, $15-75 \mathrm{~cm}$. tall. Leaves elongated, $4-6 \mathrm{~mm}$. wide, flaccid, roughish on the margins, those of the involucre 4-6, the longer exceeding the umbel; umbel often compound, the spikelets often densely crowded, very narrowly linear, subterete, $\mathbf{I}-2.5 \mathrm{~cm}$. long, 5-15-flowered; rachis narrowly winged; scales greenish-brown, oblong, obtuse, thin, faintly 3 - 5 -nerved on the back, distant, the successive ones on each side of the spikelet separated by a space of about one-half their length; stamens 3 ; style 3 -cleft; achene linear-oblong, 3 -angled, two-thirds as long as the scale. In wet soil, Mass. to S. Ont. and Wisc., south to N. J. and Mo. Aug.-Oct.
23. Cyperus strigòsus L. Straw-colored Cyperus. (I. F. f. 565.) Perennial by basal tuber-like corms; culm rather stout, $0.3-0.9 \mathrm{~m}$. tall. Leaves rough-margined, 4-6 mm . wide, the longer ones of the involucre much exceeding the umbel; umbel several-rayed, some of the primary rays often $10-15 \mathrm{~cm}$. long, their sheaths terminating in 2 bristles; involucels setaceous; heads oblong or ovoid; spikelets flat, linear, $8-19 \mathrm{~mm}$. long, 2 mm . wide or less, $7-15$-flowered, separating from the axis at maturity; scales straw-colored, oblong-lanceolate, subacute, strongly several-nerved; stamens 3 ; style 3 -cleft; achene linear-oblong, 3 -angled, acute, about one-third as long as the scale. In moist meadows, swamps or along streams, Me. and Ont. to Minn. and Neb., south to Fla. and Tex. Aug.Oct.

Cyperus strigòsus capitàtus Boeckl. Unibel simple or nearly so; spikelets 8-14 mm. long, densely capitate in subglobose heads. Range of the type.

#### Abstract

Cyperus strigòsus compósitus Britton. Umbel very compound; heads cylindric; spikelets 6-12 mm. long, 4-6-flowered. S. N. Y. and Penn. to Ala. and Iowa.

Cyperus strigòsus robústior Kunth. Umbel compound; spikelets $16-25 \mathrm{~mm}$. long, 10-25-flowered. Range of the type.

24. Cyperus refráctus Engelm. Reflexed Cyperus. (I. F. f. 566.) Perennial by tuber-like corms; culm stout, smooth, $0.3-0.9 \mathrm{~m}$. tall. Leaves $5-8 \mathrm{~mm}$. wide, rough-margined, elongated; umbel 6-13-rayed, usually compound, the longer rays sometimes 20 cm . long, their sheaths terminating in I or 2 short teeth; involucels setaceous; raylets filiform; spikelets very narrowly linear, loosely spicate, acute, flattish, $\mathbf{I}-2.5 \mathrm{~cm}$. long, I mm. thick, 3-6-flowered, the upper spreading, the lower reflexed; scales yellowish-green, oblong-lanceolate, obtuse, closely appressed, 9-II-nerved, thin; stamens 3; style 3-cleft, its branches much exserted; achene narrowly linear, obtuse, apiculate, about 5 times as long as thick, and onehalf as long as the scale. In dry fields, N. J. to N. Car. and Mo. July-Sept.
25. Cyperus retrofráctus (L.) Torr. Rough Cyperus. (I. F. f. 567.) Perennial by tuber-like corms; culm rough-puberulent, at least above, mostly longer than the puberulent leaves. Leaves $3-5 \mathrm{~mm}$. wide, those of the involucre $4-7$, the longer not greatly exceeding the umbel, sometimes shorter; umbel simple; rays $5-15 \mathrm{~cm}$. long, their sheaths 2 -toothed; heads oblong or obovoid; spikelets linearsubulate, $6-\mathbf{I} 2 \mathrm{~mm}$. long, about $\mathbf{I} \mathrm{mm}$. thick, $\mathbf{1 - 2}$-flowered, all soon strongly reflexed, separating from the axis at maturity; flowering scales lanceolate, acute, the upper one subulate, all strongly several-nerved; stamens 3; style 3-cleft; achene linear, 3 -angled, obtuse, apiculate, two-thirds as long as the scale. In dry sandy soil, S. N. J. to Fla., west to Ky., Ark. and Tex. July-Sept.
26. Cyperus Lancastriénsis Porter. Lancaster Cyperus. (I. F. f. 568.) Perennial by ovoid or oblong corms; culm slender, smooth, mostly longer than the leaves, $0.3-0.8 \mathrm{~m}$. tall. Leaves $4-6 \mathrm{~mm}$. wide, those of the involucre $4-7$, the longer much exceeding the inflorescence ; umbel simple, 5-9-rayed, the longer rays 5-10 cm . long, their sheaths nearly truncate; heads oval, obtuse, $\mathbf{I}-2.5 \mathrm{~cm}$. long; spikelets densely clustered, $8-10 \mathrm{~mm}$. long, linear, subterete, $2-4$-flowered, the lower reflexed, the middle ones spreading, all separating from the axis at maturity; scales green, strongly several-nerved, the flowering ones lanceolate, subacute; stamens 3 ; style 3 -cleft; achene linear, obtuse, apiculate, 2-3 times as long as thick, two-thirds as long as the scale. In dry fields, N. J. and Penn. to Va. and Ala. July-Sept.
27. Cyperus cylíndricus (Ell.) Britton. Pine-barren Cyperus. (I. F. f. 569.) Perennial by small hard corms ; culms smooth, usually tufted, I-5 dm. tall, longer than the leaves. Leaves $2-3 \mathrm{~mm}$. wide, the longer ones of the involucre much exceeding the umbel; umbel simple, the rays short, or the longer $2-7 \mathrm{~cm}$. long, the sheaths 2 -toothed; heads very dense, cylindric, $6-12 \mathrm{~mm}$. long, $4-8 \mathrm{~mm}$. in diameter; spikelets $3-4 \mathrm{~mm}$. long, flattish, $1-2$-flowered, spreading or the lower reflexed; scales green, oblong ; rachis winged ; stamens 3 ; style 3-cleft ; achene linear-oblong, 3 -angled, apiculate, slightly more than one-half as long as the scale. In sandy pine barrens and on the sea shore, S. N. Y. to Fla., west to Tex., mostly near the coast. July-Sept.
28. Cyperus ovulàris (Michx.) Torr. Globose Cyperus. (I. F. f. 570.) Perennial by hard tuber-like corms ; culm usually strict, smooth, $0.2-0.8 \mathrm{~m}$. tall, longer than the leaves. Leaves smooth, $4^{-6} \mathrm{~mm}$. wide, the longer ones of the involucre much exceeding the umbel ; umbel simple. few-rayed; sheath of the rays truncate or slightly toothed; heads globose or sometimes a little longer than thick. 8-14 mm. in diameter, very dense, the spikelets radiating in all directions: spikelets 4-7 mm. long, usually 3 -flowered, separating from the axis at maturity; rachis winged; scales ovate or ovate-lanceolate, ohtuse or subacute, grem, stromgly soveralnerved; stamens 3 ; style 3 -cleft; achene linear-oblonge, 3 -anslad. $2-3$ times ats has as thick. In dry fields and on hills, S. N. V. to Fla.. Wiest to III. Kans, and Tea. July-Sept.
29. Cyperus filiculmis Vahl. Slexime (ctperts. (l. F. f. 57 r.) Permmial by hard oblong corms; culm smooth, slemere or almost filifinm, asconding or reclined, $\mathbf{x}$.5-4.5 dm. long, usually longer than the romgh-matyined hates. 1 caves $2-4 \mathrm{~mm}$. wide, keeled; spikelets densely clustered in $x-7$ globose heads, linear, acute, 5-11 -flowered, subterete or compressed, $5-12 \mathrm{~mm}$. long, 2 mm . wide or less,
tardily falling from the axis at maturity ; rachis wingless ; scales ovate, acute or obtuse, pale green, strongly 7-II-nerved, appressed ; stamens 3 ; style 3-cleft ; achene oblong or obovoid, 3 -angled, obtuse, apiculate, dull gray, two-thirds as long as the scale, about twice as long as thick. In dry fields and on hills, N. H. to Ont., Minn. and Neb. south to Fla., Kans., Tex. and No. Mex. June-Aug.
30. Cyperus Hoùghtoni Torr. Houghton's Cyperls. (I. F. f. 572.) Perennial by tuber-like corms; culms very slender, smooth, $0.3-0.6 \mathrm{~m}$. tall. Leaves shorter than the culm, 2 mm . wide or less, smooth, those of involucre $3-5$, the longer much exceeding the umbel; umbel simple, 1-5-rayed, the rays mostly short, their sheaths 2 -toothed; spikelets loosely capitate, linear, compressed, acute, $8-16 \mathrm{~mm}$. long, about 2 mm . wide, $11-15$-flowered, falling away from the axis when mature; scales chestnut-brown, firm, shining, oblong, obtuse, truncate, or apiculate, strongly about II-nerved; rachis very narrowly winged; stamens 3; style 3 -cleft; achene broadly oblong, less than twice as long as thick, 3 -angled, brown, apiculate, nearly as long as the scale. In sandy soil, Mass. to Minn., Kans. and Ore. July-Aug.
31. Cyperus Gràyi Torr. Gray's Cyperus. (I. F. f. 573.) Perennial by thick hard oblong or ovoid corms; culms tufted, ascending or reclined, stiff, smooth, very slender, $15-50 \mathrm{~cm}$. long. Leaves shorter than the culm, bright green, 2 mm . wide or less, those of the involucre 4-8; umbel 4-10-rayed, simple, the longer rays $7-10 \mathrm{~cm}$. long; sheaths of the rays truncate or nearly so; spikelets 5-10 mm. long, loosely capitate, compressed, linear, rigid, spreading ; scales green, ovate, obtuse or subacute, strongly 13-15-nerved, rather widely spreading when old ; joints of the rachis broadly winged; stamens 3 ; style 3-cleft; achene oblong or oblong-obovoid, obtuse, apiculate, about two-thirds as lung as the scale. In sands of the sea shore and in pine barrens, N. H. to Fla. July-Sept.
32. Cyperus echinàtus (Ell.) Wood. Baldiwn's Cyperts. (I. F. f. 574.) Perennial by tuber-like corms; culms slender, smouth, erect, mostly longer than the leaves. Leaves pale green, $3-4 \mathrm{~mm}$. wide, those of the involucre $5-10$, the longer usually much exceeding the umbel; umbel, 6-13-rayed; the rays filiform, their sheaths short, mucronate; spikelets $4-6 \mathrm{~mm}$. long. linear, flat, capitate in globose heads; scales thin, pale green, appressed, ovate-lanceolate, acute, 9-13-nerved, with narrow scarious margins: joints of the rachis broadly winged; stamens 3 ; style 3 -cleft; achene oblong-obovoid, obtuse, one-half as long as the scale, about twice as long as thick. In dry soil, N. Car. to Fla., west to Mo. and Tex. July-Aug.

## 2. KÝLLINGA Rottb.

Annual or perennial sedges, with slender triangular culms, leafy below, and with 2 or more leaves at the summit forming an involucre to the strictly sessile, simple or compound, dense head of spikelects. Spikelets numerous, compressed, falling away from the axis of the head at maturity, consisting of only 3 or 4 scales, the I or 2 lower ones small and empty, the middle one fertile, the upper empty or staminate. Joints of the rachis wingless or narrowly winged. Scales 2-ranked, keeled. Perianth none. Stamens I-3. Style 2-3-cleft, deciduous from the summit of the achene. Achene lenticular or 3-angled. [In honor of Feter Kylling, a Danish botanist of the seventeenth century:] About 20 species, natives of tropical and temperate regions. Besides the following, 2 others occur in the So. U. S.
I. Kyllinga pùmila Michx. Low KilliNg.A. (I. F. f. 575.) Annual; culms densely tufted, filiform, erect or reclined, $3-40 \mathrm{~cm}$. long, mostly longer than the leaves. Leaves light green, roughish on the margins, usually less than 2 mm . wide. those of the involucre 3-5, elongated, spreading or reflexed; head oblong or ovoid-oblong, $6-8 \mathrm{~mm}$. long, simple or commonly with I or 2 smaller ones at the base; spikelets about 3 mm . long, flat, I-flowered, the 2 empty lower scales more or less persistent on the rachis after the fall of the rest of the spikelet; scales ovate, acuminate or acute, thin, about 7 -nerved; stamens 2; style 2 -cleft; achene lenticular, obtuse. In moist or wet soil, Va. to Fla., west to Ill., Mo., Tex. and Mex. Aug.-Sept.
3. DULÍCHIUM L. C. Richard.

A tall perennial sedge, with terete hollow jointed culms, leafy to the top, the lower leaves reduced to sheaths. Spikes axillary, peduncled, simble or compound.

Spikelets ?-ranked, flat, linear, falling away from the axis at maturity (?) manyflowered. Scales 2-ranked, rarinate, conduplicate, decurrent on the ioint below. Flowers perfect. Perianth of $5_{-9}$ retrorsely barbed bristles. Stamens 3. Style 2 -cleft at the summit, persistent as a beak on the summit of the achene. Achene linear-oblong. [Name said to be from Dulcichimum, a Latin name for some sedge.] A monotypic genus of E. N. Amer.
I. Dulichium arundinàceum (L.) Britton. Dulichium. iI. F. f. 576.) Culm stout, o.3-1 m. tall, erect. Leaves numerous, flat, $2-8=\mathrm{m}$. long, $4-8 \mathrm{~mm}$. wide, spreading or ascending, the lower sheaths bladeless, brown toward their summits; peduncles $4-25 \mathrm{~mm}$. long; spikelets narrowly linear, spreading, $1-2.5 \mathrm{~cm}$. long, about 2 mm . wide, 6-12-flowered; scales lanceolate, acuminate, strongly several-nerved, appressed, brownish; bristles of the perianth rigid, longer than ihe achene; style long-exserted, persistent. In wet places, N. S. to Ont., Minn. and Neb., south to Fla. and Tex. Aug.-Oct.

## 4. ELEÓCHARIS R. Br.

Annual or perennial sedges. Culms simple, triangular, quadrangular, terete, flattened or grooved, the leaves reduced to sheaths or the lowest very rarely bladebearing. Spikelets solitary, terminal, erect, several-many-flowered, not subtended by an involucre. Scales concave, spirally imbricated all around. Perianths of 1-12 bristles, usually retrorsely barbed, wanting in some species. Stamens 2-3. Style 2 -cleft and achene lenticular or biconvex, or 3 -cleft and achene 3 -angled, but sometimes with very obtuse angles and appearing turgid. Base of the style persistent on the summit of the achene, forming a terminal tubercle. [Greek, referring to the growth of most of the species in marshy ground.] About ioo species, widely distributed. Besides the following, some $\mathbf{1 7}$ others occur in the southern and western parts of N . Am.
Spikelet scarcely or not at all thicker than the culm.
Culm stout; spikelet many-flowered.
Culm terete, nodose. 1. E. interstincta.
Culm quadrangular, continuous. 2. E. mutata.
Culm slender, triangular, continuous; spikelet few-flowered, subulate.
3. E. Robbinsii.

Spikelet manifestly thicker than the culm.
Style mostly 2-cleft; achene lenticular or biconvex.
Upper sheath scarious, hyaline; plants perennial by slender rootstocks.
Scales pale green or nearly white; achene 0.5 mm . long.
Scales dark reddish brown ; 4. E. ochreata.
Upper sheath truncate, oblique, or toothed, not scarious.
Annual, with fibrous roots.
Achene jet black.
Culms 2-8 cm. tall; achene 0.5 mm . long; bristles 2-4.
6. E. atropurpura.

Culms $7-25 \mathrm{~cm}$. tall ; achene 1 mm . long; bristles $5-8$.
7. E. capitata.

Achene pale brown.
Spikelet ovoid or oblong; tubercle deltoid, acute.
8. E. ovata.

Spikelet oblong-cylindric; tubercle broad, low.
9. E. Engelmanni. 10. E. palust) is.

Perennial by horizontal rootstocks.
5. E. olivacea.

Style 3 -cleft; achene 3 -angled or turgid.
Achene reticulated or cancellate.
Spikelet compressed; culm filiform. II. E. acicula is.
Spikelet terete; culm slender.
Achene transversely cancellate; bristles none. 12. E. Wolfic.
Achene reticulated; bristles present, stout.
Tubercle conic, smaller than the achene. 13. E. tortilis.
Tubercle cap-like, as large as the achene or larger.
14. E. tuberculosa.

Achene smooth or papillose.
Achene smooth, white; culms capillary: 15. E. microcarpa.
Achene papillose or smooth, brown, black or yellow.
Tubercle depressed or short-conic.

# Achene smooth. <br> Tubercle flat, covering the top of the black achene. 

16. E. melanocarpa.

Tubercle ovoid-conic, acute, contracted at the base.
17. E. albida.

Achene papillose.
Achene 3 -ribbed on the angles. Achene obtuse-angled, not ribbed. Culm filiform; scales obtuse. Culm flat; scales acute.

I8. E. tricostata.
19. E. tenuis.
20. E. acuminata.

Tubercle subulate or narrowly pyramidal. Culms filiform, wiry, densely tufted, $\mathrm{I}-2.5 \mathrm{dm}$. long.
21. E. intermedia.

Culms flattened, slender, $3^{-6} \mathrm{dm}$. long.
22. E. rostellata.
I. Eleocharis interstíncta (Vahl) R. \& S. Knotted Spike-Rush. (I. F. f. 577.) Perennial by stout rootstocks; culms terete, hollow, nodose, papillose, $0.4-0.9 \mathrm{~m}$. tall, the sterile ones sharp-pointed. Sheaths membranous, the lower sometimes bearing short blades; spikelet terete, cylindric, many-flowered, subacute, $2.5-4 \mathrm{~cm}$. long, 4 mm . in diameter, not thicker than the culm; scales ovate, orbicular or obovate, obtuse or the upper acute, narrowly scarious-margined, faintly many-nerved, persistent; bristles about 6, rigid, retrorsely barbed, as long as the body of the achene or shorter; stamens 3 ; style 3 -cleft, exserted; achene obovoid, brown, shining, with minute transverse ridges, convex on one side, very obtusely angled on the other, 2 or 3 times as long as the conic acute black broadbased tubercle. In water, Mass. to Mich., the W. I. and Mex. July-Sept.
2. Eleocharis mutàta (L.) R. \& S. Quadrangular Spike-rush. (I. F.f. 578.) Perennial by stout rootstocks; culms sharply 4 -angled, stout, not nodose, papillose, $0.6-\mathbf{1} .2 \mathrm{~m}$. tall. Sheaths purplish-brown or green, sometimes bearing short blades; spikelet terete, cylindric, $2-5 \mathrm{~cm}$. long, 4 mm . in diameter, manyflowered, about as thick as the culm; scales coriaceous, broadly ovate or obovate. obtuse or the upper subacute, scarious-margined, faintly many-nerved, persistent: bristles about 6 , rigid, retrorsely barbed, about as long as the achene; stamens 3 ; style 3 -cleft; achene obovoid, biconvex or slightly angled on the back, minutely cancellate, about twice as long as the conic acute tubercle, which is truncate or contracted at the base. In ponds, streams and swamps, N. N. J. to S. Ont. Mich. south to Ala., Mo., Tex. and Guatemala. Also in the W. I. and S. Am. July-Sept.
2. Eleocharis Robbínsii Oakes. Robbins' Spike-Rush. (I. F. f. 579.) Perennial by slender rootstocks; culms slender, 3 -angled. $0.1-5 \mathrm{~m}$. long, sometimes producing numerous filiform flaccid sterile branches from the base. Sheaths appressed, obliquely-truncate; spikelet subulate. few-flowered, not thicker than the culm, $\mathbf{I}-\mathbf{2} \mathrm{cm}$. long. 2 mm . in diameter; scales lanceolate or oblong-lanceolate, strongly concave. faintly several-nerved, persistently clasping the rachis, narrowly scarious-margined; style 3 -cleft; bristles 6 , equalling the achene and tubercle, retrorsely barbed; achene obovoid, light brown, biconvex or obtusely angled on the back, longer than the conic-subulate flattened tubercle, which has a raised ring around its base. In shallow water, N. B. to Mich., south to Fla. Aug-Sept.
4. Eleocharis ochreàta (Nees) Steud. Pale Spike-RuSh. (I. F. f. 580.) Perennial by slender rootstocks; culms very slender, or filiform, pale green, 3 -angled, $5-25 \mathrm{~cm}$. tall. Upper sheath with a white, hyaline, scarious limb; spikelet subacute, $2-3$ times as thick as the culm, about 4 mm . long, $2-3 \mathrm{~mm}$. in diameter, several-flowered; scales pale green, oblong-lanceolate, obtuse or the upper acute, thin, hyaline with a faint midvein; style 2-cleft; bristles about 6 , slender, retrorsely barbed, somewhat longer than the achene; 0.5 mm . long, lenticular, obovate, smooth, brown, 2-4 times as long as the conic acute tubercle, which is often constricted at the base. In wet soil, S. Va. to Fla. and Miss. Also in trop. Amer. Aug.-Sept.
5. Eleocharis olivàcea Torr. Bright green Spike-rush. (I. F. f. 581.) Perennial by running rootstocks, often tufted and matted; culms very slender, bright green, erect or reclining, flattened, $2-10 \mathrm{~cm}$. long. Upper sheath with a white hyaline limb; spikelet ovoid, much thicker than the culm, several-many-flowered, about 4 mm . long, 2 mm . in diameter; scales ovate, thin, acute, reddish brown, with a gree: midvein and narrow, scarious margins; stamens 3 ; style $\mathbf{2}$-cleft; bris-
tles 6-8, slender, retrorsely barbed, longer than the achene and tubercle; achene obovoid, similar to that of the preceding species but twice as large. 3-4 times the length of the conic acute tubercle. In wet soil, Me. to S. Ont. and Penn., south to S. Car., mostly near the coast. Aug.-Sept.
6. Eleocharis atropurpùrea (Retz) Kunth. Purple Spike-Rush. (I. F. f. 582.) Annual ; roots fibrous ; culms tufted, very slender, $2-9 \mathrm{~cm}$. high. Upper sheath I-toothed ; spikelet ovoid, many-flowered, subacute, $3-4 \mathrm{~mm}$. long, 2 mm . in diameter or less ; scales minute, ovate-oblong, persistent, purple-brown with green midvein and very narrow scarious margins; stamens 2 or 3 style 2 - 3 -cleft ; bristles 2-4, fragile, white, minutely downwardly hispid, about as long as the achene; achene jet black, shining, 0.5 mm . long, smooth, lenticular; tubercle conic, minute, depressed but rather acute, constricted at the base. In moist soil, Iowa, Neb. and E. Colo. to Cent. Am., east to Fla.; widely distributed in tropical America. July-Sept.
7. Eleocharis capitàta (L.) R. Br. Capitate Spike-rush. (I. F. f. 583.) Annual; roots fibrous; culms densely tufted, nearly terete, almost filiform, 5-25 cm. tall. Upper sheath I-toothed; spikelet ovoid, obtuse, much thicker than the culm, $3-5 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. thick, many-flowered ; scales broadly ovate, obtuse, firm, pale or dark brown with a greenish midvein, narrowly scarious-margined, persistent ; stamens mostly 2 ; style 2 -cleft ; bristles 5-8, slender, downwardly hispid, as long as the achene ; achene obovate, jet black, smooth, shining, nearly-I mm . long; tubercle depressed, apiculate, constricted at the base, very much shorter than the achene. In moist soil, Md. to Fla., west to Ind. and Tex. Widely distributed in tropical regions. July-Sept.
8. Eleocharis ovàta (Roth) R. \& S. Ovoid Spike-Rush. (I. F. f. 584.) Annual ; roots fibrous ; culms tufted, slender or filiform, rather deep green, nearly terete, mostly erect, $5-40 \mathrm{~cm}$. tall. Upper sheath I-toothed; spikelet ovoid or oblong, obtuse, many-flowered, 4-10 mm . long, $2-3 \mathrm{~mm}$. in diameter; scales thin, oblong-orbicular, very obtuse, brown with a green midvein and scarious margins; bristles 6-8 (sometimes fewer or wanting), deciduous, usually longer than the achene; stamens 2 or 3 ; style 2-3-cleft; achene pale brown, shining, lenticular, obovate-oblong, smooth, I mm. long or more ; tubercle deltoid, acute, compressed, scarcely constricted at the base, about one-fourth as long as the achene and narrower. In wet soil. N. B. to Ont. and Br. Col. south to Fla., Ore., Neb. and Tex. Also in Europe. Variable. July-Sept.
9. Eleocharis Engelmănni Steud. Engelmann's Spike-Rush. (I. F. f. 585.) Annual, similar to the preceding species, but culms commonly taller, sometimes 0.5 m . high. Upper sheath obliquely truncate or I-toothed; spikelet oblong-cylindric or ovoid-cylindric, obtuse or subacute, $4-16 \mathrm{~mm}$. long, $2-3 \mathrm{~mm}$. in diameter, many-flowered; scales pale brown with a green midvein and narrow scarious margins, ovate, obtuse, deciduous; style 2 -cleft; bristles about 6 , not longer than the achene; achene broadly obovate, brown, smooth, lenticular; tubercle broat. low, covering the top of the achene, less than one-fourth its length. In wet soil. Mass. to Va., west to Ind., Ark., Tex. and Cal. July-Sept.
io. Eleocharis palústris (L.) R. \& S. Creeping Spike-rush. (I. F. f. 586.) Perennial by horizontal rootstocks; cuims stout, terete or somewhat compressed, striate, $0.3-\mathbf{1} .6 \mathrm{~m}$. tall. Basal sheaths brown, rarely bearing a short blade, the upper one obliquely truncate; spikelet ovoid-cylindric, $6-25 \mathrm{~mm}$. hons. 3-4 mm. in diameter, many-flowered, thicker than the culm ; scales mate-ohbmy or ovate-lanceolate, purplish brown with scarious margin and a green midvein, on pale green all over; bristles usually 4 , slender, retrorsely barbed, longer than the achene and tubercle, or sometimes wanting ; stamens $2-3$; style $2-3$-cleft ; wheme lenticular, smooth, yellow, over 1 mm . long ; tubercle conic-triangular, comstricted at the base, flattened, one-fourth to one-half as long as the achene. In ponds, swamps and marshes, Lab. to Br. Col., south to Fla., Tex. and Cal. Also in Europe and Asia. Aug.-Sept.

Eleocharis palústris glaucéscens (Willd.) A. Gray. Culms slemder or nearly fili-
 In wet meadows and marshes; range nearly of the type in N. Am. Perhaps a distinct species.

The so-called variety calva is a form without bristles.

Eleocharis palústris Wátsoni Clarke. Culms stout, $15-25 \mathrm{~cm}$. tall ; spike ovoid ; scales dark purple-brown. Lab. and Pr. Edw. Isl to Hudson Bay.
ir. Eleocharis aciculàris (L.) R. \& S. Needle Spike-rush. (I. F. f. 587.) Perennial by filiform stolons or rootstocks; culms tufted, finely filiform or setaceous, obscurely 4 -angled and grooved, weak, erect or reclining, $5-20 \mathrm{~cm}$. long. Sheaths truncate; spikelet compressed, narrowly ovate or linear-oblong, acute, broader than the culm, 3-10-flowered, $3-6 \mathrm{~mm}$. long, 1 mm . wide; scales oblong, obtuse or the upper subacute, thin, pale green, usually with a narrow brown band on each side of the midvein, deciduous, many of them commonly sterile; bristles 3-4, fragile, fugacious, shorter than the achene; stamens 3; style 3-cleft; achene obovoid-oblong, pale, obscurely 3 -angled with a rib on each angle and 6-9 lower intermediate ribs connected by fine ridges; tubercle conic, acute, one-fourth as long as the achene. In wet soil, throughout N. Am., except the extreme north. Also in Europe and Asia. July-Sept.
12. Eleocharis Wòlfii A. Gray. Wolf's Spike-rush. (I. F. f. 588.) Perennial by short rootstocks; culms slender, erect, flattened and 2 -edged, $0.2-0.5 \mathrm{~m}$. tall. Upper sheath oblique, scarious, hyaline-tipped; spikelet oblong or ovoid-oblong, terete, acute, thicker than the culm, 4-6 mm. long, nearly 2 mm . in diameter; scales ovate, obtuse or the upper acute, thin, pale green with purplish brown bands, tardily deciduous; bristles none (or perhaps early deciduous); style 3 -cleft; achene obovoid, obscurely 3 -angled, longitudinally 9 -ribbed, the ribs transversely connected by minute ridges; tubercle depressed-conic, much shorter than the achene. In wet meadows, Ill., Minn. and Iowa. June-Aug.
13. Eleocharis tórtilis (Link) Schultes. Twisted Spike-rush. (I. F. f. 589.) Annual; roots fibrous; culms tufted, filiform, sharply 3 -angled, pale green, erect or reclining; twisting when old, $0.3-0.4 \mathrm{~m}$. long. Sheaths obliquely truncate, I-toothed; spikelet ovoid or oblong, subacute, several-flowered, 4-6 mm. long, about 2 mm . thick, much thicker than the culm; scales firm, pale, ovate, mostly obtuse; bristles 4-6, rigid, retrorsely barbed, about equalling the achene and tubercle; stamens 3 ; style 3 -cleft; achene obovoid, obscurely 3 -angled, strongly reticulated, longitudinally about 18-ribbed; tubercle cap-like or conic, truncate at the base, one-fourth to one-half as long as the achene. In wet soil, near the coast, N. J. to Fla. and Tex. July-Sept.
14. Eleocharis tuberculòsa (Michx.) R. \& S. Large-tubercled SpikeRUSH. (I. F. f. 590.) Annual ; culms tufted, slightly compressed, very slender, rather stiff, striate, bright green, $0.2-0.5 \mathrm{~m}$. tall. Upper sheath obliquely truncate or I-toothed; spikelet ovoid, many-flowered, $6-12 \mathrm{~mm}$. long, nearly 4 mm . in diameter; scales broadly ovate, obtuse, pale greenish brown with a darker midvein, broadly scarious-margined, firm, tardily deciduous; bristles 6, rigid, downwardly or rarely upwardly barbed, about as long as the achene and tubercle; stamens 3 ; style 3 -cleft; achene obovoid, pale, trigonous, strongly reticulated, longitudinally about 18-ribbed; tubercle cap-like or conic, nearly or quite as large as the achene. In wet soil, near the coast, Mass. to Penn., Fla. and Tex. July-Sept.
15. Eleocharis microcàrpa Torr. Small-frtited Spike-rush. (I. F. f. 59I.) Annual; culms finely filiform, densely tufted, somewhat 4 -sided, erect or reclining, often proliferous by developing secondary culms in the axils of the spikelet, sometimes rooting at the summit, $5-20 \mathrm{~cm}$. long. Upper sheath obliquely truncate ; spikelet oblong, subacute, terete or nearly so, much thicker than the culm, many-flowered, 3-5 mm. long; scales ovate, acute, brownish-red with a green midvein and lighter margins, early deciduous except the lowest, which is commonly larger than the others, persistent and bract-like; bristles $3-6$, slender, shorter than or equalling the achene; stamens 3 ; style 3 -cleft; achene white, 3 -angled, obovoid, smooth, minute; tubercle conic-pyramidal, much shorter than the achene. In wet sandy soil, S. N. J. to Fla. and Tex., mostly near the coast. Also in Cuba. JuneAug.
16. Eleocharis melanocàrpa Torr. Black-Fruited Spike-Rush. (I. F. f. 592.) Perennial by short rootstocks; culms flattened, striate, tufted, slender, erect, $0.2-0.5 \mathrm{~m}$. tall. Upper sheath truncate, I-toothed; spikelet oblong or cylindricoblong, obtuse, $6-12 \mathrm{~mm}$. long, $3-4 \mathrm{~mm}$. in diameter, many-flowered, thicker than the culm; scales ovate, obtuse, brown, with a lighter midvein and scarious mar-
gins; bristles 3 or 4, fragile, downwardly hispid, equalling or longer than the achene, fugacious or perhaps sometimes wanting; stamens 3 ; style 3 -cleft; achene 3 -angled, obpyramidal, black, smooth; tubercle depressed, covering the summit of the achene, light brown, pointed in the middle. In wet sandy soil, E. Mass. and R. I. to Fla., near the coast. Also in W. Ind. July-Sept.
17. Eleocharis álbida Torr. White Spike-rush. (I. F. f. 593.) Annual; roots fibrous; culms very slender, tufted, nearly terete, striate, erect, $0.1-0.2 \mathrm{~m}$. tall. Upper sheath very oblique and toothed on one side; spikelet ovoid-globose or oblong, obtuse, $4-8 \mathrm{~mm}$. long, 3-4 mm. in diameter, many-flowered, thicker than the culm; scales pale green or nearly white, rather firm, ovate, obtuse, deciduous; bristles about 6, downwardly barbed, persistent, as long as the achene; stamens 3 ; style 3 -cleft; achene broadly obovoid, nearly black when ripe, 3 -angled, smooth; tubercle ovoid-conic, contracted or truncate at the base, about one-fourth as long as the achene. In wet soil, Md. to Fla., Tex. and Mex., near the coast. June-Aug.
18. Eleocharis tricostàta Torr. Three-ribbed Spike-Rush. (I. F.f. 594.) Perennial by short rootstocks; culms very slender, erect, compressed, striate, $0.3-0.6 \mathrm{~m}$. tall. Upper sheath obliquely truncate, toothed on one side; spikelet oblong, becoming oblong-cylindric, obtuse, many-flowered, $10-18 \mathrm{~mm}$. long, $2-$ 3 mm . in diameter; scales ovate, thin, deciduous, obtuse, brown with a green midvein and scarious margins; bristles none; stamens 3 ; style 3 -cleft; achene obovoid, 3 -angled, brown, dull, papillose, strongly ribbed on each of its angles; tubercle conic, acute, light brown, constricted at the base, minute, very much shorter than the achene. In wet soil, S. N. Y. to Fla. July-Sept.
19. Eleocharis ténuis (Willd.) Schultes. Slender Spike-rush. (I. F. f. 595.) Perennial by rootstocks; culms tufted, filiform, mostly erect, 4 -angled with concave sides, $0.2-0.4 \mathrm{~m}$. tall. Upper sheath obliquely truncate, toothed on one side; spikelet narrowly oblong, mostly acute, many-flowered, thicker than the culm, $6-10 \mathrm{~mm}$. long, about 2 mm . in diameter; scales thin, obovate or ovateoblong, obtuse, the midvein greenish, the margins scarious; bristles 2-4, shorter than the achene, fugacious or wanting; achene obovoid, obtusely 3 -angled, yellowish brown, papillose; stamens 3 ; style 3 -cleft; tubercle conic, short, acute. In wet soil, Cape Breton Isl. to Ont. and Manitoba, south to Fla. and Tex. The achenes are more or less persistent on the rachis of the spikelet after the fall of the scales. May-July.
20. Eleocharis acuminàta (Muhl.) Nees. Flat-stemmed Spike-rush. (I. F. f. 596.) Perennial by stout rootstocks, similar to the preceding species but stouter; culms flattened, striate, slender but rather stiff, tufted, $0.2-0.5 \mathrm{~m}$. tall. Upper sheath truncate, sometimes slightly I-toothed; spikelet ovoid or oblong, obtuse, thicker than the culm, many-flowered, $6-12 \mathrm{~mm}$. long; scales oblong or ovate-lanceolate, acute or the lower obtusish, purple-brown with a greenish midvein and hyaline white margins, deciduous; bristles $\mathbf{I}-5$, shorter than or equalling the achene, fugacious, or wanting; stamens 3 ; style 3 -cleft, exserted; achene obovoid, obtusely 3 -angled, light yellowish brown, papillose. much longer than the depressed-conic acute tubercle. In wet soil, Anticosti to Manitoha, south to (ia.. La., Mo. and Neb. Achenes persistent on the rachis as in E. temuis. June-Aug.

2I. Eleocharis intermèdia (Muhl.) Schultes. Mattel Spikis-rush. (I. F. f. 597.) Annual; roots fibrous; culms filiform, densely tufted, diffusely reclining or ascending, usually matted, grooved, $10-30 \mathrm{~cm}$. long. Upper sheath obliquely truncate, toothed on one side; spikelet ovoid-oblong, acute, 8-20-flowered. thicker than the culm; scales oblong-lanceolate, obtuse or the upper subacute, light purplebrown with a green midvein, tardily deciduous or the lower one persistent; brisiles persistent, downwardly barbed, longer than the achene and tuberle: siamens i: style 3 -cleft; achene 3 -angled, obovoid, light brown, finely ruticulated; tubercle conic-subulate, very acute, slightly constricted at the base, one-fourth to one-halt as long as the achene. In marshes, Ont. to Mimn., south to N. J.. Ohio, Ill. and Iowa. July-Sept.
22. Eleocharis rostellàta Torr. Beaked Spike-kush. (I. F. f. 59 §.) Perennial by a short caudex; culms slender, wiry, the fertile erect or aseending, the sterile reclining and rooting at the summit, grooved, 0.31 .5 m . hong. Lpper sheath truncate; spikelet oblong, narrowed at both ends, thicker than the culm,

10-20-flowered, $6-12 \mathrm{~mm}$. long, about 2 mm . in diameter: scales orate, obtuse or the upper acute, green with a somewhat darker midvein; bristles 4-8, retrorsely barbed, longer than the achene and tubercle; stamens 3 ; style 3 -cleft; achene oblong-obovoid, obtusely 3 -angled, its surface finely reticulated; tubercle conicsubulate, about one-half as long as the achene or shorter, capping its summit, partly or entirely falling away at maturity. In marshes and wet meadows, N. H. to Vt. and W. N. Y., Br. Col., Fla., Tex., Mex. and Cal. Also in Cuba. Aug-Sept.

## 5. Dichrómena michx.

Leafy-stemmed sedges, perennial by rootstocks, the spikelets crowded in a terminal head involucrate by the upper leaves, which are often white at the base. Spikelets compressed, several-many-flowered. Scales spirally imbricated all around, several of them with imperfect flowers, or empty. Perianth none. Stamens 3. Style 2-cleft, its branches subulate. Achene lenticular, transversely rugose. crowned with the broad persistent base of the style (tubercle). [Greek, alluding to the two-colored involucral leaves.] About 8 species, natives of America. Besides the following, another occurs in the southwestern United States.
Leaves of the involucre linear ; tubercle truncate at the base. I. D. colorata. Leaves of the involucre lanceolate, long-acuminate ; tubercle decurrent on the edges of the achene.
2. D. latifolia.
I. Dichromena coloràta (L.) A. S. Hitchcock. Narrow-leaved Dichromena. (I. F. f. 599.) Glabrous; culm slender, erect, rather sharply triangular, 0.3 -0.6 m. tall. Leaves distant, narrowly linear, about 2 mm . wide, much shorter than the culm, those of the involucre $4-6$, reflexed when mature, yellowish white at the base ; head globose, $1-2 \mathrm{~cm}$. in diameter ; spikelets narrowly oblong, acute; scales membranous, lanceolate, nearly white, I-nerved, subacute at the apex ; achene obovate, brown, nearly truncate at the summit, compressed, covered by the tubercle which is not decurrent on its edges. In moist sandy soil, pine barrens of N. J. to Fla. and Tex. Also in tropical America. June-Sept.
2. Dichromena latifòlia Baldw. Broad-leated Dichromena (I. F. f. 600 .) Similar to the preceding species but the culm stouter, obtusely triangular or nearly terete, the leaves lanceolate or linear-lanceolate, tapering gradually to a long-a cuminate apex from a broad base, $3-8 \mathrm{~mm}$. wide, sometimes overtopping the culm, but the lowest much shorter, those of the involucre 7-ro, strongly reflexed when old. Head globose, $\mathrm{I}-2 \mathrm{~cm}$. in diameter ; spikelets oblong, subacute; scales ovatelanceolate, nearly white, rather obtuse; achene nearly orbicular in outline, pale brown, faintly wrinkled transversely and longitudinally, so as to appear reticulated; the tubercle decurrent on its margins. In wet pine barrens, Va. to Fla. and Tex. June-Aug.

## 6. PSILOCÀRYA Torr.

Annual sedges, with fibrous roots, slender leafy stems and ovoid or oblong, many-flowered terete spikelets in terminal and axillary, mostly compound umbels, the rays and raylets bracted at the base. Scales of the spikelets spirally imbricated all around, all fertile, deciduous. Flowers perfect. Perianth none. Stamens I or 2. Style 2 -cleff, enlarged at the base. Achene lenticular or biconvex, smooth or transversely wrinkled, capped by the persistent base of the style (tubercle), or nearly the whole style persistent as a beak. [Greek, referring to the absence of perianth-bristles.] About io species, natives of temperate and tropical America. Besides the following, another occurs in the southeastern United States.
Achene strongly wrinkled, much longer than the subacute tubercle I. P. nitens.
Achene smooth or but little wrinkled ; tubercle subulate.
2. P. scirpoides.
I. Psilocarya nitens (Vahl) Wood. Short-beaked Bald-rush. (I. F. f. 601.) Glabrous: culms tufted, slightly angled. $7-36 \mathrm{~cm}$. tall. Leaves narrowly linear, about 2 mm wide, smooth, sometimes overtopping the culm, sheathing at the base the midven prominent; umbels mostly loose; spikelets ovoid; 4-6 mm . long, rather less than 2 mm . in diameter; scales brown, broadly ovate, thin, I-nerved, obtuse, acute or apiculate; achene lenticular, nearly orbicular, light brown, strongly wrinkled transversely; tubercle shorter than the achene, subacute, 2 -lobed at the base. In wet soil, L. I. and Del. to Fla. and Tex., near the coast. July-Oct.
2. Psilocarya scirpoìdes (Torr.) Long-beaked Bald-RUSH. (I. F. f. 6o2.) Similar to the preceding species. Umbels commonly more numerous; spikelets oblong or ovoid-oblong; achene nearly orbicular in outline, biconvex, not as flat as that of $P$. nitens, dark brown, faintly transversely wrinkled or smooth, sometimes longitudinally striate, slightly contracted at the base into a short stipe ; tubercle subulate, as long as the achene or sometimes longer, its base decurrent on the edges. In wet soil. E. Mass. and R. I. July-Sept.

## 7. STENOPHÝLLUS Raf.

Mostly annual sedges, with slender erect culms, leafy below, the leaves narrowly linear or filiform, with ciliate or pubescent sheaths. Spikelets umbellate, capitate or solitary, subtended by a I-several-leaved involucre, their scales spirally imbricated all around, mostly deciduous. Flowers perfect. Perianth none. Stamens 2 or 3. Style 2-3-cleft, glabrous, its base much swollen and persistent as a tubercle, on the achene as in Eleocharis. Achene 3-angled, turgid or lenticular. [Greek, referring to the narrow leaves.] A genus of some 20 species, natives of temperate and warm regions. Besides the following, 5 others occur in the southern United States.

1. Stenophyllus capillàris (L.) Britton. Hair-like Stenophyllus. (I. F. f. 603.) Annual; roots fibrous; culms filiform, densely tufted, erect, grooved, smooth, 5-25 cm. tall. Leaves roughish, much shorter than the culm, their sheaths more or less pubescent with long hairs; involucral leaves I-3, setaceous; spikelets narrowly oblong, somewhat 4 -sided, $5-8 \mathrm{~mm}$. long, less than 2 mm . thick, several in a terminal umbel, or in depauperate forms solitary; scales oblong, obtuse or emarginate, puberulent, dark brown with a green keel; stamens 2; style 3 -cleft; achene yellow-brown, narrowed at the base, very obtuse or truncate at the summit, 0.5 mm . long, transversely wrinkled; tubercle minute, depressed. In dry or moist soil, throughout N. Am. except the extreme north. Also in tropical America. July-Sept.

## 8. FIMBRÍSTYLIS Vahl.

Annual or perennial sedges. Culms leafy below. Spikelets umbellate or capitate, terete, several to many-flowered, subtended by a I-many-leaved involucre, their scales spirally imbricated all around, mostly deciduous, all fertile. Perianth none. Stamens I-3. Style 2-3-cleft, pubescent or glabrous, its base much enlarged, falling away from the summit of the achene at maturity. Achene lenticular, biconvex, or 3 -angled, reticulated, cancellate, or longitudinally ribbed or striate in our species. [Greek, in allusion to the fringed style of some species.] A large genus, the species widely distributed in temperate and tropical regions. Besides the following, some 4 others occur in the southern and western parts of North America.

Style 2-cleft ; achene lenticular or biconvex.
Culms $0.2-0.9 \mathrm{~m}$. tall ; spikelets umbellate ; style mostly pubescent. Perennial ; leaves involute.

Scales coriaceous, shining, glabrous. I. F. spadicea.
Scales membranous, dull, puberulent. 2. F. castanea Annual; roots fibrous; leaves flat. 3. F. laxa.
Culms 2-10 cm . tall, very slender; spikelets capitate ; style glabrous below.
4. F. Vahlii.

Style 3-cleft ; achene 3 -angled.
Umbel mostly compound; spikelets narrow, acute, mostly peduncled; achene $n \cdots a l y$ or quite smooth.
5. F. autumnalis.

Umbel mostly simple ; spikelets plump, obtuse, mostly capitate and sessile: achene distinctly reticulated.
6. F. Frankii.
I. Fimbristylis spadícea (L.) Vahl. Stiff Fimbristilis. (I. F. f. 604.) Peremnial by a thickened base, glabrous; culms slemier, 3-angled, wiry, 3 -0 dm. tall, usually longer than the strongly involute rigid leaves. Leaves about 2 mm . wide when unrolled, their shaths dark brown; leaves of the involucre ;-6. erect; umbel several-rayed, the rays nearly erect. $5-15 \mathrm{~cm}$. lone: central spikelets of the umbels and umbellets sessile, the others pedicelled; spikelets ovoid or owoid
cylindric, acute, $5-12 \mathrm{~mm}$. long, about 2 mm . in diameter; scales oval obovate, or orbicular, obtuse or subacute, coriaceous, glabrous, shining, dark brown with a green midvein; stamens 2 ; style 2 -cleft; achene lenticular, obovate, brown. In marshes and shallow water, Va. to Fla., near the coast. Widely distributed in tropical America. July-Sept.
2. Fimbristylis castànea (Michx.) Vahl. Marsh Fimbristylis. (I. F. f. 605.) Perennial by a thick base; culms slender, 3 -angled, $0.2-0.5 \mathrm{~m}$. tall, usually exceeding the leaves. Leaves involute, less than 2 mm . wide, their sheaths green and more or less pubescent; leaves of the involucre 2-4, short; umbel simple or compound, the rays $\mathrm{I}-5 \mathrm{~cm}$. long; central spikelets sessile; spikelets oblong, 6-10 mm . long, $2-3 \mathrm{~mm}$. in diameter; scales thin, brown with a lighter midvein, broadly oblong or nearly orbicular, dull, puberulent, obtuse or mucronate; stamens 2-3; style 2 -cleft; achene obovate or oblong, biconvex, pale brown. On salt meadows, southern N. Y. to Fla. and La. Also in wet soil in the interior from Ont., Mich. and Ill. to Kans. and Tex., and in tropical America. The achene in the prairie plant is shorter and less tapering to the base than in the coast form. July-Sept.
3. Fimbristylis láxa Vahl. Weak Fimbristylis. (I. F. f. 606.) Annual; roots fibrous ; culms slender, flattened, striate, densely tufted, erect or ascending, $5-40 \mathrm{~cm}$. long, usually longer than the leaves. Leaves flat, about I mm. wide, glabrous or sparingly ciliate, pale green, those of the involucre 3-5; umbel simple or slightly compound, the central spikelet sessile ; spikelets ovoid or ovoid-oblong, $6-12 \mathrm{~mm}$. long, about 2 mm . in diameter; scales ovate, thin, pale greenish brown, subacute or mucronulate ; stamen I ; style 2-cleft, pubescent ; achene biconvex, obovoid, light brown, longitudinally ribbed, the ribs tubercled and connected by very fine cross-lines. In moist soil, S. Pènn. to Fla., west to Ill., Mo. and Tex. Also in trop. Am. July-Sept.
4. Fimbristylis Vàhlii (Lam.) Link. Vahl's Fimbristylis. (I. F. f. 607.) Annual ; culms very slender, densely tufted, compressed, striate, $2-10 \mathrm{~cm}$. high, longer than or equalling the leaves. Leaves setaceous or almost filiform, rough, those of the involucre 3-5, erect. much exceeding the simple capitate cluster of 3-8 spikelets ; spikelets oblong-cylindric, obtuse, 4-8 mm. long, about I mm. thick, many-flowered; scales lanceolate, pale greenish-brown, acuminate; stamen I; style 2-cleft, glabrous below; achene minute, biconvex, yellowish-white, cancellate. In moist soil, Mo. to Tex., east to N. Car. and Fla. July-Oct.
5. Fimbristylis autumnàlis (L.) R. \& S. Slender Fimbristylis. (I. F. f. 608.) Annual ; roots fibrous ; culms very slender, densely tufted, flat, $7-40 \mathrm{~cm}$. long, usually much exceeding the leaves. Leaves narrowly linear, flat, $\mathbf{I}-2 \mathrm{~mm}$. wide, glabrous, those of the involucre 2-3, usually all shorter than the umbel; umbel compound or decompound, the primary rays 4-10 mm . long, the secondary filiform; spikelets linear-oblong, acute, $6-40 \mathrm{~mm}$. long, I mm. thick or less; scales ovate-lanceolate, subacute, strongly mucronate, greenish-brown, the midvein prominent; stamens I-3; style 3-cleft ; achene obovoid, nearly white, 3-angled with a ridge on each angle, smooth or indistinctly reticulated, sometimes roughened. In moist soil, Me. to Mich., south to Fla. and La. Also in trop. Am. Depauperate forms occur with culms not over 2 cm . high bearing solitary spikelets. June-Sept.
6. Fimbristylis Frànkii Steud. Annual, lower than the preceding species, the leaves often shorter. Umbel mostly simple, the spikelets, or most of them, capitate and sessile, ovoid or oval, blunt, the heads sometimes appearing almost sessile at the base; achenes rather larger, distinctly reticulated. In mud or wet sand, N. H. to Mo., Tenn. and La. June-Sept.

## 9. SCÍRPUS L.

Annual or perennial very small or very large sedges, with leafy culms or the leaves reduced to basal sheaths. Spikelets terete or somewhat flattened, solitary, capitate, spicate or umbellate, subtended by a I-several-leaved involucre or the involucre wanting in some species. Scales spirally imbricated all around, usually all fertile, the $\mathbf{I}-3$ lower sometimes empty. Flowers perfect. Perianth of $\mathbf{I}-6$, slender or rigid, short or elongated, barbed, pubescent or smooth bristles, or none in some species. Stamens 2-3. Style 2-3-cleft, not swollen at the base, wholly
decidunus from the achene, or its base persistent as a subulate tip. Achene triangular, lenticular or plano-convex. [Latin name of the Bulrush, said to be from sirs, the Celtic word for rushes.] About 200 species of very wide geographic distribution. Besides the following, some 6 others occur in the southern and western parts of North America.

Spikelet solitary, terminal, bractless or subtended by a single bract or short leaf.
No involucral bract.
Culms $2-5 \mathrm{~cm}$. high ; achene smooth ; plant of saline soil. I. S. nanus.
Culms $7^{-25} \mathrm{~cm}$. high ; achene reticulated ; plant of fresh-water marshes.
2. S. pauciftorus.

Involucral bract present, erect.
Bract shorter than or but little exceeding the spikelet; plants not aquatic. Culm terete; leaf of upper sheath subulate; bristles smooth.
3. S. caespitosus.

Culms triangular; leaf of upper sheath linear; bristles upwardly barbed. Leaves shorter than the culm ; scales acute. 4. S. Clintoni.
Leaves about as long as the culm; scales cuspidate.
5. S. planifolius.

Bract at least twice as long as the spikelet; plant aquatic.
6. S. subterminalis.

Spikelets normally more than r, usually several or numerous, often appearing lateral; involucral bract only 1 .
Spikelets few, $\mathrm{I}-12$, appearing lateral.
Culms not sharply 3 -angled; achene plano-convex ; annuals.
Achene strongly transversely rugose.
Achene smooth or very slightly roughened.
Bristles downwardly barbed, about equalling the achene.
Bristles minute or wanting.
8. S. debilis.
9. S. Smithiz.

Culms sharply 3 -angled ; plants perennial by rootstocks.
Achene plano-convex, bristles shorter than or equalling the achene.
Spikelets acute, much overtopped by the slender involucral leaf; scales awned. Iо. S. Americanus.
Spikelets obtuse ; involucral leaf short, stout ; scales mucronulate.
11. S. Olneyi.

Achene 3 -angled, ridged on the back.
Bristles longer than the achene; involucral leaf erect.
12. S. Torreyi.

Bristles as long as the achene ; involucral leaf abruptly bent.
13. S. mucronatus.

Spikelets several or numerous, umbelled; tall sedges.
Culm sharply triangular, equalled by the long leaves. 14. S. cylindricus. Culm terete; leaves reduced to sheaths.

Bristles downwardly barbed; achene gray, abruptly mucronate
15. S. lacustris.

Bristles short-plumose below ; achene nearly white, narrowed above.
16. S. Californicus.

Spikelets several, spicate. 17. S. rufus.
Spikelets several, capitate or umbellate, large ; involucral leaves 2 or more.
Achene lenticular or plano-convex; spikelets capitate.
Capitate cluster simple; achene obovate-oblong, pale brown.
18. S. campestris.

Capitate cluster often compound; achene orbicular-obovate, dark brown
19. S. robustus.

Achene sharply 3 -angled; spikelets umbellate.
20. S. fluviatilis.

Spikelets oblong-cylindric, $1.5-2.5 \mathrm{~cm}$. long; bristles 6.
Spikelets narrowly cylindric, $2-5 \mathrm{~cm}$. long; bristles 2-4. 21. So. Vozae-Angliae.
Spikelets very numerous in compound umbels or umbelled heads, small; involucral leaves several; tall sedges.
Bristles downwardly barbed; spikelets in umbelled heads.
Spikelets ovoid or oblong, $3-5 \mathrm{~mm}$, long.
Bristles equalling or slightly exceeding the achene; leaves $6-16 \mathrm{~mm}$. wide.
Style 3 -cleft ; achene 3 -angled; bristles 6 .
Spikelets $3^{-8}$ in each head; bristles barbed throughout; scales obtuse.
22. S. silzaticus.

Spikelets 8-20 in each head; bristles not barbed below; scales acute.
23. S. atrovirens.

Style 2-cleft ; achene plano-convex; bristles 4. 24. S. microcarpus.

> Bristles flexuous, twice as long as the achene; leaves $4-6 \mathrm{~mm}$. wide. Spikelets cylindric, 6-10 mm. long. 25. S. polyphyllus. 26. S. Peckiz.

Bristles smooth or slightly pubescent; umbel mostly decompound.
Bristles shorter than or scarcely exceeding the scales.
Bristles about as long as the achene; scales subacute.
27. S. divaricatus.

Bristles much longer than the achene; scales mucronate.
28. S. lineatus.

Bristles much exserted beyond the scales when mature.
29. S. cyperinus.
I. Scirpus nànus Spreng. Dwarf Club-Rush. (I. F. f. 609.) Annual; roots fibrous; culms filiform, flattened, grooved, tufted, erect or ascending, $2-5 \mathrm{~cm}$. high, bearing a scarious bladeless sheath near the base. Spikelet solitary, terminal, ovoid-oblong, rather acute, $3-8$ flowered, $2-3 \mathrm{~mm}$. long, not subtended by a bract; scales ovate or lanceolate, pale green, the lower obtuse, the upper subacute; bristles about 6 , downwardly barbed, longer than the achene; stamens 3 ; style 3 -cleft; achene oblong, 3 -angled, pale, pointed at each end, smooth. Muddy places in salt marshes, Cape Breton Id. to Fla. and Tex., and about salt springs in N. Y. and Mich. Also on the Pacific Coast of N. Am. and on the coasts of Europe. July-Sept.
2. Scirpus pauciflòrus Lightf. Few-flowered Club-rush. (I. F. f. 6io.) Perennial by filiform rootstocks; culms very slender, little tufted, 3-angled, grooved, leafless, $7-25 \mathrm{~cm}$. tall, the upper sheath truncate. Spikelet terminal, solitary, not subtended by an involucral bract, oblong, compressed, 4-10 flowered, $4-6 \mathrm{~mm}$. long, nearly 2 mm . wide; scales brown with lighter margins and midvein, lanceolate, acuminate; bristles 2-6, hispid, as long as the achene or longer; stamens 3 ; style 3 -cleft; achene obovoid-oblong, gray, rather abruptly beaked, its surface finely reticulated. In wet soil, Anticosti and Ont. to Me., W. N. Y., Minn. and Br. Col., south in the Rocky Mountains to Colo. Also in northern Europe. July-Oct.
3. Scirpus caespitòsus L. Tufted Club-Rush. (I. F. f. 6if.) Perennial; culms smooth, terete, densely tufted, light green, erect or ascending, almost filiform, wiry, $10-40 \mathrm{~cm}$. long. Basal sheaths numerous, membranous, imbricated, acuminate, the upper one bearing a short very narrow blade; spikelet solitary, terminal, few-flowered, ovoid-oblong, about 4 mm . long, subtended by a subulate involucral leaf of about its own length; scales yellowish-brown, ovate, obtuse or subacute, deciduous; bristles 6, smooth, longer than the achene; stamens 3; style 3-cleft; achene oblong, smooth, 3-angled, brown, acute. In bogs and on moist rocks, Greenl. to Alaska, south to the mountains of N. E., the Adirondacks, W. N. Y., Ill., Minn. and Br. Col., in the Rocky Mountains to Colo., and on the higher summits of the southern Alleghenies. Also in Europe and Asia. June-Aug.
4. Scirpus Clíntoni A. Gray. Clinton's Club-rush. (I. F. f. 6i2). Perennial; culms tufted, triangular, very slender, erect, $10-40 \mathrm{~cm}$. tall, roughish on the angles. Lower sheaths imbricated, one or more of them bearing short subulate blades, the upper one bearing a flat, narrowly linear blade shorter than the culm; spikelet solitary, terminal, ovoid, few-flowered, 3-4 mm. long, subtended by a subulate involucral bract; scales ovate, pale brown, acute; bristles 3-6, filiform, upwardly barbed, as long as the achene or longer; style 3 -cleft; achene oblong, brown, sharply 3 -angled, smooth, obtuse. In dry fields and thickets, N. B. to W. N. Y. and Mich., south to N. C. Local. June-Aug.
5. Scirpus planifòlius Muhl. Wood Club-Rush. (I. F. f. 613.) Perennial; culms triangular, slender, tufted, rather weak, roughish on the angles, $15-40 \mathrm{~cm}$. tall. Lower sheaths bearing short subulate blades, the upper with a flat narrowly linear rough-margined leaf about as long as the culm; spikelet solitary, terminal, ovoid-oblong, acute, several-flowered, subtended by a short involucral bract; scales ovate-lanceolate, yellowish-brown with a green midvein, which is extended beyond the acute apex into a sharp cusp; bristles 4-6, upwardly barbed, about equalling the achene; stamens 3 ; style 3 -cleft, pubescent; achene oblong, 3 -angled, smooth, light brown, rather obtuse. In woods and thickets, Mass. to Del., W. N. Y. and Mo. May-July.
6. Scirpus subterminàlis Torr. Water Club-Rush. (I. F. f. 614.) Perennial (?), aquatic, culms slender, terete, nodulose, o.3-1 m. long. Leaves slender, channeled, $15-50 \mathrm{~cm}$. long, $0.5-1 \mathrm{~mm}$. wide; spikelet solitary, terminal,
oblong-cylindric, narrowed at each end, several-flowered, $6-10 \mathrm{~mm}$. long, subtended by a subulate erect involucral leaf $\mathbf{I}-3 \mathrm{~cm}$. long, thus appearing lateral; scales ovate-lanceolate, acute, membranous, light brown with a green midvein; bristles about 6 , downwardly barbed, as long as the achene or shorter; stamens 3 ; style 3 -cleft to about the middle; achene obovoid, 3 -angled, dark brown, smooth, rather more than 2 mm . long, obtuse, abruptly beaked by the slender base of the style. In ponds and streams or sometimes on their borders, N. B. to the N. W. Terr. and Wash., south to N. J., Penn. and Mich. The so-called variety terrestris is an emersed form with erect culms and shorter spikelets. July-Aug.
7. Scirpus Hàllii A. Gray. Hall's Club-rush. (I. F. f. 6i5.) Annual; culms very slender, smooth, tufted, obtusely triangular, erect, striate, $\mathbf{I}-3 \mathrm{dm}$. tall. Lower sheaths oblique, and acuminate or mucronate, the upper one commonly bearing a filiform blade $\mathbf{I}-6 \mathrm{~cm}$. long; spikelets capitate in clusters of $\mathbf{I}-7$, oblongcylindric, obtuse, many-flowered, $6-12 \mathrm{~mm}$. long, about 2 mm . thick, appearing lateral by the extension of the solitary involucral leaf; scales ovate-lanceolate, light greenish brown, acuminate, keeled, cuspidate; bristles wanting; stamens mostly 2 ; achene obovate-orbicular or slightly broader than high, black, plano-convex, mucronulate, wrinkled transversely, about 1 mm . in diameter. In wet soil, Mass. to Fla., west to Ill., Col., Tex. and Mex. The lowest sheaths occasionally subtend a flower with very long styles. July-Sept.
8. Scirpus débilis Pursh. Weak-stalked Club-rush. (I. F.f. 6ib.) Annual, smooth; culms slender, terete or nearly so, tufted, 1.5-5 dm. high. Sheaths obliquely truncate, the upper one rarely bearing a short subulate blade; spikelets capitate in clusters of $\mathbf{I - 1 2}$, ovoid-oblong, subacute, many-flowered, appearing lateral, the involucral leaf narrowly linear, $3-10 \mathrm{~cm}$. long, erect or divergent; scales light yellowish brown with a green midvein, broadly ovate, obtuse or acute; bristles 4-6, downwardly barbed, about as long as the achene; stamens 2-3; style 2 -cleft or rarely 3 -cleft; achene plano-convex, broadly obovate or orbicular, smooth or slightly roughened, dark brown, shining, obtuse, mucronulate. In wet soil, Me. to Ont. and Minn., south to Ga., Ala. and Neb. July-Sept.
9. Scirpus Smíthii A. Gray. Smith's Club-rush. (I. F. f. 6i7.) Annual, similar to the preceding species; culms usually lower and more slender or nearly filiform; sheaths oblique and acuminate or the upper one bearing a subulate blade. Spikelets $\mathbf{1 - 4}$, ovoid, acute, 4-6 mm. long, the involucral leaf narrow, elongated, erect; scales oblong, obtuse, mucronulate, pale brown with a green midvein; bristles usually wanting, sometimes I-3, and very much shorter than the achene; style 2 -cleft; achene plano-convex, obovate or orbicular, brown, rather dull, smooth or minutely roughened, obtuse, mucronulate. In wet muddy places, Vt. to Ont. and Minn., Del., Penn. and Mich. July-Sept.
10. Scirpus Americànus Pers. Three-square. Chair-maker's Rush. (I. F. f. 618.) Perennial by long rootstocks; culms sharply triangular, erect, stiff, 0.3-1.1 m. tall. Leaves I-3, narrowly linear, keeled, shorter than the culm; spikelets oblong-ovoid, acute, $8-\mathbf{1 2} \mathrm{mm}$. long, capitate in clusters of $\mathbf{1 - 7}$, appearing as if lateral; involucral leaf slender, $3-10 \mathrm{~cm}$. long; scales broadly ovate, brown, often emarginate or sharply 2 -cleft at the apex, the midvein extended into a subulate awn sometimes 2 mm . long, the margins scarious; bristles 2-6, downwardly barbed, shorter than or equalling the achene; stamens 3 ; achene obovate, planoconvex, smooth, dark brown, mucronate. In fresh water and brackish swamps throughout N. Am. Also in Chile. June-Sept.

Scirpus Americànus longispicàtus Britton. Spikelets linear-cylindric, $\mathbf{x - 2 . 5} \mathrm{cm}$. long; bristles as long as the broadly obovate achene. S. shore of Lake Ont., Cul. and N. Mex.

I I. Scirpus Ólneyi A. Gray. Olney's Bulrush. (I. F.f. 6io.) Similar to the preceding species; culms stout, sharply 3 -angled with concave sides, $0.5-2 \mathrm{~m}$. tall. Leaves $\mathbf{I}-3,2-\mathbf{1} 3 \mathrm{~cm}$. long, or sheaths sometimes leafless; spikelets capitate in dense clusters of 5-12, oblong or ovoid-oblong, obtuse, 5-8 mm. long, the involucral leaf short, stout, erect, $\mathbf{I}-3 \mathrm{~cm}$. long; scales oval or orbicular, dark brown with a green midvein, emarginate or mucronulate, glabrous; bristles usually 0 , slightly shorter than or equalling the achene, downwardly barbed; stamens $2-3$; style 2-cleft; achene obovate, plano-convex, brown, mucronate. In salt marshes, Mass.
to Fla., Tex., Mex. and Cal., extending north along the Pacific Coast to Ore. Also in Ark. June-Sept.
12. Scirpus Tórreyi Olney. Torrey's Búlrush. (I. F. f. 620.) Perennial by rootstocks; culms sharply 3 -angled, rather slender, nodulose, $0.5-\mathbf{1 . 1} \mathrm{m}$. tall. Leaves narrowly linear, elongated, nodulose, light green; spikelets $\mathbf{1}-4$, in an apparently lateral capitate cluster, oblong, narrowed at each end, $10-16 \mathrm{~mm}$. long; involucral leaf $5-15 \mathrm{~cm}$. long, erect; scales ovate or lanceolate, shining, chestnutbrown, glabrous, mucronulate; bristles about 6, downwardly barbed, longer than the achene; stamens 3; style 3-cleft; achene obovoid, smooth, shining, light brown, 3 -angled, one of its sides broader and flatter than the others. In swamps, Vt. to R. I. and Penn., west to Minn. and Manitoba. July-Sept.
13. Scirpus mucronàtus L. Bog Bulrush. (I. F. f. 62I.) Perennial ; culms stout, tufted, 3 -angled, smooth, $0.3-1 \mathrm{~m}$. tall. Spikelets $5-\mathbf{1 2}$ in a capitate cluster, oblong, obtuse, $8-18 \mathrm{~mm}$. long, rather more than 2 mm . in diameter, subtended by a linear abruptly spreading involucral leaf ; scales broadly ovate, obtuse, light brown with a narrow green midvein, mucronate ; bristles 6 , stout, rigid, downwardly barbed, as long as the achene ; stamens 3 ; style 3 -cleft; achene obovoid, smooth, shining, dark brown, 3 -angled, two of the sides narrower and more convex than the third. In a swamp in Del. Co., Penn. Probably adventive or fugitive from Europe. Widely distributed in the Old World. July-Sept.

I4. Scirpus cylindricus (Torr.) Britton. Canby's Bulrush. (I. F. f. 622.) Perennial by stout rootstocks: culm stout, 3 -angled above, $\mathbf{I}-2 \mathrm{~m}$. high, the linear nodulose keeled dark green leaves nearly or quite as long. Involucral leaf I-2.5 dm. long, erect ; spikelets in an apparently lateral umbel, drooping, oblong-cylindric, acutish, $1-2 \mathrm{~cm}$. long, primary rays of the umbel bracted by I or more subu-late-linear leaves ; scales ovate or ovate-lanceolate; pale brown, acute, mucronulate ; bristles 6 , stout, rigid, about as long as the achene, serrate; stamens 3 ; style 3-cleft ; achene obovoid, 3 -angled, light brown, smooth, abruptly subulate-pointed. In ponds and swamps, Md. to Fla. and La. July-Sept.

Ic. Scirpus lacústris L. Great Bulrush. Mat-rush. (I. F. f. 623.) Perennial by rootstocks; culm stout, terete, smooth, erect, $\mathbf{I}-3 \mathrm{~m}$. tall, sometimes 2 cm . in diameter, sheathed below. Involucral leaf solitary, erect, shorter than the umbel; umbel compound, appearing lateral, its primary rays $2-10 \mathrm{~cm}$. long; bracts linear-lanceolate ; spikelets becoming oblong-cylindric, sessile or some of them peduncled, in capitate clusters of $1-5,5-16 \mathrm{~mm}$. long, 3-4 mm. in diameter; scales ovate or oblong, with a strong midvein which is sometimes excurrent ; bristles, 4-6, downwardly barbed, equalling or longer than the achene ; stamens 3 ; style 2 -cleft : achene plano-convex, obovate, gray, abruptly mucronate, dull. In ponds and swamps throughout N. Am. Also in the Old World. June-Sept.
16. Scirpus Califórnicus (C. A. Meyer) Britton. California Bulrush. (I. F. f. 624.) Perennial, similar to the preceding species, the leaves reduced to basal sheaths. Involucral leaf short, stoutly subulate; umbel compound; spikelets $6-10 \mathrm{~mm}$. long, acute, peduncled or some of them sessile; scales brown, ovate, awnpointed; bristles shorter than or equalling the achene, short plumose below; stamens 2-3; style 2 -cleft; achene obovate, plano-convex, nearly white, narrowed above into a short point, contracted at the base. In swamps, Fla. to La., N. Mex. and Cal., and widely distributed in tropical America. Not certainly known within our area. June-Aug.

I7. Scirpus rùfus (Huds.) Schrad. Red Club-Rush. (I. F. f. 625.) Perennial; culms smooth, slender, somewhat compressed, $7-40 \mathrm{~cm}$. tall. Leaves halfterete, smooth, shorter than the culm, channeled, $\mathbf{I}-8 \mathrm{~cm}$. long, less than 2 mm . wide, the lowest reduced to sheaths; spikelets red-brown, few-flowered, narrowly ovoid-oblong, subacute, about 6 mm . long, in a terminal 2 -ranked spike; involucral leaf solitary, erect, equalling or longer than the spike; scales lanceolate, acute, I-nerved; bristles 3-6, upwardly barbed, shorter than the achene, deciduous; stamens 3 ; style 2 -cleft; achene oblong, pointed at both ends, light brown, planoconvex or slightly angled, 3-4 mm. long. In marshes, N. B. and Que. to the N. W. Terr. Also in northern Europe. Summer.
18. Scirpus campéstris Britton. Prairie Bulrush. (I. F. f. 626.) Perennial, culm smooth, sharply triangular, $0.3-0.5 \mathrm{~m}$. tall. Leaves usually pale green, smooth, $2-4 \mathrm{~mm}$. wide, those of the involucre 2 or 3 , the longer much exceeding
the inflorescence; spikelets 3 -ro in a dense terminal simple head, oblong cylindric, $1.5-2.5 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. in diameter; scales ovate, pale brown, 2 -toothed at the apex, the midvein excurrent into an ascending or spreading awn; bristles I-3, much shorter than the achene or none; style 2 -cleft; achene lenticular, obovate or oblong-ovate, mucronulate, yellow-brown, its surface strongly cellularreticulated. On wet prairies and plains, Man. and Minn. to Neb., Kans. and Mex., west to Nev. May-Aug.
19. Scirpus robústus Pursh. Salt Marsh Bulrush. (I. F. f. 627.) Perennial by rootstocks; culm stout, stiff, 3 -angled with flat sides, smooth, 0.5-1.4 m . tall. Leaves dark green, smooth, $5-10 \mathrm{~mm}$. wide; involucral leaves $2-4$, elongated, similar; spikelets ovoid-oblong, stout, $\mathbf{1} \cdot 5-2.5 \mathrm{~cm}$. long, $8-\mathrm{ro} \mathrm{mm}$. in diameter, 6-20 together in a dense terminal cluster; scales ovate, brown, puberulent, thin, the midvein excurrent into an, at length, reflexed awn 3-5 mm. long; bristles I-6, fragile, shorter than the achene, or none; style 3 -cleft; achene compressed, flat on the face, convex or with a low ridge on the back, obovate-orbicular, dark brown, shining, 3 mm . long. In salt marshes, N. S. to Tex. July-Oct.
20. Scirpus fluviátilis (Torr.) A. Gray. River Bulrush. (I. F. f. 628.) Perennial by rootstocks; culm stout, smooth, triangular with nearly flat sides, o.9-2 m . tall. Leaves $8-\mathbf{I} 6 \mathrm{~mm}$. wide, smooth, attenuate to a very long tip; those of the involucre $3-5$, erect or spreading, often 20 cm . long; spikelets in a terminal umbel, solitary or $2-3$ together at the ends of its long spreading or drooping rays, or the central spikelets sessile, oblong-cylindric, acute, $1.6-2.5 \mathrm{~cm}$. long, about 7 mm . in diameter; scales ovate, scarious, puberulent, the midvein excurrent into a curved awn 3-4 mm. long; bristles 6 , downwardly barbed, about as long as the achene; style 3 -cleft; achene sharply 3 -angled, obovoid, rather dull, short-pointed, 4 mm . long. In shallow water, Que. to Minn., N. J., Neb. and Kans. June-Sept.
21. Scirpus Nòvae-Angliae Britton. New England Coast Sedge. (I. F. f. 627 a.) Perennial by rootstocks; culm stout, 1-2 m. tall, sharply 3 -angled. Leaves long, $8-12 \mathrm{~mm}$. wide, roughish on the margins when dry, the lowest reduced to pointed sheaths, those of the involucre $2-5$, the longer of them much exceeding the inflorescence; spikelets narrowly cylindric, acute, $1.8-5 \mathrm{~cm}$. long, less than 8 mm . thick, solitary or $2-5$ together at the ends of the rays; rays $2-10 \mathrm{~cm}$. long; scales awned; bristles $2-4$, shorter than the grayish-white dull obovate achene, which is distinctly 3 -angled; style 3 -cleft. In fresh water and brackish marshes, Conn. and S. N. Y.
22. Scirpus sylváticus L. Wood Bulrush. (I. F. f. 629.) Perennial by long rootstocks; culm triangular, stout, smooth, I-2 m. tall, often overtopped by the upper leaves. Leaves I-I. 6 cm . wide, rough on the margins, those of the involucre 5-8, the larger often 0.3 m . long or more; umbel terminal, very large, sometimes 2 dm . broad, about 3 times compound, the spikelets ovoid or ovoidoblong, $3-5 \mathrm{~mm}$. long, in capitate clusters at the ends of the raylets; bractlets of the involucels small, linear or lanceolate; scales ovate-oblong, obtuse, brown with a green centre; bristles 6 , downwardly barbed, slightly exceeding the achene; stamens 3; style 3 -cleft; achene oblong, 3 -angled, obtuse, nearly white, mucronulatc. In swamps, N. H. to N. Car. Also in Europe. June-Aug.
23. Scirpus atróvirens Muhl. Dark-green Bulrush. (I. F. f. 630.) Perennial by rootstocks; culms triangular, rather slender, leafy, $0.5-\mathbf{1} .2 \mathrm{~m}$. high. Leaves elongated, nodulose, dark green, $6-12 \mathrm{~mm}$. wide, one or two of them usually exceeding the inflorescence; spikelets ovoid-oblong, acute, densely capitate at the ends of the rays or raylets; involucels short; scales greenish-brown, oblong, acute, the midvein excurrent; bristles usually 6 , downwardly barbed above, naked below, about as long as the achene; stamens 3 ; style 3 -cleft; achene ohlongobovoid, 3 -angled, pale brown, dull. In swamps, N. S. to Manitoba, Ga. and La-June-Aug.

Scirpus atróvirens pállidus Britton. Whole plant pale green; scales awned; spikelets oblong-cylindric, very numerous in the capitate clusters. Minn. to the N. II. Terr.and Colo.
24. Scirpus microcàrpus Presl. Smali-fruited Bulerish. (I. F. f. 63i.) Perennial; culms $0.9-\mathbf{1} .6 \mathrm{~m}$. tall, often stout, overtopped by the leaves. Longer leaves of the involucre usually exceeding the inflorescence; spikelets ovoid-oblong, acute, $3-4 \mathrm{~mm}$. long, in capitate clusters at the ends of the usually spreading ray-
lets; scales brown with a green midvein, bristles 4, barbed downwardly nearly or quite to the base, somewhat longer than the achene; stamens 2 ; style 2 -cleft; achene oblong-obovate, nearly white, plano-convex or with a low ridge on the back, pointed. In swamps and wet woods, N. S. to Quebec and Alaska, Mass., N. Y., Minn. and Cal. July-Sept.
25. Scirpus polyphýllus Vahl. Leafy Bulrush. (I. F. f. 632.) Perennial by rootstocks; culms slender, sharply triangular, o.3-1. 1 m. tall, very leafy, the leaves 4-6 mm. wide, 3 -ranked, rough-margined, those of the involucre 3-6, the longer commonly somewhat exceeding the inflorescence; spikelets ovoid, about 3 mm . long, capitate at the ends of the raylets; scales ovate, bright brown, mostly obtuse, mucronulate; bristles 6, downwardly barbed above the middle, twice as long as the achene; stamens 3 ; style 3 -cleft; achene obovoid, 3 -angled with a broad face and narrower sides, short-pointed, dull. In swamps, wet wonds and meadows, Mass. to Minn., Ala. and Ark. Some of the scales of the spikelets occasionally develop into linear leaves. July-Sept.
26. Scirpus Péckii Britton. Peck's Bulrush. (I. F. f. 633.) Perennial by rootstocks; culms slender, triangular, $0.4-1 \mathrm{~m}$. tall, leafy. Leaves elongated, 4-10 mm. wide, rough-margined, the upper overtopping the culm, those of the involucre $3-5$, the longer exceeding the inflorescence; umbel compound, large; spikelets cylindric, obtusish, $6-10 \mathrm{~mm}$. long, in capitate clusters at the ends of the raylets or some of them peduncled; scales dark brown, keeled, mucronate, falling early; bristles $4-6$, downwardly barbed from below the middle to the summit, longer than the achene; style 3 -cleft; achene 3 -angled, 0.5 mm . long. oblong, narrowed at each end, slender-beaked. In swamps, Conn. and N. Y. July-Sept.
27. Scirpus divaricàtus Ell. Spreading Bulrush. (I. F. f. 634.) Roots fibrous; culms obtusely triangular, smooth, rather slender, 0.6 - 1 . 1 m . tall. Leaves +.8 mm . wide, rough-margined, not exceeding the inflorescence; umbel decompound, the primary rays very slender, sometimes $\mathbf{1} .5 \mathrm{dm}$. long, spreading or drooping; involucels setaceous. spikelets mostly solitary at the ends of the raylets, linear-oblong, obtuse, $6-12 \mathrm{~mm}$. long, I mm . thick; scales ovate, greenish-brown, subacute or obtuse, bristles 6, flexuous, longer than the achene, somewhat pubescent, not barbed, shorter than the scales; stamens 3 ; style 3 -cleft; achene 3 -angled, oblong, narrowed at both ends, apiculate, nearly white, not shining. In swamps, Va. and Ky. to Mo., Fla. and La. The spikelets sometimes partially develop into tufts of leaves. June-Aug.
28. Scirpus lineàtus Michx. Reddish Bulrush. (I. F. f. 635.) Perennial by stout rootstooks; culms triangular, erect, o.3-1 m. high, leafy. Leaves $4-8 \mathrm{~mm}$. wide not exceeding the inflorescence; light green, flat, rough-margined; umbels lecompound, the rays very slender, becoming pendulous; spikelets mostly solitary at the ends of the raylets, oblong, obtuse, $6-10 \mathrm{~mm}$. long, about 2 mm . in diameter; scales ovate or oblong, reddish-brown with a green midvein; bristles 6, weak, smooth, entangled, much longer than the achene, equalling the scales or longer; stamens 3 ; style 3 -cleft; achene oblong or oblong-obovoid, pale brown, narrowed at both ends, 3 -angled, short-beaked. In swamps and wet meadows, N. H. to Ont., Ore., Ga. and Tex. June-Sept.
29. Scirpus cypérinus (L.) Kunth. Wool-Grass. (I. F. f. 636.) Perennial; culms smooth, obtusely triangular or nearly terete, stiff, leafy, $0.6-2 \mathrm{~m}$ : tall. Leaves elongated, $3-6 \mathrm{~mm}$. wide, rough-margined, those of the involucre 3-6, the longer much exceeding the inflorescence; umbel terminal, compound, the rays at length somewhat drooping; spikelets ovoid-oblong, obtuse, $3-5 \mathrm{~mm}$. long, in capitate clusters of $3-15$ at the ends of the raylets; scales ovate or lanceolate, acute or subacute; bristles 6, entangled, smooth, much longer than the achene, much exserted beyond the scales and grayish brown at maturity; stamens 3 ; style 3 -cleft; achene 3 -angled, oblong, slender-beaked, nearly white. In swamps, Newf. to Ont., Va. and Ky. Aug.-Sept.

Scirpus cypérinus Erióphorum (Michx.) Britton. Spikelets mostly peduncled. Range of the type, but extending to Fla. and La.

## 10. ERIÓPHORUM L.

Bog serlges. perennial by rontstocks, the culms erect, triangular or nearly terete, the leaves linear. or 1 or 2 of the upper ones reduced to bladeless sheaths. Spike-
lets terminal, solitary, capitate or umbelled, sujtended by a I-several-leaved involucre, or naked. Scales spirally imbricated, usually all fertile. Flowers perfect. Perianth of 6 or numerous filiform smooth soft bristles, which are white or brown, straight or crisped, and exserted much beyond the scales at maturity. Stamens 1-3. Style 3-cleft. Achene 3-angled, oblong, ellipsoid or obovoid. [Greek, signifying wool-bearing, referring to the soft bristles.] About Io species, in the northern hemisphere. Besides the following, one occurs in Alaska.

Spikelet solitary ; involucral leaf short or none.
Bristles only 6 , white, crisped, very long.

1. E. alpinum.

Bristles numerous, straight or slightly crisped. Bristles bright white.

Culm with 2 inflated bladeless sheaths; achene obovoid, obtuse.
2. E. vaginatum.

Only the upper sheath bladeless, or all blade-bearing; achene linear-oblong, acute. Bristles reddish-brown
3. E. Scheuchzeri.
4. E. russeolum.

Achene obovoid, obtuse ; spikelets umbellate.
5. E. polystachyon.

Achene linear-oblong, acute; spikelets capitate or some of them peduncled.
Leaves channeled or $3^{\text {-sided; }}$; bristles $4^{-6}$ times as long as the scale, bright white.

Upper part of culm and the peduncles rough ; bristles $2-2.5 \mathrm{~cm}$. long.
6. E. paucinervium.

Plant smooth or nearly so throughout ; bristles $\mathrm{I}-\mathrm{I} .5 \mathrm{~cm}$. long.
7. E. gracile. Leaves flat ; bristles 3 times as long as the scale, brown (rarely white).
8. E. Virginicum.
I. Eriophorum alpìnum L. Alpine Cotton-Grass. (I. F. f. 637.) Perennial by short rootstocks, sending up numerous filiform triangular roughish culms, 1.5-2.5 dm. high. Leaves subulate, 6-20 mm. long, triangular, channeled, borne near the base of the culm. the lower sheaths often bladeless; spikelet terminal, small, erect; involucral bract subulate, mostly shorter than the spikelet, sometimes wanting; scales oblong-lanceolate, yellowish brown, firm, the midvein slender; bristles 6 , white, crisped, 4-7 times as long as the scale; achene narrowly obovoidoblong, brown, apiculate, dull. In bogs and on high mountains, Newf. to Hudson Bay and the N. W. Terr., south to Vt., N. N. Y. and Minn. Also in Europe and Asia. Summer.
2. Eriophorum vaginàtum L. Sheathed Cotton-Grass. (I. F. f. 638.) Culms stiff, obtusely triangular, smooth, slender, 2-4 dm. tall, bearing two distant inflated sheaths, the upper one usually above the middle. Leaves stiff, filiform, triangular, channeled, shorter than or sometimes overtopping the culm; involucral leaf wanting; spikelet solitary; scales ovate-lanceolate or the lowest lanceolate, acuminate, purple-brown, thin; bristles numerous, white, straight, glossy, 4-5 times as long as the scale; anthers linear; achene obovoid, obtuse, brown, dull, minutely apiculate. In bogs, Newf. to Alaska, Mass., Penn. and Minn. Also in N. Europe and Asia. June-Aug.
3. Eriophorum Scheuchzèri Hoppe. Scheuchzer's Cotton-grass. (I. F. f. 639.) Similar to the preceding, but the sheaths all blade-bearing or onlythe upper one bladeless; culms slender, smooth, nearly terete. Leaves usualiy much shorter than the culm; scales ovate-lanceolate, long-acuminate, purplebrown; bristles white or slightly yellowish, weak, nearly straight; "anthers cor-date-ovate;" achene narrowly oblong, acute, brown, dull, subulate-beaked. In boys, Newf. and Lab. to Manitoba, Alaska and Ore. Also in Europe. Summer.
4. Eriophorum russèolum Fries. Russet Cotton-cirass. (I. F. f. Gfo.) Culms triangular, erect, smooth, longer than the leaves. Upper sheath inflated, bladeless, mucronate, or rarely with a short subulate blade usually borne below the middle of the culm; leaves filiform, triangular-channeled, mucronite. $2-10 \mathrm{~cm}$ long; spikelet erect; involucre none; scales ovate-lanceolate, acuminate, thin, purplish brown with nearly white margins; bristles numerous, brisht reddish brown, 3-5 times as long as the scale; achene oltong, narrowed at each end, apiculate. Searcely differs from the preceding species except in the color of the bristles and the shorter-pointed achene. In bogs, Newf. to Quebec. June-Ang.
5. Eriophorum polystàchyon L. Tall Cotton-Grass. (I. F. f. 641 r. Culm stiff, smooth, obtusely triangular above, $0.4-0.9 \mathrm{~m}$. tall, all the sheaths blade bearing. Leaves flat, $3-8 \mathrm{~mm}$. wide, tapering to a channeled rigid tip, those o the involucre $2-4$, the longer commonly equalling or exceeding the inflorescence spikelets 3-12, drooping, in a terminal umbel ; rays filiform. smooth or rough scales ovate-lanceolate, acute or acuminate, purple-green or brown; bristles numerous, bright white, about 2.5 cm . long, $4-5$ times as long as the scale; achene obovoid, obtuse, light brown. In bogs, Newf. to Alaska, south to N. J., Ga. and Neb. Also in Europe and Asia. June-Aug.
6. Eriophorum paucinérvium (Engelm.) A. A. Eaton. Few-nerved Cot-ton-Grass. (I. F. f. 642 , as E. gracile.) Culm slender, obtusely triangular, rough above on the angles, $0.4-1 \mathrm{~m}$. tall, the sheaths all blade-bearing. Leaves narrowly linear, $2-4 \mathrm{~mm}$. wide, triangular-channeled, rough-margined; involucral leaf commonly only I, stiff, erect ; spikelets $3-8$, capitate or subumbellate, the longerpeduncled ones drooping ; peduncles scabrous ; scales ovate or oblong, obtuse or subacute, yellowish brown, the midvein rather strong, often with a weaker nerve on each side ; bristles numerous, bright white, $2-2.5 \mathrm{~cm}$. long, 4-6 times as long as the scale ; achene linear-oblong, acute, pointed. In bogs, N. B. to N. J. and Ill. May-Aug.
7. Eriophorum grácile Koch. Slender Cotton-Grass. Culms slender, 3-7 dm. tall, terete or nearly so, smooth, with 1 or 2 triquetrous leaves 1.5-2.5 cm . long. Involucral leaves I or 2 , short ; spikelets usually 3 or 4 , sessile, or on smooth peduncles; scales ovate, or the inner lanceolate, obtuse, dark leadcolored ; bristles numerous, I-I. 5 cm . long. In bogs, Newf. to Wash., south to S. N. Y., Pa., Neb. and Cal. July-Sept.
8. Eriophorum Virgínicum L. Virginia Cotton-grass. (I. F. f. 643.) Culm stiff, obtusely triangular above, smooth, o.4-1. I m. tall, rather leafy. Leaves narrowly linear, flat, $2-5 \mathrm{~mm}$. wide, channeled toward the apex, those of the involucre 2-4, spreading or deflexed, $5-15 \mathrm{~cm}$. long ; spikelets several or numerous in a dense terminal capitate cluster, erect or the outer spreading; scales ovate, acute, brown with a green centre, about 5 -nerved; bristles numerous, dingy brown, about 3 times as long as the scale; achene linear-oblong, acute, apiculate, light brown. In bogs, Newf. to Manitoba, Fla. and Neb. June-Sept.

Eriophorum Virginicum álbum A. Gray. Bristles white. N. N. Y.

## ir. FUIRÈNA Rottb.

Perennial sedges, with leafy triangular culms (in a southern species the leaves reduced to inflated sheaths), and many-flowered terete spikelets in terminal and axillary clusters, or rarely solitary. Scales spirally imbricated, awned, the I or 2 lower commonly empty. Flowers perfect. Perianth of 3 ovate oblong or cor-date-ovate, stalked, often awned sepals, usually alternating with as many downwardly barbed bristles. Stamens 3. Style 3-cleft, not swollen at the base, deciduous. Achene stalked or nearly sessile, sharply 3-angled, acute or mucronate, smooth. (In honor of Georg Fuiren, 1581-1628, Danish physician.) About 20 species, natives of warm-temperate and tropical regions. Besides the following, I or 2 others occur in the southern United States.

Sepals awned from the apex or awnless. Sepals awned on the back below the apex.

1. $F$. squarrosa.
2. F. simplex.
I. Fuirena squarròsa Michx. SQuarrose Fuirena. (I. F. f. 644.) Rootstock short, sometimes tuber-bearing; culms tufted, glabrous or nearly so, 5-50 cm . tall. Leaves flat, nearly or quite glabrous or the lower sheaths pubescent; spikelets sessile and I-IO together, capitate clusters, ovoid or ovoid-oblong, $6-12 \mathrm{~mm}$. long, about 5 mm . in diameter; scales ovate or oblong, brown, pubescent, mostly obtuse, 3-nerved, tipped with a stout spreading or recurved awn of nearly their own length; sepals oblong, long-stalked, usually narrowed at both ends, the awn downwardly baribed or sometimes smooth; bristles mostly longer than the achene. In wet meadows and marshes, Mass. to Fla. and La. near the coast. Also in Mich. and Neb. July-Sept.

Fuirena squarròsa híspida (Ell.) Chapm. Sheaths and leaves hirsute ; sepals ovate, cordate at the base or abruptly narrowed into the stalk, awnless or very short-awned at the apex ; bristles usually shorter than or equalling the achene ; plant usually taller. N. Y. to Fla., Ala. and Tex.
2. Fuirena símplex Vahl. Western Fuirena. (I. F. f. 645.) Similar to the preceding species; culms $\mathbf{1}-5 \mathrm{dm}$. tall, glabrous. Leaves flat, glabrous or ciliate; scales tipped with a spreading or reflexed awn; sepals ovate-oblong, obtuse and usually notched at the apex, obtuse, truncate or subcordate at the base; awned on the back from below the apex, the awn smooth or downwardly barbed; bristles retrorsely hispid, equalling or exceeding the sessile or short-stalked achene. In moist soil, Neb. to Tex. and Mex. June-Sept.

## 12. HEMICÀRPHA Nees \& Arn.

Low tufted mostly annual sedges, with erect or spreading, almost filiform culms and leaves, and terete small terminal capitate or solitary spikelets subtended by a r-3-leaved involucre. Scales spirally imbricated, deciduous, all subtending perfect flowers. Perianth of a single hyaline sepal (bract?) between the flower and the rachis of the spikelet; bristles none. Stamens 1-3. Style 2 -cleft, deciduous, not swollen at the base. Achene oblong, turgid or lenticular. [Greek, in allusion to the single sepal.] About 3 species, natives of temperate and tropical regions. Besides the following, another occurs in the southwestern U.S.

1. Hemicarpha micrántha (Vahl) Britton. Hemicarpha. (I. F. f. 646.) Annual; glabrous; culms compressed, grooved, $2-10 \mathrm{~cm}$. long, mostly longer than the setaceous smooth leaves. Spikelets ovoid, many-flowered, obtuse, about 2 mm . long; involucral leaves usually much exceeding the spikelets; scales brown, obovate, with a short blunt spreading or recurved tip; stamen I; achene obovateoblong, obtuse, mucronulate, little compressed, light brown. In moist, sandy suil, R. I. to Penn., Iowa and Neb., Fla., Tex. and Mex. July-Sept.

Hemicarpha micrántha aristulàta Coville. Scales pale, cuneate-obovate, tapering into squarrose awns about their own length. Kans. to Tex.
13. LIPOCARPHA R. Br.

Low annual sedges, with slender tufted culms leafy at the base, and terete many-flowered spikelets in a terminal head, subtended by a I-several-leaved involucre. Scales firm, spirally imbricated, all fertile or several of the lower ones empty, at length deciduous. Flowers perfect. Perianth of two small sepals (bracts ?) one on each side of the flower; bristles none. Stamens r-2. Style 2-3-cleft, deciduous, its base not swollen. Achene plano-convex or 3 -angled. (Greek, alluding to the thick sepals in some species.) About 7 species, widely distributed in warm and tropical regions.

1. Lipocarpha maculàta (Michx.) Torr. American Lipocarpha. (I. F. f. 647.) Glabrous; culms grooved, compressed, smooth, longer than the narrowly linear somewhat channeled leaves, $7-25 \mathrm{~cm}$. tall. Leaves of the involucre 2-4; spikelets ovoid-oblong, obtuse, $5-6 \mathrm{~mm}$. long, 2 mm . in diameter, in a terminal capitate cluster; scales rhombic or lanceolate, acute, curved, the sides nearly white. or flecked with reddish-brown spots; exterior sepal convolute around the achene. nerved, hyaline; stamen 1; achene oblong, yellowish, contracted at the base. In wet or moist soil, E. Va. to Fla. Also near Philadelphia, where it is probably adventive. July-Sept.

## 14. RYNCHÓSPORA Vahl.

Leafy sedges, mostly perennial by rootstocks, with erect 3 -angled or terete culms, narrow flat or involute leaves, and ovoid oblong or fusiform, iariously clustered spikelets. Scales thin, I-nerved, imbricated all aroum, usually mucronate by the excurrent midvein, the lower empty. Upper flowers imperfect, the lower perfect. Perianth of I-20 (mostly 6) upwardly or downwardly barked or scabrons: bristles, wanting in some species (no. 2). Stamens commonly 3. Style z-ckett, 2 -toothed or rarely entire. Achene lenticular or swollom, not 3 -angled, smonth or transversely wrinkled, capped by the persistent base of the style (tubercle), or in
some species by the whole style. [Greek, referring to the beak-like tubercle.] About 200 species, of wide geographic distribution, most abundant in warm regions. Besides the following, some 27 others occur in the southern U. S.

Style entire or 2 -toothed, persistent as a long-exserted subulate beak.
Style deeply 2 -cleft, only its base persistent as a tubercle.
Bristles minute or wanting.

1. R. corniculata.

Bristles plumose.
2. R. pallida.

Bristles downwardly barbed or rarely smooth.
Scales white or nearly so; bristles 9-15.
3. R. oligantha. Scales brown; bristles 6 .

Leaves filiform; achene oblong.
Leaves narrowly linear, flat; achene obovate.
Bristles equalling the achene; tubercle one-half as long or less.
6. R. Knieskernii.

Bristles reaching or exceeding the end of the tubercle, which is as long as the achene.
Spikelets few-several in numerous rather loose clusters.
7. R. glomerata.

Spikelets very numerous in $2-6$ very dense globose heads.
8. R. axillaris.

Bristles upwardly barbed.
Spikelets very numerous in $2-6$ very dense globose heads. 8. $R$. axillaris. Spikelets few-several in rather loose clusters.

Achene smooth.
Leaves setaceous; achene obovate, shining. 9. R. fusca.
Leaves narrowly linear, flat; achene broadly oval, dull.
10. R. gracilenta.

Achene transversely wrinkled.
Spikelets ovoid, in erect cymose clusters; achene longer than the bristles.
Leaves flat ; spikelets nearly or quite sessile. II. R. cymosa.
Leaves involute; spikelets distinctly pedicelled.
12. R. Torreyana.

Spikelets spindle-shaped, in drooping panicles; achene shorter than the bristles.
13. $R$. inexpansa.
I. Rynchospora corniculàta (Lam.) A. Gray. Horned Rush. (I. F. f. 648.) Culm triangular, smooth, $1-2 \mathrm{~m}$. tall. Leaves flat, $1.5-4.5 \mathrm{dm}$. long, 6 16 mm . wide, rough-margined; umbels sometimes 2.5 dm . broad; spikelets spindleshaped, $8-12 \mathrm{~mm}$. long in flower, capitate at the ends of the rays and raylets; primary rays sometimes 15 cm . long; scales lanceolate, thin, acute, light brown; bristles about 6, rigid, upwardly scabrous; style subulate, entire or minutely 2 -toothed at the apex, 2-4 times longer than the achene, upwardly scabrous, $\mathbf{I}-2.5 \mathrm{~cm}$. long, much exserted beyond the scales when mature; achene obovate, flat, 4 mm . long, dark brown, smooth. In swamps, Del. to Fla., Ohio, Mo. and Tex. July-Sept.

Rynchospora corniculàta macrostàchya (Torr.) Britton. Bristles about twice as long as the achene. Range of the type, but extending north to Mass.
2. Rynchospora pállida M. A. Curtis. Pale Beaked-Rush. (I. F. f. 649.) Rootstocks slender ; culms triangular, $0.3-0.6 \mathrm{~m}$. tall. Leaves $\mathbf{I}-2 \mathrm{~mm}$. wide, nearly smooth, the lowest reduced to scales; spikelets numerous, spindle-shaped, 4-6 mm. long, aggregated in a compound terminal head, or occasionally also in a cluster from the upper axil; uppermost leaves subulate; scales pale greenish brown, lanceolate, acuminate ; bristles minute and early deciduous, or wanting; style 2 cleft ; achene lenticular, obovate-oblong, smooth, brown, shining, 1 mm . long, tipped by a short tubercle. In pine-barren bogs, N. J. to N. Car. Aug.-Sept.
3. Rynchospora oligántha A. Gray. Few-flowered Beaked-rush. (I. F. f. 650.) Rootstocks short ; culms almost thread-like, leafy toward the base, I.5-4 dm. tall. Leaves filiform ; spikelets $\mathbf{I}-4$, terminal, narrowly oblong, acute, $6-8 \mathrm{~mm}$. long, subtended by 1 or 2 filiform bracts; scales ovate, pale brown, acute, cuspidate ; bristles usually 6 , densely plumose below the middle; style 2 -cleft ; achene obovoid-oblong, obtuse, pale brown, dull, transversely wrinkled; tubercle
with a flat depressed border and a flattened conic acute projection. In wet sandy soil, Del. to Fla. and Tex. June-Aug.
4. Rynchospora álba (L.) Vahl. White Beaked-rush. (I. F. f. 651 .) Pale green; rootstocks short; culms slender or filiform, glabrous, 1.5-5 dm. tall. Leaves bristle-like, o. $\mathbf{5}^{-1} \mathrm{~mm}$. wide, shorter than the culm ; spikelets in $\mathbf{1}-4$ dense corymbose clusters, narrowly oblong, acute at both ends, $4-6 \mathrm{~mm}$. long ; scales ovate or ovate-lanceolate, white, acute; bristles $9-15$, downwardly barbed, slender, about as long as the achene and tubercle ; style 2 -cleft ; achene obovate-oblong, smooth, pale brown, lenticular; tubercle triangular-subulate, flat, one-half as long as the achene. In bogs, Newf. to Alaska, south to Fla., Ky., Minn. and Ore. Alsc in N. Europe and Asia. June-Aug.
5. Rynchospora capillàcea Torr. Capillary Beaked-rush. (I. F. f. 652.) Culms filiform, glabrous. $1.5-5 \mathrm{dm}$. tall. Leaves filiform, less than 0.5 mm . wide, much shorter than the culm; spikelets few, in I-3 loose clusters oblong, acute at both ends, 4-6 mm. long ; scales ovate-oblong, chestnut-brown, heeled, mucronate; bristles 6, slender, downwardly barbed ; achene narrowly oblong, short-stalked, light brown, minutely wrinkled, lenticular ; style 2-cleft ; tubercle compressed, tri-angular-subulate, dark brown, about one-half as long as the achene. In bogs, Me. to Ont. and Minn., south to N. J., Penn. and Mich. July-Aug.

Rynchospora capillàcea laevisèta E. J. Hill. Bristles smooth. N. Ind. and Mich.
6. Rynchospora Knieskérnii Carey. Knieskern's Beaked-Rush. (I. F. f. 653.) Culms slender, smooth, $2-3.5 \mathrm{dm}$. tall. Leaves narrowly linear, flat, about I mm . wide, much shorter than the culm ; spikelets numerous, in several distant compact clusters, oblong, acute, about 2 mm . long; scales chestnut-brown, ovate ; bristles 6, downwardly barbed, equalling the achene ; achene obovate, lenticular, brown, minutely wrinkled; style 2-cleft; tubercle triangular-subulate, pale, one-half as long as the achene or less. Pine barrens, N. J. to Va. July-Aug.
7. Rynchospora glomeràta (L.) Vahl. Clustered Beaked-RuSh. (I. F. f. 654.) Rootstocks slender; culms smooth, triangular, $0.3-\mathrm{I} \mathrm{m}$. high. Leaves flat, $2-4 \mathrm{~mm}$. wide, rough-margined, shorter than the culm ; spikelets, in 3-7 corymbose-capitate axillary clusters, oblong, narrowed at both ends, $3-4 \mathrm{~mm}$. long; scales lanceolate, dark brown; bristles 6, downwardly barbed; achene obovate, lenticular, smooth, dark brown; tubercle subulate, about as long as the achene. In moist soil, Me. to Ont., Mich., Fla. and Tex. July-Sept.

Rynchospora glomeràta paniculàta (A. Gray) Chapm. Culm stouter, sometimes I-1.I m. tall ; leaves usually wider; spikelets numerous in compound clusters. Md. to Fla. and La.

Rynchospora glomeràta minor Britton. Culms very slender, x.2-2.5 dm. tall; leaves 0.5 mm . wide or less ; clusters 2 or 3, small, with 3-10 spikelets. Mass. and N. H.

Rynchospora glomeràta discùtiens Clarke. Bristles smooth, or barbed at the apex only. N. J. to N. Car.
8. Rynchospora axillàris (Lam.) Britton. Capitate Beaked-Rush. (I. F. f. 655.) Culms stout, 3 -angled, $0.5-\mathbf{I} \mathrm{m}$. tall. Leaves flat, keeled, $2-3 \mathrm{~mm}$. wide; spikelets spindle-shaped, $5-6 \mathrm{~mm}$. long, numerous, in several short-peduncled axillary and terminal dense globose heads sometimes 2 cm . in diameter; scales dark brown, ovate-oblong, acute; bristles usually 6, downwardly or upwardly barbed; achene broadly obovate, brown, smooth, lenticular; tubercle subulate, about as long as the achene. In swamps, L. I. to Fla. and La. July-Sept.

Rynchospora axillaris microcéphala Britton. Heads $8-10 \mathrm{~mm}$. in diameter: spikelets 3 mm . long; achene one-half as large as that of the type. N. J. to Fla, and La.
9. Rynchospora fúsca (L.) R. \& S. Brown Beaked-rush. (I. F. f. 656. ) Rootstocks short; culms 3 -angled, smooth, $1.5-4.5$ dm. tall. Leaves setaceous. channeled, scarcely 1 mm . wide, much shorter than the culm; spikelets spindleshaped, acute, about 5 mm . long, in 1-4 loose clusters; scales oblong-lanceolate. brown, shining, concave; bristles 6, upwardly barbed. often unequal; achene narrowly obovate, turgid-lenticular, smooth, shining; tubercle triangular-subulate. nearly as long as the achene. In, bogs, N. B. to Del., west to Mich. Also in Europe. July-Aug.
io. Rynchospora gracilénta A. Gray. Slender Beaked-rush. (I. F. f 657.) Culms slender or filiform, smooth, $0.3-0.5 \mathrm{~m}$. tall. Leaves flat or becoming involute in drying, rather less than 2 mm . wide, shorter than the culm; spikelets narrowly ovoid, acute, 4 mm . long, few, in 1-4 loose clusters, the lower clusters filiform stalked; scales ovate, brown, mucronate; bristles 6, upwardly barbed, equalling the achene and tubercle; achene broadly oval or nearly orbicular, dark brown, lenticular, dull, smooth; tubercle narrowly subulate, flat, widened at the base, pale, about as long as the achene. In pine-barren swamps, N. J. to Fla. and Tex. June-Aug.
II. Rynchospora cymòsa Ell. Grass-like Beaked-Rush. (I. F. f. 658.) Light green; culms tufted, 3 -angled, smooth, $0.3-0.5 \mathrm{~m}$. tall. Leaves flat, narrowly linear, grass-like, $3-4 \mathrm{~mm}$. wide or the basal ones broader; spikelets ovoidoblong, acute, 3 mm . long, sessile or nearly so, capitate in 2 's- 7 's on the ultimate branches of the axillary and terminal clusters; bracts setaceous; scales dark brown, broadly ovate; bristles 6, upwardly barbed, shorter than the achene; achene broadly obovate or oblong, lenticular, transversely wrinkled; style 2 -cleft; tubercle conic, one-fourth to one-third as long as the achene. In moist soil, N. J. to Ky., Mo., Fla. and Tex. Also in Cuba. June-Aug.
12. Rynchospora Torreyàna A. Gray. Torrey's Beaked-rush. (I. F. f. 659.) Culms terete or obscurely 3 -angled, smooth, slender, $0.4-0.9 \mathrm{~m}$. tall. Leaves involute, the lower $3-4 \mathrm{~mm}$. wide at the base, elongated, the upper bristlelike, distant; spikelets ovoid, 3 mm . long, peduncled, numerous in $1-4$ loose distant clusters; scales brown, ovate, mucronate; bristles 6, upwardly barbed, shorter than the oblong-obovate transversely wrinkled lenticular achene; style 2 -cleft; tubercle flat, conic, one-fourth to one-third as long as the achene. In wet pine barrens, N. J. to S. Car. July-Aug.
13. Rynchospora inexpànsa (Michx.) Vahl. Nodding Beaked-rush. (I. F. f. 660.) Rootstocks slender; culms smooth, slender, 3-angled, $0.5-0.9 \mathrm{~m}$. tall. Leaves smooth, 2 mm . wide or less, flat, the lower elongated, the upper bristle-like, remote; spikelets spindle-shaped, acute at both ends, about 6 mm . long, numerous in I-4 narrow finally drooping panicles; scales brown, lanceolate, acuminate; bristles 6, upwardly hispid, very slender, about twice as long as the achene; achene narrowly oblong, transversely wrinkled; style 2 -cleft; tubercle flat, triangular-subulate, one-half as long as the achene. In moist soil, Va. to La. june-Aug.

## 15. CLÀDIUM P. Br.

Perennial leafy sedges, similar to the Rynchosporas the spikelets oblong or fusiform, few-flowered, variously clustered. Scales imbricated all around, the lower empty, the middle ones mostly subtending imperfect flowers, the upper usually fertile. Perianth none. Stamens 2 or sometimes 3 . Style $2-3$-cleft, deciduous from the summit of the achene, its branches sometimes 2-3-parted. Achene ovoid to globose, smooth or longitudinally striate. Tubercle none. [Greek, referring to the branched inflorescence of some species.] About 30 species. natives of tropical and temperate regions. Besides the following, another occurs in California.

Leaves about 2 mm . wide; umbels small ; achene truncate at the base.

1. C. mariscoides. Leaves 6-20 mm. wide; umbels large, panicled; achene narrowed to the base.
2. C. effusum.
t. Cladium mariscoìdes (Muhl.) Torr. Twig-RUSH. (I. F. f. 66i.) Culm slender, rather stiff, obscurely 3 -angled, smooth, $0.3-0.9 \mathrm{~m}$. tall. Leaves about 2 mm . wide, concave, with a long compressed tip, nearly smooth; umbels 2 or 3 , compound, small; spikelets oblong, narrowed at both ends, acute, 5 mm . long, capitate on the raylets; scales chestnut-brown, ovate or ovate-lanceolate, acute; upper scale subtending a perfect flower with 2 stamens and a filiform 3 -cleft style, the next lower one with 2 stamens and an abortive ovary; achene ovoid, acute, finely longitudinally striate, about 2 mm . long. In marshes, N. S. to Ont. and Minn., south to Fla, and Ky. July-Sept.
3. Cladium effúsum (Sw.) Torr. Saw-Grass. Culm stout, 1.5-3 m. high, obtusely 3 -angled. Leaves very long, glabrous, $6-20 \mathrm{~mm}$. wide, the margins spinulose-serrulate; umbels several or numerous, decompound, forming a large panicle; spikelets mostly $2-5$ together at the ends of the raylets, narrowly ovoid, acute, $4-5 \mathrm{~mm}$. long; uppermost scale subtending a perfect flower; stamens 2 ; achene ovoid, abruptly sharp-pointed, wrinkled, narrowed to the base, 2 mm . long. In fresh water, southern Va. to Fla. and Tex. Also in the W. I. Aug.-Sept.

## 16. SCLERIA Berg.

Leafy sedges, mostly perennial, the spikelets small, clustered in terminal, or terminal and axillary fascicles, or sometimes interruptedly spicate. Flowers monoecious. Fertile spikelets I-flowered. Staminate spikelets many-flowered. Scales imbricated, the $\mathbf{1}-3$ lower and sometimes also the upper ones of the fertile spikelets empty. Perianth none. Style 3-cleft, slender or sometimes swollen at the base, deciduous. Ovary supported on a disk (hypogynium), or this wanting. Stamens 1-3. Achene globose or ovoid, obtuse, crustaceous or bony, white in our species. [Greek, in allusion to the hard fruit.] About 100 species, natives of tropical and temperate regions. Besides the following, some 4 others occur in the southern U. S.

Spikelets in terminal, or terminal and lateral clusters; achene supported on a hypogynium.

## Achene smooth.

Hypogynium supporting 8 or 9 small tubercles under the achene.

| Hypogynium covered with a rough white crust. Achene reticulated or irregularly rugose. | 1. S. oligantha. <br> 2. S. triglomerata. |
| :---: | :---: |
| Achene reticulated or irregularly rugose. <br> Culms erect or ascending ; achene reticulated; leaves $2-3 \mathrm{~mm}$. wide. |  |
| Culms spreading ; achene irregularly rugose ; leav | 3. S. reticularis. m. wide. |
| Achene papillose. kelets interruptedly glomerate-spicate ; no hypogynium. | 4. S. Torreyana. <br> 5. S. pauciflora. <br> 6. $S$. verticillata. |

I. Scleria oligántha Michx. Few-flowered Nut-rush. (I. F. f. 662.) Rootstocks thick, hard, clustered. Culms slender, erect, sharply 3-angled, nearly smooth, $0.4-0.6 \mathrm{~m}$. tall. Leaves smooth or slightly rough at the apex, $4-6 \mathrm{~mm}$. wide, the lower short, acute, the upper elongated; clusters terminal, usually also I or 2 axillary and filiform-stalked; bracts slightly ciliate or glabrous; achene ovoid, obtuse but sometimes pointed, bright white, smooth, shining; hypogynium a narrow obtusely triangular border supporting 8 or 9 small tubercles under the achene. In moist soil, Va. to Fla. and Tex., near the coast. June-Aug.
2. Scleria triglomerata Michx. Tall Nut-Rush. (I. F. f. 663.) Rootstocks hard, clustered; culms 3 -angled, $0.4-0.9 \mathrm{~m}$. tall. Leaves flat, glabrous or nearly so, $3-5 \mathrm{~mm}$. wide, the upper tapering to a long tip, rarely exceeding the culm; flower-clusters terminal, and usually also I or 2 smaller ones from the axils; achene ovoid or ovoid-globose, obtuse, bony, obscurely 3 -angled, smooth, bright white, shining, about 2 mm . high, supported on a low obtusely triangular, papil-lose-crustaceous hypogynium. In meadows and thickets, Vt. to Wis., Fla. and Tex. July-Sept.

Scleria triglomerata minor Britton. Culms very slender, $0.2-0.3 \mathrm{~m}$, long; flowerclusters smaller; achene ovoid, subacute, one-half as large as that of the type. S. N. J.
3. Scleria reticulàris Michx. Reticulatel) Nut-Rusil. (I. F. f. (o) .) Rootstocks small; culms slender, erect, 3 -angled, $0.3-0.0 \mathrm{~m}$. tall. l.aves narrowly linear, glabrous or nearly so, $2-3 \mathrm{~mm}$. wide, not owertopping the culm: spikelets in a terminal cluster and $1-3$ remote axillary rather loxse ones: bracts glabrous; achene globose, crustaceous, dull white when mature, reticulated, 1 mm . in diameter, glabrous; hypogynium 3 -lobed, its lobes appressed to the base of the achene. In moist meadows, E. Mass. to llan, west to Mo. Mso in Cuba. JulySept.

Scleria reticularis pubéscens Britton. Reticulations on the achene pubescent; lateral clusters usually longer stalked. N. J. to Fla. and Cuba.

Scleria reticularis obscùra Britton. Reticulations very obscure, the top of the achene almost smooth. R. I. to N. Car.
4. Scleria Torreyàna Walp. Torrey's Nut-rush. (I. F. f. 665.) Culms weak, spreading or diffuse, 3 -angled, nearly or quite smooth, $0.3-0.6 \mathrm{~m}$. long. Leaves linear, nearly flat, glabrous, $3-8 \mathrm{~mm}$. wide, not exceeding the culm; spikelets in a loose terminal cluster, and 1-3 filiform-stalked axillary ones; bracts glabrous; achene globose, somewhat pointed, nearly 2 mm . in diameter, irregularly rugose with low ridges, the ridges usually pubescent, and connected by shorter longitudinal ones; hypogynium 3 -lobed, the lobes appressed to the base of the achene. In moist soil, S. N. J. to Fla., Tex. and Mex. Also in Cuba. June-Aug.
5. Scleria paucifiòra Muhl. Papillose Nut-rush. (I. F. f. 666.) Rootstocks hard, clustered ; culms slender, erect, usually tufted, 3 -angled, $2-5 \mathrm{dm}$. tall. Leaves narrowly linear, less than 2 mm . wide, the upper elongated and often overtopping the culm, their sheaths often densely puberulent; spikelets in a small terminal cluster and sometimes also in I or 2 axillary ones; achene oblong or globular, I mm. in diameter or rather more, crustaceous. papillose, the lower papillae elongated and reflexed; hypogynium a narrow obtusely triangular border supporting 6 small tubercles. In dry soil, N. H. to Ohio, Mo., Fla, and Tex. Also in Cuba. June-Sept.
6. Scleria verticillàta Muhl. Low Nut-Rush. (I. F. f. 667.) Roots fibrous; culms very slender or filiform, 3 -angled, smooth or nearly so, erect, 1 - 5 dm . tall. Leaves very narrowly linear, o. $5-1 \mathrm{~mm}$. wide, erect, shorter than the culm ; spikelets in several separated clusters; bracts bristle-like; scales glabrous; achene globose, $\mathbf{I} \mathrm{mm}$. in diameter, crustaceous, marked by sharp distinct transverse ridges, or somewhat reticulated; hypogynium none. In moist meadows. E. Mass. to Ont. and Mich., south to Fla., Tex. and Mex., and in the W. I. Plant, especially the roots, fragrant in drying. July-Sept.
17. ELỲNA Schrad.

Low tufted arctic and mountain sedges, with erect slender mostly leafless culms, the narrowly linear leaves clustered at the base, and small 2 -flowered spikelets in a narrow terminal cylindric spike. Scales of the spikelet 3 or 4, distinct, usually only one of them flower-bearing; the staminate flower of 3 stamens, the pistillate of a single pistil. Bristles or perianth wanting. Style slender, 3-cleft, not jointed to the oblong ovary. Achene obtusely 3 -angled, sessile. [Greek, signifying covering, perhaps in allusion to the overlapping scales.] Four or five species of the arctic and alpine regions of the northern hemisphere.
I. Elyna Bellàrdi (All.) C. Koch. (I. F. f. 668.) Culms very slender, 1-4.5 dm. tall, longer than the very narrow leaves. Old sheaths fibrillose, brown; margins of the leaves more or less revolute; spike subtented by a short bract, or bractless, densely flowered or sometimes interrupted below, $1.5-3 \mathrm{~cm}$. long, $3-4 \mathrm{~mm}$. in diameter: achenes rather less than 2 mm . long, I mm. thick, appressed. In arctic America from Greenl. to Bering Sea, south in the Rocky Mountains to Colo. Also in Europe and Asia. Summer.

## 18. KOBRESIA Willd.

Slender arctic and mountain sedges, with erect culms leafy below, and few-severalflowered spikelets clustered in a terminal spike. Scales of the spikelets I-flowered, the lower usually pistillate, and the upper staminate. Stamens 3. Perianthbristles or perigynium wanting. Ovary oblong, narrowed into a short style; stigmas 3, linear. Achene obtusely 3-angled, sessile. [In honor of Von Kobres, a naturalist of Augsburg.] Three or four species, widely distributed in arctic and mountainous regions.
I. Kobresia bipartita (All.) Britton. (I. F. f. 669.) Culms solitary or tufted. smooth or very nearly so, $1-3 \mathrm{dm}$. tall. Leaves about 1 mm . wide, infolded at least in drying, the old sheaths becoming fibrillose; spike 3 cm . long or less, composed of several or numerous linear appressed or ascending spikelets; scales somewhat serrulate on the keel, rather more than I mm. long; mature achenes slightly
longer than the scales. Greenland to the Canadian Rocky Mountains. Also in Europe and Asia. Summer.

19. UNCÍNIA Pers.

Culms erect, leafy, or the leaves all basal. Spike simple, erect, terminal, the scales imbricated, I-flowered, the lower pistillate, the upper staminate. Scales ovate or oblong, concave, not keeled, obtuse or the lower acute. Stamens 3, rarely 1 or 2. Pistil enclosed in a utricle (perigynium), borne at the base of a slender axis, which is usually exserted beyond the orifice of the perigynium, at least in fruit, and sometimes hooked. Stigmas mostly 3. Achene 3-angled. [Latin, referring to the hooked axis of the southern species.] About 30 species, all but the following natives of the southern hemisphere.
I. Uncinia microglòchin (Wahl.) Spreng. Northern Uncinia. (I. F. f. 670.) Perennial by short stolons; culms very slender, weak, $1-3 \mathrm{dm}$. long. Leaves I-2 mm . wide, much shorter than the culm; spike $8-16 \mathrm{~mm}$. long, usually pistillate for more than one-half its length; scales oblong-lanceolate, r-nerved, deciduous; perigynia narrowly lanceolate, 6-8 mm . long, less than I mm. thick, reflexed in fruit; achene oblong, obtusely 3 -angled, much shorter than the perigynium; axis of the pistillate flower bristle-like, long-exserted beyond the orifice of the perigynium. Greenland to James Bay and Br. Col. Also in the arctic and mountainous parts of Europe and Asia and at the Strait of Magellan. Summer.

## 20. CAREX L.

Grass-like sedges, perennial by rootstocks. Culms mostly 3-angled. Leaves 3ranked, the upper elongated or very short (bracts) and subtending the spikes of flowers, or wanting. Flowers monoecious or dioecious, solitary in the axils of bracts (scales). Spikes either wholly pistillate, wholly staminate, or bearing both staminate and pistillate flowers (androgynous). Perianth none. Staminate flowers of 3 stamens, the filaments filiform. Pistillate flowers of a single pistil with a style and 2 or 3 stigmas, borne on a very short axis in the axil of a sac-like bractlet or second bract called the perigynium (utricle), which completely encloses the achene. Achene 3 -angled, lenticular or plano-convex. A vast genus, of more than 1000 species, widely distributed, most abundant in the temperate zones. Besides the following about an equal number occur in the western and southern parts of N. A. Specimens can only be satisfactorily determined when nearly or quite mature.

[^10]B. Perigynia short-beaked or beakless, little or not at all inflated, $1-5 \mathrm{~mm}$. long, the beak coinmonly not more than one-half as long as the body (long-beaked in Nos. 43, 82, 83, 96) ; spikes small and oblong or globose; or elongated, linear or narrowly cylindric. Nos. 36-142.
Spikes 2 or more, the staminate one always uppermost, sometimes partly pistillate. (No. 140 may be looked for here.) Nos. 36-132.
Pistillate spike or spikes many-flowered, mostly 2.5 cm . long or more (or shorter in Nos. $44,48,53-55,61,63-65,73,75,76,85,89-92$ ), linear, narrowly cylindric or oblong. Nos. $36-92$.
Perigynia with a straight short beak (long-beaked in No. 43; nearly beakless in No. 36 ), firm or leathery in texture; pistillate spikes erect (or nodding in No. 37); stigmas 3. Nos. 36-43. [p. 197.]

Perigynia beakless or very short-beaked (see No. 36), and with orifices nearly or quite entire, thin in texture, not inflated, closely investing the achene; pistillate spikes erect or drooping, often brown or purple; stigmas often 2. Nos. 44-72.
Pistillate spikes erect or somewhat spreading (drooping when mature in No. 45). Nos. 44-58. [p. 199.]

Pistillate spikes drooping, mostly on slender or filiform stalks (erect in Nos. 66 and 71). Nos. 59-72. [p. 201.]
Perigynia tapering to a distinct beak (nearly or quite beakless in Nos. 73-77), membranous in texture (firm in No. 88), inflated or loosely investing the achene; pistillate spikes mostly drooping, often narrowly linear. Nos. 73-92.
Terminal spike staminate below, pistillate above; beak of the perigynium short or none. Nos. 73-81.

Spikes all erect or nearly so. Nos. 73-76. Virescentes. [p. 204.] Pistillate spikes drooping or spreading (erect or little spreading in No. 78). Nos. 77-81. Gracillimae. [p. 205.]
Terminal spike entirely staminate, or sometimes pistillate at the base. Nos. 82-92. [p. 206.] (See No. 140.)
Pistillate spikes small, few-many-flowered, mostly $6-25 \mathrm{~mm}$. long (sometimes longer in Nos. 103, 104, 116). Nos. 93-132. (See also Nos. 44, 48, 53-55, 6I, 63-65, $68,73,75,80,84,85$ and 89-92.)
Perigynia glabrous. Nos. 93-120. [p. 208.] (See No. 123.)
Pistillate spikes many-flowered, $6-25 \mathrm{~mm}$. long, usually dense. Nos. 93-99.
Pistillate spikes few-several-flowered, often loose. Nos. 100-120; r36-r 38 .
Perigynia more or less pubescent (becoming glabrous in No. 123). Nos. 121I32. [p. 213.]
Spike solitary (except in No. 140), sometimes diœecious. Nos. 133-142. [p. 215.]
II. Staminate flowers few, at the summits or bases of the always sessile spiles, or sometimes forming whole spikes, or variously intermixed with the pistillate; stigmas always 2; achene lenticular, compressed, ellipsoid or plano-convex. Nos. 143-205. VIGNEA.

Staminate flowers at the summits of the spikes. Nos. 143-173.
Spike solitary, terminal, mostly brown, plants often diœcious. Nos. 143-146. Dioicae. [p. 217.]
Spikes several or many, clustered, separated or sometimes panicled. Nos. 147-151.
Spikes densely aggregated into a glubose or ovoid head, often appearing like a solitary terminal spike. Nos. 147-151 [p. 218.]
Clusters of spikes looser, often compound or the spikes distinctly separated (more or less aggregated in Nos. 170-173). Nos. ${ }^{152-173 .}$
Spikes yellowish or brown at maturity, often in compound or panicled clusters. Nos. $152-163$. [p. 218.]
Spikes green or greenish when mature, aggregated or separated, in simple clusters. Nos. 164-173. Muhlenbergianae. [p. 220.]
Staminate flowers variously mingled with the pistillate in the spikes or occasionally forming whole spikes. (See Nos. 143-146.)
Perigynia radiately spreading or reflexed. 174. C. sterilis.
Perigynia erect or appressed.
Perigynia wingless, the inner face flat. 187. C. bromoides.
Perigynia winged, the inner face concave. 190. C. siccata.

Staminate flowers at the bases of the spikes. Nos. 174-205,
Perigynia without a marginal wing. Nos. 174-187. Elongatae. [p. 222.]
Perigynia with a narrow or broad marginal wing. Nos. 188-205. Ovales. [p. 225.]
I. Carex pauciflòra Lightf. Few-flowered Sedge. (I. F. f. 671.) Glabrous• culms slender, $0.7-5 \mathrm{dm}$. high. Leaves very narrow, shorter than the culm, spike
androgynous, the staminate and pistillate flowers each 2-5; perigynium green, narrow, scarcely inflated, $6-8 \mathrm{~mm}$. long, about I mm . in diameter, several-nerved, tapering into a slender or almost subulate beak, strongly reflexed and readily detachable when mature, 2-3 times longer than the deciduous lanceolate or ovate scale; stigmas 3. In bogs, Newf. to Alaska, Mass., Penn., Mich. and Wash. June-Aug.

Pistillate spikes ovoid or globose, few-many-flowered.

Perigynia subulate, reflexed when mature.
Perigynia conic or ovoid, not reflexed.
Plants yellow or yellowish ; perigynia little inflated.
Leaves $2-4 \mathrm{~mm}$. wide; staminate spikes sessile.

$$
\text { Leaves } 4^{-12} \mathrm{~mm} \text {. wide; staminate spike mostly stalked. } 4 \text {. C. folliculata. }
$$

Plants green ; perigynia much inflated ; staminate spike stalked.
Leaves 4 $^{-6} \mathrm{~mm}$. wide ; heads loosely flowered. 5. C. intumescens.
Leaves $6-10 \mathrm{~mm}$. wide ; heads globose, dense.
6. C. Asa-Grayi.

Pistillate spikes oblong or cylindric, densely many-flowered.
Pistillate spikes oblong ; achene longer than thick.
Perigynia several-nerved, shining; leaves $2-4 \mathrm{~mm}$. wide.
Perigynia many-nerved, dull ; leaves $4-10 \mathrm{~mm}$. wide.
7. C. Louisianica.

Pistillate spikes cylindric ; achene not longer than thick.
Ferigynia yellowish, tapering into a beak twice as long as the body.
9. C. Iupuliformis.

Perigynia greenish-brown, abruptly narrowed into a beak $2-3$ times as long as the body.
10. C. grandis.
2. Carex Collínsii Nutt. Collins' Sedge. (I. F. f. 672.) Glabrous; culms slender, erect or reclining, 1.5-5 dm. long. Leaves narrow, the broadest about 5 mm . wide; staminate spike stalked; pistillate spikes $2-4$, distant, $2-8$-flowered; bracts similar to the leaves; perigynia light green, scarcely inflated, subulate, $\mathbf{I}-\mathbf{I} .4 \mathrm{~cm}$. long, tapering into an almost filiform beak, faintly many-nerved, strongly reflexed when mature, about 3 times as long as the lanceolate-acuminate persistent scale; stigmas 3. In bogs, R. I. to E. Penn. and Ga. June-Aug.
3. Carex abácta Bailey. Yellowish Sedge. (I. F. f. 673.) Glabrous, yellowish; culm rather stiff, slender, $0.2-0.5 \mathrm{~m}$. high. Leaves narrow, the broadest about 4 mm . wide, the uppermost often exceeding the culm; staminate spike sessile; pistillate spikes 2 or 3 , several-flowered, the upper sessile or very nearly so; bracts similar to the leaves; perigynia slender, narrow, scarcely inflated, tapering into a subulate 2 -toothed beak, $\mathbf{I - 1 . 5} \mathrm{cm}$. long, less than 2 mm . thick, strongly manynerved, about twice as long as the acute or acuminate scale. In bogs and wet meadows, Newf. to N. H., N. Y. and Mich. Also in Japan. July-Sept.
4. Carex folliculàta L. Long Sedge. (I. F. f. 674.) Glabrous; light green or yellowish; culm erect or reclining, o.4-1 m. long. Leaves elongated, often 12 mm . wide; pistillate spikes $2-4$, usually distant, all except the uppermost slender-stalked, the lower often nodding; bracts commonly overtopping the spikes; perigynia ovoid, somewhat inflated, green, rather prominently many-veined, I216 mm . long, about 2 mm . in diameter near the base, tapering from below the middle into a slender 2 -toothed beak, longer than the awned scarious-margined persistent scale; teeth of the perigynium nearly erect; stigmas 3 . In swamps and wet woods, Newf. to Md., Mich. and W. Va. Probably extends further south, but there mostly represented by the var. Australis Bailey. May-Sept.
5. Carex intuméscens Rudge. Bladder Sedge. (I. F. f. 675.) Glabrous; culms slender, commonly tufted, $0.4-0.9 \mathrm{~m}$. high. Leaves elongated, dark green, roughish, 3-6 mm . wide; bracts similar, overtopping the culm; staminate spike mostly long-stalked; pistillate spikes I-3, sessile or short-stalked, globosc or ovoid; perigynia 1-30, spreading or the upper erect, $12-20 \mathrm{~mm}$. long, much inflated, about 6 mm . in diameter above the base, many-nerved, tapering into a subulate 2 -toothed beak, the teeth somewhat spreading; scales narrowly lanceolate, acuminate or aristate, about one-half as long as the perigynia; stigmas 3 . In swamps, bogs and wet woods, Newf. to Manitoba, Fla. and la. May-Oct.

Carex intuméscens Fernáldi Bailey. Perigynia narrower, $1-5$ in each spike, all erect or slightly spreading. Me, to N. Y.
6. Carex Asa-Gràyi Bailey. Gray's Smese. (1. F. f. 0,-(1.) (ilabrous; culms stout, $0.5^{-0.9 ~ m . ~ t a l l . ~ L e a v e s ~ e l o n g a t e d, ~ d a r k ~ g r e e n, ~} 10$ (1 mm. wide; bracts
similar to the upper leaves, usually much overtopping the culm; staminate spike mostly long-stalked; pistillate spikes I or 2 , dense, about 2.5 cm . in diameter; perigynia 10-30, ovoid, glabrous or pubescent. much inflated, many-nerved, about 8 mm . in diameter, tapering to a sharp 2-toothed beak; scales ovate or lanceolate, acuminate or cuspidate, scarious, about one-third as long as the perigynia; stigmas 3. In swamps and wet meadows, Vt. to Mich., Ga. and Mo. June-Sept.
7. Carex Louisiánica Bailey. Louisiana Sedge. (I. F. f. 677.) Culms slender, smooth or nearly so, $0.2-0.5 \mathrm{~m}$. tall. Leaves $2-4 \mathrm{~mm}$. wide, roughish, the upper overtopping the spikes; pistillate spikes I-3, oblong, about 2.5 cm . long, $1.5-2 \mathrm{~cm}$. thick, erect, the lower slender-stalked, the upper nearly sessile; staminate spike long-stalked; perigynia ovoid, much inflated, smooth, strongly severalnerved, shining, $\mathbf{1 0}-\mathbf{1 2} \mathrm{mm}$. long, about 5 mm . in diameter at the rounded base, tapering into the long 2 -toothed beak, the small teeth slightly spreading; scales oblong-lanceolate, acuminate, about one-half as long as the perigynia; stigmas 3 . Swamps, Mo. to Tex. and Fla. June-Aug.
8. Carex lupulìna Muhl. Hop Sedge. (I. F. f. 678.) Glabrous; culms stout, $0.3-1 \mathrm{~m}$. tall. Leaves elongated, nodulose, $5-12 \mathrm{~mm}$. wide, the upper ones and the similar bracts much overtopping the culm; staminate spike solitary or rarely several; pistillate spikes 2-5, densely many-flowered, oblong, 2.5 cm . long, often 3-6 cm. in diameter; perigynia often short-stalked, much inflated, many-nerved, $12-15 \mathrm{~mm}$. long, about 3 mm . in diameter above the base, tapering from below the middle into a subulate 2 -toothed beak; achene longer than thick; scales acuminate or aristate, one-third as long as the perigynia; stigmas 3. In swamps and ditches, Hudson Bay to W. Ont., Iowa, Fla. and Tex. June-Aug.

Carex lupulìna Bélla-villa (Dewey) Bailey. Culm slender; pistillate spikes remote, slender-stalked, sometimes staminate at the summit, the perigynia widely spreading, the staminate spike sometimes branched and with I or 2 perigynia at its base. E. N. Y. to S. Ont.

A hybrid with C. retrorsa is described.
9. Carex lupulifórmis Sartwell. Hop-Like Sedge. (I. F. f. 679.) Glabrous; culm stout, erect, o.3-1 m. tall. Leaves and bracts similar to those of the preceding species; staminate spike stalked or nearly sessile, sometimes 10 cm . long; pistillate spikes 3-6, densely many-flowered, $5-8 \mathrm{~cm}$. long, $\mathrm{r}-2 \mathrm{~cm}$. in diameter, often staminate at the top; perigynia yellowish, sessile, much inflated, severalnerved, $\mathbf{I}-1.6 \mathrm{~cm}$. long, about 4 mm . in diameter above the base, tapering from below the middle to a subulate 2 -toothed beak; achene as long as thick, its angles mamillate; scales lanceolate. awned, shorter than or equalling the perigynia. Swamps, Mass. to Del. and Mirn. June-Aug.

Ic. Carex grándis Bailey. Large Sedge. (I. F. f. 68o.) Glabrous; culms slender, $0.5-0.9 \mathrm{~m}$. high. Leaves rather dark green, elongated, $8-12 \mathrm{~mm}$. wide; bracts similar to the leaves, much overtopping the culm; staminate spike sometimes bearing perigynia at its base; pistillate spikes 3-5, all stalked or the upper sessile, cylindric, $2-7.5 \mathrm{~cm}$. long; perigynia much swollen at the base, about 4 mm . in diameter, $10-12 \mathrm{~mm}$. long, many-nerved, spreading at maturity, 3-4 times as long as the scarious lanceolate acuminate or aristate scale, abruptly contracted into a subulate 2 -toothed beak $2-3$ times as long as the inflated portion; stigmas 3. In swamps, Del. to Ky. and Mo., Fla., La. and Tex. June-Aug.

Spikes small, 2.5 cm . long or less, oblong or subglobose; stigmas often 2.
Spikes green or greenish yellow.
Leaves involute ; perigynia ovoid; pistillate spikes few-several-flowered.
II. C. oligosperma.

Leaves flat; perigynia oblong-elliptic; pistillate spikes many-flowered.
12. C. Mainensis.

Spikes dark brown or purple; arctic species.
Leaves flat.
Perigynia little inflated, papery.
Beak of perigynium nearly or quite entire. I3. C. miliaris. Beak of perigynium sharply and minutely 2 -toothed.

Perigynia much inflated, very fragile.
Leaves involute when dry.
14. C. saxatilis.
15. C. membranopacta.

16, C. ambusta.

Spikes large, 2-15 cm. long, cylindric or oblong-cylindric; stigmas 3 .
Scales acute, acuminate or smooth-awned, or the lower slightly roughened. Perigynia ascending or spreading, not reflexed.

Spikes narrowly cylindric, $2-15 \mathrm{~cm}$. long, 6-8 mm. thick.
Leaves 4-12 mm, wide; culm stout. 17. C. utriculata.
Leaves $2-5 \mathrm{~mm}$, wide; culm slender. 18. C. monile.
Spikes cylindric or oblong-cylindric, $2-5 \mathrm{~cm}$. long, 12 mm . thick. Scales smooth-awned. 19. C. Tuckermani. Scales acute, acuminate or the upper obtuse. 20. C. bullata. Perigynia, at least the lower ones, reflexed when mature.

Spikes all clustered at the summit or the lower 1 or 2 separated; perigynia all reflexed when old. 21. C. retrorsa.
Spikes scattered; only the lower perigynia reflexed. 22. C. Hartiz.
Scales tapering into rough awns, or subulate and scabrous.
Spikes cylindric, about 12 mm . thick; perigynia tapering into the beak.
23. C. lurida.

Spikes narrowly cylindric, 6-8 mm. thick; perigynia abruptly narrowed into the beak.
24. C. Baileyi.
11. Carex oligospérma Michx. Few-seeded Sedge. (I. F. f. 681.) Glabrous; culms slender, $0.4-0.9 \mathrm{~m}$. tall. Leaves about 3 mm . wide, involute when old: bracts similar, overtopping the culm; staminate spike stalked; pistillate spikes I or $2, \mathbf{I}-2 \mathrm{~cm}$. long, sessile or the lower short-stalked, the upper sometimes reduced to I or 2 perigynia and with a staminate summit; perigynia ovoid, erect, inflated, strongly few-nerved, yellowish green, $4-5 \mathrm{~mm}$. long, tapering into a minutely 2 -toothed beak; scales acute or mucronate, shorter than the perigynia; stigmas 3. In bogs, Lab. to the N. W. Terr., Mass., Penn. and Mich. June-Sept.
12. Carex Mainénsis Porter. Maine Sedge. (I. F. f. 682.) Culm stouter than that of C. miliaris, rough above, $0.4-0.9 \mathrm{~m}$. tall. Leaves $2-3 \mathrm{~mm}$. wide, flat, shorter than the culm, the lower bracts narrower, staminate spikes $1-4$, slenderstalked; pistillate spikes I-3, erect, cylindric or oblong, $\mathbf{1}-\mathbf{2 . 5} \mathrm{cm}$. long, sessile or the lower short-stalked; perigynia oblong-elliptic, yellowish green, few-nerved, acute, narrowed into a 2 -toothed beak; scales lanceolate, acute or acuminate, yellowish or brownish margined, slightly shorter than the perigynia; stigmas 2 or 3. On lake and river shores, Me. to Lab. Summer. (C. Raeana of Ill. Fl. not of Boott.) Perhaps a hybrid of the following with C. monile.
13. Carex miliaris Michx. Northeastern Sedge. (I. F. f. 683.) Glabrous; culm slender, roughish above. $0.2-0.5 \mathrm{~m}$. tall. Leaves, flat, about 2 mm . wide, elongated, nodulose; bracts similar to the leaves, often overtopping the culm; staminate spikes I or 2 , stalked, narrowly linear; pistillate spikes $\mathbf{I}-3$, oblong or linearoblong, many-flowered, 8-25 mm. long, the upper sessile, the lowest, when three, stalked; perigynia ovoid, faintly few-nerved, $2-3 \mathrm{~mm}$. long, dark brown or browntipped, tapering into a short, nearly entire beak, slightly longer than the wholly or partly brown scale; stigmas 2. Borders of lakes and streams, Lab. to Me. Reported from N. Minn. Summer.

The var. major Bailey is perhaps distinct.
14. Carex saxatilis L. Russet Sedge. (I. F. f. 684.) Glabrous; culms slender, $7-25 \mathrm{~cm}$. tall. Leaves flat, $2-3 \mathrm{~mm}$. broad; bracts short; staminate spike short-stalked; pistillate spikes 1-4, all stalked or the upper nearly or quite sessile. oblong, densely many-flowered; perigynia dark purple-brown, ovoid, nerveless or faintly few-nerved, tipped with a short minutely 2 -toothed beak; scales oblong. subacute, greenish purple, about as long as the perigynia; stigmas usually 2. Greenland to James Bay and Alaska. Also in arctic Europe and Asia. Summer.
15. Carex membranopácta Bailey. Fragine, Sedie. (I. F. f. 685.) Similar to $C$. saxatilis but stouter and taller, $1.5-4.5 \mathrm{dm}$. high. Leaves flat, not exceeding the culm, 3 mm . wide; bracts short; staminate spikes $\mathbf{I}-3$, short-stalked; pistillate spikes commonly 2 , sessile or the lower short-peduncled, narrowly oblong, obtuse. about 2.5 cm . long and 8 mm . in diameter; perigynia spreading, brown-purple, ovoid, fragile, much inflated, about 3 mm . long, tipped with a short nearly entire beak, about as long as the ovate-oblong greenish-purple or white-margined scales. Greenland, through arctic America to Kamptchatka. Summer.
16. Carex ambústa Bontt. Blackenen Sideg. (I. F. f. 6 Šo.) Similar to C. saxatilis; culms $2-4.5 \mathrm{dm}$. tall. Leaves mostly less than 2 mm . wide, involute
in drying; bracts similar to the upper leaves; staminate spike stalked; pistillate spikes I or 2 , erect, obtuse, $\mathbf{1 2 - 1 8} \mathrm{mm}$. long, about 7 mm . in diameter; perigynia oblong-lanceolate, 3 mm . long, biconvex, smooth, firm, not inflated, dull, few-nerved at the base, green below, dark brown at the summit, tapering into a short minutely 2-toothed beak; stigmas 2. Lab., Br. Col. to Alaska. Summer.
17. Carex utriculàta Boott. Bottle Sedge. (I. F. f. 687.) Glabrous; culms erect, $0.4-\mathrm{I}$ m. tall. Leaves elongated, nodulose, $4-12 \mathrm{~mm}$. wide; bracts overtopping the culm; staminate spikes 2-4, linear, stalked; pistillate spikes 3 or 4, nearly erect, cylindric, usually densely many-flowered, $5-15 \mathrm{~cm}$. long, the lower short-stalked, the upper sessile; perigynia ovoid, light green, somewhat inflated, few-nerved, $4-5 \mathrm{~mm}$. long, narrowed into a sharp 2 -toothed beak; scales lanceolate, the lower awned and slightly longer than the perigynia. Marshes, Anticosti to Br. Col., Del., Ohio, Minn., Nev. and Cal. June-Sept.
18. Carex monile Tuckerm. Necklace Sedge. (I. F. f. 688.) Glabrous; culm slender, $0.3-1 \mathrm{~m}$. tall. Leaves elongated, rather light green, $3-5 \mathrm{~mm}$. wide, little or not at all nodulose; staminate spikes $1-4$, slender-stalked; pistillate spikes $1-3$, erect-spreading, cylindric, $2-8 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. in diameter, rather loose at maturity, the upper sessile, the lower one, when 3, slender-stalked; perigynia yellowish green, ovoid, inflated, about 5 mm . long, rather strongly 8 -10nerved, tapering into a sharp 2 -toothed beak; scales lanceolate, acuminate or awned, shorter than the perigynia. In marshes and wet meadows, N. S. to Br. Col., N. J., Mo., Colo. and Cal. June-Aug.
19. Carex Tuckermàni Dewey. Tuckerman's Sedge. (I. F. f. 689.) Glabrous: culm slender, usually roughish above, erect or reclining, $0.5-1 \mathrm{~m}$. long. Leaves and bracts much elongated, 3-5 mm. wide; staminate spikes 2 or 3; pistillate spikes cylindric, $2-5 \mathrm{~cm}$. long, about 1.2 cm . in diameter; the upper sessile or nearly so, the lower stalked; perigynia very much inflated, yellowish green, ovoid, few-nerved, abruptly contracted into a subulate 2 -toothed beak; scales lanceolate, awned, about half as long as the perigynia. In bogs and meadows, N. B. to Ont., Minn., N. J. and Iowa. June-Aug.
20. Carex bullàta Schk. Button Sedge. (I. F. f. 69o.) Glabrous; stoloniferous; culms slender, $0.3-0.6 \mathrm{~m}$. high, roughish. Leapes and bracts very narrow and elongated, rarely more than 4 mm . wide, rough-margined; staminate spikes mostly 2, long-stalked; pistillate spikes I-3, light green, oblong or oblongcylindric, $2-4 \mathrm{~cm}$. long, $9-12 \mathrm{~mm}$. in diameter; perigynia much inflated, ovoid, 5-6 mm. long, tapering into a subulate rough 2 -toothed beak, shining, strongly nerved, $2-3$ times longer than the scale. In swamps, N. H. to N. C. June-Aug.
21. Carex retrórsa Schwein. Retrorse Sedge. (I. F. f. 691.) Glabrous; culm stout, $0.3-1 \mathrm{~m}$. tall. Leaves elongated, thin, rough-margined, $5-7 \mathrm{~mm}$. wide, the upper commonly exceeding the culm, the bracts similar; staminate spikes $1-3$, short-stalked; pistillate spikes $3-6$, all close together at the summit and sessile or very nearly so or the lowest distant and stalked, cylindric, $2-5 \mathrm{~cm}$. long; perigynia ovoid, membranous, strongly few-nerved, yellowish green, about 6 mm . long, reflexed at maturity, tapering into a subulate 2 -toothed beak; scales lanceolate, acute, one-third to one-half as long as the perigynia. In swamps and wet meadows, N. S. to Manitoba, Idaho, Wash., Mass., Penn., Mich. and Iowa. Aug.-Sept.
22. Carex Hàrtii Dewey. Hart Wright's Sedge. (I. F. f. 692.) Glabrous; culms nearly smooth, $0.3-0.8 \mathrm{~m}$. long. Leaves elongated, rough on the margins and midvein, $4-6 \mathrm{~mm}$. wide; staminate spikes I or 2 , the lower sometimes pistillate at the base, stalked; pistillate spikes 2-4, scattered, rather loosely manyflowered, the upper sessile, the lower slender-stalked, $2-5 \mathrm{~cm}$. long, all erect or ascending; perigynia inflated, ovoid-conic, spreading or the lower slightly reflexed, few-nerved, about 6 mm . long, gradually tapering into the long 2 -toothed beak, 2-3 times as long as the scale. In marshes, Ont. and N. Y. to Mich. June-Aug.
23. Carex lùrida Wahl. Sallow Sedge. (I. F. f. 693.) Glabrous; culm slender, $0.3-1 \mathrm{~m}$. tall. Leaves elongated, rough, rarely more than 4 mm . wide ; staminate spike short-stalked ; pistillate spikes, $1-4$, cylindric, $2-5 \mathrm{~cm}$. long, the upper sessile, the lower peduncled; perigynia inflated, ovoid, tapering into a long subulate beak, ascending or the lower spreading, 8 mm . long, thin, yellowish green, rather conspicuously nerved, longer than the rough-awned scale. In swamps and
wet meadows, N. S. to Minn., Neb., Fla. and Tex. June-Oct. C. tentaculata altior Boott is a hybrid with C. lupulina.

Carex lùrida fláccida Bailey. Pistillate spikes $1-2.5 \mathrm{~cm}$. long, brown, all sessile or very nearly so, clustered at the summit, rather more loosely flowered. Northern N. Y. to N. Car. and Tenn.

Carex lùrida párvula (Paine) Bailey. Culm 1-3.5 dm. high; pistillate spikes only I or 2, scarcely more than I cm. long, globose or oblong, sessile or very nearly so; perigynia 6 mm . long. N. H. to Penn. and Iowa.

Carex lùrida exúndans Bailey. Culms long and spreading: pistillate spikes $3-6 \mathrm{~cm}$. long. on very long stalks; scales subulate, the lower often much longer than the perigynia. Occasional with the typical form.
24. Carex Bàileyi Britton. Bailey's Sedge. (I. F. f. 694.) Glabrous; culms erect or reclining, slender, minutely scabrous above, $0.2-0.5 \mathrm{~m}$. long. Leaves roughish, elongated, $3-4 \mathrm{~mm}$. wide; staminate spike short-peduncled; pistillate spikes I-3, narrowly cylindric, very densely erect or ascending, $1.5-2.5 \mathrm{~cm}$. long, about 8 mm . in diameter; perigynia inflated, ovoid, 5-6 mm. long, ascending, abruptly contracted into the subulate 2 -toothed beak, prominently several-nerved. Bogs, Vt. to Va. and Tenn. June-Aug.

Spikes all erect or ascending. 25 C. Schweinitziiz.
Spikes, at least the lower ones, slender-stalked and drooping.
Pistillate spikes oblong-cylindric, $1.2-5 \mathrm{~cm}$. long ; perigynia ascending.
26. C. hystricina.

Pistillate spikes narrowly cylindric, $2.5-6 \mathrm{~cm}$. long ; perigynia reflexed. Teeth of the beak erect or little spreading. Teeth of the beak recurved-spreading.
27. C. Pseudo-cyperus.
28. C. comosa.
25. Carex Schweinítzii Dewey. Schweinitz's Sedge. (I. F. f. 695.) Glabrous; light green; culm roughish above, $0.3-0.8 \mathrm{~m}$. tall. Leaves elongated, $5-8 \mathrm{~mm}$. wide, those of the culm mostly short; staminate spike solitary or sometimes 2 , often pistillate at the base or in the middle; pistillate spikes $3-5$, ascending, linear-cylindric, $3-8 \mathrm{~cm}$. long, about 8 mm . thick, the upper usually sessile, the lower stalked; perigynia thin, somewhat inflated, ovoid-conic or oblong, tapering into the subulate, 2 -toothed beak, about 5 mm . long and 2 mm . in diameter, ascending, few-nerved, equalling, or the upper luager than the lanceolate or linear scale; stigmas 3. In swamps and bogs, Mass. to Ont., Mich., N. J. and Mo. June-Aug.
26. Carex hystricina Muhl. Porcupine Sedge. (I. F. f. 696.) Glabrous, light green; culms $0.3-0.5 \mathrm{~m}$. tall. Leaves $3-5 \mathrm{~mm}$. wide; staminate-spike slen-der-stalked; pistillate spikes, $\mathbf{I - 4}$, oblong-cylindric, dense, $\mathbf{1}-3 \mathrm{~cm}$. long, about 9 mm . in diameter, the lower slender-stalked and drooping; perigynia ascending. somewhat inflated, ovoid-conic, 5-6 mm. long, strongly many-nerved, tapering into the subulate 2 -toothed beak, equalling or the upper longer than the narrow rough scales; stigmas 3. In swamps and low meadows, N. S. to N. W. Terr., Ga. and Neb. June-Aug. Said to hybridize with C. comosa.

Carex hystricina Dúdleyi Bailey. Culms often reclining, o.5-0.9 m. long; leaves 5-8 mm . wide ; staminate spike long-stalked ; pistillate spikes $3^{-6} \mathrm{~cm}$. long, 1 cm . in diameter, filiform-stalked. Me. to Conn., Penn. and Mich.
27. Carex Pseùdo-Cypèrus L. Cyperus-like Sedge. (I. F. f. 607.) Glabrous; culms stout, rough on the angles, at least above, $0.5-1 \mathrm{~m}$. high. Leaves nodulose, $5-10 \mathrm{~mm}$. wide; staminate spike short-stalked; pistillate spikes $2-5$. linear-cylindric, dense, slender-stalked, spreading or drooping, $2-7 \mathrm{~cm}$. long, 0-S mm . in diameter; perigynia light green, slightly inflated, conic, prominently many-ribbed, somewhat flattened, at length reflexed, taporing into a short i-toothed beak, the short teeth slightly spreading; scales linear with a broal base, ciliatescabrous, about equalling the perigynia; stigmas 3. In bogs. N. S. to Manitoba, Me., N. Y., and Mich. Also in Europe and Asia. June-Aug.
28. Carex comòsa Boott. Bristly Sedeif. (I. F. f. ons.) similar to the preceding species; culms commonly stouter, the leaves sometimes 12 mm . wide. Staminate spike sometimes pistillate at the summit: pistillate spikes z-ti, all spreading or drooping, stouter and bristly, about 12 mm. in diameter : perigynia
more slender, little inflated, strongly reflexed when mature, tapering into a slender prominently 2 -toothed beak, the teeth subulate and recurved-spreading; scales mostly shorter than the perigynia, very rough; stigmas 3 . . In swamps, N. S. to Ont. and Wash., south to Ga., La. and Cal. May-Oct.

Scales linear-subulate, longer than the perigynia. 29. C. Frankii. Scales lanceolate, about one-half as long as the perigynia.

Spikes I-3, subglobose or oval, staminate below; achene linear-oblong.
30. C. squarrosa.

Spikes 2-6, oblong-cylindric, usually staminate at both ends; achene ovoid.
31. C. typhinoides.
29. Carex Fránkii Kunth. Frank's Sedge. (I. F. f. 699.) Glabrous; tufted; culms stout, smooth, leafy, $0.3-0.7 \mathrm{~m}$. tall. Leaves elongated, roughish, $5-8 \mathrm{~mm}$. wide; staminate spike stalked ; pistillate spikes 3-6, exceedingly dense, cylindric, erect, $\mathrm{r}-4 \mathrm{~cm}$. long, about 8 mm . in diameter, the upper nearly or quite sessile, the lower slender-stalked; perigynia green, slightly inflated, about 2 mm . in diameter, few-nerved, obovoid with a depressed summit from which arises the subulate 2 toothed beak; scales linear-subulate, longer than the perigynia; stigmas 3. In swamps and wet meadows, E. Penn. to Va. and Ga., Mo., La. and Tex. JuneSept.
30. Carex squarròsa L. SQuarrose Sedge. (I. F. f. 700.) Glabrous; culms slender, rough above on the angles, $0.6-0.9 \mathrm{~m}$. tall. Leaves elongated, rarely more than 4 mm . wide, rough-margined; spikes I-3, erect, stalked, oblong or globose, exceedingly dense, rarely over 2.5 cm . long, $\mathbf{I - 2 ~ c m}$. in diameter, the upper one club-shaped, staminate at the base or sometimes for one-half its length or more ; perigynia yellowish green, becoming tawny, the lowest reflexed, somewhat inflated but firm, obovoid, $2-3 \mathrm{~mm}$. in diameter, few-nerved, abruptly narrowed into the subulate minutely 2 -toothed beak, twice as long as the lanceolate acuminate or awn-tipped scale; achene linear-oblong, tapering into the stout style; stigmas 3. In swamps and bogs, Conn. to Mich. and Neb., south to Ga., La. and Ark. June-Sept.
31. Carex typhinoìdes Schwein. Cat-tail Sedge. (I. F. f. 7or.) Similar to the preceding, but darker green; leaves often $8-10 \mathrm{~mm}$. wide; spikes $2-6$, cylindric, $2-5 \mathrm{~cm}$. long, $8-14 \mathrm{~mm}$. in diameter, often staminate at both ends, the terminal one commonly tapering to a conic summit; basal staminate flowers much less numerous; perigynia dull straw color, ascending or the lowest spreading or reflexed, inflated, abruptly contracted into the slender 2 -toothed beak, which is often upwardly bent; scales oblong-lanceolate, obtusish; achene ovoid-elliptic, sharply 3 -angled, tipped with the subulate style. In swamps, Quebec to Iowa, Va., La. and Mo. July-Aug.

Leaves bright green, not glaucous; teeth of the perigynium-beak slender, conspicuous.

> Scales lanceolate, acute or acuminate; leaves glabrous.
32. C. trichocarpa.

Scales ovate-lanceolate, rough-awned; leaves often pubescent.
33. C. aristata.

Leaves pale green, glaucous; teeth of the perigynium-beak short.
Pistillate spikes about 8 mm . thick, teeth of the perigynium-beak manifest.
34. C. riparia.

Pistillate spikes about 4 mm . thick, teeth of the perigynium-beak minute.
35. C. acutiformis.
32. Carex trichocàrpa Muhl. Hairy-fruited Sedge. (I. F. f. 702.) Culm usually stout and tall, smooth below, very rough abov. Leaves elongated, glabrous, rough-margined, 4-6 mm. wide; staminate spikes $2-6$, long-stalked; pistillate spikes cylindric, densely flowered except at the base, $2-10 \mathrm{~cm}$. long, I-1. 6 cm . in diameter, the upper sessile or nearly so and erect, the lower slenderstalked; perigynia ovoid-conic, pubescent or glabrous, many-ribbed, 8 -10 mm . long, tapering into the stout conspicuously 2 -toothed beak, the teeth somewhat spreading; scale hyaline, acute or acuminate. In marshes and wet meadows, Quebec to Mich., Iowa, Ga. and Kans. June-Aug.
33. Carex aristàta R, Br. Awned Sedge. (I. F. f. 703.) Cuìms erect, smooth or roughish above, sharp-angled, $0.5-1.2 \mathrm{~m}$. tall. Leaves elongated, 5-10 mm. wide, often pubescent beneath and on the sheatlis; staminate spikes as in the preceding; pistillate spikes 3-5, remote, cylindric, sessile or the lower short-
stalked, 2-10 cm . long. perigynia ascending, conic, glabrous, many-ribbed, $8-12 \mathrm{~mm}$. long, tapering into the conspicuously 2 -toothed beak, the teeth divergent; scales oblong-lanceolate, rough-awned, one-half to two-thirds as long as the perigynia. In bogs, Ont. to the N. W. Terr., N. Y., Iowa, Utah and Ore. June-Aug.
34. Carex ripària Curtis. River-bank Sedge. (I. F. f. 704.) Glabrous, pale green; culms smooth, or roughish above, o.5-1 m. tall. Leaves elongated, $6-12 \mathrm{~mm}$. wide, about equalling the culm; staminate spikes $\mathrm{I}-5$; pistillate spikes $2-5$, cylindric, $3-10 \mathrm{~cm}$. long, about 8 mm . in diameter, the upper erect, sessile or nearly so, the lower stalked; perigynia narrowly ovoid, firm, scarcely inflated, ascending, tapering into a short 2 -toothed beak, the teeth divergent; scales lanceolate or oblanceolate, long-aristate or acute, the lower longer, the upper equalling or shorter than the perigynia. In swamps, Newf. to James' Bay and Manitoba, south to Fla., La., Tex. and Idaho. Also in Europe. May-Aug.
35. Carex acutifórmis Ehrh. Swamp Sedge. (I. F. f. 705.) Culms stout, sharp-angled, $0.5-0.9 \mathrm{~m}$. tall, often rough above. Leaves $5-12 \mathrm{~mm}$. wide, flat, pale green; lower bracts similar to the leaves, the upper short and narrow; staminate spikes $1-3$, stalked; pistillate spikes $3-5$, linear-cylindric, $3-8 \mathrm{~cm}$. long, $4-5 \mathrm{~mm}$. thick, the upper sessile or nearly so and erect, the others slender-stalked, spreading or drooping; perigynia ovoid, 3 mm . long, not inflated, many-nerved, tapering into a short and minutely 2 -toothed beak; scales awn-tipped, longer than the perigynia or the upper equalling them. In swamps and wet meadows, E. Mass. Naturalized from Europe. June-Aug.

Uppermost spike staminate from the base to about the middle. Shortianae.
36. C. Shortiana.

Upper one or more spikes entirely staminate, or occasionally pistillate at the base. Perigynia papillose; beak very short, nearly or quite entire. Anomalae.
37. C. scabrata.

Perigynia pubescent (sometimes glabrous in no. 39), the beak sharply 2 -toothed. Hirtae.
Staminate spike or spikes sessile or nearly so. 38. C. vestita.
Staminate spike or spikes distinctly stalked.
Leaves glabrous; native species.
Leaves flat or their margins slightly revolute,
Scales only half as long as the perigynia; southern coast species.
39. C. Walteriana.

Scales equalling or but slightly shorter than the perigynia; northern species.
Leaves $4^{-7} \mathrm{~mm}$, wide; perigynia 3 mm . thick, the nerves prominent.
40. C. Houghtonii. Leaves $2-4 \mathrm{~mm}$. wide; perigynia 2 mm . thick, the nerves obscured by the dense pubescence. 41. C. lanuginosa. 42. C. filiformis. Leaves strongly involute, 2 mm . wide or less. $\begin{gathered}\text { 42. C. fliz }\end{gathered}$
43. C. hirta.
36. Carex Shortiàna Dewey. Short's Sedge. (I. F. f. 706.) Glabrous; culms slender, rough above, o.3-1 m. tall, usually overtopped by the upper leaves. Leaves elongated, roughish, $4-5 \mathrm{~mm}$. wide; bracts short, narrow; rarely much exceeding the spikes; spikes $3-7$, linear-cylindric, densely many-flowered, $\mathrm{J}-3$ cm . long, 3-4 mm. in diameter, erect, the lower stalked; perigynia dark brown. compressed, 2 -edged, orbicular or obovate, nerveless, abruptly minutely beaked. equalling or shorter than the scales, which are hyaline, scarious-margined, ovate or oblong-lanceolate, persistent; orifice of the perigynium entire or very nearly so; stigmas 3. In moist meadows and thickets, Penn. to Va. and Tenn.. west to Iowa and the Ind. Terr. May-July.
37. Carex scabràta Schwein. Rough Sedge. (I. F. f. 707.) Glabrous: culms rough above, leafy, $0.3-0.9 \mathrm{~m}$. long. Leaves rough, much elongated, $5-7 \mathrm{~mm}$. wide, the bracts similar but narrower; staminate spike short-stalked; pistillate spikes 3-6, erect, the upper short-stalked, the lower sometimes spreading or drooping, all linear-cylindric, densely many-flowered, $2-5 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. in diameter ; perigynia greenish brown, ovoid, somewhat inflated, strongly nerved, papillose. tipped with a short minutely 2 -toothed or entire beak; scales lanceolate, acute or
short-awned, prominently I-nerved, shorter than the perigynia. In moist woods and thickets, Me. to Ont., Mich., S. Car. and Tenn. May-Aug.
38. Carex vestita Willd. Velvet Sedge. (I. F. f. 708.) Culms strict and slender, $0.4-0.8 \mathrm{~m}$. tall, rough above. Leaves $3-5 \mathrm{~mm}$. wide, not overtopping the culm; bracts similar, but narrower, short, rough-ciliate ; staminate spike solitary. rarely 2, almost sessile ; pistillate spikes I-5, oblong, I-2 cm . long, $6-8 \mathrm{~mm}$. in diameter, erect, commonly staminate at the summit, sessile or the lower shortstalked; perigynia ovoid, densely pubescent, less than 2 mm . in diameter, prominently few-ribbed, tapering gradually into a short conic 2 -toothed whitish beak, slightly shorter than or equalling the ovate acute membranous scales. In sandy woods, N. H. to Penn., south to Ga. June-July;
39. Carex Walteriàna Bailey. Walter's Sedge. (I. F. f. 709.) Culms slender, strict, usually rough above. $0.3-0.8 \mathrm{~m}$. tall. Leaves narrow. elongated, 2-4 mm. wide, nodulose, not overtopping the culm; lowest bract similar, the upper smaller, often almost filiform; staminate spikes $2-5$. long-stalked; pistillate spikes I or 2 , when 2 the lower remote from the upper, sessile or short-stalked, oblong; cylindric. erect, $2-4 \mathrm{~cm}$. long. about 8 mm . in diameter. rather loosely, manyflowered; perigynia ovoid, purple-brown. many-nerved. slightly inflated, glabrous, or pubescent, 3 mm . in diameter, tapering into a short 2 -toothed beak; scales ovate, acute, short-aristate or obtuse, membranous, one-half the length of the perigynia. In pine-barren bogs, southern N. J. to Fla. May-July.
40. Carex Houghtònii Torr. Hotahton's Sedge. (I. F. f. 710.) Culms rough above, erect, $0.3-0.8 \mathrm{~m}$. tall, exceeding the leaves. Leaves and lowest bract $4-7 \mathrm{~mm}$. wide, rough, their margins revolute; upper bracts much shorter; staminate spikes I-3, stalked. sometimes pistillate at the base; pistillate spikes 2 or 3 . oblong-cylindric. $1-4 \mathrm{~cm}$. long. $6-8 \mathrm{~mm}$. in diameter, erect. rather loosely flowered. the upper sessile, the lower stalked; perigynia broadly ovoid. 3 mm . in diameter, light green. densely pubescent, many-ribbed, narrowed into a short conspicuously 2-toothed beak; scales lanceolate. short-awned, hyaline-margined, strongly $\mathbf{I}$ nerved. somewhat shorter than the perigynia. In sandy or rocky soil, N. S. to the N. W. Terr., Me., Mich. and Minn. June-Sept.

4I. Carex lanuginòsa Michx. Woolly Sedge. (I. F. f. 7 II.) Culm slender, but usually rather stouter than that of C. fliformis, sharp-angled and rough above. Leaves and lower bracts elongated. not involute, $2-4 \mathrm{~mm}$. wide. sometimes overtopping the culm; staminate spikes I-3. long-stalked, sometimes pistillate at the base; pistillate spikes I-3. usually distant. sessile or the lower slender-stalked. cylindric; $5-6 \mathrm{~mm}$. in diameter; scales acuminate or aristate. In swamps and wet meadows, N. S. to Br. Col., south to N. J., Kans., N. Mex. and Cal. June-Aug.

Carex lanuginòsa Kansàna Britton. Plant pale; leaves I-2 mm. wide, very rough; perigynia I mm. in diameter, the ribs conspicuous. Mo. and Kans.
42. Carex filifórmis L. Slender Sedge. (I. F. f. 712.) Culms very slender, erect or reclining, smooth, obtusely angled, $0.5-0.9 \mathrm{~m}$. long. Leaves very narrow, involute, about 2 mm . wide, rough-margined, not overtopping the culm; lower bract similar. upper bracts filiform; staminate spikes I-3. commonly 2 . stalked; pistillate spikes $\mathrm{I}-3$. cylindric. $1.5-2 \mathrm{~cm}$. long, abuut 6 mm . in diameter. erect. sessile, or the lower distant and short-peduncled; perigynia green. ascending, oval. densely pubescent, faintly nerved. about 2 mm . in diameter, tapering into a short 2-toothed beak; scales ovate.membranous, acute or short-awned. shorter than or equalling the perigynia. In wet meadows and swamps, Newf. to Br. Col.. N. J.. Penn., Mich. and Iowa. Occasionally diœcious. Also in Europe. June-Aug.
43. Carex hírta L. Hairi Sedge. (I. F. f. 7I3.) Rootstocks creeping; culms rather slender. nearly smooth. $1.5-4 \mathrm{dm}$. tall. Leaves flat. pubescent, especially on the sheaths, $3-5 \mathrm{~mm}$. wide. the basal ones much elongated, the upper and the similar bracts shorter; staminate spikes 2 or 3. stalked; pistillate spikes 2 or 3 , remote. erect, oblong-cylindric. $2-3 \mathrm{~cm}$. long. a bout 6 mm . in diameter; perifynia ovoid-oblong, green. densely pubescent. 2 mm . in diameter, +mm . long, fewiibbed, tapering into a prominently 2 -toothed beak; teeth often as long as the heak; scales lanceolate, aristate, 3 -nerved. shorter than the perigynia. In fields and waste places, Mass. to E. N. I. and Penn. Nat. or adv. from Europe. June-Sept.

Terminal spike staminate below, pistillate above (rarely all staminate in No. 47); stigmas 3. Atratae.

Scales shorter than or equalling the perigynia; arctic and alpine species.
Orifice of the perigynium minutely 2 -toothed; scales obtuse or acutish.
Pistillate spikes 4 -10 mm . long, erect.
Pistillate spikes $8-25 \mathrm{~mm}$. long, drooping when old.
44. C. alpina.
45. C. atratiformis.

Orifice of the perigynium entire; scales acute or awned.
Perigynium ovate, the style usually protruding.
Perigynium obovate, the style not protruding.
Scales manifestly longer than the perigynia; bog species.
46. C. stylosa.
47. C. Parryana.
48. C. fusca.

Terminal spike staminate throughout (occasionally pistillate at the top in No. 53); stigmas 2, rarely 3 in No. 55 . Rigidae.
Lower sheaths becoming very fibrillose; tufted bog species. 49. C. stricta.
Lower sheaths not at all fibrillose, or slightly so.
Scales shorter than or equalling the perigynia (or longer in No. 50).
Culms $0.3-0.6 \mathrm{~m}$. tall; scales acute or acuminate.
Pistillate spikes linear-cylindric. 50. C. Haydeni.
Pistillate spikes oblong-cylindric. 51. C. Nebraskensis.
Culms o.2-1.1 m. tall; scales obtuse or the lower acute.
Scales green.
Leaves $4^{-6} \mathrm{~mm}$. wide; pistillate spikes $4^{-6} \mathrm{~mm}$. thick; perigynia nerveless. 52. C. aquatilis.
Leaves 2 mm . wide; pistillate spikes $2-4 \mathrm{~mm}$. thick; perigynia faintly few-nerved. 53. C. lenticularis.
Scales purple or brown.
Scales shorter than the perigynia; marsh and meadow species.
54. C. Goodenovii.

Scales equalling or longer than the perigynia; arctic and alpine species.
55. C. Bigeloviz.

Culms only $2-17 \mathrm{~cm}$. tall ; arctic species. 56. C. subspathacea.
Scales distinctly longer than the perigynia; northern salt marsh species.
Basal leaves 2 mm . wide or less; scales little longer than the perigynia.
57. C. salina.

Basal leaves $2-6 \mathrm{~mm}$. wide ; scales much longer than the perigynia.
58. C. cuspidata.
44. Carex alpìna Sw. Alpine Sedge. (I. F. f. 714.) Culms slender, rough above, leafy below the middle, $1.5-5 \mathrm{dm}$. tall. Leaves roughish, $\mathrm{I}-3 \mathrm{~mm}$. wide, shorter than or equalling the culm; spikes $2-4$, clustered, the terminal I or 2 staminate below, oblong or globose, 4-10 mm . long, sessile, or the lower peduncled; perigynia oval, orbicular or obovoid, light green, about 2 mm . long, tipped with a very short and minutely 2 -toothed beak, nerveless or with a few faint nerves, equalling or slightly shorter than the ovate black or purple-brown scales. In rocky places, Quebec to James' Bay and Athabasca, western Ont. and Isle Royale, Lake Superior, south in the Rocky Mts. to Colo. Also in Europe. Summer.
45. Carex atratifórmis Britton. Black Sedge. (I. F. f. 715.) Glabrous; culms slender, sharp-angled, rough above, $2-5 \mathrm{dm}$. tall, usually leafy only below. Leaves $2-4 \mathrm{~mm}$. wide, rarely over 1.5 dm . long, much shorter than the culm; spikes $2-5$, dense, oblong-cylindric, $8-25 \mathrm{~mm}$. long, about 5 mm . in diameter, the terminal one usually staminate at the base and sessile, or nearly so, the others slenderstalked; lower bracts $\mathrm{I}-3.5 \mathrm{~cm}$. long, very narrow, the upper subulate; perigynia flattened, ovate or nearly orbicular, puncticulate, about 2 mm . long, tipped with a short, 2-toothed beak; scales black or reddish-brown, oblong, slightly narrower than the perigynia and about equalling them. Newf. to the mountains of N. E., west to the N. W. Terr. Summer.
46. Carex stylòsa C. A. Meyer. Variegatel Sedge. (I. F. f. 716. ) Culms slender, 3-4 dm. tall, rough and leafless above. Leaves 3 mm . wide; staminate spike solitary, nearly sessile, often pistillate for onc-half its length or more; pistillate spikes 2 or 3 , oblong-cylindric, erect, $8-12 \mathrm{~mm}$. longr, about 3 mm . in diameter, the lower slender-stalked and subtended by a subulate bract; perigynia ovate, slightly inflated, brown, minutely granulate, less than 2 mm . long, nerveless, beakless, the orifice entire and closed by the usually protruding style; scales black with white veins, obtusish, shorter than the perigynia. Lab, and Greenland to Alaska. Summer.
47. Carex Parryàna Dewey. Parry's Sfnge. (I. F. f. 717.) Glabrous, culms very slender, smooth, stiff, 2-5 dm. tall, leafless above. Leaves about 2 mm . wide, much shorter than the culm, their margins somewhat involute: spikes 1-4, dense, erect, linear-cylindric, $\mathbf{1 - 2 . 5 ~ d m}$. long, 3 mm . in diameter, the upper sessile, staminate below or throughout, the lower stalked and subtended by an almost filiform bract; perigynia plano-convex, obovate, pale, less than 2 mm . long, minutely papillose, faintly few-nerved, minutely beaked, the orifice entire; scales ovate, acute or mucronulate, dark brown with lighter margins, about as long as the perigynia. Hudson Bay to N. W. Terr., south in the Rocky Mts. to Colo. Summer.
48. Carex fúsca All. Brown Sedge. (I. F. f. 718.) Glabrous; culms slender, stiff, sharp-angled, rough above, 3-9 dm. tall. Leaves rough, erect, z-4 mm . wide; spikes $2-4$, oblong or cylindric, erect, all sessile and close together, or the lowest sometimes distant and short-stalked, $8-37 \mathrm{~mm}$. long, about 8 mm . in diameter, the terminal one staminate at the base or rarely throughout; perigynia elliptic or obovate, flat, ascending, 2 mm . long, light green, faintly few-nerved, beakless, the apex minutely 2 -toothed; scales ovate, awn-tipped, black or dark brown with a green midvein, longer than the perigynia. In bogs, Newf. to Alaska, south to Ga., Ky., Kans., Utah and Cal. Also in Europe. May-July.
49. Carex strícta Lam. Tussock Sedge. (I. F. f. 719.) Glabrous, rather dark green; culms slender, stiff, usually in dense clumps, sharply 3-angled, rough above, o.3-I.I m. tall. Leaves rarely overtopping the culm, very rough margined, $2-4 \mathrm{~mm}$. wide, their sheaths becoming fibrillose; lower bract similar ; staminate spikes solitary or sometimes 2, stalked; pistillate spikes 2-5, linear-cylindric, often staminate at the top, densely flowered, or loose at the base, $2-5 \mathrm{~cm}$. long, about 4 mm . thick, sessile or the lower stalked ; perigynia ovate-elliptic, acute, faintly few-nerved, 2 mm . long or less, minutely beaked, the orifice entire or nearly so; scales brown-purple with green margins and midvein, oblong or lanceolate, appressed; stigmas 2. In swamps, Newf. to Ont., Neb., Ga. and Tex. Hybridizes with C. filiformis. July-Sept.

Carex stricta angustàta (Boott) Bailey. Pistillate spikes longer, 5-10 cm. long, erect; scales lanceolate, acute, often longer than the perigynia. Range apparently nearly that of the type.

Carex stricta xerocàrpa (S. H. Wright, Britton). Pistillate spikes almost filiform, about 2 mm . in diameter, erect. N. Y. to Ill.
50. Carex Hàydeni Dewey. Hayden's Sedge. (I. F. f. 720.) Glabrous, similar to C. stricta but smaller; culm slender, seldom over 0.5 m. high. Leaves $2-3 \mathrm{~mm}$. wide, their sheaths slightly fibrillose or not at all; lower hract foliaceous, about equalling the culm; pistillate spikes $\mathrm{r}-3 \mathrm{~cm}$. long, about 4 mm . in diameter, erect or somewhat spreading, sessile or nearly so ; perigynia orbicular, obtuse, about 1 mm . broad, faintly $2-4$-nerved, minutely beaked, the orifice entire; scales lanceolate, purplish, spreading, very acute, about twice as long as the perigynia; stigmas 2. Swamps, N. B. to R. I., Iowa and Neb.
51. Carex Nebraskénsis Dewey. Nebraska Sedge. (I. F. f. 721.) Glabrous; culms stout, sharp-angled, $0.3-0.6 \mathrm{~m}$. tall. Leaves pale green, $3-5 \mathrm{~mm}$. wide, rough-margined, their sheaths more or less nodulose; lower bract sometimes equalling the culm, the upper much shorter and narrower; staminate spikes commonly 2, stalked; pistillate spikes 2-4. dense, oblong-cylindric, erect, $2-3 \mathrm{~cm}$. long, about 6 mm . in diameter, sessile or the lower short-stalked; perigynia elliptic or obovate, prominently several-ribbed, short-beaked, the beak 2 -toothed; scales ovate or lanceolate, acute or mucronate, brown with a green midvein or green all over, the upper shorter than the perigynia; stigmas 2. Neb. to Ore. and N. Mex. May-Aug.
52. Carex aquátilis Wahl. Water Sedge. (I. F. f. 722.) Glabrous, glaucous, pale green; culms sharp-angled above, smooth or nearly so, $0.5-1.1 \mathrm{~m}$. tall. Leaves elongated, $4-7 \mathrm{~mm}$. wide, their sheath nodulose; bracts similar, the lower much overtopping the culm; staminate spikes $1-3$, stalked; pistillate spikes linear-cylindric, often staminate at the summit, $2-6 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. in diameter, sessile and dense, or the lower loosely flowered at the base and short-stalked; perigynia e lipic, green, nerveless, minutely beaked, the orifice entire; scales oblong,
shorter than or equalling the perigynia and much narrower, stigmas 2. In swamps and along streams, Newf. to Alaska, Mass., Penn., Ohio, Minn. and Br. Col. Also in Europe. Hybridizes with C. stricta. June-Aug.
53. Carex lenticulàris Michx. Lenticular Sedge. (I. F. f. 723.) Glabrous, pale green; culms slender, sharp-angled, roughish above, $0.3-0.6 \mathrm{~m}$. tall. Leaves elongated, rarely over 2 mm . wide, slightly rough-margined, their sheaths not fibrillose; lower bracts similar, usually much overtopping the spikes; staminate spike solitary or rarely 2 , sessile or short-stalked, often pistillate above; pistillate spikes 2-5, clustered or the lower distant, sessile or the lower short-stalked, erect, linear-cylindric, $8-25 \mathrm{~mm}$. long, 3-4 mm. in diameter; perigynia ovate or elliptic, acute, minutely granulate, faintly few-nerved, tipped with a minute entire beak; scales green, appressed, shorter than the perigynia; stigmas 2. On shores, Lab. to the N. W. Terr., Me., Vt., Ont. and Minn. June-Aug.
54. Carex Goodenòvii J. Gay. Goodenough's Sedge. (I. F. f. 724.) Glabrous; culms stiff, sharp-angled, sometimes rough above, $0.3-0.6 \mathrm{~m}$. tall. Leaves elongated, smooth, glaucous, 2-4 mm. wide, not exceeding the culm, their sheaths not fibrillose; lower bracts usually foliaceous; staminate spike sessile or stalked; pistillate spikes 2-4, sessile or nearly so, erect, many-flowered, narrowly cylindric, $4-5 \mathrm{~mm}$. in diameter, $\mathrm{I}-2.5 \mathrm{~cm}$. long; perigynia flattened, broadly oval or ovate, faintly few-nerved, green, less than 2 mm . long, minutely beaked, the orifice nearly entire; scales purple-brown to black with a green midvein, very obtuse, shorter than the perigynia; stigmas 2. In wet grounds, Newf. to Mass. and Penn. June-Aug.
55. Carex Bigelòvii Torr. Bigelow's Sedge. (I. F. f. 725.) Glabrous and smooth throughout or nearly so; culms sharp-angled, $2-5 \mathrm{dm}$. tall. Leaves 3-4 mm. wide, not exceeding the culm, the lower bracts similar, but shorter; sheaths slightly or not fibrillose; staminate spike stalked, sometimes pistillate at the base, pistillate spikes 2-4, linear-cylindric, loosely flowered at the base, dense above, $1-2.5 \mathrm{~cm}$. long, 3-4 mm. thick, the upper sessile, the lower often slenderstalked; perigynia oval, about 2 mm . long, faintly nerved, scarcely beaked, the orifice entire; scales purple-brown with a narrow green midvein, often with green margins, obtuse or the lower acute, equalling or a little exceeding the perigynia; stigmas 2, rarely 3. Greenland and Lab. to the mountains of New England and N. Y. Also in Europe. Summer.
56. Carex subspathàcea Wormsk. Hoppner’s Sedge. (I. F. f. 726.) Glabrous; culm smooth, $2-\mathrm{I} 3 \mathrm{~cm}$. tall. Leaves rigid, smooth, about 2 mm . wide; lower bracts foliaceous; staminate spike stalked; pistillate spikes I-3, erect, sessile or very short-stalked, $6-\mathbf{1} 2 \mathrm{~mm}$. long, about 3 mm . in diameter; perigynia oval or ovoid, very short beaked, pale green, faintly few-nerved, about 2 mm . long; scales ovate or ovate-oblong, shorter than or equalling the perigynia; stigmas 2. Greenland to Hudson Bay. Summer.
57. Carex salina Wahl. Salt-marsh Sedge. (I. F. f. 727.) Glabrous; culm smooth, $\mathbf{1} .5-5 \mathrm{dm}$. tall. Leaves narrowly linear, $\mathbf{I}-2 \mathrm{~mm}$. wide, the lower bract similar; staminate spikes I or 2 , stalked; pistillate spikes I-3, slender-stalked or the upper sessile, erect, loosely few-several-flowered, $\mathbf{1}-2.5 \mathrm{~cm}$. long. $3-4 \mathrm{~mm}$. thick: perigynia ovate-elliptic, pale, faintly few-nerved, ascending, 3 mm . long, tapering into a short entire beak; scales ovate, brown with a green midvein, acute or cuspidate, somewhat longer than the perigynia; stigmas 2. . In salt marshes, Greenland to Hudson Bay. Also in arctic Europe. Summer.
58. Carex cuspidàta Wahl. Cuspidate Sedge. (I. F. f. 728.) Glabrous; culms erect, 3-7 dm. tall. Basal leaves often equalling the culm, 3-6 mm . wide. smooth; leaves of the culm similar to the lower bracts, which usually overtop the spikes; staminate spikes I-3, stalked; pistillate spikes 2-4, cylindric, often staminate at the summit, erect, the lower stalked; perigynia elliptic, green. 2- +-nerved. with a short entire beak; scales lanceolate, pale, acuminate or contracted into a scrate awn, much longer than the perigynia; stigmas 2. In marshes, Lat), to Mass. Also in Europe. Summer.

Culms slender ; pistillate spikes o. $6-6.5 \mathrm{~cm}$. long; stigmas 3 (2 in No. 59).
Pistillate spikes linear; scales shorter than the perigynia. PRASINAE.

> Perigynia twisted toward the top; scales purple-brown. 59. C. torta.

Perigynia straight; scales green.
6o. C. prasima.

Pistillate spikes oblong, globose or cylindric; scales equalling the perigynia or longer.
Bracts manifestly sheathing; arctic species. Ferrugineae. 6r. C. misandru. Bracts sheathless; scales mostly dark. Pendulinae.

Pistillate spikes narrowly cylindric; southern coast species.
62. C. littoralis.

Pistillate spikes oblong or globose; northern species. Scales not longer than the perigynia.

Pistillate spikes 6-12 mm . long, few-flowered; scales obtuse.
63. C. rariflora.

Pistillate spikes $1-2 \mathrm{~cm}$. long, several-flowered; scales acute.
64. C. limosa.

Scales distinctly longer than the perigynia. Perigynia oval or suborbicular.
65. C. Magellanica. Perigynia elliptic-lanceolate.
66. C. podocarpa.

Culms tall, usually stout; pistillate spikes $2-10 \mathrm{~cm}$. long; scales $1-8$ times as long as the perigynia; stigmas 2 (or 3 in Nos. 70 and 71). CRyptocarpae. Perigynia smooth.

Scales purule-brown; arctic species.
67. C. cryptocarpa.

Scales green; plants not arctic.
Perigynia nerveless or faintly nerved, much shorter than the scales.
Perigynia nearly orbicular, biconvex. 68. C. maritima.
Perigynia obovoid, obtuse. 69. C. crinita.
Perigynia oblong or elliptic, acute.
70. C. gynandra.

Perigynia strongly several-nerved, about equalling the scales.
Spikes erect; leaves very rough-margined. 71. C. macrokolea. Spikes drooping, filiform stalked. 71 a.C. verrucosa.
Perigynia granular or papillose.
72. C. glauca.
59. Carex tórta Boott. Twisted Sedge, (I. F. f. 729.) Glabrous; culm slender, smooth or slightly scabrous above, o.4-1 m. long. Leaves about 4 mm . wide, those of the culm very short; sheaths not fibrillose; lower bract commonly foliaceous; staminate spikes I-3, stalked; pistillate spikes 3-5, all but the upper spreading or drooping, linear, $2-7.5 \mathrm{~cm}$. long, about 4 mm . in diameter; often loosely flowered toward the base; perigynia oblong or narrowly ovate, green, nerveless, narrowed and more or less twisted above, $2-3 \mathrm{~mm}$. long; scales ovate, purplebrown with a green midvein, shorter and mostly narrower than the perigynia; stigmas 2. In marshes and wet thickets, Me. and Vt. to N. Car. and Mo. June-July.
60. Carex prásina Wahl. Drooping Sedge. (I. F. f. 730.) Glabrous; rather light green; culm slender, smooth or nearly so, reclining, 3 -angled, o.30.7 m . long. Leaves flaccid, roughish, $3-5 \mathrm{~mm}$. wide; lower bract similar, commonly overtopping the spikes; staminate spike short-stalked, often pistillate at the summit; pistillate spikes 2 or 3, linear-cylindric, drooping, the lower filiformstalked, $2-6 \mathrm{~cm}$. long, 4 mm . in diameter, rather loosely many-flowered; perigynia light green, lanceolate, obscurely nerved, tapering into a slender minutely 2 -toothed beak; scales ovate, acute, acuminate, or short-awned, pale green, shorter than the perigynia; stigmas 3. In meadows and moist thickets, Me. to Ont., N. J. and Penn., south in the Alleghanies to Ga. May-July.

6r. Carex misándra R. Br. Short-leaved Sedge. (I. F. f. 73I.) Glabrous; culms 2-40 cm. tall. Leaves $2-3 \mathrm{~mm}$. wide, clustered, seldom over 6 cm . long; bracts narrowly linear, sheathing, not overtopping the spikes; terminal spike slender-stalked; pistillate spikes I or 2, filiform-stalked, 6-15 mm. long, about 4 mm . thick, rather few-flowered, drooping; perigynia narrowly lanceolate, acuminate, narrowed at the base, 3 mm . long, dark brown, denticulate above; scales obtuse, purple-black with white margins, somewhat shorter than the perigynia; stigmas 2 or 3. Throughout arctic America, extending south in the Rocky Mts. to the higher summits of Colo. Also in arctic Europe and Asia. Summer.
62. Carex littoràlis Schwein. Barratt's Sedge. (I. F. f. 732.) Glabrous, pale green, somewhat glaucous; culms smooth, $0.2-0.5 \mathrm{~m}$. tall; leafless above. Leaves 3-4 mm. wide, smooth, the lower sheaths fibrillose; bracts not sheathing, the lower usually short and narrow; staminate spikes I-3, usually rather longstalked; pistillate spikes 2-4, drooping or the upper ascending, slender-stalked, linear-cylindric, $1-5 \mathrm{~cm}$. long, 6 mm . in diameter, mostly staminate at the summit;
verigynia oblong, green, faintly few-nerved, $2-3 \mathrm{~mm}$. long, tipped with a minute entire beak: scales brown-purple with lighter margins, obtuse, equalling or shorter than the perigynia; stigmas 3. In pine-barren swamps, L. I. and N. J. to E. Penn. and N. Car. May-July.
63. Carex rarifiòra J. E. Smith. Loose-flowered Alpine Sedge. (I. F. f. 733.) Glabrous, culms very slender, rather stiff, erect, I-3 dm. tall, smooth, or roughish above. Leaves 2 mm . wide or less, the lower very short; bracts subulate, purple at the base; staminate spike solitary, long-stalked; pistillate spikes I or 2 . narrowly oblong, few-flowered, $6-12 \mathrm{~mm}$. long, 4 mm . in diameter, nodding on filiform stalks; perigynia pale, oblong, acute at each end, 3 mm . long, 1 mm . wide, minutely beaked, few-nerved, the orifice entire; scales oval, purple-brown with a greenish midvein, obtuse or mucronate, equalling or a little longer than the perigynia; stigmas 3. In wet places, Greenland and Lab. to Hudson Bay, south to Me. and to northern Minn. Also in Europe and Asia. Summer.
64. Carex limòsa L. Mud Sedge. (I. F. f. 734.) Glabrous; culms rough above, $2.5-5 \mathrm{dm}$. tall. Leaves 2 mm . wide or less, shorter than the culm; bracts linear-filiform; staminate spike long-stalked; pistillate spikes I or 2, filiformstalked, drooping, $\mathbf{I}-2 \mathrm{~cm}$. long, about 6 mm . thick; perigynia pale, oval, narrowed at both ends, 3 mm . long, with a minute entire beak, several-nerved, about as long as the oval cuspidate or acute scale; stigmas 3. In bogs, Lab. to the N. W. Terr., south to Me., N. J., Iowa and Idaho. Also in Europe. Summer.
65. Carex Magellánica Lam. Magellan Sedge. (I. F. f. 735.) Glabrous; culms smooth or nearly so, $1.5-5 \mathrm{dm}$. tall. Leaves flat, $2-4 \mathrm{~mm}$. wide, commonly shorter than the culm, the lower bract similar; staminate spike solitary, rarely 2 ; pistillate spikes $1-3$, filiform-stalked, drooping, $8-16 \mathrm{~mm}$. long, about 6 mm . in diameter; perigynia biconvex, oval, pale, granulate-papillose, few-nerved, $2-3 \mathrm{~mm}$. long, with a very minute entire beak; scales long-acuminate or awned, dark green or purplish brown, longer than the perigynia; stigmas 3. In bogs, Newf. to Manitoba, Me., Penn. and Mich. Also in Utah, Europe, and in southern S. Am. Summer.
66. Carex podocàrpa R. Br. Long-awned Arctic Sedge. (I. F. f. 736.) Glabrous; culms slender, rough above, 2.5-5 dm. long. Leaves $3-4 \mathrm{~mm}$. wide, the lowest reduced to sheaths; lower bract similar to the upper leaves; staminate spikes 1 or 2, stalked; pistillate spikes $2-4$, cylindric, dense, $1-3.5 \mathrm{~cm}$. long, 6 mm . in diameter, the lower often nodding ; perigynia elliptic-lanceolate, flat, about 5 mm . long, acute, faintly nerved, the orifice entire; scales purple-black, ovate, acuminate, longer than the perigynia, long-awned; stigmas 2 or 3. Arctic America. Summer.
67. Carex cryptocàrpa C. A. Meyer. Hidden-fruited Sedge. (I. F. f. 737.) Glabrous; culm stout, 3 -angled, rough above, $0.4-0.9 \mathrm{~m}$. tall. Leaves smooth, 4-6 mm. wide;; staminate spikes $2-4$, stalked; pistillate spike $2-5$, filiform-stalked and drooping, $2-8 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. in diameter; perigynia oblong or oval, green, several-nerved, 3 mm . long, with a very short entire beak; scales purplebrown, lanceolate, acuminate, 2 or 3 times longer than the perigynia; sigmas 2 . Arctic America from Greenland to Alaska. Summer.

Carex cryptocàrpa variegàta (Derjer) Britton. Seldom over 3 dm. tall; pistillate spikes about $2, \mathrm{I}-2 \mathrm{~cm}$. long; scales ovate-lanceolate, acute, little longer than the perigynia. Range of the species.
68. Carex marítima Muller. Seaside Sedge. (I. F. f. 738.) Glabrous. light green: culms 3 -angled, smooth, or roughish above, $0.3-0.6 \mathrm{~m}$. tall. Leaves 4-6 mm . wide, the lower bracts similar; staminate spikes $\mathbf{I}-3$. slender-stallicd: pintillate spikes 2-4, cylindric, often staminate at the summit, $2-S \mathrm{~cm}$. long, $\$ 12 \mathrm{~mm}$. thick, drooping on filiform stalks; perigynia oval to orbicular, pale, biconvex. less than 2 mm . long, nerveless or with a few faint nerves. with a very short and nearly entire beak; scales green, linear-subulate, ciliate, scabrous, $3-8$ times as long as the perigynia; stigmas 2. In salt meadows, Newf. and Lab, to Mass. Also in Europe. June-Aug.
69. Carex crinita Lam. Fringen Sence. (I. F. f. 730.) Glabrous: culms 3 -angled, $0.5-\mathbf{1 . 3} \mathrm{m}$. tall. Leaves rough-margined, $6-10 \mathrm{~mm}$. wide, the lowest very short and sheathing; staminate spikes I or 2. stalked; pistillate spikes
$3 \cdot 5$, narrowly cylindric. 2-1 I cm. long, 6-8 mm. in diameter, stalkerl, drooping: perigynia obovoid, obtuse. about 2 mm . long and nearly as thick, nerveless, abruptly tipped by the short entire beak; scales green, subulate, ciliate-scabrous, spreading, 2-6 times as long as the perigynia; stigmas 2 . In swamps and wet woods, N. S. and Ont. to Fla. and Tex. June-Aug. A hybrid with C. torta is described.

Carex crinita minor Boott. Culms slender, lower ; leaves $3-5 \mathrm{~mm}$. wide; pistillate spikes $2-3 \mathrm{~cm}$. long, 4 mm . thick, spreading or slightly drooping ; perigynia little more than Imm . in diameter. Me. to S . N. Y.
70. Carex gynándra Schwein. Nodding Sedge. (I. F. f. 740.) Similar to the preceding species. Leaves $6-12 \mathrm{~mm}$. wide, glabrous or their sheaths often finely pubescent; pistillate spikes $2-10 \mathrm{~cm}$. long, narrowly cylindric; perigynia oblong or elliptic, faintly few-nerved or nerveless. compressed, slightly inflated, $3-4 \mathrm{~mm}$. long, and about one-half as broad. tapering to an acute entire orifice; scales subulate. rough, ascending, 2-4 times as long as the perigynia. In swamps, N. S. to northern N. Y., Fla. and La. June-Aug.

Carex gynándra Pòrteri (Olney) Britton. Smaller, bearing the same relation to the species that minor does to C. crinita. Me.
71. Carex macrokòlea Steud. Southherǐ Glaucoưs Sedge. (I. F. f. 741.) Glabrous, light green, glaucous; culms stout. O.5-I.I m. tall. Leaves rough. 3-6 mm . wide, tapering to a very long narrow tip; lower bracts similar: staminate spikes I or 2 , short-stalked; pistillate spikes $2-8$. cylindric, $2-5 \mathrm{~cm}$. long, erect, sessile or the lower stalked; perigynia dark brown, 3 -angled, 3 mm . long, sev-eral-nerved, abruptly contracted into a short sharp beak; scales oblong. roughawned, as long as the perigynia or longer. In swamps, Mo. to Fla. and Tex. June-Aug.

7Ia. Carex verrucòsa Muhl. Warty Sedge. Glabrous and usually glaucous; culms slender, I m. tall or less. Leaves smooth or very nearly so, 2-6 mm . wide, long-attenuate; staminate spike I. stalked; pistillate spikes I-6. cylindric, $3-5 \mathrm{~cm}$. long, filiform-stalked and nodding, or the upper erect; perigynia 3 -angled, somewhat swollen. abruptly sharp-beaked. 3-4 mm. long, about as long as the orate awned scales. In wet soil. S. E. Va. to Fla., Mo. and Miss. June-Aug.
72. Carex glaùca Scop. Glaucous Sedge. (I. F. f. 742.) Glabrous, pale green, glaucous; culms $0.2-0.5 \mathrm{~m}$. tall. Leaves smooth or nearly so. about +mm . wide; lower bract similar, narrower; staminate spikes mostly 2, stalked; pistillate spikes 2 or 3 , at length drooping, slender-stalked. linear-cylindric. $2-5 \mathrm{~cm}$. long, 6 mm . thick; perigynia brown, ellipsoid, few-nerved, or nerveless, granulate or papillose, nearly 2 mm . long, minutely beaked, the orifice entire; scales ovate or lanceolate, brown with a green midvein. about as long as the perigynia; stigmas 2. In meadows, N. S. and Ont. Adventive from Europe. June-Aug.

Perigynium densely pubescent.
Pistillate spikes oblong-cylindric, $8-20 \mathrm{~mm}$. long; perigynia oval or ovoid, fewnerved.
73. C. virescens.

Pistillate spikes narrowly cylindric, $12-36 \mathrm{~mm}$. long; perigynia oblong. strongly several-nerved.
Perigynium nearly glabrous, at least when mature.
Spikes $5-7 \mathrm{~mm}$. thick; perigynia imbricated, flattened ; top of the achene not bent.
75. C. triceps.

Spikes 4 mm . thick ; perigynia not imbricated, swollen ; top of the achene bent, or tipped with a bent style.
76. C. Caroliniana.
73. Carex viréscens Muhl. Downy Green Sedge. (I. F. f. 743.) Culms slender, rough above, $1.5-5 \mathrm{dm}$. tall. Leaves light green, pubescent, especially on the sheaths; spikes $2-5$, short-stalked, erect or nearly so, $8-20 \mathrm{~mm}$. long, about 3 mm . in diameter, the terminal one staminate below; perigynia 3 -sided. rather less than 2 mm . long, green. beakless, the orifice entire; scales oblong-ovate, cuspidate, slightly shorter than the perigynia. In dry woods and thickets, Me. and Ont. to Mich., N. Car. and Mo. June-July.
74. Carex costellàta Britton. Ribbed Sedge. (I. F. f. 744.) Similar to the preceding, but taller and more spreading. Leaves pubescent; spikes 2-5,
rather loose, 3 mm . in diameter, the terminal one staminate below, the lower one commonly filiform-stalked; perigynia narrowed at each end, 2 mm . long, rather more than I mm. thick; scales ovate, shorter than the perigynia. In woods, Me . and Ont. to N. Car. June-Aug.
75. Carex tríceps Michx. Hirsute Sedge. (I. F. f. 745.) Light green; culms rough above, $1.5-9 \mathrm{dm}$. long. Leaves $2-4 \mathrm{~mm}$. wide, pubescent; spikes $2-5$, dense, erect, sessile or very nearly so, $6-16 \mathrm{~mm}$. long, usually clustered, the terminal one staminate at the base; perigynia oval or obovoid, flattened, not inflated, green or greenish-brown, few-nerved, usually pubescent when young, when mature $\mathbf{I}-2 \mathrm{~mm}$. long, the orifice minutely notched or entire; scales ovate, cuspidate or short-awned; achene elliptic-obovoid, its summit not bent. In woods, fields and swamps, Mass. to southern Ont. and Mich., Fla. and Tex. April-Aug.
76. Carex Caroliniàna Schwein. Carolina Sedge. (I. F. f. 746.) Culms slender, rough above, $0.3-0.6 \mathrm{~m}$. tall. Leaves $2-3 \mathrm{~mm}$. wide, rather dark green, glabrous except on the sheaths; spikes 2-4, oblong, dense, sessile or nearly so, $8-12 \mathrm{~mm}$. long; clustered; the upper one staminate at the base; perigynia subglobose or .obovoid, swollen, about I mm. in diameter, nerveless or faintly nerved, brown, beakless; scales brown, ovate, mucronate; achene pyriform, bent at the summit or tipped with the bent style. In meadows, N. J. and Penn. to N. Car. and Ark. May-July.

Perigynia $2-4 \mathrm{~mm}$. long, slightly swollen; spikes linear or linear-cylindric. Plant glabrous; perigynia obtuse.
Sheaths pubescent ; perigynia pointed at both ends.
Perigynia 2 mm . long; spikes erect or somewhat spreading. 78. C. aestivalis.
Perigynia 4 mm . long; spikes drooping, at least when old. 79. C. oxylepis.
Perigynia $4-5 \mathrm{~mm}$. long, manifestly swollen; spikes eblong or oblong-cylindric.
Perigynia faintly few-nerved; scales ovate, acute or short-awned. 8o. C. formosa.
Perigynia strongly many-nerved; scales lanceolate, long-awned. 8r. C. Davisiz.
77. Carex gracíllima Schwein. Graceful Sedge. (I. F. f. 747.) Glabrous; culms roughish above, $0.3-1 \mathrm{~m}$. long. Leaves dark green, 3-6 mm. wide, shorter than the culm; lower bract foliaceous; spikes $3-5,2-6 \mathrm{~cm}$. long, about 4 mm . thick or sometimes much smaller, filiform-stalked and drooping, the upper one partly or wholly staminate; perigynia ovoid-oblong, obtuse, few-nerved, glabrous, 2 mm . long; scales ovate-oblong, pale, one-half as long as the perigynia. In moist woods and meadows, N. S. to Manitoba, N. Car., Ohio and Mich. MayJuly.

Professor Bailey has described a hybrid with C. hirsuta. Carex Sullivantii Boott, is a hybrid of C. gracillima with C. pubescens.
78. Carex aestivàlis M. A. Curtis. Summer Sedge. (I. F. f. 748.) Culms slender or filiform, $0.2-0.5 \mathrm{~m}$. tall. Leaves flat, $2-3 \mathrm{~mm}$. wide, elongated, their sheaths usually pubescent; spikes $3-5$, narrowly linear, erect or somewhat spreading, $2-5 \mathrm{~cm}$. long, about 3 mm . thick, the terminal staminate at the base or also at the summit; perigynia oblong, 3 -sided, few-nerved, 2 mm . long, beakless, the orifice entire; scales ovate-oblong, the lower cuspidate or short-awned. In mountain woods, Mass. and N. Y. to Ga. June-Aug.
79. Carex oxylepis Torr. \& Hook. Sharp-scaled Sedge. (I. F. f. 740.) Culms slender, smooth, $0.2-0.5 \mathrm{~m}$. tall. Leaves $3-6 \mathrm{~mm}$. wide, pubescent, especially on the sheaths; spikes 4 or 5 , linear-cylindric, $2-5 \mathrm{~cm}$. long, about 4 mm . in diameter, filiform-stalked, the terminal one staminate at the base or sometimes wholly staminate; perigynia oblong, 3 -angled, pointed at both ends. less than 2 mm . thick, several-nerved, the orifice entire; scales ovate-lanceolate: short-awned, shorter than the perigynia. Mo. to Tenn., S. Car., Tex, and Fla. April May.
80. Carex formòsa Dewey. Handsome Sence. (I. F. f. 750.) Culms slender. smooth, $0.2-0.6 \mathrm{~m}$. tall. Leaves pubescent, especially on the sheaths, the has.al 4-6 mm . wide; spikes $3-5$, dense, $\mathbf{1}-3 \mathrm{~cm}$. long, nearly 6 mm . in diameter, filitormstalked, the upper one staminate at the base: perigynia owoid, glabrous, wollen, 4 mm . long, 2 mm , thick, with a short slightly notched beak; scales lanceolate or ovate, green, acute, or the lower short-awned. In dry woods and thickets, Mass. and Vt. to Ont., N. Y. and Mich. June-July.
81. Carex Davísii Schwein. \& Torr. Davis' Sedge. (I. F. f. 751.) Similar to the preceding, stouter. Leaves $3-6 \mathrm{~mm}$. wide, pubescent; lower bract foliaceous; spikes clustered, or the lower one distant, 6 mm . in diameter, at length spreading or drooping, the terminal one staminate at the base; perigynia much swollen, strongly several-nerved, $4-5 \mathrm{~mm}$. long, with a short but conspicuously 2 -toothed beak; scales lanceolate or oval, long-awned, equalling or longer than the perigynia. In moist thickets and meadows, Mass. to N. Y., Minn., Ga., Ky., Kans. and the Ind. Terr. May-July.

Perigynia manifestly beaked, nerved or nerveless; pistillate spikes drooping, at least when old.

Beak of the perigynium cylindric or subulate, $\mathrm{r}-2$ times as long as the body. Sylvaticae.

Perigynia broadly oval, smooth, spreading. 82. C. longirostris.
Perigynia narrowly conic, tuberculate-hispid, appressed. 83. C. Assiniboinensis. Beak of the perigynium not more than one-half as long as the body.

Leaves pubescent. Flexiles. 84. C. castanea.
Leaves glabrous.
Pistillate spikes narrowly oblong, 4-12 mm. long; perigynium 2 mm . long; arctic and alpine species. Capillares. 85. C. capillaris.
Pistillate spikes linear, $2-8 \mathrm{~cm}$. long ; perigynium $4-6 \mathrm{~mm}$. long. 'Debiles. Perigynia membranous, few-nerved ; pistillate spikes slender.

Leaves 5 - 10 mm . wide ; scales two-thirds as long as the perigynia.
86. C. arctata.

Leaves $2-5 \mathrm{~mm}$. wide ; scales one-half as long as the perigynia.
87. C. tenuis. Perigynia coriaceous, strongly many-nerved ; pistillate spikes thicker. 88. C. oblita.

Perigynia beakless or minutely beaked, finely many-striate; spikes erect or nearly so. Griseae.

Leaves slightly glaucous or not at all.
Perigynia little longer or shorter than the scales.
Pistillate spikes dense, usually many-flowered ; leaves $4^{-6 ~ m m}$. wide, spreading, soft. 89. C. grisea.

Pistillate spikes loosely several-flowered ; leaves $2-4 \mathrm{~mm}$. wide, mostly erect and rigid.
Perigynia $2-3$ times longer than the scales.
Plant very glaucous all over.
90. C. amphibola.
91. C. flaccosperma.
92. C. glaucodea.
82. Carex longiróstris Torr. Long-beaked Sedge. (I. F. f. 752.) Glabrous, light green; culms slender, roughish above, $0.2-1 \mathrm{~m}$. long. Leaves flat, $2-3 \mathrm{~mm}$. wide, usually not exceeding the culm, the bracts similar; staminate spikes I-3, slender-stalked; pistillate spikes 2-4, oblong-cylindric, loosely flowered, I-5 cm . long, $6-8 \mathrm{~mm}$. in diameter, all filiform-stalked and nodding or the upper one nearly sessile; perigynia slightly inflated, pale, strongly i-nerved on each side, the body about 2 mm . long, contracted into a very slender beak; scales lanceolate, spreading, acuminate, scarious-margined, $6-8 \mathrm{~mm}$. long. On banks and in moist thickets, N. B. to Ont. and the N. W. Terr., Mass., Penn., Mich. and Neb. JuneSept.
83. Carex Assiniboinénsis W. Boott. Assinibola Sedge. (I. F. f. 753.) Glabrous; culms filiform, reclining, $0.5-0.6 \mathrm{~m}$. long, longer than the leaves. Leaves and bracts 2 mm . wide or less, the lower reduced to short purplish sheaths; staminate spike long-stalked; pistillate spikes 2 or 3 , distant, loosely few-flowered, $1.5-3 \mathrm{~cm}$. long, drooping on filiform stalks; the flowers alternate; perigynia obtusely 3 -angled, subulate-beaked, above 6 mm . long and 2 mm . thick above the base; scales lanceolate, awned, about the length of the perigynia. In wet soil, northern Minn. and Manitoba. Summer.
84. Carex castànea Wahl. Chestaut Sedge. (I. F. f. 754.) Culms slender or filiform, rough above, o.3-1 m. tall. Leaves $3-5 \mathrm{~mm}$. wide, shorter than the culm; bracts linear-filiform, $1-3 \mathrm{~cm}$. long; staminate spike stalked; pistillate spikes I-4, oblong or oblong-cylindric, $\mathrm{I}-2.5 \mathrm{~cm}$. long, about 6 mm . thick, drooping on filiform stalks; perigynia glabrous, oblong or oblong-lanceolate, 3-angled, few-nerved, tapering into a 2 -toothed beak one-half as long as the body, scales ovate or ovate-lanceolate, acute or cuspidate, rather shorter than the perigynia. In dry thickets and on banks, Newf. to Conn., Minn. and Kans. June-July.
85. Carex capillàris L. Hair-Like Sedge. (I. F. f. 755.) Glabrous; culms slender or filiform, $5-35 \mathrm{~cm}$. tall. Leaves $\mathrm{I}-2 \mathrm{~mm}$. wide, much shorter than the culm, roughish; lower bract similar, the upper much narrower; spikes filiformstalked, the terminal one staminate; pistillate spikes $\mathbf{I}-3,4-12 \mathrm{~mm}$. long, 2 mm . thick, nodding, 2-12-flowered; perigynia oblong, 3-angled, almost nerveless, about 2 mm . long, the slender beak about one-third as long as the body; scales oval, scarious-margined, shorter than the perigynia. Greenland to Alaska, Me., N. H., N. Y., Mich., and in the Rocky Mts. to Colo. and Utah. Also in Europe and Asia.
86. Carex arctàta Boott. Drooping Wood Sedge. (I. F. f. 756.) Glabrous, culms 3-6 dm. long. Leaves roughish-margined, much shorter than the culm, $5-10 \mathrm{~mm}$. wide; staminate spike short-stalked; pistillate spikes $2-5$, linear, 3 mm . thick, many-flowered, ascending, or at length drooping and filiform-stalked; perigynia oblong, rather strongly few-nerved, about 4 mm . long, less than 2 mm . thick, 3 -angled, tapering into a short 2 -toothed beak; scales ovate, cuspidate or short-awned, shorter than the perigynia. In dry woods and thickets, N. B. to Minn., Penn. and Mich. May-June.

Carex arctàta Fáxoni Bailey. Spikes nearly erect, 2-4 of them clustered near the summit, usually shorter, the staminate one very short; perigynia 4-5 mm. long. Quebec to N. H., Minn. and Mich.

Carex Kniéskerni Dewey is probably a hybrid of C. arctata with C. castanea or $C$. formosa.
87. Carex ténuis Rudge. Slender-Stalked Sedge. (I. F. f. 757.) Culms rough above, $1-9 \mathrm{dm}$. long. Leaves $3-5 \mathrm{~mm}$. wide; lower bracts similar; staminate spike short-stalked; pistillate spikes $2-5$, linear, 3 mm . thick, filiform-stalked and spreading or drooping; perigynia spindle-shaped, glabrous or puberulent, faintly few-nerved, obtusely 3 -angled, 6 mm . long, less than 2 mm . thick, tapering into a short 2 -toothed beak; scales ovate or oblong, one-half as long as the perigynia. In woods, Newf. to Mich., N. Car. and Ky. May-Aug. A hybrid with C. virescens occurs at Revere, Mass.

Carex ténuis interjécta (Bailey) Britton. Pistillate spikes very slender, often compound at the base, erect or nearly so, filiform-stalked, loosely flowered, the perigynia alternate, only about 4 mm . long. N. Y. and Penn.

Carex ténuis eréctior Britton. Mostly taller and stouter than the type, and erect : leaves about 4 mm . wide; pistillate spikes erect or but slightly spreading; perigynia 5 mm . long, one-third longer than the scales. White Mts.
88. Carex oblita Steud. Dark-green Sedge. (I. F. f. 758.) Glabrous; culms sharply 3 -angled, smooth or nearly so, 3-9 dm. long. Leaves $4-5 \mathrm{~mm}$. wide, shorter than the culm; lower bract similar; staminate spike solitary, filiformstalked; pistillate spikes $3-5,2-6 \mathrm{~cm}$. long, about 5 mm . thick, loosely flowered, slender-stalked, the lower distant, drooping; perigynia 3 -angled, glabrous, 6 mm . long, less than 2 mm . thick, tapering into a short 2 -toothed beak; scales obtuse, about one-third the length of the perigynia. In bogs, central N. Y. and Penn. to N. J. and N. Car. June-Aug.
89. Carex grísea Wahl. Gray Sedge. (I. F. f. 759.) Glabrous; culms smooth or nearly so, $3^{-6} \mathrm{dm}$. long. Leaves light green, sometimes slightly glaucous; bracts similar, much overtopping the spikes; staminate spike sessile; pistillate spikes 3-5, oblong, $8-25 \mathrm{~mm}$, long. about 4 mm . thick, the lower slender-stalked and distant; perigynia 5 mm . long, 2 mm . thick; beakless; scales cuspidate or awned. In woods and thickets, Me. to Ont. and Minn., N. Car. and Kans. May-July.
90. Carex amphíbola Steud. Narrow-Leaved Sedcie. (I. F. f. 760.) Glabrous; culms slender, $3-5 \mathrm{dm}$. long. Leaves $2-4 \mathrm{~mm}$. wide; bracts similar. erect, not over 2 mm . wide, overtopping the spikes; staminate spike short; pistiliate spikes 2-4, $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, less than 4 mm . thick, loosely several-thowered, the lower on filiform stalks; perigynia oblong or obovoid, firm, pointed, beakless. 3 -angled, 4 mm . long, about 2 mm . thick; scales awned, sproading. In dry soil. N. J. and Penn. to Iowa, Fla. and Tex. April-June.
91. Carex flaccospérma Dewey. Thin-frutren Smbak. (I. F. f. Toi.) Similar to Carex grisea and C. glaucodec, slightly glamons: culms s-6 dm. tall. Leaves thin, the basal ones $6-12 \mathrm{~mm}$. wide, the bracts leafy; staminate spike sos sile or nearly so ; pistillate spikes $2-4$, oblong, erect, the hower slemder-stalked
perigynia oblong, 3 -angled, 5 mm . long; scales broadly ovate, green, 2-3 times shorter than the perigynia. S. Mo. to Tex., N. Car. and Fla. June-July.
92. Carex glaucòdea Tuckerm. Glaucescent Sedge. (I. F. f. 762.) Similar in habit to Carex grisea, but pale and very glaucous; culms 1.5-5 dm. long. Leaves $4^{-8} \mathrm{~mm}$. wide; bracts foliaceous ; staminate spike sessile ; pistillate spikes 3-5, erect, densely flowered, the lower slender-stalked; perigynia oblong, $3-4 \mathrm{~mm}$. long, beakless, nearly twice as long as the scales. In open fields and meadows, Mass. to Penn., Ill., Va. and Ark. May-July.

Pistillate spikes scattered, distant, long-stalked or the 2 upper ones close together and nearly sessile. Granulares.

Bracts elongated, mostly overtopping the spikes ; perigynia strongly many-nerved.
Basal leaves $3^{-6} \mathrm{~mm}$. wide ; perigynia $2-3 \mathrm{~mm}$. long. 93. C. granularis.
Basal leaves $5-16 \mathrm{~mm}$. wide ; perigynia-1. 5 mm . long. 93a. C. Shriveri.
Bracts short, rarely overtopping the spikes ; perigynia obscurely few-nerved.
94. C. Crawei.

Pistillate spikes close together and nearly sessile at the summit of the culm, or the lowest distant and stalked.

Beak of the perigynium stout, 2-toothed; plants glabrous. Extensae.
Leaves strongly involute ; perigynia brown, the beak shorter than the body.
95. C. extensa.

Leaves flat, $2-5 \mathrm{~mm}$. wide ; perigynia yellow when mature, $4^{-6} \mathrm{~mm}$. long, the beak about as long as the body.
96. C. flava.

Leaves flat, 2 mm . wide or less ; perigynia dark green, 2 mm . long, the beak one-half as long as the body.
97. C. viridula.

Beak of the perigynium short, entire or none ; leaves, or their sheaths, more or less pubescent. Pallescentes.

Perigynia faintly few-nerved, beakless. 98. C. pallescens.
Perigynia strongly many-nerved, cylindric-beaked.
99. C. abbreviata.
93. Carex granulàris Muhl. Meadow Sedge. (I. F. f. 763.) Glabrous, slightly glaucous ; culms slender, smooth or nearly so, I.5-6 dm. long. Leaves 3-6 mm. wide, the basal shorter than the culm ; bracts similar ; staminate spike sessile or short-stalked ; pistillate spikes $3-5$, erect or slightly spreading, $1-3 \mathrm{~cm}$. long, 4 mm . thick, many-flowered, stalked or the upper sessile perigynia ovoid, strongly many-nerved, $2-3 \mathrm{~mm}$. long, with a short, bent or nearly straight beak; scales ovate, acute or cuspidate. In moist meadows, N. B. to Ont., Manitoba, Fla. and La. May-July.

93a. Carex Shriveri Britton. Basal leaves broader, 5-16 mm. wide, glaucous; spikes smaller and narrower; perigynia $\mathbf{I}-\mathbf{I} .5 \mathrm{~mm}$. long, narrower, the beak slightly bent. N. Y. and Penn. to Wis. and Va. (C. granularis Shriveri Britton, I. F. I: 322.)
94. Carex Cràwei Dewey. Crawe's Sedge. (I. F. f. 764.) Glabrous; culms stiff, $7-40 \mathrm{~cm}$. tall. Leaves rather stiff, $2-4 \mathrm{~mm}$. wide, shorter than the culm; the bracts similar; staminate spikes $1-3$, long-stalked; pistillate spikes $1-4$, cylindric, erect, $\mathbf{x}-2.5 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. thick, the lowest often borne near the base; perigynia ovoid, usually resinous dotted, $2-3 \mathrm{~mm}$. long, tapering into a short entire beak; scales obovate or oval, acute or cuspidate, shorter than the perigynia. In meadows and on banks, Quebec to Man., Penn., Tenn. and Neb. May-July.
95. Carex exténsa Gooden. Long-bracted Sedge. (I. F.. f. 765.) Glabrous; culms stiff, $2.5-5 \mathrm{dm}$. tall. Leaves $2-4 \mathrm{~mm}$. wide, involute, erect, shorter than the culm; lower bract similar, much exceeding the spikes; staminate spike sessile; pistillate spikes $\mathbf{I}-3$, erect, oblong, densely many-flowered, $10-\mathbf{1} 6 \mathrm{~mm}$. long, about 6 mm . thick; perigynia ovoid or ovoid-oblong, brown, 3 mm . long, many-ribbed, tapering into a short 2 -toothed beak; scales ovate, acute, shorter than the perigynia. Borders of salt meadows, Coney Island, N. Y., and near Norfolk, Va. Naturalized from Europe. June-Aug.
96. Carex flàva L. Yellow Sedge. (I. F. f. 766.) Glabrous, yellowgreen; culms slender but stiff, smooth or nearly sn, $2-6 \mathrm{dm}$. tall. Leaves $2-5 \mathrm{~mm}$. wide, flat; lower bract elongated, spreading or ascending; staminate spike; pistillate spikes I-4, oblong, erect, densely flowered, $6-\mathbf{1 2} \mathrm{mm}$. long, about 6 mm . thick; perigynia yellow, spreading or deflexed when mature, 4-6 mm . long, severalnerved, the subulate 2 -toothed beak about as long as the body; scales acute or subacute, shorter and narrower than the perigynia. In swamps and wet meadows,

Newf. to the N. W. Terr., R. I., N. J., Ohio and Mont. Also in Europe. JulySept.
97. Carex virídula Michx. Green Sedge. (I. F. f. 767.) Glabrous, bright green; culms slender, smooth, I-4 dm. tall, often exceeded by the basal leaves. Leaves 2 mm . wide or less, the similar bracts much overtopping the spikes; staminate spike sessile; pistillate spikes $2-5$, oblong, $4-12 \mathrm{~mm}$. long, 4 mm . in diameter or less; perigynia ovoid-oblong, 2 mm . long or less, few-nerved, narrowed at the base, tapering into a 2 -toothed beak about one-half as long as the body; scales ovate, shorter than the perigynia. In bogs and on wet rocks, Newf. to Hudson Bay and the N. W. Terr., south to Me., Penn., Minn., Utah and Wash. Summer.
98. Carex palléscens L. Pale Sedge. (I. F. f. 768.) Light green; culms slender, rough above, $\mathrm{I}-5 \mathrm{dm}$. tall. Leaves flat, $2-3 \mathrm{~mm}$. wide, pubescent at least on the sheaths; lower bract similar; staminate spike stalked; pistillate spikes 2-4, oblong, slender-stalked or the upper one sessile, densely many-flowered, $8-18 \mathrm{~mm}$. long, $4-5 \mathrm{~mm}$. in diameter; perigynia short-oblong, pale, 2 mm . long, obtuse, fewnerved, beakless, the orifice entire; scales ovate, cuspidate or short-awned. In fields and meadows, N. S. to Ont., R. I., Penn., Ill. and Wis. Also in Europe. May-July.
99. Carex abbreviàta Prescott. Torrey's Sedge. (I. F. f. 769.) Pale green; culms rather stiff, $2.5-5 \mathrm{dm}$. tall, finely ciliate-pubescent. Leaves about 2 mm . wide, elongated, usually densely pubescent; lower bract spreading or ascending; staminate spike short-stalked; pistillate spikes 1-3, short-oblong, 6-10 mm . long, sessile or the lower one short-stalked, clustered ; perigynia broadly oblong or obovoid, glabrous, about 2 mm . long, many-nerved, obtuse, abruptly tipped by a short cylindric beak; scales cuspidate, shorter than the perigynia. In dry soil, N. Y. to the N. W. Terr., south in the Rocky Mts. to Colo. June-July.

Scales of the spike normal, not elongated and leaf-like. Nos. roo-i20.
Leaves $2-36 \mathrm{~mm}$. wide; bracts leafy, usually large. Nos. 100-119.
Periginia green (yellow or purple in no. 116). Nos. 100-117.
Perigynia finely many-striate. Oligocarpae.
Sheaths glabrous.
Perigynia narrowed at both ends, beakless. 100. C. conoidea.
Perigynia with a short entire beak. ror. C. oligocarpa.
Sheaths pubescent.
102, C. Hitchcockiana. Perigynia with few or many, mostly strong nerves. Laxiflorae.

Plants not at all glaucous, or very slightly so.
Beak of the peregynium straight, slender.
Culms slender, spreading; pistillate spikes 2 or 3 , stalked, spreading. 103. C. altocaulis.
Culms stout, erect ; pistillate spikes I or 2 , erect.
104. C. polymorpha.

Beak of the perigynium bent, short or none.
Leaves mostly narrow, $2-12 \mathrm{~mm}$. wide.
Scales, at least the upper, obtuse.
Bracts elongated; spikes loosely flowered; culms slender. 105. C. tetanica.
Bracts short ; spikes densely flowered; culms stout. 106. C. Meadii.

Scales acute, cuspidate, acuminate or awned.
Perigynia obtusely 3 -angled.
Perigynia obovoid, $2.5-3 \mathrm{~mm}$. long. 107. C. laxiflora.

Perigynia oblong, narrow, about 4 mm . long. ro8. C. styloftexa.
Perigynia sharply 3 -angled.
Spikes drooping or spreading; leaves $2-4 \mathrm{~mm}$. wide, or wider in the variety.
109. C. digitalis.

Spikes erect ; leaves 6-12 mm . wide. 110. C. Careyana.

Leaves broad, $12-36 \mathrm{~mm}$. wide.
Bracts leafy, the upper usually overtopping the spikes. III. C. -thersina.

Bracts mostly reduced to purple leafless sheaths. 112. C. plantaginea.

Plants distinctly glaucous.
Pistillate spikes drooping on hair-like stalks.
Pistillate spikes erect.
Basal leaves much longer than the culm.
114. C. ptychocarpa.

Basal leaves shorter than the culm or equalling it.
Leaves $12-25 \mathrm{~mm}$. wide.
115. C. platyphylla.

Leaves $2-4 \mathrm{~mm}$. wide.
Scales acute ; perigynia yellow, purple or mottled.
II6. C. panicea.
Scales obtuse, or the lower acute; perigynia pale green.

ri7. C. livida.<br>Perigynia white, yellow or becoming brown. Bicolores.<br>Perigynia beakless. 118. C. aurea.<br>Perigynia with a short cylindric beak; arctic species. 119. C. bicolor. Leaves and culms almost capillary ; bracts reduced to bladeless sheaths. Digitatae. 120. C. setifolia.

Scales of the spikes leaf-like, elongated. Phyllostachyae.
Lower scales 2 mm . wide or less, not concealing the perigynia.
Body of the perigynium oblong; beak flattened. 136. C. Willdenovii.
Body of the perigynium globose; beak subulate. 137. C. Jamesii.
Lower scales $2-4 \mathrm{~mm}$. wide, concealing the perigynia.
138. C. durifolia.
100. Carex conoìdea Schk. Field Sedge. (I. F. f. 770.) Glabrous; culms rather stiff, $2-5 \mathrm{dm}$. tall. Leaves $2-3 \mathrm{~mm}$. wide; lower bracts similar; staminate spike long-stalked; pistillate spikes $\mathbf{I}-3$, distant, erect, oblong, $\mathbf{I}-2.5 \mathrm{~cm}$. long, 5 mm . thick, the lower slender-stalked; perigynia oblong, obtusely 3 -angled, acute, beakless, $2-3 \mathrm{~mm}$. long, about I mm. thick, the orifice entire; scales broadly ovate, contracted into a rough awn, the lower longer than the perigynia, the upper shorter than or equalling them. In meadows, N. S. to Ont., south to R. I., N. J., Ohio and Iowa. May-June.
ior. Carex oligocàrpa Schk. Few-fruited Sedge. (I. F. 77 I.) Glabrous; culms very slender or almost filiform, roughish, 2-5 dm. long. Leaves about 2 mm . wide, soft, the bracts similar: staminate spike long-stalked or nearly sessile; pistillate spikes 2-4, erect or i:is rly so, distant, loosely few-flowered, $8-16 \mathrm{~mm}$. long, less than 4 mm . thick, the loi:er filiform-stalked; perigynia oblong, pale, 22.5 mm . long, narrowed into a short entire beak; scales ovate, with a rough spreading awn. In dry woods and thickets, Vt. and Ont. to Mich., Iowa, N. J., W. Va. Mo., and Kans. May-July.
102. Carex Hitchcockiàna Dewey. Hitchcock's Sedge. (I. F. f. 772.) Culms slender, $3-6 \mathrm{dm}$. tall ; leaves $3-6 \mathrm{~mm}$. wide, the similar bracts overtopping the spikes, their sheaths pubescent, their blades somewhat so; pistillate spikes 2-4, loosely few-flowered, perigynia ovoid. obtusely 3 -angled, 3 mm . long, nearly 2 mm . thick, with a short oblique entire beak; scales ovate or ovate-lanceolate, roughawned. In woods and thickets, Vt. and Ont. to Mich., Iowa, N. J., W. Va. and Mo. May-July.
103. Carex altocaùlis (Dewey) Britton. Sheathed Sedge. (I. F. f. 773.) Glabrous; culms slender, weak, 2-6 dm. long. Leaves $3-4 \mathrm{~mm}$. wide, shorter than the culm, the upper ones and the bracts usually very short; staminate spike long-stalked; pistillate spikes 2 or 3 , distant, slender-stalked, less than 2.5 cm . long, loosely several-flowered, their stalks partly enclosed by the long sheaths; perigynia oblong, 3 -angled, few-nerved, 4 mm . long, with a beak about one-fourth the length of the body, the orifice 2-tooth, oblique; scales oval or ovate-lanceolate. In swamps, Quebcc and Vt. to Ont., N. Y. and Minn. Summer.
104. Carex folymórpha Muh1. Variable Sedge. (I. F. f. 774.) Glabrous, rather dark green; culms stiff, 2-6 dm. tall. Leaves $3-4 \mathrm{~mm}$. wide, nearly erect; bracts usually little longer than the pistillate spike; staminate spikes I or 2 , long-stalked; pistillate spikes commonly solitary, erect, short-stalked or sessile, $2-4 \mathrm{~cm}$. long, 8 mm . thick; perigynia ovoid-oblong. obscurely 3 -angled, fully 4 mm . long and 2 mm . in diameter, the beak more than one-half as long as the body, the orifice oblique; scales red-brown, somewhat shorter than the perigynia. In swamps or wet meadows, Me. to N. J., Penn. and N. Car. June-Aug.
105. Carex tetánica Schk. Wood's Sedge. (I. F. f. 775.) Light green
and glabrous; culms slender, rough above, $2-5 \mathrm{dm}$. tall. Leaves $2-4 \mathrm{~mm}$. wide ; bracts narrow, elongated; staminate spike stalked; pistillate spikes 2 or 3, erect, distant, 2.5 cm . long or less, or the lower filiform-stalked and drooping; perigynia oblong, many-nerved, about 3 mm . long, the summit curved outwardly and tapering to an entire orifice, beakless; scales ovate-oblong. In meadows and wet woods, Me. and Ont. to Manitoba, N. Car. and La. June-July.
106. Carex Mèadii Dewey. Mead's Sedge. (I. F. f. 776.) Similar to the preceding; culm stouter, very rough above, 3-4 dm. tall. Bracts short, not overtopping the spikes; staminate spike long-stalked; pistillate spikes 1 - 3 , oblongcylindric, dense, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long, about 6 mm . in diameter, erect, stalked or the upper one sessile; perigynia broadly oblong, many-nerved, 3 mm . long, tipped with a minute slightly bent beak; scales ovate, green with purple-brown margins. In swamps and wet meadows, R. I. to Penn. and Ga., west to Mich., Assiniboia, Neb. and Ind. Terr. The lowest spike is sometimes borne on a very long stalk arising from the axil of one of the basal leaves. May-July.
107. Carex laxifiòra Lam. Loose-flowered Sedge. (I. F. f. 777.) Glabrous; culms slender, roughish above, I.5-6 dm. long. Leaves $3-6 \mathrm{~mm}$. wide, soft; staminate spike usually stalked; pistillate spikes 2-4, distant, linear-cylindric, 3-4 mm . thick, all slender-stalked and spreading or drooping or the upper one erect and sessile; perigynia obovoid, mor e or less oblique, $2 \cdot 5-3 \mathrm{~mm}$. long, strongly many-nerved, tapering into a short outwardly bent entire beak; scales ovate with broad white scarious margins acute, cuspidate or awned. In meadows and thickets, Me. and Ont. to Minn., Fla., Ala. and the Ind. Terr. May-July.

Carex laxiflòra blánda (Dewey) Boott. Pistillate spikes cylindric, mostly densely flowered, the upper sessile or nearly so, erect, contiguous to the usually sessile staminate one, the lower slender-stalked. Range of the type. Perhaps specifically distinct.

Carex laxifiòra vàrians Bailey. Stouter and taller than the preceding: leaves 57 mm . wide : pistillate spike sometimes 3 cm . long and 5 mm . thick, dense, often c®mpound at the base, the upper sessile or short-stalked and contiguous to the sessile staminate one, the lower long-stalked. N. H. to N. Y., Mich., Mo. and Neb.

Carex laxifìra patulifòlia (Dewey) Carey. Glaucous or pale green; basal leaves $5-9 \mathrm{~mm}$. wide; staminate spike usually stalked; pistillate spikes 2.5 cm . long or more, loosely flowered, scattered; perigynia oblong or ellipsoid, the beak nearly straight. Halifax, N. S. (according to Macoun) ; Mass. to Mich., Ala. and Tenn.

Carex laxiflòra divaricàta Bailey. Perigynia larger than in the other forms, contracted into a stipe one-half as long as the body. Washington, D. C.
108. Carex styloféxa Buckley. Bent Sedge. (I. F. f. 778.) Glabrous; culms slender, smooth, $2-5 \mathrm{dm}$. long. Leaves $3-6 \mathrm{~mm}$. wide, shorter than the culm; bracts short; staminate spike usually long-stalked; pistillate spikes 1-4, distant, loosely flowered, less than 16 mm . long, the lower drooping on filiform stalks; perigynia oblong, triangular, many-nerved, about 4 mm . long, 2 mm . thick. somewhat oblique, slender-beaked; scales ovate or ovate-lanceolate, acute, cuspidate or short-a wned, shorter than the perigynia. In woods and thickets, N. Y. and Penn. to Fla., La. and Tex. May-July.
109. Carex digitalis Willd. Slender Wood Sedge. (I. F. f. 779.) Gilabrous, bright green; culms slender or almost filiform, usually reclining, I-4.5 dm. long. Leaves $2-4 \mathrm{~mm}$. wide; staminate spike stalked; pistillate spikes $2-4$, linear; loosely alternately flowered, $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, the lower filiform-stalked, spreading or drooping; perigynia oblong, sharply triangular, many-nerved, 2 mm . long, more than I mm. thick, the short beak slightly oblique; scales acute, acuminate or short-awned. In woods and thickets, Me. and Ont. to Minn., Fla. and Tex. MiayJuly.

Carex digitallis copulata Bailey. Larger in every way, culms sometimes 5 dm . long, reclining; leaves $5-8 \mathrm{~mm}$. wide; pistillate spikes shorter and denser; perigynia larger. Mich., S. Ont. and Iowa.
110. Carex Careyana Torr. Carey's Sence. (I. F. f. 7So.) Glabrous, bright green; culms 2-6 dm. tall. Basal leaves, 6-12 mm. wide, short: bracts lincarlanceolate with very long sheaths, the blade's $2-7.5 \mathrm{~cm}$. long; staminate spike usually large, long-stalked; pistillate spikes $1-3$. less than 2.5 cm . longr, the lower on a long filiform stalk; perigynia ovoil-ohlong, sharply 3 -angled, many-nervel, fully

4 mm . long, the short beak slightly oblique, entire; scales ovate with white hyaline margins, cuspidate or awned, shorter than the perigynia. In woods, N. E. (according to Bailey); N. Y. to Mich. and Va. May-June.
iri. Carex Albursìna Sheldon. White Bear Sedge. (I. F. f. 78i). Glabrous, rather deep green; culms flattened, usually spreading, $2-5 \mathrm{dm}$. long. Basal leaves lanceolate or oblong-lanceolate, acuminate, shorter than the culm, $\mathbf{I}-3 \mathrm{~cm}$. wide; bracts similar to the narrower culm leaves; staminate spike sessile or nearly so; pistillate spikes $2-4, \mathbf{I}-2.5 \mathrm{~cm}$. long, very loosely flowered; perigynia obovoid, obtusely 3 -angled, many-nerved, 4 mm . long, 2 mm . thick, with a short bent entire beak; scales ovate-oblong, scarious-margined, shorter than the perigynia. In woods, Quebec to Mass., N. Y., Minn., Va. and Iowa. June-Aug.
112. Carex plantagínea Lam. Plantain-leaved Sedge. (I. F. f. 782.) Glabrous, rather dark green; culms I. $5-5 \mathrm{dm}$. long. Leaves $\mathrm{I}-2.5 \mathrm{~cm}$. wide, persistent through the winter; bracts short, usually with purplish clasping sheaths; staminate spike long-stalked, purple; pistillate spikes 3 or 4 , slender-stalked, 2.5 cm . long or less; perigynia oblong, outwardly curved, many-nerved, 3 mm . long; scales ovate, cuspidate. In woods, N. B. and Ont. to Manitoba, Va. and Wis. MayJuly.

II3. Carex laxicúlmis Schwein. Spreading Sedge. (I. F. f. 783.) Glabrous; blue-green and glaucous; culms filiform, ascending or diffuse $1.5-6 \mathrm{dm}$. long. Basal leaves elongated, $6-10 \mathrm{~mm}$. wide; bracts usually short; staminate spike long-stalked; pistillate spikes $2-4$, oblong, $6-12 \mathrm{~mm}$. long, about 4 mm . thick, drooping on long hair-like stalks or the upper short-stalked; perigynia ovoidoblong, 3 -angled, many-nerved, about 2 mm . long, scarcely beaked, longer than the ovate green cuspidate or short-awned scales. In woods and thickets, Me. and N. H. to Ont., Mich., R. I. and Va. May-June.
114. Carex ptychocàrpa Steud. Thicket Sedge. (I. F. f. 784.) Glabrous; pale green and glaucous; culms very slender, smooth, $5-15 \mathrm{~cm}$. tall ; basal leaves 4-8 mm. wide; bracts foliaceous; staminate spike small, sessile; pistrllate spikes 2 or 3, the lower one often slender-stalked and nearly basal, all erect, 8-16 mm . long; perigynia oblong, pale, 3-angled, many-nerved, 2 mm . long, pointed at both ends, minutely straight-beaked, the orifice entire; scales ovate, obtuse, about one-half as long as the perigynia. In moist woods and thickets, Mass. and N. J. to Fla. and La. June-Sept.

II5. Carex platyphýlla Carey. Broad-leaved Sedge. (I. F. f. 785.) Glabrous, pale green and glaucous; culms spreading or reclining, I-4 dm. long. Leaves flat, $\mathbf{I}-2.5 \mathrm{~cm}$. ide; bracts linear-lanceolate with clasping sheaths; staminate spike stalked; pistillate spikes 2-4, distant, erect, slender-stalked or the upper one nearly sessile, several-flowered, $\mathbf{r - 2} \mathrm{cm}$. long; perigynia oblong, 3 -angled, many-nerved, slightly bent at the summit, $2-3 \mathrm{~mm}$. long; scales acute, cuspidate or short-awned. In woods and thickets, Quebec and Ont. to Mich. N H., Va. and Ill. May-June.
ir6. Carex panícea L. Grass-like Sedge. Carnation-Grass. (I. F. f. 786.) Glabrous, pale bluish green and glaucous; culms smooth, stiff, $2.5-6 \mathrm{dm}$. tall. Leaves $2-4 \mathrm{~mm}$. wide, the bracts much shorter and narrower; staminate spikes I or 2, stalked; pistillate spikes 2 or 3, distant, filiform-stalked or the upper nearly sessile, about 5 mm . thick; perigynia oval, about 3 mm . long, obscurely 3 -angled, yellow, purple, or mottled, faintly few-nerved, with a short entire somewhat oblique beak; scales ovate, acute, purple or purple-margined. In fields and meadows, N. S. to Me. and R. I. Nat. from Europe. June-July.

1I7. Carex livida (Wahl.) Willd. Livid Sedge. (I. F. f. 787.) Glabrous, pale green and very glaucous; culms erect, smooth, 2-4 dm. tall. Leaves 2-4 mm . wide, involute in drying; bracts narrow, usually short; staminate spike shortstalked; pistillate spikes $1-3,1-2.5 \mathrm{~cm}$. long, about 4 mm . thick, clustered at the summit, cylindric, the third, when present, distant, stalked; perigynia oblong, very pale, nearly 4 mm . long, finely nerved, straight, beakless, narrowed to an entire orifice; scales ovate, obtuse or the lower subacute, rather shorter than the perigynia. In bogs, Lab. and Hudson Bay to Alaska, south to Conn., the pine barrens of N. J., central N. Y. and Mich. Also in Europe. Summer.
i18. Carex aùrea Nutt. Golden-fruited Sedge. (I. F. f. 788.) Glabrous, light green; culms erect or reclining, $5-40 \mathrm{~cm}$. long. Leaves flat, $2-3 \mathrm{~mm}$. wide;
bracts similar; terminal spike short-stalked, staminate or androgynous; pistillate spikes $2-4$, oblong, clustered near the summit or the lower one distant, filiformstalked, few-flowered, 4-20 mm . long; perigynia obovoid or subglobose, becoming fleshy, yellow or brown and about 2 mm . in diameter when mature, many-nerved, beakless, the orifice entire; scales ovate; stigmas mostly 2. In wet meadows, springs and on wet rocks, Newf. to the N. W. Terr. and Br. Col., south to Mass., Penn., Mich., Utah and Wash. Summer.
119. Cirex bicolor All. Parti-colored Sedge. (I. F. f. 789.) Similar to the preceding, but with somewhat glaucous culms. Basal leaves $2-4 \mathrm{~mm}$. wide; spikes $2-4$, mostly clustered at the summit; perigynia oblong, white, compressed, few-nerved, less than 2 mm . long, not fleshy at maturity, abruptly tipped with a short entire nearly cylindric beak; scales brown-purple with white midvein and margins, oval, shorter than the perigynia. Greenland and Lab. (according to Boott). Also in Europe. Summer.
120. Carex setifòlia (Dewey) Britton. Bristle-Leaved Sedge. (I. F. f. 790.) Glabrous, pale green; culms filiform, smooth, weak, $\mathbf{I}-4 \mathrm{dm}$. long. Leaves filiform, shorter than the culm, less than 0.5 mm . wide; bracts reduced to blade1 'ss sheaths; staminate spike sessile or nearly so; pistillate spikes $2-4$, slenders: alked, 4-8 mm. long, loosely few-flowered, the upper commonly overtopping the st.ıminate; perigynia oblong, 3 -angled, 2 mm . long, polished and nearly olack when mature, faintly few-nerved, tapering into a short entire beak; scales ovate, hyaline, shorter than the perigynia; stigmas 3. In dry sandy or rocky soil, preferring limestone, N. B. to the N. W. Terr., Penn., Ky. and Neb. May-July.
Culm-leaves present, often short; bracts mainly reduced to bladekss purplish sheaths. Pedunculatae.
Staminate spike short-stalked or sessile.
Perigynia about twice as long as the scales. 121. C. concinna.
Perigynia not longer than the scales. 122. C. Richardsoni.
Staminate spike long-stalked, commonly with some pistillate flowers at its base.
123. C. pedunculata.

Leaves all basal; bracts short or long, not sheathing.
Neither the culm nor the leaves pubescent ; perigynia rounded. Montanae. Plant not stoloniferous.
124. C. pedicellata.

Plants stoloniferous, the stolons sometimes short.
Culms, or some of them, longer than the leaves.
Scales smooth or very nearly so.
Staminate spike conspicuous, $6-18 \mathrm{~mm}$. long.
Staminate spike stout, $\mathrm{I}-3 \mathrm{~mm}$. thick.
Plant dark green; staminate spike very prominent; perigynia broadly oval. 125. C. Pennsylranica.
Plant light green; staminate spike shorter; perigynia oblong. 126. C. varia. Staminate spike very slender, not over 1 mm . thick. 127. C. Novae-Angliae: Staminate spike inconspicuous, rarely over 4 mm . long (longer in the variety). 128. C. deflexa. Scales, at least the lower, rough-awned. 129. C. praecox.

## Culms, or most of them, much shorter than the leaves.

Scales light green with purple margins ; perigynia oblong.
130. C. nigromarginata. Scales green with lighter scarious margins ; perigynia oval. 131. C. umbellata.

Plant pubescent all over; perigynia sharply 3 -angled. Triquetrae. 132. C. pubescens.
121. Carex concínna R. Br. Low Northern Sedge. (I, F. f. 701.) Culms filiform, smooth, 5-15 cm. tall. Leaves about 2 mm . wide, pale green, much shorter than the culm; bracts reduced to green bladeless sheaths, or the lower one with an erect subulate blade $6-12 \mathrm{~mm}$. long; staminate spike sessile; pistillate spikes I-3, erect, 4-8 mm . long, about 2 mm . thick, compactly few-flowered; perigynia oblong-ovoid, 3-angled, pubescent, short-beaked, few-nerved, about twice as long as the ovate green or purplish scales. In rocky places, (ubher and Ont. to Br. Col. Summer.
122. Carex Richardsòni R. Br. Richarnson's Spieie. (I. F. f. 702.) Culms slender, rough, I-3 dm. tall. Leaves about 2 mm . wide, these of the culm
vel $\mathrm{y}^{\text {s }}$ snort; bracts bladeless, sheathing, $6-25 \mathrm{~mm}$. long. usually brown-purple with a white hyaline tip; staminate spike short-stalked; pistillate spikes $\mathbf{I}$ or 2 , erect, short-stalked, $8-18 \mathrm{~mm}$. long, compact, their stalks partly or wholly enclosed in the sheaths; perigynia obovoid, pubescent, about 2 mm . long, minutely beaked; scales mostly longer than the perigynia, purple, conspicuously white-margined. In dry soil, Ont. to the N. W. Terr. and Br. Col., south to western N. Y., Ill., Iowa and S. Dak. Summer.
123. Carex pedunculàta Muhl. Long-stalked Sedge. (I. F. f. 793.) Densely matted; culms slender, roughish above, $7-25 \mathrm{~cm}$. long. Leaves flat, 23 mm . wide; sheaths green, the upper almost bladeless; staminate spike longstalked; pistillate spikes $2-6,6-12 \mathrm{~mm}$. long, few-flowered. filiform-stalked and spreading or drooping, some of them appearing basal; perigynia obovoid, 3 -angled, 4 mm . long, nerveless, narrowed into a stipe tipped with a minute and somewhat oblique entire beak; scales ovate, abruptly cuspidate or the lower subulate-awned. In dry woods, Anticosti to Manitoba, Va., Penn. and Iowa. May-July.
124. Carex pedicellàta (Dewey) Britton. Fibrots-rooted Sedge. (I. F. f. 794.) Light green, not stoloniferous; culms slender, roughish above, I.5-5 dm. long. Leaves $2-4 \mathrm{~mm}$. wide, shorter than the culms; lower bract $0.6-5 \mathrm{~cm}$. long; staminate spike short-stalked, $8-25 \mathrm{~mm}$. long ; pistillate spikes $2-4$, short-oblong, few-flowered; perigynia oval or oblong, rather less than 2 mm . long, pale, pubescent, with a subulate 2 -toothed beak one-fourth the length of the body; scales green, ovate, acute. In dry soil, N. S. to Minn. Ga., Ohio and Neb. May-July.

#### Abstract

Carex pedicellàta Wheèleri (Bailey) Britton. Usually lower than the species and the leaves much shorter than the culm; staminate spike only $4-6 \mathrm{~mm}$. long; pistillate spikes closer together. N. S. to Conn. and Mich.

125. Carex Pennsylvánica Lam. Pennsylvania Sedge. (I. F. f. 795.) Dark or dull green, stoloniferous ; culms slender, I.5-4 dm. tall. Leaves $\mathrm{I}-3 \mathrm{~mm}$. wide. the old sheaths persistent and fibrillose ; lower bract rarely over 1 cm . long ; staminate spike sessile or very short-stalked. $\mathbf{I}-2.5 \mathrm{~cm}$. long ; pistillate spikes $\mathrm{I}-3$, short-oblong, few-flowered, sessile ; perigynia oval. about 2 mm . long, pubescent, I-ribbed on each side, with a 2 -toothed beak about one-fourth the length of the body ; scales ovate, purplish, acute or cuspidate. In dry soil, N. B. to Manitoba and the N. W. Terr., south to N. Car., Tenn. and Kans. May-June.
126. Carex vària Muhl. Emposs' Sedge. (I. F. f. 796.) Stoloniferous; culms filiform, erect or somewhat spreading, $1.5-5 \mathrm{dm}$. long. Leaves $\mathrm{I}-2.5 \mathrm{~mm}$. wide, nearly always shorter than the culms; lower bract scale-like or subulate, rarely 2 cm . long; staminate spike $4-8 \mathrm{~mm}$. long, sessile, usually rather prominent; pistillate spikes $2-4,4-6 \mathrm{~mm}$. long; perigynia oblong, pubescent, about 2 mm . long. narrowed at the base, with a subulate minutely 2 -toothed beak commonly one-half the length of the body; scales ovate, green or purplish-brown, acute. In dry soil, N. S. to Ont., Manitoba, Ga. and Tex. May-July.
127. Carex Nòvae-Ángliae Schwein. New Evgland Sedge. (I. F. f. 797.) Stoloniferous; culms filiform, erect or reclining, $1-2 \mathrm{dm}$. long. Leaves about I mm. wide, soft, elongated, often exceeding the culms; staminate spike short-stalked, very narrow, $6-16 \mathrm{~mm}$. long; pistillate spikes $\mathrm{I}-4$, distant. subglobose; lower bract filiform, sometimes overtopping the spikes; perigynia 2 mm . long, pubescent. tipped by a subulate 2 -toothed beak about one-fourth the length of the body; scales ovate, greenish-brown, acute or cuspidate; stigmas 2 or 3 . In wet shaded places. N. B. to Me., Mass. and N. N. Y. Summer.
128. Carex defiéxa Hornem. Northern Sedge. (I. F. f. 798.) Culms filiform, diffuse, $2-30 \mathrm{~cm}$. long. Bracts $1-5 \mathrm{~cm}$. long; staminate spike sessile, 2-6 mm. long, inconspicuous; pistillate spikes 1-4, 4-8 mm. long. the upper sessile, the lower slender-stalked; commonly also I or 2 nearly basal filiformstalked spikes from the lowest sheaths; perigynia oblong, pubescent. 2 mm . long or less, with a flat 2 -toothed beak about one-fourth the length of the budy; scales green. acute or cuspidate; stigmas 3 or 2. In open places, N. S. to Ont., Me., Vt. and Penn. Summer.

Carex defléxa Farwéllii Britton. Densely tufted; culms stiff, erect, I.5-4 dm. tall, commonly much longer than the leaves; staminate spike conspicuous, 6 -ro mm . long: pistillate spikes 2 or 3 , scattered, the lower slender-stalked and subtended by a foli-
aceous bract which often overtops the culm; perigynia $2-3 \mathrm{~mm}$. long. N. Mich. to $\mathrm{Br}, \mathrm{Col}$. and Ore., south in the Rocky Mts, to Colo.

128a. Carex álbicans Willd. Whitish Sedge. Stoloniferous, pale green; culms $0.7-5 \mathrm{dm}$. tall. Leaves usually shorter than the culm, $2-3 \mathrm{~mm}$. wide, flat; bracts very short; staminate spike less than 6 mm . long, sessile; pistillate spikes 2 or 3 , clustered, ovoid, about as long as the staminate; perigynia ellipsoid, 3 -angled, pubescent, the short beak 2 -toothed; scales acute or cuspidate, shorter than the perigynia. In dry soil, N. E. and N. Y. May-June.
129. Carex praécox Jacq. Vernal Sedge. (I. F. f. 799.) Dark green, stoloniferous; culms slender, smooth, $7-30 \mathrm{~cm}$. long. Leaves $\mathrm{I}-3 \mathrm{~mm}$. wide, almost always much shorter than the culm; lower bract 6-25 mm. long; staminate spike usually large and conspicuous; pistillate spikes $\mathbf{1}-3$, all close together, oblong, $6-12 \mathrm{~mm}$. long; perigynia oblong or obovoid, sharply 3 -angled, pubescent, brown, about 2 mm . long; tipped with a minute beak; scales ovate, purple-brown with a lighter midvein, acute, cuspidate or the lower rough-a wned, about equalling the perigynia. E. Mass. to N. Y. Nat. from Europe. Native also of Asia. May-June.
130. Carex nìgro-marginàta Schwein. Black-edged Sedge. (I. F. f. 800.) Bright green, stoloniferous; culms filiform, $5-20 \mathrm{~cm}$. long. Leaves $2-4$ mm . wide, much longer than the culms, rather stiff; bracts short and subulate or wanting; staminate spike sessile, $4^{-6} \mathrm{~mm}$. long; pistillate spikes $\mathbf{I}-3$, sessile, about 6 mm . long; perigynia oblong, narrowed at the base into a short stipe, pubescent or nearly glabrous, $2-3 \mathrm{~mm}$. long, with a cylindric-subulate 2 -toothed beak onethird to one-half as long the body; scales acute or cuspidate, green with purple margins or variegated, rather longer than the perigynia. Dry soil, N. Y. to N. Car. May-July.

13i. Carex umbellàta Schk. Umbel-Like Sedge. (I. F. f. 8oi.) Rather light green, tufted and matted, stoloniferous; culms filiform, $5-15 \mathrm{~cm}$. long. Leaves $\mathrm{I}-3 \mathrm{~mm}$. wide, usually much exceeding the culms, the old sheaths fibrillose; staminate spike commonly conspicuous; pistillate spikes I-3, filiform-stalked from the basal sheaths or 1 or 2 of them sessile or very nearly so at the base of the staminate, ovoid-oblong, $4-8 \mathrm{~mm}$. long; perigynia oval, pubescent, 3 -angled, the body rather less than 2 mm . long, tipped with a subulate 2 -toothed beak of nearly its length; scales acuminate or short-awned, about as long as the perigynia. Dry soil, N. S. to the N. W. Terr., N. J., the Ind. Terr. and Ore. May-July.
132. Carex pubéscens Muhl. Pubescent Sedge. (I. F. f. 8o2.) Pubescent all over, bright green, stoloniferous; culms $3-6 \mathrm{dm}$. long. Leaves flat, soft, elongated, $4-7 \mathrm{~mm}$. wide ; lower bracts $2-8 \mathrm{~cm}$. long; staminate spike sessile or nearly so ; pistillate spikes $2-4$, oblong-cylindric, $8-20 \mathrm{~mm}$. long, the upper sessile ; perigynia 3 -angled, obovoid, narrowed to a stipe-like base, densely pubescent, and, including the subulate minutely 2 -toothed beak, about 4 mm . long; scales ovate, rough-awned or cuspidate, about as long as the perigynia. In woods and thickets, N. S. to N. Dak., N. J., Ky. and Mo. June-Aug.

Leaves $2-5 \mathrm{~cm}$. wide, thick, spreading. Physocephalae. 133. C. Fraseri.
Leaves $0.5-6 \mathrm{~mm}$. wide.
Staminate and pistillate spikes on different culms. Scirpinae. Leaves longer than the culm; perigynia obovoid; southern species. 134. C. picta.

Leaves shorter than the culm ; perigynia oval; northern species.
135. C. scirpoidea.

Staminate and pistillate flowers in the same spike.
Scales of the spike leaf-like, elongated. Phyllostachyae.
Lower scales 2 mm . wide or less, not enclosing the perigynia.
Body of the perigynium oblong, its beak flattened. 136. C. Willdenovii.
Body of the perigynium globose, its beak subulate. 137. C. Jamesii:
Lower scales $2-5 \mathrm{~mm}$. wide enclosing the perigynia. 138. C. durifulia.
Scales of the spike short, normal.
Leaves $\mathrm{I}-2 \mathrm{~mm}$. wide; arctic and western species. Rupestres.
Spike solitary, androgynous; perigynium-beak stout, long.
139. C. ripestris.

Spikes 2-4, the staminate uppermost ; perigynium-beak short.
140. C. supina.

Leaves 0.5 mm . wide or less.
Perigynia obtuse, beakless; swamp species. Leptocephalae.
141. C. leptalea.

Perigynia obovoid-oval, beaked; prairie species. Filifoliae. 142. C. filifolia.

#### Abstract

133. Carex Fràseri Andr. Fraser's Sedge. (I. F. f. 803.) Glabrous; culms smooth, slender, reclining, 2.5-5 dm. long. Basal leaves 2-4 dm. long, flat, firm, spreading. finely many-nerved. their margins usually finely crumpled in drying; culm leaves reduced to clasping basal sheaths; spike solitary, bractless, terminal, androgynous, $\mathrm{I}-2.5 \mathrm{~cm}$. long, the pistillate portion dense, about 1.2 cm . in diameter in fruit; perigynia ovoid, pale green, faintly many-nerved, fully 4 mm . long, with a short nearly truncate beak; scales ovate, obtuse, much shorter than the perigynia. In rich woods, Va.. W. Va., Tenn. and N. Car. Our largest-leaved species. May-July. 134. Carex pícta Steud. Boott's Sedge. (I. F. f. 804.) Dioecious; foliage glabrous, light green; culm slender. smooth, 1.5-3 dm. long. Leaves $3-6 \mathrm{~mm}$. wide ; spike usually solitary, densely many-flowered, the staminate about 2.5 cm , long, the pistillate narrowed at the base. $2-6 \mathrm{~cm}$. long, subtended by a short purple sheath; perigynia strongly many-nerved, pubescent at least toward the obtuse summit, about 3 mm . long; scales purple, shining, obovate, acute or cuspidate, longer and wider than the perigynia. In woods, Ind. to Ala. and La. Summer.

135. Carex scirpoìdea Michx. Scirpüs-like Sedge. (I. F. f. 805.) Dioecious; foliage glabrous, rather bright green ; culms erect. stiff, I.5-4.5 dm. tall. Leaves $\mathrm{I}-2 \mathrm{~mm}$. Wide; spike usually solitary, linear-cylindric, $\mathbf{I} .5-3 \mathrm{~cm}$. long, $3-4 \mathrm{~mm}$. in diameter, subtended by a short or subulate bract; perigynia few-nerved, densely pubescent, 2 mm . long. with a very short beak; scales ovate-oval, dark purple, acute, about as long as the perigynia. In rocky soil, Greenland to Alaska, south to the higher mountains of N. Eng. and Lake Huron. Also in northern Europe and Asia. Summer.
136. Carex Willdenòvii Schk. Willderow's Sedge. (I. F. f. 806.) Glabrous and pale green; culms $2-10 \mathrm{~cm}$. high. Leaves $2-3 \mathrm{~mm}$. wide, often 3 dm . long, much overtopping the spikes, the lowest reduced to sheaths; spikes $1-5$, androgynous, staminate above, pistillate below, or sometimes completely staminate, about 1.2 cm . long, appearing nearly basal. one of them or more on long filiform stalks; body of the perigynium oblong, smooth. $2-3 \mathrm{~mm}$. long, narrowed into a 2-edged rough beak of about its own length; scales lanceolate. acute, acuminate or awned, finely several-nerved, the lower 1 or 2 commonly bract-like. In dry woods and thickets, Me. to Ohio, Mich., Manitoba. Fla.. Ky. and Tex. April-July.

I37. Carex Jàmesii Schwein. James' Sedge. (I. F. f. 807.) Similar to the preceding species, but the leaves rather narrower, soft, spreading or ascending. Spikes androgynous, the terminal staminate portion slender, the pistillate flowers only I-4 and slightly separated; body of the perigynium subglobose. 2 mm . in diameter, abruptly tipped by a subulate rough beak of more than it own length; lower scales bract-like, foliaceous, the upper shorter and sometimes not exceeding the perigynia. In dry woods and thickets, S. Ont. and N. Y. to Ind., Iowa, D. C., W. Va. and Mo. April-May.
138. Carex durifolia Bailey. Back's Sedge. (I. F. f. 808.) Glabrous; culms scarcely 2.5 cm . high. Leaves I.5-3 dm. long. 3-6 mm. wide, much overtopping the spikes; spikes $1-3$. nearly basal, androgynous, I or 2 of them very slender-stalked, the staminate flowers few, terminal, the pistillate $2-6$, subtended $b_{y}$ leafy bract-like elongated scales which nearly enclose the inflorescence ; perigynia oval, smooth, tapering into a stout subulate beak nearly or quite as long as the body. In woods and thickets, Ont. to Manitoba., Mass., N. Y., Ohio and Neb. Also in Colo. (according to Bailey). May-June.

I39. Carex rupéstris All. Rock Sedge. (I. F. f. 809.) Culms rather stout, obtusely 3 -angled, erect, $2-15 \mathrm{~cm}$. tall. Leaves $\mathrm{I}-2 \mathrm{~mm}$. wide. involute in drying. often curved; bract subulate, erect, shorter than the terminal androgynous spike or wanting ; spike $\mathbf{I}-2.5 \mathrm{~cm}$. long. the pistillate flowers few. basal ; perigynia smooth, obovoid or elliptic. firm. faintly few-nerved, about 4 mm . long. the beak stout, cylindric, about one-half as long as the body; scales purple-brown.

Lab. and Greenland to Br. Col., south in the Rocky Mts. to Colo. Also in northern Europe and Asia. Summer.
140. Carex supína Willd. Weak Arctic Sedge. (I. F. f. 8io.) Glabrous, tufted; culms nearly filiform, sharply 3 -angled, $\mathbf{I} \mathbf{- 2 . 5} \mathrm{dm}$. tall. Leaves about I mm . wide, rough-margined, flat, shorter than the culm ; lower bract short, subulate ; staminate spike sessile or nearly so, $6-\mathbf{1 2} \mathbf{~ m m}$. long ; pistillate spikes $\mathrm{I}-3$, sessile near the summit, subglobose or oblong, 4-6 mm. long ; perigynia ovoid, smooth, hard, nerveless, about 2 mm . long, 3 -angled, with a very short beak; scales ovate, brown-purple or lighter-margined. N. Minn. (according to Bailey) and Manitoba to arctic America and Greenland. Also in northern Europe and Asia. Summer.
141. Carex leptàlea Wahl. Bristle-stalked Sedge. (I. F.f.8if.) Light green and glabrous; culms filiform, smooth, 1.5-4.5 dm. long. Leaves not over 0.5 mm . wide; spike solitary, terminal, androgynous, linear, $4-14 \mathrm{~mm}$. long; perigynia few, linear-oblcng, light green, many-nerved, obtuse and beakless, about 3 mm . long; scales membranous, the lowest sometimes attenuated into a subulate awn nearly as longas the spike; stigmas 2 or 3 . In bogs and swamps, Newf. to Br . Col., Fla., La., Tex., Colo. and Ore. June-Aug.
142. Carex filifolia Nutt. Thread-leaved Sedge. (I. F. f. 8i2.) Densely tufted, pale green and glabrous; culms slender, smooth, erect, o.7-3.5 dm. tall. Leaves filiform, rather stiff, about 0.5 mm . wide, their sheaths ultimately fibrillose; spike erect, bractless, $0.6-3 \mathrm{~cm}$. long, the pistillate part about 4 mm . in diameter; perigynia obovoid-oval, triangular, few-nerved or nearly nerveless, rough or somewhat pubescent at the summit, 2 mm . long, abruptly tipped by a short cylindric entire beak; scales broadly oval, about as long as the perigynia but much broader. In dry soil, Manitoba to Br. Col., Kans., Colo. and Cal. May-July.

Perigynia nerveless, or faintly few-nerved.
Perigynia with a short nearly entire beak. 143. C. capitata.
Perigynia beakless, the orifice 2 -toothed.
Perigynia strongly several-nerved on the outer face.
Beak of the perigynium very short.
Beak slender, rough, about half as long as the body of the perigynium.
146. $C$. exilis.
143. Carex capitàta L. Capitate Sedge. (I. F. f. 813.) Culms very slender, stiff, o.5-4.5 dm. tall, smooth or nearly so. Leaves filiform, involute, erect, shorter than the culm; spike ovoid, bractless, $4-8 \mathrm{~mm}$. high; perigynia oblong-elliptic, 2 mm . long, 1 mm . thick, with a nearly entire dark brown beak about one-fourth as long as the body; scales broadly ovate, brown, shorter and rather broader than the perigynia. Greenland and Lab. to the N. W. Terr, and on the White Mts. Also in Europe. Summer.
144. Carex nàrdina Fries. Nard Sedge. (I. F. f. 814.) Culms filiform, smooth, 4-12 cm. tall, densely tufted. Leaves filiform, erect, about as long as the culms; spike terminal, ovoid-oblong, $6-12 \mathrm{~mm}$. long, bractless; perigynia oblongelliptic, yellowish brown, nerveless, nearly 4 mm . long, somewhat hispid above, beakless, the orifice 2 -toothed; scales ovate, brown, rather longer than the perigynia. Lab. and Hudson Bay to Br. Col. Summer.
145. Carex Redowskyàna C. A. Meyer. Redowsky's Sence. (I. F. f. 815.) Culms slender, stiff, $0.7-2 \mathrm{dm}$. tall. Leaves almost bristle-form, erect; spike oblong, 4-16 mm. long, the pistillate part 4-6 mm. thick, sometimes wholly staminate or pistillate; perigynia ovoid-ellipsoid, stipitate, $2-3 \mathrm{~mm}$. long, spreading or reflexed when mature, strongly several-nerved, little compressed, rough alove, narrowed into a very short 2 -toothed beak; scales ovate, acute or cuspidate, shorter than or equalling the perigynia. In bogs, Lab. to the N. W. Tirr., Me., Vt., Penn., Mich. and in the Rocky Mts. to Colo. Also in Europe and Asia. Summer.
146. Carex exilis Dewey. Coast Senge. (I. F. f. Si6.) Culms very slender, stiff, nearly or quite smooth, $2.5-5 \mathrm{dm}$. tall. Leaves involute-filiform; spike bractless, $0.6-3.6 \mathrm{~cm}$. long, occasionally quite dioecious; perigynia owoidellipsoid, about 3 mm . long, rather strongly several-nerved on the outer face, faintly few-nerved on the inner, spreading or reflexed at maturity, narrowed into a slender rough 2 -toothed beak, about one-half as long as the body; scales ovate,
acute. In bogs, Newf. and Lab. to S. N. J., mostly near the coast. Reported from Minn. May-July.
Scales ovate or ovate-lanceolate, acute or acuminate, not awned. Foetidae, Perigynia strongly many-nerved.
147. C. chordorhiza.

Perigynia faintly several-nerved.
Culms and leaves usually curved; scales shorter than the perigynia.
148. C. incurva.

Culms mostly straight, erect; scales equalling the perigynia.
149. C. stenophylla.

Scales lanceolate, awned, or long-acuminate. Arenariae.
Scales 2-4 times longer than the perigynia; western species. 150. C. Douglasii. Scales about equalling the perigynia; introduced sea-coast species.
151. C. arenaria.
147. Carex chordorhìza L. f. Creeping Sedge. (I. F. f. 817.) Rootstocks slender; culms slender, $2-4.5 \mathrm{dm}$. tall. Leaves $2-3 \mathrm{~mm}$. wide, shorter than the culm, somewhat involute in drying, the lower ones reduced to sheaths; spikes 2-4, aggregated into a head $8-12 \mathrm{~mm}$. long ; perigynia ellipsoid, slightly more than 2 mm . long, flat on the inner side, convex on the outer, strongly many-nerved, abruptly tipped by a short entire beak. In bogs and shallow water, Anticosti to Hudson Bay and the N. W. Terr., south to Me., N. Y., Penn., Ill. and Iowa. Also in Europe. Summer.
148. Carex incúrva Lightf. Curved Sedge. (I. F. f. 818.) Densely tufted ; culms smooth, often curved, $2-15 \mathrm{~cm}$. long. Leaves less than 2 mm . wide, usually curved; spikes $2-5$, sessile and aggregated into a dense head $10-16 \mathrm{~mm}$. in diameter; staminate flowers few, borne at the tops of the spikes; perigynia ovate, slightly swollen, compressed, 3 mm . long, narrowed above into a short conic entire beak, faintly several-many-nerved, scales ovate, brown or brownish, acute or subacute, shorter than the perigynia. Greenland and Hudson Bay to Br. Col., south in the Rocky Mts. to Colo. Also in Europe and Asia. Summer.
149. Carex stenophýlla Wahl. Involute-Leaved Sedge. (I. F. f. 8i9.) Densely tufted and strongly stoloniferous, pale green; culms smooth, stiff, $7-20 \mathrm{~cm}$. high. Leaves involute, about I mm . wide; inflorescense much as in the preceding species; perigynia about 2 mm . long, faintly several-nerved. flat on the inner face, low convex on the outer, narrowed into a short entire beak: scales ovate, brownish, acute or acuminate, about equalling the perigynia. In dry soil, Man. to Br. Col., Iowa, Kans. and Colo. Also in Europe and Asia. June-Aug.
150. Carex Douglásii Boott. Dotglas' Sedge. (I. F. f. 820.) Light green ; rootstock extensively creeping ; culms smooth or nearly so. 1-3 dm. tall. Leaves 2 mm . wide or less, somewhat involute in drying: spikes oblong, acute, $8-12 \mathrm{~mm}$. long, in a dense oblong or ovoid cluster $2-5 \mathrm{~cm}$. long; staminate flowers terminal or variously distributed ; perigynia ovate-lanceolate, about 3 mm . long, faintly several-nerved. the slender beak more than one-half as long as the body; scales pale greenish brown. lanceolate, scarious. smonth-awned, 2-4 times longer than the perigynia. In dry soil. Manitoba to Neb., N. Mex.. Br. Col. and Cal. June-Aug.

I5I. Carex arenària L. SAND SEDGE. SAND-STAR. (I. F. f. 82I.) Rootstock extensively creeping; culms I-4 dm. high. Leaves 2 mm . wide or less: lower bract subulate : spikes oblong, $6-10 \mathrm{~mm}$. long. in a terminal ovoid cluster $2-5 \mathrm{~cm}$. long ; perigynia lanceolate, $3-4 \mathrm{~mm}$. long, strongly several-nerved on both sides, the flat strongly 2-toothed beak nearly as long as the body; scales lanceolate. long-acuminate or awned, about equalling the perigynia. On sea beaches near Norfolk. Va. Adventive or naturalized from Europe. June-July.
Perigynia strongly several-nerved, especially on the outer face. Nos. 152-154. V'lupinae.

Beak of the perigynium shorter than the body.
152. C. conjuncta.

Beak of the perigynium equalling or longer than the body. Spikes crowded in an oblong cluster; beak I-2 lengths of the body.
153. C. stipata.

Spikes in a large branching cluster ; beak 3-4 lengths of the body.
154. C. Crus-Corvi.

Perigynia nerveless or faintly nerved. Nos. 155-163. Multiflorae.
Spikes very numerous in a branched decompound cluster, small. 155. C. decomposita.

Spikes several or many in an oblong or narrow, simple or somewhat compound cluster.

Leaves 2 mm . wide or less
Beak of the perigynium shorter than the body; western species.
156. C. marcida.

Beak as long as the body; northern marsh species. 157. C. teretiuscula. Leaves $2-6 \mathrm{~mm}$. wide.

Scales acuminate, cuspidate or awned.
Perigynia $3-5 \mathrm{~mm}$. long.
Perigynia ovate or ovate-lanceolate, the beak about as long as the body. 158. C. alopecoidea. Perigynia broadly ovate or obicular, the beak about one-third as long as the body.
159. C. gravida.

Perigynia 3 mm . long or less.
Leaves as long as the culm or longer. 160. C. vulpinoidea.
Leaves shorter than the culm.
Perigynia ovate-elliptic, the base narrowed.
161. C. xanthocarpa.

Perigynia lanceolate, the base truncate. 162. C. setacea.
Scales blunt, scarious-tipped.
163. C. Sartwellii.
152. Carex conjúncta Boott. Soft Fox Sedge. (I. F. f. 822.) Light green ; culms sharply 3 -angled when fresh, soft, 4-9 dm. tall. Leaves soft, roughmargined, $5-7 \mathrm{~mm}$. wide ; bracts small and bristle-like, or wanting ; spikes in a terminal elongated cluster, or the lower separated ; perigynia ovate-lanceolate or lanceolate, 3 mm . long, tapering into a roughish 2 -toothed beak; scales oblonglanceolate, cuspidate or short-awned, about as long as the perigynia. In moist meadows and thickets, N. J. (according to Bailey), Penn. to Ky., Iowa and Minn. June-Aug.
153. Carex stipàta Muhl. Awl-fruited Sedge. (I. F. f. 823.) Culms smooth, sharply 3 -angled, 2 -10 dm. tall. Leaves flat, $4^{-8} \mathrm{~mm}$. wide; bracts bristleform or wanting; spikes numerous, yellowish brown, in a terminal oblong cluster $3-10 \mathrm{~cm}$. long, the staminate flowers few, always terminal; perigynia lanceolate, $4-5 \mathrm{~mm}$. long, tapering into a rough flattened 2 -toothed beak $\mathbf{I}-2$ times as long as the body; scales ovate or lanceolate, acuminate, shorter than the perigynia. In swamps and wet meadows, Newf. to Ont. and Br. Col., south to Fla., Tenn., Mo., N. Mex. and Cal. May-July.
154. Carex Crús-Córvi Shuttlw. Raven's-foot Sedge. (I. F. f. 824.) Pale green and glaucous; culms 3 -angled, rough above, o.5-1.I m. tall. Leaves flat, 5-12 mm . wide, rough-margined; usually shorter; spikes yellowish brown, very numerous in a large compound branching cluster I-3 dm. long; perigynia elongated-lanceolate, about 8 mm . long, with a short hard base and a subulate rough 2 -toothed beak; scales ovate or lanceolate, thin, much shorter than the perigynia. In swamps, Ind. to Minn., Fla., La. and Tex. May-July.
155. Carex decompósita Muhl. Large-panicled Seige. (I. F. f. 825.) Dark green; culms smooth, obtusely angled, or terete below, 4-9 dm. tall. Leaves 4-8 mm. wide, rough, longer than the culm; spikes yellowish brown, very numerous in a decompound cluster $5-13 \mathrm{~cm}$. long, the lower branches $2-5 \mathrm{~cm}$. long; bracts subulate, ciliate, or wanting ; perigynia short-obovate, less than 2 mm . long, hard, abruptly tipped with a short slightly 2 -toothed beak; scales ovate, about equalling the perigynia. In swamps, N. Y. to Ohio, Mich., Fla. and La. MayAug.
156. Carex màrcida Boott. Clustered Field Sedge. (I. F. f. S26.) Light green; culms 3-angled, rough, at least above, 3-6 dm. tall. Leaves 2 mm . wide or less, much shorter than the culm; bracts short, subulate, or wanting; spikes several, staminate at the summit or some of them wholly staminate, in an oblong head about 3 cm . long; perigynia ovate, dark brown, ahout 2 mm . long, faintly nerved, tapering into a flat serrate beak; scales brownish. acute or cuspidate. about equalling the perigynia. In dry soil, Manitoba to Br. Col.. Kans., N. Mex. and Nev. June-Sept.
157. Carex teretiúscula Gooden. Lesser Panicimi) Smotie. (1. F. f. S27.) Rather light green; culms very rough, at least above. $3-7$ dm. long. Leaves mostly less than 2 mm . wide; bracts small or none; spikes sweral or numerons, in a narrowly oblong cluster $2-5 \mathrm{~cm}$. long: perigynia ovateonval, smonth, dark brown,
hard, shining, the body slightly more than I mm. long, truncate or rounded at the head, short-stalked, tapering into a flat conic beak about its own length; scales thin, ovate, brownish, acute or short-awned, about equalling the perigynia. In swamps and wet meadows, N. S. to Hudson Bay, Br. Col., R. I., Penn. and Neb. Also in Europe. May-July.

Carex teretiúscula pràirea (Dewey) Britton. Cluster of spikes compound, branched, the top commonly nodding. Ont. to Br. Col., Mass., Tenn., Ky., Iowa and Ore.
158. Carex alopecoìdea Tuckerm. Foxtail Sedge. (I. F. f. 828.) Light green; culms soft, sharply 3 -angled, 5-9 dm. long, roughish above. Leaves flat, 3-6 mm. wide; bracts almost filiform, commonly short; spikes several or numerous, in a cluster $2-5 \mathrm{~cm}$. long; perigynia ovate or ovate-lanceolate, short-stipitate, 34 mm . long, pale brown, the tapering rough 2 -toothed beak nearly as long as the body ; scales ovate or oval, light brown, cuspidate or short-awned, ahout as long as the perigynia. In meadows, Vt. to N. Y., Penn., Mich. and Manitoba.

Carex alopecoidea sparsispicàta Dewey. Spikes distinctly separated. S. E. Mich.
159. Carex grávida Bailey. Heavy Sedge. (I. F. f. 829.) Light green; culms 4-9 dm. tall, 3 -angled, rough above. Leaves flat, $3-6 \mathrm{~mm}$. wide; bracts usually very short; spikes several, in a dense heavy head $2-3.5 \mathrm{~cm}$. long, pale, subglobose ; perigynia flat, broadly ovate or suborbicular, $3-4 \mathrm{~mm}$. long, rounded at the base, narrowed into a 2 -toothed beak about one-third as long as the body, several-nerved on the outer face or nerveless ; scales, acute, cuspidate or shortawned, about as long as the perigynia. Ill. to S. Dak., Neb. and Ind. Terr. May-July.
160. Carex vulpinoìdea Michx. Fox Sedge. (I. F. f. 830.) Culms stiff, 3 -angled, rough above, 3-9 dm. tall. Leaves $2-5 \mathrm{~mm}$. wide, often exceeding the culm ; bracts bristle-like; spikes ovoid-oblong, $4-8 \mathrm{~mm}$. long, very numerous in a cluster $3-13 \mathrm{~cm}$. long; perigynia ovate, less than 2 mm . long, greenish brown, flat, several-nerved on the outer face, nerveless or 1-3-nerved on the inner, tipped with a lanceolate 2 -toothed beak about half as long as the body ; scales lanceolate, acuminate or awned, about as long as the perigynia, but narrower. In swamps and wet meadows, N. B. to Manitoba, Fla., La., Neb. and Tex. June-Aug.
161. Carex xanthocàrpa Bicknell. Yellow-fruited Sedge. (I. F. f. 831.) Culms rather stout, rough above, o.3-1.4 m. tall, much longer than the leaves. Leaves $3-6 \mathrm{~mm}$. wide; head usually dense; spikes numerous, ovoid, short ; bracts mostly short and inconspicuous ; perigynia bright yellow, plano-convex, ovateelliptic, about 3 mm . long, with a narrowed or cuneate base, and a short minutely 2-toothed beak, nerveless, or obscurely few-nerved on the outer face; scales acuminate, short-awned. In fields, Mass. to N. Y. and Iowa. June-Aug.

Carex xanthocàrpa annéctens Bicknell. Lower and slender; leaves $2-4 \mathrm{~mm}$. wide ; head not over 3.5 cm . long; bracts usually numerous and longer than the globose spikes; perigynia ovate or suborbicular. Abundant in the vicinity of N. Y.
162. Carex setàcea Dewey. Bristly-spiked Sedge. (I. F. f. 832.) Culms 0.4-1.2 m. tall, rough above. Leaves 3-6 dm. long, 2-6 mm. wide, shorter than the culm; head narrowly oblong, $3-6 \mathrm{~cm}$. long; bracts bristle-like; spikes ovoid or ovoid-oblong, $5-8 \mathrm{~mm}$. long, usually close together; perigynia lanceolate or ovate-lanceolate, tapering from a more or less truncate base to a narrow rough 2 -toothed beak, few-nerved, $2.5-3 \mathrm{~mm}$. long. N. Y. and Mass. June-Aug.
163. Carex Sartwéllii Dewey. Sartwell's Sedge. (I. F. f. 833.) Culms stiff, rough above, 3 -angled, 3-9 dm. tall. Leaves $2-4 \mathrm{~mm}$. wide; bracts setaceous, usually small; spikes ovoid or oblong, $4-8 \mathrm{~mm}$. long, usually densely aggregated in a narrow cluster; perigynia lanceolate, about 2 mm . long, strongly several-nerved on both faces, tapering into a short 2 -toothed beak; scales ovate, pale brown, about equalling the perigynia. In swamps, Ont. to Br. Col., N. Y., Ill., Mich., Ark. and Utah. May-July.
Perigynia ellipsoid, nearly terete; spikes $\mathbf{x}$ - 5 -flowered, widely separated, or the upper close together.
164. C. tenella.

Perigynia lanceolate, ovate or roundish, compressed or plano-convex; spikes several-many-flowered.

Spikes separated or the upper close together ; perigynia mostly radiating, or reflexed. Leaves $\mathrm{I}-3 \mathrm{~mm}$. wide.

Beak of the perigynium one-fourth to one-half as long as the body; native woodland species.
Ferigynia ovate-lanceolate, $2-3 \mathrm{~mm}$. long.
Perigynia stellately radiating.
Perigynia reflexed when mature.
165. C. rosea.

Perigynia narrowly lanceolate, $3-4 \mathrm{~mm}$. long. 167. C. Texensis.
Beak of the perigynium more than half as long as the body; introduced field species.
Leaves $5-9 \mathrm{~mm}$. wide.
168. C. muricata.
169. C. sparganioides.

Spikes all aggregated or the lower separated; perigynia spreading or ascending.
Leaves thin, lax, $4-8 \mathrm{~mm}$. wide; perigynia about 4 mm . long:
170. C. cephaloidea.

Leaves stiffer, $\mathrm{r}-4 \mathrm{~mm}$. wide.
Perigynia 2 mm . long or less, nerveless or faintly few-nerved.
Leaves $2-4 \mathrm{~mm}$. wide; perigynia ovate 17I. C. cephalophora.
Leaves $1-2 \mathrm{~mm}$. wide; perigynia orbicular-ovate; southern.
172. C. Leavenworthii.

Perigynia 3 mm . long, strongly-nerved (except in var. Xalapensis).
173. C. Muhlenbergii.
164. Carex tenélla Schk. Soft-Leaved Sedge. (I. F. f. 834.) Light green; rootstocks slender; culms almost filiform, rough, 1.5-5 dm. long. Leaves soft, about 1 mm . wide, spreading; spikes only $\mathrm{I}-5$-flowered; perigynia ovoidellipsoid, nearly terete, hard, finely many-nerved, about 2 mm . long, with a very minute entire beak; scales ovate, hyaline, acute. In bogs, Newf. to Br. Col., N. J., Penn., Mich., N. Mex. and Cal. Also in Europe. June-July.

Carex Eleócharis Bailey. A very slender erect species, with 2 or 3 small brown r-3-flowered spikes aggregated in a terminal head, $3-4 \mathrm{~mm}$. long, ovoid, slightly swollen marginless plano-convex short-beaked perigynia. Collected by Prof. Macoun on the Saskatchewan Plains; probably occurs within the northwestern limits of our area.
165. Carex ròsea Schk. Stellate Sedge. (I. F. f. 835.) Culms slender or filiform, rough above, 3-7 dm. long. Leaves flat, soft, 2 mm . wide or less, shorter than the culm; lower bract I-6 cm. long; spikes 4-8, subglobose, $4-6 \mathrm{~mm}$. in diameter, 5-15-flowered; perigynia ovate-lanceolate, flat, bright green, stellately diverging, nerveless, shining, $2-3 \mathrm{~mm}$. long, tapering into a stout 2 -toothed beak, about one-fourth the length of the body; scales ovate-oblong, white, half as long as the perigynia. In woods and thickets, Newf. to Ont., Manitoba, N. Car., Mo. and Neb. May-July.

Carex ròsea radiàta Dewey. Culms filiform, spreading; leaves about i mm. wide; spikes only 2 -6-flowered, scattered ; perigynia ascending, lanceolate, about 1 mm . wide. Me, and Ont. to Mich., N. Car. and Ky.
166. Carex retrofléxa Muhl. Reflexed Sedge. (I. F. f. 836.) Culms very slender, $2-5 \mathrm{dm}$. tall. Leaves about $\mathbf{I ~ m m}$. in width, mostly shorter than the culm; lower bract bristle-form; spikes 4-8, subglobose, 4-9-flowered, the upper all close together; staminate flowers terminal or rarely variously intermixed with the pistillate; perigynia oblong-lanceolate or ovate-lanceolate, radiating or reflexed at maturity, about 3 mm . long, smooth, compressed, but not as flat as those of the preceding species, somewhat corky-thickened at the base, tapering upwardly into a 2 -toothed beak about one-third the length of the body; scales ovate, about half as long as the perigynia. In woods and thickets, Mass. to Ont., Mich.. Ark.. Fla. and Tex. May-July.
167. Carex Texénsis (Torr.) Bailey. Texas Sedge. (I. F. f. §.3.) Similar to the preceding; culms very slender. Leaves soft, about I mm, wide, shorter than the culm; lower bract commonly filiform: spikes $4-7.4$ 10-flowered; all close together in a narrow head, or the lower separated; perigynia narmowly lanceolate, green, nerveless, smooth, radiating or widely spreading, i-4 mm. long, the tapering beak about one-half as long as the body; seales lanceolate or ovate, acute or acuminate, less than one-half as iong as the perigynia. S. Ill. (according to Bailey), Ala. to Tex. April-May.
168. Carex muricàta L. Lesser Prickly Sedge. (I. F. f. 838.) Bright green ; culms slender, roughish, at least above, 3-7 dm. long. Leaves $2-3 \mathrm{~mm}$. wide, shorter than the culm ; bract short, subulate ; spikes 5-10, 4-10-flowered, clustered into an oblong head, or the lower I or 2 distant ; perigynia ovate or ovate-lanceolate, 4 mm . long, smooth, shining, nerveless, spreading or radiating when mature, not reflexed, tapering into a rough-edged 2 -toothed beak as long as the body; scales ovate or ovate-oblong, acute, shorter than the perigynia. In meadows and fields, Mass. to N. Y., Ohio and Va. Naturalized from Europe. June-Aug.
169. Carex sparganioìdes Muhl. Bur-Reed Sedge. (I. F. f. 839.) Rather dark green with nearly white sheaths; culms rough, 3-angled, 5-9 dm. tall. Leaves flat, 5-9 mm. wide, the lower very short; spikes 6-12, oblong or subglobose, $5-8 \mathrm{~mm}$. in diameter, the upper aggregated, the lower $2-4$ commonly separated; perigynia flat, ovate, 3 mm . long, spreading or radiating, pale, narrowly wing-margined, usually few-nerved on the outer face, the rough 2 -toothed beak one-fourth to one-third the length of the body ; scales ovate, acute or cuspidate, about one-half as long as the perigynia. In woods and thickets, Mass. to Ont., Mich., Va., Ky., Iowa and Mo. June-Aug.

I70. Carex cephaloidea Dewey. Thin-leaved Sedge. (I. F. f. 840.) Similar to the preceding ; culms rough above. Leaves flat, 4-8 mm. wide, thin and lax, somewhat shorter than the culm ; bracts usually short ; spikes $4-8$, subglobose, in an oblong cluster; perigynia ovate or ovate-lanceolate, greenish brown, nearly 4 mm . long, ascending, nerveless or faintly few-nerved, tapering into a rough 2 -toothed beak one-fourth to one-third as long as the body; scales ovate, white, short-cuspidate or awned, about one-half as long as the perigynia. In dry fields and on hills, Mass. to Penn., Ill., Mich. and Wyo. May-July.
i7 i. Carex cephalóphora Muhl. Oval-headed Sedge. (I. F. f. 84i.) Pale green ; culms slender, rough above, $2.5-6 \mathrm{dm}$. tall. Leaves $2-4 \mathrm{~mm}$. wide; bracts of the lower spikes bristle-form; spikes few, subglobose, clustered in a short. oblong head $8-16 \mathrm{~mm}$. long ; perigynia broadly ovate, 2 mm . long or less, pale, nerveless or very faintly few-nerved, tipped with a 2 -toothed beak about one-fourth the length of the body; scales ovate, rough-cuspidate or awned, equalling or a little shorter than the perigynia. In dry fields and on hills, Me. and Ont. to Man., Fla., Mo. and Tex. May July.
172. Carex Leavenwórthii Dewey. Leavenworth's Sedge. (I. F. f. 842.) Similar to the preceding, but smaller; culms almost filiform. roughish, 1.5-4 dm. tall. Leaves narrower, $1-3 \mathrm{~mm}$. wide, mostly shorter than the culm ; bracts of the lower spikes bristle-form or wanting; spikes 4-7, densely crowded; perigynia orbicular-ovate, rather less than 2 mm . long and about as wide, tipped with a very short 2 -toothed beak ; scales ovate, acute or cuspidate, shorter and narrower than the perigynia. In meadows, Iowa to Miss., Ark. and Tex. May-June.

I73. Carex Muhlenbérgii Schk. Muhlenberg's Sedge. (I. F. f. 843.) Light green ; culms slender, erect, 3 -angled, rough, at least above. 3-6 dm. tall. Leaves $2-4 \mathrm{~mm}$. wide, usually shorter than the culm, somewhat involute in drying; bracts bristle-form, usually short ; spikes 4-10, ovoid or subglobose, close together in an oblong head; perigynia broadly ovate-oval, 3 mm . long, strongly nerved on both faces, ascending, with a short 2 -toothed beak; scales ovate-lanceolate, rough-cuspidate or short-awned, narrower and mostly longer than the perigynia. In dry fields and on hills; Me. and N. H. to Ont., Minn., Fla. and Tex. May-July.

Carex Muhlenbérgii Xalapénsis (Kunth) Britton. Perigynia nearly or quite nerveless ; leaves broader and longer. S. N. Y. to Mo., Tex. and Mex.

Perigynia radiately spreading, or reflexed when old.
Perigynia distinctly nerved on both faces, the beak rough.
Yerigynia lanceolate; beak more than half as long as the body.
174. C. sterilis.

Perigynia ovate; beak about one-third as long as the body, abrupt.
175. C. Atlantica.

Perigynia faintly nerved on the outer face, nerveless or nearly so on the inner; beak smoothish.

Perigynia ascending, appressed or somewhat spreading when old, not radiating.
Perigynia ovate, oval, oblong or elliptic.
Bracts short, scale-like or none, the lowest occasionally longer than its spike. Spikes distinctiy separated or the upper close together.

Heads silvery green or nearly white.
177. C. canescens.

Heads brown or brownish.
Spikes few-flowered, $4-6 \mathrm{~mm}$. long ; perigynia less than 2 mm . long, the beak manifest.
178. C. brunnescens.

Spikes dense, many-flowered; perigynia about 2 mm . long, the beak very short.
179. C. Norvegica. Spikes densely clustered at the top of the culm, or the lower separated. Spikes green or greenish brown.

Spikes several in an ovoid cluster; perigynia ovate, rough-beaked. 180. C. arcta.

Spikes only 2-4; perigynia elliptic, beakless. 18r. C. tenuiflora. Spikes dark brown; arctic species.

Culms slender, stiff, erect.
Leaves involute; scales about equalling the perigynia.
182 C. Heleonastes.
Leaves flat; scales shorter than the perigynin.
183. C. lagopina.

Culms weak, spreading or reclining.
184. C. glareosa.

Bracts bristle-form, much elongated, much exceeding the 2-4 oblong nerved perigynia.
185. C. trisperma.

Perigynia lanceolate or ovate-lanceolate.
Perigynia nerveless; spikes oblong or subglobose. 186. C. Deweyana.
Perigynia strongly several-nerved; spikes narrowly oblong-cylindric. 187. C. bromoides.
174. Carex stérilis Willd. Little Prickly Sedge. (I. F. f. 844.) Culms siender, $2-4.5 \mathrm{dm}$. tall, rough, at least above. Leaves $\mathbf{I}-2 \mathrm{~mm}$. wide, shorter than the culm; spikes 3-5, subglobose or short-oblong, about 5 mm . thick; staminate flowers usually numerous at the bottom of the upper spike, or whole spikes occasionally staminate, or plants rarely quite diœcious; perigynia pale, lanceolate, compressed, spreading or reflexed when old, 3 mm . long, I mm . wide, several-nerved on both faces, tapering into a sharp-edged 2-toothed rough beak more than onehalf as long as the body; scales ovate, shorter than the perigynia. In moist soil, Newf. to Br. Col., Fla., La., Colo. and Cal. Variable. May-July.

Carex stérilis cephalántha Bailey. Stouter, sometimes 5 dm . tall. Spikes 4-8, contiguous or separated; fluwers more numerous; perigynia rather larger; spikes very bristly. Range nearly that of the species; perhaps merely a stout form.
175. Carex Atlántica Bailey. Eastern Sedge. (I. F. f. 845.) Similar to large forms of the preceding, but stouter; culms rough above, $3-7 \mathrm{dm}$. tall. Leaves $2-3 \mathrm{~mm}$. wide, stiff, flat, or in drying somewhat involute; spikes 4-7. subglobose or short-cylindric, nearly 6 mm . in diameter; perigynia broadly ovate, flat, sharpmargined, $2-3 \mathrm{~mm}$. long, strongly several-nerved on the outer face, few-nerved on the inner, spreading or reflexed at maturity, abruptly tipped with a stout rough 2-toothed beak about one-third as long as the body; scales shorter than the perigynia. In swamps, Newf. to Fla. June-July.
176. Carex intèrior Bailey. Inland Sedge. (I. F. f. 846.) Similar to C. sterilis; culms slender, wiry, $2-6 \mathrm{dm}$. tall. Leaves about I mm . wide, shorter than the culm; spikes 2-4. nearly globular, 4 mm . in diameter; perigynia owate or ovate-lanceolate, 2 mm . long or less, faintly few-nerved on the outer face, nearly nerveless on the inner, thickened, spreading or reflexed when old, taperme into is nearly smonth 2-toothed beak one-third to one-half as long as the body: scalesomitte. shorter than the perigynia. Wet soil, Me, to Minn., Fla, and Kans. May-July.

Carex intèrior capillàcea Bailey. Leaves about 0.5 mm . wide: perigynia owate, cordate, strongly nerved. Mass. to N. J. and Penn.
177. Carex canéscens L. Silvery Smoin. (I. F. f. S47.) Pale green and somewhat glaucous; culms slender, 2.5-6 dm. tall. Leaves tlat, 1-2 mm. wide. shorter thin the culm ; spikes 4-9, short-oblong or subghonose, sessile. 5-10 mm. long; perigynia oval or ovate-oval, silvery green or nearly white, fatuty few nerved, blunt-edged, rather less than 2 mm. long, rough above, with a minute
entire beak; scales ovate. In swamps and bogs, Newf. to Br. Col., Va.. Mich., Colo. and Ore. Also in Europe and Asia. May-July.
178. Carex brunnéscens (Pers.) Poir. Brownish Sedge. (I. F. f. 848.) Rather dark green, not glaucous; culms stiff, roughish above, $2-4.5 \mathrm{dm}$. tall. Leaves 2 mm . wide or less, shorter than the culm ; spikes 4-8, subglobose or shortoblong, few-flowered, rarely over 5 mm . long; perigynia brown, smaller than those of the preceding, less than 2 mm . long, with a manifest beak about one-fourth as long as the body ; scales ovate, membranous, brownish. In wet places mostly at high altitudes, Lab. to Br. Col., N. Y. and N. E., on the southern Alleghenies, and the Rocky Mts. Also in Europe. Summer.

Carex brunnéscens gracilior Britton. Culms nearly filiform, weak, often spreading: spikes $4-8$-flowered ; perigynia spreading, longer-beaked. Range of type, mostly at lower altitudes.
179. Carex Norvégica Willd. Norway Sedge. (I. F. f. 849.) Bright green; culms slender but stiff, 1.5-4 dm. tall. Leaves 2 mm . wide or less, shorter than the culm ; bracts very short or wanting ; spikes 3-6, brown, oblong or subglobose, 6-12 mm. long; perigynia about 2 mm . long, elliptic, blunt-edged. narrowed at both ends, brownish, finely many-nerved, with a very short rough beak; scales ovate or oval, brown, obtuse, rather shorter than the perigynia. Along salt meadows, Me. to Anticosti. Reported from Minn. Also in Europe. Summer.
180. Carex àrcta Boott. Northern Clustered Sedge. (I. F. f. 850.) Rather light green, not glaucous ; culms slender, 3-7 dm. tall, rough above; leaves flat, about 2 mm . wide. Spikes oblong, $6-8 \mathrm{~mm}$. long, aggregated into a cluster about 2.5 cm . long ; perigynia pale, ovate, many-nerved, mostly spreading, tapering into a rough beak about one-half as long as the body; scales pale brown, usually acute, shorter than the perigynia. In swamps and wet woods, Me. and N. B. to Manitoba., Minn. and Br. Col. June-July.

18i. Carex tenuifiòra Wahl. Sparse-flowered Sedge. (I. F. f. 851.) Light green; culms very slender, rough above, $2-5 \mathrm{dm}$. long. Leaves I mm. wide or rather more, flat, usually much shorter than the culm ; spikes only $2-4$, clustered, subglobose, few-flowered, about 5 mm . in diameter; perigynia pale, elliptic, very obscurely few-nerved, narrowed at both ends, $2-2.5 \mathrm{~mm}$. long. beakless, spreading ; scales nearly white, about equalling the perigynia. In bogs, N. B. to Manitoba, south to Me., Vt. and Mich. Also in Europe. Summer.
182. Carex Heleonástes Ehrh. Hudsos̃ Bay Sedge. (I. F. f. 852.) Culms slender, very rough above, $1.5-4.5 \mathrm{dm}$. high. Leaves rigid, erect, becoming involute, less than 2 mm . wide, shorter than the culm ; bracts very short or none ; spikes $3-5$, subglobose, brown, about 5 mm . in diameter, clustered; perigynia broadly ovate or ovate-elliptic, blunt-edged, faintly several-nerved, about 2 mm . long, with a short sharp beak; scales ovate, brown with broad hyaline margins, about as long as the perigynia. Hudson Bay to Manitoba and the Canadian Rocky Mts. Also in Europe. Summer.
183. Carex lagopìna Wahl. Arctic Hare's-foot Sedge. (I. F. f. 853.) Culms rough, stiff, I. $5-4 \mathrm{dm}$. tall. Leaves flat, 2 mm . wide or less, shorter than the culm ; bracts very short or wanting ; spikes 3-6, oblong, dark brown, narrowed at the base, $6-8 \mathrm{~mm}$. long ; perigynia elliptic or obovate, rather less than 2 mm . long, firm, several-nerved, narrowed at the base. rather abruptly tipped by the beak; scales ovate, brown, hyaline-margined. acute, shorter than the perigynia. Lab. and Greenland to Alaska ; south in the Rocky Mts. to Utah. Also in northern Europe and Asia. Summer.
184. Carex glareòsa Wahl. Weak Clustered Sedge. (I. F. f. 854.) Closely resembles the preceding. but has weak spreading or reclining culms $0.5-4.5 \mathrm{dm}$. long. Leaves narrower, flat, about I mm. wide, spikes 2 or 3, oblong or subglobose, several-flowered, $4-8 \mathrm{~mm}$. long, brown, subtended by very small scale-like bracts; perigynia oblong-oval, strongly several-nerved. less than 2 mm . long, short-beaked; scales ovate, rich brown, about as long as the perigynia. Greenland and Hudson Bay to Quebec, west through arctic America to Alaska. Also in northern Europe and Asia. Summer.

Carex glareòsa ursina (Dewey) Bailey. Lower; densely tufted; spikes smaller. Arctic America.
185. Carex trispérma Dewey. Three-fruited Sedge. (I. F. f. 855.) Bright green ; culms filiform, weak, usually reclining or spreading, 3-7 dm. long. Leaves flaccid, flat, about I mm. wide, shorter than the culm; spikes 2 or 3, only $2-4$-flowered, widely separated, the lowest subtended by a bristle-form bract 1-8 cm. long ; perigynia oblong, green, $3-4 \mathrm{~mm}$. long, very finely many-nerved, narrowed at both ends and tipped with a very short nearly entire beak; scales ovate or ovate-lanceolate, acute, somewhat shorter than the perigynia. In swamps and wet woods, Newf. to Manitoba, Md., Ohio, Mich. and Neb. June-Aug.
186. Carex Deweyàna Schwein. Dewey's Sedge. (I. F. f. 856.) Pale green ; culms slender, spreading, $2-6 \mathrm{dm}$. long. Leaves $2-3 \mathrm{~mm}$. wide, flat, soft, shorter than the culm ; bracts bristle-form, the lower commonly elongated; spikes 3-6, oblong or subglobose, few-flowered, about 5 mm . in diameter, sessile, separated or the upper contiguous ; perigynia lanceolate or ovate-lanceolate, thin, nerveless, $4-5 \mathrm{~mm}$. long, the inner face flat, the tapering rough strongly 2 -toothed beak at least one-half as long as the body; scales nearly white, cuspidate or acute, equalling the perigynia, or shorter. In dry woods, N. S. to Manitoba, Ore., Conn., Penn., Iowa, N. Mex. and Utah. May-July.
187. Carex bromoìdes Schk. Brome-Like Sedge. (I. F. f. 857.) Bright green ; culms slender, roughish above, $2-6 \mathrm{dm}$. long. Leaves 2 mm . wide or less, flat, soft; bracts subulate or bristle-form, the lowest commonly elongated; spikes 3-7, narrowly oblong-cylindric, $8-16 \mathrm{~mm}$. long, erect or ascending, mostly close together, the staminate flowers either basal, basal and terminal, or forming whole spikes, the plant occasionally quite dioecious; perigynia linear-lanceolate, pale, strongly several-nerved, $4-5 \mathrm{~mm}$. long, the inner face flat, the tapering rough 2 -toothed beak at least one-half as long as the body; scales oblong-lanceolate, green, acute or acuminate, shorter than the perigynia. In bogs and swamps, N. S. to Ont., Mich., Fla. and La. June-Aug.
Perigynia lanceolate or ovate-lanceolate, $2-5$ times as long as wide.
Top of the culm nodding; arctic and northwestern species, 188. C. pratensis.
Culms strictly erect, mostly stiff.
Perigynia nerveless, broadly winged; northwestern species.
189. C. xerantica.

Perigynia several-nerved on both faces.
Perigynia broadly winged ; staminate flowers intermixed with the pistillate. 190. C. siccata.

Perigynia narrowly winged; staminate flowers all basal. Spikes $1-2.5 \mathrm{~cm}$. long; perigynia about 8 mm . long.
191. C. Muskingumensis.

Spikes $0.4-\mathrm{r} .6 \mathrm{~cm}$. long; perigynia $4^{-6} \mathrm{~mm}$. long.
Spikes oblong or oval; perigynia ascending or erect.
Spikes green-brown, blunt. 192. C. tribuloides.

Spikes bright brown, pointed; perigynia lanceolate. 193. C. scoparia.

Spikes rather dark brown, blunt ; perigynia ovate-lanceolate. 194. C. leporina.

Spikes subglobose; perigynia spreading, at least when old. 195. C. cristatella.

Perigynia ovate, not more than twice as long as wide (longer in some forms of no. 198).
Perigynia narrowly winged above; heads greenish brown. 196. C. adusta.
Perigynia broadly wing-margined.
Perigynia spreading or ascending.
Spikes silvery green. 197. C. foenea.
Spikes yellowish brown or greenish. 198. C. straminea.
Perigynia erect or appressed.
Heads silvery green or nearly white; sea beach species.
199. C. silicea.

Heads brown-green; meadow or marsh species. 200. C. tenera.
Perigynia orbicular, very broadly ovate or somewhat obovate, sometimes wider than lung. Heads green-brown.

Perigynia spreading or ascending; achene sessile. 201. C. festucacea.
Perigynia erect, $4-5 \mathrm{~mm}$. broad; achene short-stalked. 202. C. alata. Heads silvery green, yellowish or whitish.

Perigynium-wing firm; achene sessile. 203. C. albolutesiens.
Perigynium-wing membranous; achene stalked. 204. C. Bichnel/ii. 'erigynia narrowly linear-lanceolate, tapering into a subulate beak $2-3$ times as long as the body. Cyperoideae.
205. C. sychnocephala.
188. Carex pratícola Rydb. Northern Meadow Sedge. (I. F. f. 858.) Light green; culms erect when young, the summit later nodding, nearly smooth, 3-4 dm. tall. Leaves about 2 mm . wide, shorter than the culm; lower bracts bristle-form; spikes 3-6, oblong or club-shaped, silvery-brown and shining, 6-10 mm. long, about 5 mm . in diameter ; perigynia lanceolate, pale, nerveless on the inner face, few-nerved on the outer, 5 mm . long, wing-margined, tapering into a beak nearly as long as the body; scales membranous, lanceolate, acute or acuminate. Lab. to Ont., Mich., Manitoba and Alaska, south in the Rocky Mountains to Colo. Summer. (C. pratensis Drej. not Hose.)
189. Carex xerántica Bailey. White-scaled Sedge. (I. F. f. 859.) Similar to the preceding, but the culms stout, stiff and strictly erect, even when mature. Leaves about 2 mm . wide, involute in drying, shorter than the culm; spikes about 5, oblong, close together, $8-12 \mathrm{~mm}$. long; perigynia lanceolate, pale, 5 mm . long, nerveless, conspicuously wing-margined, the inner face concave, the rough tapering beak about as long as the body; scales silvery white, lanceolate, acute or acuminate. W. Manitoba and adjacent N. W. Terr. May-July.
190. Carex siccàta Dewey. Dry-spiked Sedge. Hillside Sedge. (I. F. f. 860.) Rootstocks long and stout; culms slender, rough above, $2-6 \mathrm{dm}$. tall. Leaves erect, about 2 mm . wide; spikes 3-6, oblong or subglobose, $5-8 \mathrm{~mm}$. long, brownish or brown, the staminate flowers basal, or variously situated, or whole spikes staminate; perigynia ovate-lanceolate, firm, about 5 mm . long, wing-margined, strongly several-nerved on both sides, the inner face concave by the incurved margins, the tapering rough beak nearly as long as the body; scales ovatelanceolate, membranous, acute or acuminate. In dry fields and on hills, Ont. and Manitoba to Br. Col., R. I., N. Y., Mich., Ariz. and Cal. May-July.
191. Carex Muskinguménsis Schwein. Muskingum Sedge. (I. F. f. 86I.) Culm stout, stiff, very rough above, 5-9 dm. tall. .Leaves flat, longpointed, 3-5 mm . wide, shorter than the fertile culms, those of sterile culms crowded near the summit; bracts short and scale-like; spikes 6-12, oblongcylindric, $1.2-2.5 \mathrm{~cm}$. long, erect, close together, pale brown; perigynia narrowly lanceolate, about 8 mm . long and rather less than I mm . wide, strongly severalnerved, flat, narrowed to both ends, scarious-margined, rough-ciliate, the tapering 2-toothed beak at least as long as the body; scales lanceolate, acuminate, onethird to one-half as long as the perigynia. In moist woods and thickets, Ohio to Mich., Manitoba and Mo. June-Aug.
192. Carex tribuloìdes Wahl. Blunt Broom Sedge. (I. F. f. 862.) Bright green; culms erect, roughish above, $2-9 \mathrm{dm}$. tall. Leaves flat, $2-6 \mathrm{~mm}$. wide; lower bract bristle-form; spikes 6-20, oblong or top-shaped, blunt, 6-12 $\mathbf{~ m m}$. long; perigynia lanceolate, greenish brown, flat, $4-5 \mathrm{~mm}$. long, $\mathbf{1}-2 \mathrm{~mm}$. wide, several-nerved on each face, with a sharply 2 -toothed, rough wing-margined beak; scales lanceolate, whitish, acute, about half as long as the perigynia. In meadows, N. B. to Manitoba, Fla. and Ariz. July-Sept.

Carex tribuloìdes Bébbii Bailey. More slender, spikes fewer, smaller, about 6 mm . long, commonly bractless, mostly clustered in a dense head; perigynia broader and shorter. Range of the type.

Carex tribuloides moniliformis (Tuckerm.) Britton. Slender, the culm much exceeding the leaves; spikes all or all but the uppermost separated, $5-8 \mathrm{~mm}$. long, the rachis somewhat zigzag. Me. and N. B. to N. Y., Iowa and N. Dak.
193. Carex scopària Schk. Pointed Broom Sedge. (I. F. f. 863.) Culms slender, erect, roughish above, $1.5-7.5 \mathrm{dm}$. tall. Leaves less than 3 mm . wide; spikes $3-10$, oblong, narrowed at both ends, bright brown, $6-16 \mathrm{~mm}$. long, usually aggregated into an ovoid head; perigynia lanceolate, 4-6 mm. long, rather less than 2 mm . wide, narrowly wing-margined, several-nerved on both faces, tapering into the ciliate 2 -toothed beak; scales thin, brown, acuminate or cuspidate, shorter than the perigynia. In moist soil, N. S. to Manitoba, Fla. and Colo. July-Sept.
194. Carex leporìna L. Hare's-foot Sedge. (I. F. f. 864.) Culms slender, roughish above, 3-4 dm. tall. Leaves about 2 mm . wide, flat, shorter than the culm; bracts very short and scale-like or wanting; spikes $4-7$, oblong, blunt, $8-12 \mathrm{~mm}$. long, dark brown, shining, clustered in a terminal oblong head;
perigynia ascending or appressed, ovate-lanceolate, 4 mm . long, rather narrowly wing-margined, several-nerved on both faces, the rough tapering 2 -toothed beak nearly as long as the body; scales lanceolate, brown, acute, narrower and shorter than the perigynia. E. Mass. Adventive from Europe. June-Aug.
195. Carex cristatélla Britton. Crested Sedge. (I. F. f. 865.) Culms 3-7 üm. tall, stiff, roughish above, longer than the leaves. Leaves $3-4 \mathrm{~mm}$. wide ; lower bracts bristle-form, $0.6-3 \mathrm{~cm}$. long ; heads $6-15$, globose or subglobose, $4-6 \mathrm{~mm}$. in diameter, densely aggregated into an oblong head or the lower slightly separated ; perigynia lanceolate or ovate-lanceolate, squarrose when mature, green or greenish brown, 3-4 mm. long, narrowly wing-margined, several-nerved on both faces, tapering into a ciliate 2 -toothed beak; scales lanceolate, nearly white, much shorter than the perigynia. In meadows and thickets, N. B. to Manitoba, Mass., Penn., Ill. and Neb. July--Sept.
196. Carex adústa Boott. Browned Sedge. (I. F. f. 866.) Culms stout, entirely smooth, 3-8 dm. tall, growing in dense tufts. Leaves about 2 mm . wide, shorter than the culm; bracts subulate, tapering from a broad nerved base, the lower 1 or 2 often exceeding the spikes; spikes 5-12, subglobose or shortoval, several-flowered, apparently confluent, or slightly separated, bright greenish brown ; perigynia broadly ovate, firm, very narrowly wing-margined or wingless, rough above, plano-convex, $4-5 \mathrm{~mm}$. long, tapering into a 2 -toothed beak, several-nerved on the outer face, nerveless on the inner; scales lanceolate, acute or cuspidate, about equalling the perigynia. In dry soil, Newf. to the N. W. Terr., N. Y. and Mich. June-July.
197. Carex foènea Willd. Hay Sedge. (I. F. f. 867.) Rather light green ; culm smooth, erect or the summit nodding, 3-10 dm. tall. Leaves flat, soft, 2- $-\mathbf{~ m m}$. wide, shorter than the culm ; bracts very short or wanting, or the lowest occasionally manifest ; spikes 4-10, subglobose or short-oblong, narrowed at the base, $5^{-6} \mathrm{~mm}$. in diameter, silvery green, all separated on a sometimes zigzag rachis, or the upper contiguous; perigynia ovate, about 3 mm . long, broadly wingmargined, strongly several-nerved on both faces, tapering into a short rough 2-toothed beak; scales lanceolate, acuminate, about equalling the perigynia. In dry woods, often on rocks, N. B. to Penn., Iowa, Minn. and Br. Col. June-July.

Carex foènea perpléxa Bailey. Culms stouter, spikes commonly aggregated and larger, less contracted at the base, the summit of the culm erect or nearly so ; perigynia thicker. Me. to Va., Iowa and Minn.
198. Carex stramínea Willd. Straw Sedge. (I. F. f. 868.) Culms slender, roughish above, $3-7.5 \mathrm{dm}$. long, the top commonly nodding. Leaves 2 mm . wide or less, long-pointed, shorter than the culm ; bracts short or the lower bristle-form and exceeding its spike ; spikes $3-8$, subglobose or slightly obovoid, $4-5 \mathrm{~mm}$. thick, yellowish brown or greenish ; perigynia ovate, brown, about 3 mm . long, strongly several-nerved on the outer face, fewer-nerved on the inner, wingmargined, the tapering rough 2 -toothed beak about as long as the body; scales lanceolate, acute, about equalling the perigynia, but narrower. In dry fields, N. B. to Manitoba, Penn., Mich. and Iowa. June-July.

Carex stramínea mirábilis (Dewey) Tuckerm. Larger ; culm slender, $0.5-\mathrm{I} .3 \mathrm{~m}$. long; leaves $2-5 \mathrm{~mm}$. wide; spikes larger, $6-8 \mathrm{~mm}$. thick, rather greener; perigynia spreading, narrowed, longer than the scales. Range of the type, extending south to N. Car., Mo. and Neb. Perhaps better regarded as a distinct species.
199. Carex silícea Olney. Sea-bfach Sfidge. (I. F. f. 869.) Culms slender. rather stiff, roughish above, $3-8 \mathrm{dm}$. tall, the summit recurved or nodding. Leaves 2 mm . wide or rather less, involute in drying, shorter than the culm; bracts bery short ; spikes 5-8, ovoid-conic or ovoid-oblong, silvery-green, nearly white or becoming brownish, erect, conspicuously contracted at the hase, $\& 12 \mathrm{~mm}$. long. about 5 mm . thick, separated or the uppermost close tongether ; perigyni.n wateoval, short-beaked, finely nerved on both faces, wing-margined, appressed, about 4 mm . long, longer and broader than the lanceolate scales. In samds of the sea coast, Nova Scotia to New Jersey. June-Aug.
200. Carex ténera Dewey. Marsh Straw Smok. (1. ľ. f. S7o.) Čuln slender, erect or the summit nodding, roughish above, $2-0$ dm. high. Leares
shorter than the culm, usually less than 2 mm . wide, tapering to a very long tip ; spikes 4-6, oval, obtuse, greenish brown, $8-10 \mathrm{~mm}$. long, commonly much contracted at the base ; perigynia ovate to ovate-lanceolate, strongly several-nerved on both faces, wing-margined, the tapering rough beak more than half as long as the body ; scales lanceolate, about as long as the perigynia, but much narrower. In wet soil, common along brackish marshes, Me. and Ont. to Va. and La. Reported from Iowa. May-June.

#### Abstract

Carex ténera invìsa (W. Boott) Britton. Spikes smaller, subglobose or short-oblong, not more than 6 mm . thick, the lower one usually subtended by a filiform bract $\mathrm{I}-8 \mathrm{~cm}$. long. Me. to Del.

201. Carex festucàcea Willd. Fescue Sedge. (I. F. f. 87x.) Culms nearly or quite smooth, erect, $0.3-1.2 \mathrm{~m}$. tall. Leaves erect, $2-4 \mathrm{~mm}$. wide, shorter than the culm; spikes 3-8, green-brown, oblong or nearly globular, clustered, $4^{-8} \mathrm{~mm}$. in diameter ; perigynia orbicular or very broadly ovate, broadly wing-margined, about 3 mm . in diameter, several-nerved on both faces, the roughish beak about one-third the length of the body; scales acute or obtusish. In dry or moist soil, N. B. to Assiniboia, Neb., Fla. and Kans. May-July.
202. Carex alàta Torr. Broad-winged Sedge. (I. F. f. 872.) Culms erect, roughish above, $0.3-1 \mathrm{~m}$. tall. Leaves $2-4 \mathrm{~mm}$. wide, shorter than the culm ; spikes oblong or oblong-conic, green-brown, $10-16 \mathrm{~mm}$. long, $8-10 \mathrm{~mm}$. thick, usually little separated, bractless, or the lower one subtended by a short bract ; perigynia orbicular or obovate-orbicular, very broadly winged, $4-5 \mathrm{~mm}$. in diameter, faintly few-nerved or almost nerveless, the short beak not more than onefourth as long as the body; scales lanceolate, acuminate, scarcely over 0.5 mm . wide ; achene distinctly stipitate. In moist soil, N. H. to Penn. and Fla., mostly near the coast. Reported from Iowa. May-June.
203. Carex albolutéscens Schwein. Greenish-white Sedge. (I. F. f. 873.) Similar to the preceding; culms $0.3-0.5 \mathrm{~m}$. tall, stout. Leaves $2-4 \mathrm{~mm}$. wide, shorter than the culm; bracts filiform or wanting; spikes $3-8$, oblong, usually narrowed at both ends, silvery green when young, becoming brownish, $8-12 \mathrm{~mm}$. long, clustered; perigynia broadly ovate, not twice as long as wide, broadly winged, strongly nerved on both faces, about 4 mm . long, the roughish beak about one-third as long as the body ; scales lanceolate, acuminate ; achene nearly or quite sessile. In wet soil, abundant along salt meadows, N. B. to Penn. and Fla. May-July.
204. Carex Bicknéllii Britton. Bicknell's Sedge. (I. F. f. 874.) Culms $0.5-1 \mathrm{~m}$. high, rough above, much longer than the leaves. Leaves mostly nearly basal, 3-5 mm. wide ; bracts usually very short ; spikes 3-7, ovoid, subglobose, or somewhat obovoid, $8-12 \mathrm{~mm}$. long, silvery green or becoming yellowish; perigynia very broadly ovate, thin, several-nerved on the outer face, 4-6 mm. long, the broad membranous wing I mm . wide, the rough 2 -toothed beak one-fourth to one-half as long as the body; achene stalked. In dry soil, N. Y. to Minn., Mo. and Kans. June-July.
205. Carex sychnocéphala Carey. Dense Long-beaked Sedge. (I. F. f. 875.) Culms quite smooth, o. $7-5 \mathrm{dm}$. high. Leaves about 2 mm . wide; lower bracts similar, much elongated, $0.7-3 \mathrm{dm}$. long, nearly erect; spikes $4-10$, oblong, densely many-flowered, aggregated and confluent into an oblong or ovoid head 3 cm . long or less; perigynia linear-lanceolate, $5-6 \mathrm{~mm}$. long, about I mm . wide at the base, tapering into a subulate rough 2 -toothed beak 2-3 times as long as the few-nerved body; scales linear-lanceolate, long-acuminate, shorter and rather narrower than the perigynia. In meadows and thickets, Ont. and N. Y. to Manitoba, Iowa and Br. Col. July-Aug.

Order 4, PRÍNCIPES, including only the family Palmaceae, Palms, and Order 5, SYNANTHAE, including only the family Cyclanthaceae, are not represented in our territory.

## Order 6. ARÀLES.

Monocotyledonous herbs, mostly fleshy. Inflorescence in the Araceae a fleshy spadix, subtended by a spathe, or naked. The Lemnaceae are minute floating thalloid plants, with few or solitary flowers on the margin or back of the thallus.

Family 1. ARACEAE Neck.

## Arum Family.

Herbs mostly with basal long-petioled leaves, and spathaceous inflorescence, the spathe enclosing or subtending a spadix. Rootstock tuberous or a corm. Spadix densely flowered, the staminate flowers above, the pistillate below, or the plants wholly diœccious, or with perfect flowers in some species. Perianth wanting, or of 4-6 scale-like segments. Stamens $4-10$ in our species; filaments very short ; anthers 2 -celled, commonly with a thick truncate connective, the sacs opening, by dorsal pores or slits. Ovary I-several-celled; ovules I-several in each cavity ; style short or wanting; stigma terminal, mostly minute and sessile. Fruit a berry or utricle. Seeds various. Endosperm copious, sparse or none. About IO5 genera and goo species, mostly of tropical regions, a few in the temperate zones.
Flowers without a perianth.

Flowers monœcious or diœcious, borne at the base of the spadix.
Flowers monœecious, covering the whole spadix.
Flowers perfect.
Flowers with a perianth.
Spadix enclosed in a shell-like fleshy spathe.
Spadix naked, terminating the scape.
Spadix naked, borne at the base of a leaf-like spathe.

1. Arisaema.
2. Peltandra.
3. Calla.
4. Spathyema.
5. Orontium.
6. Acorus.

## I. ARISAEMA Mart.

Perennial herbs with acrid corms, simple scapes and $\mathbf{I}$ to 3 slender-petioled divided leaves unfolding with the flowers. Spadix bearing the flowers near its base. Spathe convolute, open or contracted at the throat. Flowers dioecious or monoecious, the staminate of 4 almost sessile $2-4$-celled anthers, which open by confluent slits at the apex, the pistillate with a I-celled ovary containing I to many orthotropous ovules; style very short or none, tipped with a peltate-capitate stigma. Fruit a globose red berry, the clusters usually large and conspicuous when ripe. Seeds with copious endosperm and an axial embryo. [Greek, in reference to the red-blotched leaves of some species.] About 50 species, mostly natives of temperate and subtropical Asia. Besides the following another occurs in the S. U. S.
Spathe hooded, open at the throat, enclosing the spadix.
Hood of spathe striped; spadix stout, club-shaped. 1. A. triphyllum.
Hood of spathe deep brown to black; spadix slender, cylindric. 2. A. pusilum.
Spathe convolute ; summit of the spadix exserted.
3. A. Dracontium.
I. Arisaema triphýllum (L.) Torr. Jack-in-the-pulpit. Indiñ TikNip. (I. F. f. 876.) Leaves nearly erect, 2.5-9 dm. high, usually exceeding the scape. 3 -foliolate, the segments ovate, sometimes lobed. $4-8 \mathrm{~cm}$. wide, sessile or very short-stalked; flowers commonly diœecious, yellow; spadix $4-8 \mathrm{~cm}$. long, its naked summit blunt, colored; spathe green, and purple-striped, curving in a broad striped flap over the top of the spadix, acuminate; ovules 5 or 6 ; berrics shining. about 1 cm . in diameter. forming a dense ovoid head $2-8 \mathrm{~cm}$. long. In moist worods and thickets, N. S. to Fla., Ont., Minn., Kans. and La. April-June.
2. Arisaema pusillum (Peck) Nash. Similar to the preceding, hut smaller and more slender, seldom over 3.5 dm . high. Leaf-segments narrowed at the base; spathe striped below, the hood deep brown or mearly hack; spadix slender. cylindric. In open sunny bogs, N. Y.. flowering about a month later than -1 . triphyllum where the two grow in the same region. (\%. triphlilum fusilhum Peck, Rep. N. Y. State Mus. 5 I : 297).
3. Arisaema Dracóntium (L.) Schott. Green Dragon. Dragon-root. (I. F. f. 877.) Corms clustered. Leaves 2-II dm. long, pedately divided into 517 segments, much longer than the scape; segments obovate or oblong, $2-10 \mathrm{~cm}$. wide, abruptly acute at the apex, narrowed to a sessile or nearly sessile base, entire or the lateral ones somewhat lobed; spathe greenish or whitish, acuminate, 25 cm . long; spadix ovary turbinate, with 6-8 bottle-shaped ovules; berries reddish:orange in large ovoid heads. Mostly in wet woods and aleng streams, Me. to Ont. and Minn., south to Fla., Kans. and Tex. . May-June.

## 2. PELTÁNDRA Raf.

Bog herbs, with sagittate or hastate leaves, the petioles sheathing the shorter scape. Spathe elongated, convolute, or expanded above. Flowers monœcious, covering the spadix. Perianth none. Staminate flowers uppermost, consisting at first of irregularly 4 -sided oblong flat-topped shields, from the edges of which appear 6-10 imbedded anthers opening by apical pores, the shields shrivelling and leaving the anthers nearly free. Ovaries ovoid, surrounded at base by 4 or 5 white fleshy scale-like staminodia, r-celled; ovules solitary or few, amphitropous; style erect, thick, tipped with a small stigma. Fruit a green or red berry, 1-3seeded, when ripe forming large globose heads and enclosed in the persistent leathery base of the spathe. Seeds surrounded by a tenacious jelly; endosperm none. [Greek, referring to the shield-shaped staminate disks.] The genus consists of the two following species :

Spathe narrow, convolute its whole length, green.

1. $P$. Virginica.

Spathe with a whitish dilated summit.
2. P. sagittaefolia.
I. Peltandra Virgínica (L.) Kunth. Green Arrow-arum. (I. F. f. 878.) Leaves bright green, somewhat hastate-sagittate, I-8 dm. long, acute or acuminate, firm, strongly veined. Root a tuft of thick fibres; scape recurving and immersing the fruiting spadix at maturity; spathe green, I-2 dm. long, long-conic, closely investing the spadix throughout, the strongly involute margins undulate; spadix shorter than the spathe, the pistillate flowers covering about one-fourth of its length, the rest occupied by staminate flowers; ovaries globose-ovoid; style nearly 2 mm . long; berries green when ripe. In swamps o: shallow water, Me. and Ont. to Mich., Fla. and La. May-June.
2. Peltandra sagittaefollia (Michx.) Morong. White Arrow-Arum. (I. F. f. 879.) Leaves sagittate, sometimes wider than those of the preceding, the basal lobes diverging; petioles $2-5 \mathrm{dm}$. long; spathe $7-10 \mathrm{~cm}$. long, with a whitish expanded acuminate apex; spadix scarcely more than one-half as long as the spathe; ovaries ovoid; style scarcely any; stigma broad, depressed, lobed; ripe berries red. In marshes and springs, southern Va. (according to Gray) to Fla. May-July.

## 3. cálla l.

A bog herb with slender acrid rootstocks, broadly ovate or nearly orbicular cordate leaves, and a large white persistent spathe. Spathe ovate-lanceolate or elliptic, acuminate, open. Spadix cylindric, much shorter than the spathe, densely covered with flowers. Flowers perfect or the uppermost staminate; perianth none. Stamens about 6; filaments linear; anther-sacs divaricate, opening by slits. Ovary ovoid, I-celled; style very short; stigma small, flat, circular. Ovules 6-9, anatrapous. Berries obconic, depressed. Seeds hard, smooth, oblong, striate toward the micropyle and pitted at the other end. Endosperm copious. [An ancient name, taken from Pliny.] A monotypic genus of the cooler portions of the north temperate zone.
I. Calla palústris L. Water Arum. (I. F. f. 880.) Petioles I-2 dna, long. Blades thick, entire, $3-10 \mathrm{~cm}$. wide, cuspidate or abruptly acute; scape as long as the petioles. sheathed at the base; rootstocks covered with sheathing scales and with fibrous roots at the nodes; spathe $2.5-6 \mathrm{~cm}$. long and about $2-5 \mathrm{~cm}$. wide; berries red, distinct, few-seeded, forming a large head when mature. In bugs, N. S. to Minn., Va., Wis. and Iowa. Also in Europe and Asia. May-June. Fruit ripe July-Aug.

## 4. SPATHYÈMA Raf.

A fetid herb, with large ovate cordate leaves, thick straight rootstocks and a short erect partly underground scape. Spathe swollen, shell-like, thick, pointed, completely enclosing the spadix. Spadix globose or oblong, short-stalked, covered by the perfect flowers. Perianth of 4 hooded sepals. Filaments slightly dilated; anthers 2 -celled, short, extrorse, opening longtitudinally. Ovary nearly buried in the tissue of the spadix, I-celled with a solitary suspended anatropous ovule. Style pyramidal, 4 -sided, thick, elongated; stigma minute. Berries immersed in the spongy axis of the spadix, becoming adnate to the succulent perianth in ripening, $\mathrm{I}_{\mathrm{i}}$ seeded, forming large heads. Seeds large. Embryo large, fleshy; endosperm none. [Greek, referring to the spathe.] A monotypic genus of E. North America and N. E. Asia.
I. Spathyema foètida (L.) Raf. Skunk Cabbage. (I. F. f. 88i.) Leaves numerous, in large crowns, $3-9 \mathrm{dm}$. long, often 3 dm . wide. strongly nerved, abruptly acute at the apex, thin, entire, their petioles deeply channeled. Rootstock thick, terminating in whorls of fleshy fibers; spathe preceding the leaves, erect, $7-15 \mathrm{~cm}$. high, $2-8 \mathrm{~cm}$. in diameter at the base, convolute, firm, purplebrown to greenish yellow, often mottled; spadix about 2.5 cm . in diameter in flower, enlarging and sometimes 15 cm . in diameter in fruit. In swamps and wet soil, N. S. to Ont., Minn., Fla. and Iowa. Feb.-April.

## 5. ORÓNTIUM L.

Aquatic herbs, with thick rootstocks, oblong-elliptic nerved leaves without a distinct midvein, and slender terete scapes terminated by a cylindric spadix. Spathe enclosing the spadix when very young, soon parting and remaining as a sheathing bract at its base, or falling away. Flowers perfect, bright yellow, covering the whole spadix. Sepals 4-6, scale-like, imbricated upon the ovary; stamens as many as the sepals; filaments linear; abruptly narrowed above; anthers small, with two diverging sacs opening by oblique slits. Ovary partly imbedded in the axis of the spadix, depressed, obtusély angled, I-celled; ovule solitary, half-anatropous; stigma sessile. Fruit a green utricle. Endosperm none: embryo long-stalked. [Ancient name of some water plant.] A monotypic genus of eastern N. America.
I. Orontium aquáticum L. Golden-club. (I. F. f. 882.) Leaves deep dull green above, pale beneath, the blade $\mathbf{I}-3 \mathrm{dm}$. long, $4-12 \mathrm{~cm}$. wide, entire, acute or cuspidate at the apex, narrowed at the base into a petiole. Scape 1.56 dm . long, flattened near the spadix; spadix $2-5 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. in diameter, much thickened in fruit; spathe bract-like, $5-10 \mathrm{~cm}$. long, 2 -keeled on the back, usually falling away early; utricle roughened on top with 9 or 10 tubercles. In swamps and ponds, Mass. to Penn., Fla. and La., mostly near the coast. AprilMay.

## 6. ÁCORUS L.

Erect herbs, with long branched rootstocks, sword-shaped leaves, and 3 -angled scapes keeled on the back and channeled in front, and a seemingly lateral cy lindric spadix, the scape appearing as if extending long beyond it, but this upper part is morphologically a spathe. Flowers perfect, densely covering the spadix. Perianth of 6 membranous concave sepals. Stamens 6; filaments flattened; anthers reniform or sagittate, 2 -celled, the cells confluent at maturity. Ovary oblong. 3-4celled with 2-8 anatropous ovules in each cavity; stigma sessile, depressed-capitate. Fruit a $2-3$-celled gelatinous berry, few-seeded. Endosperm copions. [Name ancient.] Two known species, the following widely distributed in the north temperate zone, the other Japanese.
I. Acorus Cálamus L. Sweet Flag. Calamus-root. (I. F. f. S83.) Leaves linear, erect, $5-15 \mathrm{dm}$. tall and $2-5 \mathrm{~cm}$. wide or less, sharp-pointed and sharp-edged, with a ridged midvein, 2 -ranked, closely sheathing each other and the scape. Spathe projecting $2-8 \mathrm{dm}$. beyond the spadix; spadix spike-like. 5-9 cm. long, about I cm. in diameter; flowers minute, greenish-yelhow. In swamps and along streams, N. S. to Ont., Minn., La. and Kins. Also in lurope and Asia. May-July.

## Family 2. LEMNÀCEAE Dumort.

## Duckweed Family.

Minute perennial floating aquatic plants, without leaves or with only very rudimentary ones. The plant-body consists of a disk-shaped, elongated or irregular thallus, which is loosely cellular, densely chlorophyllous and sometimes bears one or more roots. The vegetative growth is by lateral branching, the branches being but slightly connected by slender stalks and soon separating. The inflorescence consists of one or more naked monœcious flowers borne on a slight lateral prominence on the edge or upper surface of the plant. Each flower commonly consists of but a single stamen or a single flask-shaped pistil. The anther is provided with two to four pollen-sacs, containing spherical minutely barbellate grains. The pistil is narrowed to the funnel-shaped scar-like stigmatic apex, and produces $1-6$ erect or inverted ovules. The fruit is a $1-6$ seeded utricle. The family comprises the smallest of the flowering plants and contains 4 genera and about 30 species of wide distribution.
Thallus with one root or several.

Roots several.
Root solitary.
Thallus rootless.
Thallus thick, globose to subcylindric.
Thallus thin, ligulate.

1. Spirodela.
2. Lemna.
3. Wolffia.
4. Wolffiella.

## 1. SPIRODÈLA Schleid.

Thallus disk-shaped, 7-12-nerved. The lateral branches subtended by a single bipartite basilar rudimentary leaf. The thinly capped rootlets as well as the nerves are provided with a single bundle of vascular tissue. Spathe sac-like. The ovary produces two anatropous ovules. Fruit unknown. [Greek, in allusion to the cluster of rootlets. Two species, the following, and S. oligorkiza, a native of the southern hemisphere.

1. Spirodela polyrhiza (L.) Schleid. Greater Duckween. (I. F. f. 884.) Thallus $2-10 \mathrm{~mm}$. long, thick, flat and dark green above, slightly convex and purple beneath, palmately 5-I5-nerved, bearing a central cluster of from 4-16 elongated roots. Rootcap pointed. In still water, N. S. to Br. Col., S. Car., Tex., northern Mex. and Nev. Widely distributed in the Old World and in tropical America.

## 2. LÉMNA L.

Thallus disk-shaped, usually provided with a central nerve and with or without two or four lateral nerves. Each thallus produces a single root, which is devoid of vascular tissue and is commonly provided with a thin blunt or pointed rootcap. The ovary contains from one to six ovules. Fruit ovoid, more or less ribbed. Endosperm in one or three layers. [Greek, in allusion to the growth of these small plants in swamps.] About ro species, in temperate and tropical regions.
Thalli long-stipitate.

1. L. trisulca.

Thalli short-stipitate or sessile.
Spathe open.
Thalli $x$-nerved or nerveless.
Thalli thin, without papules; rootcap strongly curved, tapering.

> 2. L. cyclostasa.

Thalli thick with a row of papules along the nerve; rootcap little curved, cylindric.
3. L. minima.

Thalli 3-nerved; rootcap cylindric. 4. L. perpusilla.
Spathe sac-like.
Thalli green or purplish beneath; fruit not winged. 5. L. minor.
Thalli pale beneath, usually strongly gibbous; fruit winged.
6. L. gibba.

1. Lemna trisúlca L. Ivy-Leaved Duckweed. (I. F. f. 885.) Thallus lanceolate, submerged and devoid of stomata in the primary aquatic form, ovate to oblong-lanceolate, $5-15 \mathrm{~mm}$. long. floating and provided with stomata in the later flowering stage. The later and more common form is narrowed at the base to a
slender stipe, thin, denticulate, with or without rootlets, and slightly 3 -nerved; several individuals often remain connected, so as to furm a chain-like series; rootcap pointed; fruit symmetrical; seed deeply $\mathbf{1 2 - 1} 5$-ribbed. In water, N. S. to N. J., N. Mex., Br. Col. and Cal. Also in Europe, Asia, Africa and Australia. July-August.
2. Lemna cyclostàsa (Ell.) Chev. Valdivia Duckweed. (I. F. f. 886.) Thallus oblong-elliptic, $2-4.5 \mathrm{~mm}$. long, thin, subfalcate and shortly stalked at the base, provided with numerous stomata, except on the borders, nerveless; rootcap blunt; spathe reniform; fruit ovoid-oblong, unsymmetrical; seed prominently 12-29-ribbed. In pools and rivers, Mass. to Fla., Ill., Wyo. and Cal. Also in South America. June-July. (L. Valdiviana Phil.)
3. Lemna mínima Philippi. Least Duckweed. (I. F. f. 886a.) Thallus oblong to elliptic, $2-4 \mathrm{~mm}$. long, obscurely I -nerved, or nerveless, with a row of papules along the nerve, the lower surface flat, or slightly convex; the apex rounded, rootcap usually short, a little curved, rarely perfectly straight, cylindric, blunt; spathe open; pistil short-clavate; stigma concave; ovule solitary, obliquely orthotropous; seed oblong, pointed, about i6-ribbed, with many transverse striations. Ga. and Fla. to Kans., Wyo. and Cal.
4. Lemna perpusílla Torr. Minute Duckweed. (I. F. f. 887.) Thallus small, $2-3.5 \mathrm{~mm}$. long, obovate, often purplish tinged beneath, unsymmetrical and abruptly narrowed to a very short stalk, provided throughout with numerous stomata, obscurely 3-nerved; rootcap straight, pointed; fruit ovoid; seed 12-20ribbed. In ponds, rivers, springs and lakes, Mass. to N. Y., Fla., Minn., Neb. and Kan. June-July.

Lemna perpusilla trinèrvis Aust. Thallus oblong to oblong-obvate, less unsymmetrical, thin, prominently 3 -nerved. N. J. to Mo., La, and the Ind. Terr.
5. Lemna mìnor L. Lesser Duckweed. (I. F. f. 888.) Thallus obovate or subcircular, $\mathbf{I} .5-5 \mathrm{~mm}$. long, thickish, rarely reddish or purplish tinged, shortstalked when young, provided throughout with stomata, nearly symmetrical, obscurely 3-nerved, very rarely 4 - 5 -nerved. Rootcap obtuse or subtruncate; fruit symmetrical, subturbinate; seed with a prominent protruding hilum, deeply and unequally $\mathbf{1 2 - 1 5}$-ribbed; ovule I. In ponds, lakes and stagnant waters, throughout N. Am., except the extreme north. Also in Europe, Asia, Africa and Australia. Summer.
6. Lemna gíbba L. Gibbous Duckweed. (I. F. f. 889.) Thallus unsymmetrical, obovate or short-obovate, $2-6 \mathrm{~mm}$. long, thickish or more or less strongly gibbous beneath, short-stalked when young, soon separating, provided with stomata which are sparse beneath, obscurely 3 - 5 -nerved; rootcap mostly short-pointed, cylindric, rarely long-pointed or obtuse; fruit symmetrical; seed thick, deeply and unequally ribbed. In ponds and rivers, Neb. to Tex., Wyo., Ariz. and Cal. Also in Mexico, Europe, Asia, Africa and Australia. June-July.

## 3. WOL lffia Horkel.

Thallus small, globose, ovoid-oblong, subcylindric or irregular, rootless, nerveless and leafless. The vegetative growth is from a cleft near one end of the plant, the branch being mostly sessile and soon detached. The ovary contains one orthotropous ovule. Fruit spherical or short ovate, smooth. Endosperm in a single layer. [Name in honor of Nath. Matth. v. Wolff, 1724-1784, Polish physician and naturalist.] A genus of about 12 species, mostly in tropical and subtropical regions.

| Thallus globose to ellipsoid, not punctate. | r. W. Columbiana. |
| :--- | :--- |
| Thallus flattened above, at least on the margin, brown-punctate. | 2. W. punctata. |
| Apex of thallus acute. | 3. W. papulifera. |

I. Wolffia Columbiàna Karst. Columbia Wolffia. (I. F. f. Soo.) Thallus spherical or subellipsoidal, o.5-1 mm. long, with a limited number of stomata ( 1 to 6), loosely cellular and clear green throughout, not punctate nor gibbous. Floating as minute alga-like grains just beneath the surface of the water in stagnant ponds, pools and shallow lakes, Mass. to Ont., N. J., S. Car., Minn., Mo. and La. Also in Mexico and South America. June-July.
2. Wolffia punctàta Griseb. Punctate Wolffia. (I. F. f. 891.) Thallus oblong, smaller than the last, $0.5-0.8 \mathrm{~mm}$. long, flattish, densely cellular, with numerous stomata and dark green above, gibbous, more loosely cellular, with fewer stomata and paler beneath; brown-dotted throughout with minute pigment cells. Floating on the surface of stagnant waters, Ont. to Mich. and Penn. JuneJuly. (W. Brasiliensis Engelm., not Wedd.)
3. Wolffia papulifera Thompson. Pointed Duckweed. (I. F. f. 8gia.) Thallus slightly unsymmetrical, obliquely broadly ovate, about 1 mm . broad, the apex rounded, the upper surface flat at the margin, gradually ascending into a prominent conic papule on the median line, brown-punctate, the under surface strongly gibbous, less punctate; stomata numerous on the upper surface; flower and fruit unknown. Floating, with the entire upper surface exposed to the air. Kennett and Columbia, Mo.

## 4. WOLFFiÉlla Hegelm.

Thallus thin, unsymmetrical, rootless, curved in the form of a segment of a band, punctate on both surfaces with numerous brown pigment-cells. Pouch opening as a cleft in the basal margin of the thallus, a stipe attached to its margins. Flowers and fruit unknown. [Diminutive of Wolffa.] About 7 species, mostly of tropical regions. Besides the following, 2 others are known from western North America.
I. Wolffiella Floridàna (J. D. Smith) Thompson. Florida Wolffiella. (I. F. f. 88ga.) Thallus solitary, or commonly coherent for several generations, forming densely interwoven masses, strap-shaped, scythe-shaped, or doubly curved, tapering from the rounded oblique base to a long-attenuate apex, $5-10 \mathrm{~mm}$. long, 14-2I times as long as wide; basal portion of the long stipe persistent, the pouch elongated-triangular, or the upper angle rounded. Ga. and Fla. to Mo., Ark. and Tex.

## Order 7. XYRIDÀLES.

Monocotyledonous herbs, mostly with narrow leaves. Flowers usually complete, their parts mostly in 3 's or 6 's. Corolla regular or nearly so (except in Commelina). Ovary compound, superior. Endosperm of the seed mealy.
$a$. Ovary I-celled.
Aquatic moss-like leafy herbs; flowers solitary. Fam. r. Mayacaceae.
Erect scapose rush-like herbs; flowers in terminal scaly heads or spikes.
Fam. 2. Xyridaceae.
Mud or aquatic herbs, the flowers subtended by spathes (Heteranthera in Pontederiaceae).
b. Ovary 2-3-celled (except in some Pontederiaceae).

Flowers very small, densely capitate, monoecious or dioecious.
Fam. 3. Eriocaulaceae.
Flowers perfect. Epiphytes ; leaves scurfy.

Fam. 4. Bromeliaceae. Terrestrial or aquatic herbs; leaves not scurfy.

Perianth of 2 series of parts, the outer (sepals) green, the inner (petals colored.

Fam. 5. Commelinaceae.) Perianth 6-parted. Fam. 6. Pontederiaceae.

## Family 1. MAYACÀCEAE Walp.

## Mayaca Family.

Slender branching aquatic moss-like herbs, with linear sessile i-nerved entire soft leaves, notched at the apex. Flowers solitary, peduncled, white, perfect, and regular, the peduncles bracted at the base. Perianth persistent, consisting of 3 lanceolate green herbaceous sepals and 3 obovate white spreading petals. Stamens 3 , hypogynous, alternate with the petals; filaments filiform ; anthers oblong, somewhat 4 -sided, 2 -celled. Ovary superior, sessile, I-celled with 3 parietal placentae; ovules several or numerous, orthotropous; style filiform; stigmas terminal, entire or with 3 short lobes. Capsule I-celled, 3 -valved. Seeds ovoid or globose,
the testa reticulated ; embryo at the apex of the mealy endosperm. The family consists of the following genus :

## r. MAYACA Aubl.

Characters of the family. [Aboriginal name of these plants in Guiana.] About 7 species, natives of warm and tropical America. Only the following occurs in the United States :
I. Mayaca Aublèti Michx. Mayaca. (I. F.f. 892.) Stems tufted, 7-35 cm . long, little branched. Leaves densely clothing the stem and widely spreading, linear-lanceolate, translucent, 4-6 mm. long, about 0.5 mm . wide; peduncles $4-12$ mm . long, very slender, recurved in fruit; flowers $6-8 \mathrm{~mm}$. broad, lateral, rarely more than one on each branch ; capsule oblong-oval, about as long as the sepals, tipped until dehiscence by the subulate style. In fresh water pools and streams, Va. to Fla. and Tex. May-July.

## Family 2. XYRIDACEAE Lindi. <br> Yellow-eyed Grass Family.

Tufted herbs, with basal narrow equitant commonly 2 -ranked leaves, and erect simple leafless scapes. Flowers perfect, mostly yellow, nearly or quite regular, solitary and sessile in the axils of coriaceous imbricated bracts (scales), forming terminal heads. Sepals 3, the two lateral ones small, keeled, persistent, the other one larger, membranous (wanting in the South American genus Abolboda). Corolla inferior, with a narrow tube and 3 spreading lobes. Stamens 3 , inserted on the corolla, usually alternating with as many plumose or bearded staminodia. Ovary sessile, i-celled or incompletely 3 -celled; ovules on 3 parietal placentae, orthotropous; style terminal (unappendaged in Xyris, in Abolboda appendaged at the base), 3-branched above ; stigmas apical. Fruit an oblong 3-valved capsule. Seed-coat longitudinally striate. Embryo apical. Endosperm mealy or somewhat fleshy. Two genera, comprising some 60 species, mostly of tropical distribution in both the Old World and the New.

## 1. XỲRIS L.

Characters of the family as given above. [Greek name for some plant with 2-edged leaves.]

Besides the following species there are some 9 others in the southern United States. Lateral sepals wingless, the keel fringed with short hairs.

1. X. flexuosa.

Lateral sepals winged, the keel fimbriate or lacerate.
Scapes not bulbous-thickened at the base; leaves flat or but slightly twisted.
Lateral sepals about as long as the bracts, their keels lacerate.
Head oblong, 3-6 mm. long; northern. 2. X. montana. Head oval or ovoid, 6-16 mm. long ; southern.

Keel of lateral sepals lacerate to below the middle. 3. X. macrocephala. Keel of lateral sepals lacerate only above the middle.
4. X. Caroliniana. Lateral sepals longer than the bracts, their keels long-fimbriate.
5. X. fimbriata.

Scapes conspicuously bulbous-thickened at the base; leaves spirally twisted.
6. X. conocephala.

1. Xyris flexuòsa Muhl. Slender Yellow-eyed Grass. \{I. F. f. Suj.) Scapes slender, straight or sometimes slightly twisted, $1-+.5 \mathrm{dm}$. tall, 2-edsed above, bulbous-thickened at the base. Leaves flat or becoming twisted when old, ${ }^{2-15} 5 \mathrm{~cm}$. long, $\mathbf{1}-3 \mathrm{~mm}$. wide; head globose, or short-oblongr, obtuse, $6-8 \mathrm{~mm}$. high ; bracts broadly oval or slightly obovate, entire, or somewhat lacerate at the apex; lateral sepals linear, about as long as the bracts, curved, fringed with short hairs on the wingless keel; flowers $6-8 \mathrm{~mm}$. broad. In hoys, Mc. to Minn., Ga. and Tex. July-Sept.
2. Xyris montàna II. Ries. Northern lellow-hiln (ikiss. (I. F. f. 894.) Scapes very slender, straight or slightly twisted, z-edged above, $5-30 \mathrm{~cm}$.
rall, not bulbous-thickened at the base. Leaves narrowly linear, $2-15 \mathrm{~cm}$. long, 1-2 mm . wide, not twisted or but slightly so ; head oblong or ovoid, subacute, $3-6 \mathrm{~mm}$. long ; bracts rounded and finely lacerate at the apex; lateral sepals linear, irregurarly serrate-fimbriate on the winged keel above the middle, about as long as the bracts. In bogs, N. S. to Ont., Mich., Penn. and N. J. July-Aug.
3. Xyris macrocéphala Vahl. Southern Yellow-eyed Grass. (I. F. f. 895.) Scapes slender, slightly twisted, 2 -edged above, r-edged below, not thickened at the base, 1.5-4.5 dm. tall. Leaves linear or linear-lanceolate, flat, 7-25 cm. long, $2-8 \mathrm{~mm}$. wide; head ovoid, or subglobose, blunt or subacute, $\mathbf{I - 1 . 5} \mathrm{cm}$. long; scales ovate or oval, mostly entire; lateral sepals lanceolate, the winged keel fimbriate from the apex to below the middle ; corolla-lobes obovate, $4-6 \mathrm{~mm}$. long. In bogs, Mid. to Fla. and La. Widely distributed in tropical America. June-Aug. (X. communis.)
4. Xyris Caroliniàna Walt. Carolina Yellow-eyed Grass. (I. F. f. 896.) Scapes mostly slender, straight or somewhat twisted, 2-edged above, 2-5 dm. tall, not thickened at the base. Leaves linear or linear-lanceolate, flat, I-4 dm. long, $2-10 \mathrm{~mm}$. wide; head globose, ovoid or broadly oval, blunt, $8-16 \mathrm{~mm}$. long; scales oval or slightly obovate, entire or somewhat lacerate; lateral sepals linear, about as long as the bracts, the narrowly winged keel lacerate or incisedserrate only above the middle. In swamps and bogs, Mass. to Penn., Fla. and La., mostly near the coast. • June-Aug.
5. Xyris fimbriàta Ell. Fringed Yellow-eyed Grass. (I. F. f. 897.) Scapes rather stout, roughish, straight or somewhat twisted, strongly 2 -edged above, $0.5-1.2 \mathrm{~m}$. high. Leaves flat, $6-12 \mathrm{~mm}$. wide; head oblong-cylindric, or sometimes globose-ovoid, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. in diameter; scales obovate, their margins entire or the apex lacerate; lateral sepals longer than the bracts, exserted, long-fringed on the winged keel above the middle. In wet pine barrens, S. N. J. to Fla. and Miss., mostly near the coast. July-Sept.
6. Xyris conocéphala Sauv. Twisted Yellow-eyed Grass. (I. F. f. 898.) Scapes stout, much spirally twisted, I-edged below, or 2 -edged at the summit. smooth or nearly so, the base conspicuously bulbous-thickened and with th: sheathing leaves sometimes 2.5 cm . in diameter. Leaves narrowly linear from $a$ broad shining nearly black base, rigid, rather shorter than the scapes, spirally twisted; head oblong or oblong-cylindric, acute or subacute, $\mathbf{I - 2 . 5} \mathrm{cm}$. long; bracts oblong-obovate, minutely lacerate-serrulate at the apex or entire; lateral sepals linear, exserted, the winged keel fringed with rather short processes above the middle. In dry pine barrens, S. N. J. to Fla., west to Tex., mostly near the coast, extending north to Ark. (X. torta Kunth, not J. E. Smith.) May-Aug.

## Family 3. ERIOCAULACEAE Lindl.*

## Pipewort Family.

Bog or aquatic herbs, perennial or perhaps sometimes annual, with fibrous mostly knotted or spongy roots, tufted grass-like basal leaves, and monocious (androgynous) or occasionally dioecious very small flowers, in terminal solitary heads, on long slender scapes. Head of flowers involucrate by bracts, each flower borne in the axil of a scarious scale. Perianth of 2 series of segments or rarely of one series. Stamens in the staminate flowers as many or twice as many as the sepals. Ovary 2 -3-celled. Ovules 2 or 3 . Fruit a 2 -3-celled, $2-3$-seeded capsule, loculicidally dehiscent. Seeds pendulous, orthotropous; endosperm farinaceous. Six genera and about 340 species, widely distributed in warm and tropical regions, a few extending into the temperate zones.
Perianth of 2 series of segments; sepals and petals 2 or 3 ; stamens distinct; anthers 2 celled.

Stamens twice as many as the inner perianth-segments (petals). I. Eriocaulon. Stamens as many as the inner perianth-segments.
2. Dupatya.

Perianth simple, of 3 segments (sepals); stamens 3 , monadelphous below; anthers r-celled.

## 1. ERIOCAÛLON L.

Acaulescent or very short stemmed herbs, the scapes erect, or when immersed delicate, angular with a long sheathing bract at the base. Leaves mostly short, spreading, acuminate, parallel-nerved. Head of flowers woolly, white, leadcolored or nearly black. Staminate flowers: outer perianth-segments 2 or 3, distinct or sometimes connate, the inner united below into a tube, alternate with the outer ones, each with a minute spot or gland near its middle or apex; stamens mostly 4-6, one opposite each perianth-segment, the filaments of those opposite the inner segments the longer; pistil small, rudimentary or none. Pistillate flowers: outer perianth-segments as in the staminate flowers, the inner indistinct, narrow; stamens wanting; ovary sessile or stalked; style columnar or filiform, stigmas 2 or 3, filiform. Fruit a thin-walled capsule. Seeds oval, covered with minute processes. [Greek, in allusion to the wool at the base of the scape in some species.] About IIO species, of very wide geographic distribution in tropical and warm regions. Besides the following, 3 others occur in the southern U. S. and 3 in Mexico.
Leaf-blades as long as the sheaths, coarsely 3 - 8 -fenestrate-nerved; scapes 7 -angled; heads $4^{-6} \mathrm{~mm}$. in diameter.
I. E. septangulare.

Leaf-blades shorter than the sheaths, finely 6-20-fenestrate-nerved; scapes ro-12-angled; heads $6-12 \mathrm{~mm}$. in diameter.
Leaf-blades much longer than the sheaths, finely 10-50-nerved; scapes 10-14-angled; heads $8-16 \mathrm{~mm}$. in diameter.
3. E. decangulare.
I. Eriocaulon septangulàre With. Seven-angled Pipewort. (I. F. f. 899.) Stem a mere crown. Leaf-blades pellucid, 3-8-fenestrate-nerved, $\mathbf{1}-8 \mathrm{~cm}$. long; scapes weak, twisted, about 7 -angled, smooth, $2-20 \mathrm{~cm}$. tall, or when submersed sometimes $\mathrm{I}-3.5 \mathrm{~m}$. long; involucral bracts glabrous, or the innermost bearded at the apex, oblong, usually shorter than the flowers; marginal flowers usually staminate; scales of the receptacle spatulate or obovate, abruptly pointed, brown above; staminate flowers about 2.5 mm . high; pistillate flowers scarcely more than half as large; perianth-segments of both kinds of flowers white-bearded. In still water or on shores, Newf. to Ont., Minn., Fla. and Tex. Also in western Europe. July-Oct.
2. Eriocaulon compréssum Lam. Flattened Pipewort. (I. F. f. 900.) Leaf-blades 6-20-fenestrate-nerved, tapering to a long sharp tip, rigid, or when submerged thin and pellucid. Stem a mere crown ; scapes $1.5-9 \mathrm{dm}$. tall ; smooth, flattened when dry, IO-I2-angled ; involucral bracts rounded, obtuse, scarious, shining, smooth, imbricated in 3 or 4 series; heads frequently dioecious; receptacle glabrous ; flowers $3-4 \mathrm{~mm}$. high, otherwise similar to those of the preceding. In still shallow water, S. N. J. to Fla. and Tex. Also in Cuba. At flowering time the styles and stigmas are much exserted, standing above the heads like projecting threads. May-Oct.
3. Eriocaulon decangulàre L. Ten-angled Pipewort. (I. F. f. 90I.) Stems short and thick, $2-5 \mathrm{~cm}$. long. Leaf-blades finely many-nerved, tapering to a blunt tip, $\mathbf{I} .5-5 \mathrm{dm}$. long, $4-\mathbf{I} 6 \mathrm{~mm}$. wide; scapes stout, rigid, glabrous, ro-14-angled, $0.3-1 \mathrm{~m}$. tall ; heads $8-16 \mathrm{~mm}$. in diameter; involucral bracts ovate, often eroded, denticulate at the apex and pubescent below, imbricated in 4 or 5 series; receptacle pubescent with many-celled hairs; flowers 4 mm. high, densely woolly at the base ; scales longer than the flowers, acute, white-bearded ; as are the spatulate perianth-segments. In swamps, S. N. J. and Penn. to Fla. and Tex. Also in Cuba. June-Oct.

## 2. DUPÀtYA Vell.

Perennial or rarely annual herbs, our species with the habit of Erioctulon. Stems very short. Leaves awl-shaped, tufted. Scapes slender, several-ingled. erect, twisted in growth, sheathed at the base by a long acute bract. Flowers androgynous, in globular or hemispheric heads, each in the axil of a scale, or the scales sometimes obsolete. Involucral bracts imbricated in 3 or 4 series. Perianth of 2 series, each of 2 or 3 segments in the staminate Howers, the outer segments distinct, the inner connate : stamens 2 or 3 , inserted on the inner perianth and opposite its lobes. Pistillate flowers with the outer segments distinct.
the inner often connate above the 2 -celled, $2-3$-ovuled ovary; style cleft into 2 or 3 entire or 2 -cleft stigmas. Fruit a 2-3-celled, $2-3$-seeded capsule, loculicidally dehiscent. [Name in honor of Dupaty.] About 215 species, mostly natives of tropical America. Only the following is known in the U. S.:
I. Dupatya flavídula (Michx.) Kuntze. Dupatya. (I. F. f. 902.) Leaves $3-5$-nerved, $2-5 \mathrm{~cm}$. long, awl-shaped, woolly at the base, glabrous or sparingly pubescent above. Scapes usually numerous, 5 -angled, pubescent, I-3 dm. high ; sheaths longer than the leaves, slightly inflated above, pubescent ; involucral bracts straw-colored, glabrous, obtuse, oval, shining, somewhat pubescent at the base; scales very thin, scarious-white, linear, slightly pubescent, about as long as the flowers; flowers about 2.5 mm . high ; perianth 6-parted; outer perianth of the staminate flowers stalked, woolly, the inner a campanulate tube with 3 stamens; pistillate flowers with both sets of perianth-segments distinct, the inner much narrower than the outer; style 3-parted ; stigmas 3. In moist pine barrens, S. Va. to Fla. March-July.

## 3. LACHNOCÀULON Kunth.

Tufted herbs with the habit of Eriocaulon, the leaves linear. Scape severalangled, sheathed at the base by an entire bract about as long as the leaves; heads globose. Receptacle pilose. Flowers androgynous. Perianth of 3 segments. Staminate flowers with 3 stamens united below into a thickened tube which is coalescent with a body, variously regarded as a corolla or as a rudimentary pistil, bearing at its apex 3 fimbriate or entire lobes alternate with the filaments; anthers I-celled, minute. Pistillate flowers with a sessile 3 -celled, 3-ovuled ovary surrounded by copious woolly hairs at the base ; styles united below, spreading above into 3 divisions which are 2-parted, there being thus 6 stigmas. [Greek, referring to the woolly scapes of some species.] Four known species, natives of the southern U. S.
I. Lachnocaulon ánceps (Walt.) Morong. Hairy Pipewort.' (I. F. f. 903). Leaves glabrous or sparingly pubescent, $2-8 \mathrm{~cm}$. long, tapering to an obtuse callous tip. Scapes slender, $0.5-5 \mathrm{dm}$. tall, $2-4$-angled, clothed with long soft appressed upwardly pointed hairs; sheaths equalling or shorter than the laves ; heads globose, $2-6 \mathrm{~mm}$. in diameter ; involucral bracts ovate or oblong, shorter than the flowers, usually brown ; flowers about 2 mm . high ; scales brown, spatulate, white-bearded at the apex; perianth of the staminate flowers shortstalked, pubescent at the base, woolly and fimbriate at the summit; segments of the pistillate perianth white, glabrous, obtuse; ovary densely villous around the base ; seeds strongly ribbed. In most pine barrens, Va. to Fla. March-June.

## Family 4. BROMELIACEAE J. St. Hil. Pine-Apple Family.

Epiphytic herbs (some tropical species terrestrial), mostly scurfy, with elongated, entire or spinulose-serrate leaves. Flowers spiked, panicled, or solitary, regular and perfect, usually conspicuously bracted. Perianth of 3 thin distinct or somewhat united sepals, and 3 clawed distinct or united petals. Stamens 6, usually inserted on the base of the corolla. Ovary inferior or superior, 3-celled; ovules numerous in each cavity, anatropous; style short or elongated; stigmas 3. Capsule 3-valved in our species. Seeds numerous, the testa membranous. Embryo small, situated at the base of the copious endosperm. About 35 genera and 900 speries, all natives of tropical and subtropical America.

## x. TILLÁNDSIA L.

Epiphytic plants with narrow entire leaves and white, yellow or purple flowers. Sepals distinct and separate or very nearly so. Petals distinct. Stamens hypogynous or the three inner ones inserted on the bases of the petals; filaments filiform; anthers linear or linear-oblong. Ovary superior ; style subulate ; stigmas short. Capsule sedticidally 3 -valved. Seeds erect, narrow, supported on a long funiculus which splits up into fine threads. [Dedicated to Elias Tillands, Swedish (?) botanist
of the seventeenth century.] About 350 species, hatives of warm and tropical America. Besides the following some 9 others occur in the southern U. S.

1. Tillandsia usneoìdes L. Long Moss. Florida Moss. (I. F. f. 904.) Stems very slender, thread-like, flexuous, hanging clustered in festoons from the branches of trees, I-8 m. long, gray and, like the filiform leaves, densely silveryscurfy' all over. Leaves scattered, $2-8 \mathrm{~cm}$. long, scarcely I mm. thick, their bases somewhat dilated; flowers sessile and solitary or rarely 2 together in the axils of the leaves ; sepals about 6 mm . long, pale green ; petals yellow; stamens about as long as the calyx; capsule linear, $2-3 \mathrm{~cm}$. long, at length splitting into 3 linear valves. E. Va. to Fla., Tex. and Mex. Very widely distributed in tropical America.

## Family 5. COMMELINÀCEAE Reichenb.

## Spiderwort Family.

Perennial or annual leafy herbs with regular or irregular perfect and often showy flowers in cymes, commonly subtended by spathe-like or leafy bracts. Perianth of 2 series; a calyx of mostly 3 persistent sepals and a corolla of mostly 3 membranous and deciduous or fugacious petals. Stamens mostly 6, hypogynous, rarely fewer, all similar and perfect or 2 or 3 of them different from the others and sterile; filaments filiform or somewhat flattened; anthers 2 -celled, mostly longitudinally dehiscent. Ovary superior, sessile or very nearly so, $2-3$-celled; ovules i or several in each cell, anatropous or half anatropous; style simple ; stigmas terminal, entire or obscurely 2-3-lobed. Seeds solitary or several in each cell of the capsule. Capsule 2-3-celled, loculicidally 2-3-valved. Embryo small. Endosperm copious. About 25 genera and 350 species, mostly natives of tropical regions, a few in the temperate zones.
$\begin{array}{ll}\text { Perfect stamens 3, rarely 2; petals unequal ; bracts spathe-like. } & \text { I. Commelina. } \\ \text { Perfect stamens 6, rarely } 5 \text {; petals all alike ; bracts leaf-like. } & \text { 2. Tradescantia. }\end{array}$

## r. COMMELINNA L.

Somewhat succulent, branching herbs, with short-petioled or sessile leaves, and irregular mostly blue flowers in sessile cymes subtended by spathe-like bracts. Sepals unequal, the larger ones sometimes slightly united. Petals unequal. : of them larger than the third. Perfect stamens 3, rarely 2, one of them incurved and its anther commonly larger. Sterile stamens usually 3, smaller, their anthers various. Filaments all glabrous. Capsule 3-celled. Seeds 1 or 2 in each cavity, the testa roughened, smooth or reticulated. [Dedicated to Kaspar Commelin, 1667-173I, Dutch botanist.] About 95 species of wide distribution in warm and temperate regions. Besides the following, some 5 others occur in the southern U. S.

Spathes not united at the base.
Spathes acuminate; capsules 3 -celled, 5 -seeded.

1. C. nudiflora.
Spathes acute; capsules 2-celled, 4 -seeded.
2. C. communis.

Spathes with united bases.
All three cavities of the ovary with 2 ovules.
Sheaths, at least the lower ones, glabrous or nearly so ; pubescence, if present, not hirsute.
Sheaths more or less hirsute.
Capsules 2-valved, dorsal cavity indehiscent. 4. C. Tirginica.
Capsules 3 -valved, all cavities dehiscent. 5. C. erecta.
Ventral cavities of the ovary with 2 ovules, dorsal cavity with 1 ovule.
6. C. hirtella.
9. Conmelina nudiflòra L. Creeping Day-fionfer. (I. F. f. oos.) Clabrous or very nearly so; stems procumbent or creeping. $3^{-8}$ dm. long. Leaves lanconlate or ovate-lanceolate, $2.5-7.5 \mathrm{~cm}$. long, acute or acuminate at the apex. their sheaths sometimes ciliate ; spathe acuminate, $2-4 \mathrm{~cm}$. long, peduncled, the z hracts not united by their margins; flowers few in each spathe. $0-12 \mathrm{~mm}$. hroad; ventral cavities of the ovary 2 -ovuled, the dorsal 1 -ovuled; capsule commonly 5 -sected
(2 seeds in each of the ventral cells, I in the dorsal) ; seeds oblong, reticulated, about 2 mm . long. Along streams and in waste places, N. J. to Ind. and Mo., south to Fla., Tex. and through tropical America to Paraguay: Widely distributed in Asia and Africa. July-Oct.
2. Commelina commùnis L. Asiatic Day-flower. (I. F. f. 907.) Glabrous or nearly so ; stems ascending or decumbent, sometimes rooting at the nodes. 3-9 dm. long. Leaves lanceolate or oblong-lanceolate, 4-12 cm. long. acuminate at the apex, narrowed or rounded at the base, smooth; sheath white-membranous with green reins, sometimes ciliate, $1.5-2.5 \mathrm{~cm}$. long; spathes few. peduncled, their 2 bracts acute, nearly 2.5 cm . long. glabrous or sometimes pubescent, distinct; flowers deep blue, 12 mm . broad or more; ventral cavities of the ovary 2-ovuled, the dorsal 1-ovuled; capsule 2 -celled, each cavity 2 -seeded ; seeds dark brown, roughened. In waste places, S. N. Y. and E. Penn., south to Ga. and Ky. Adventive or naturalized from Asia. July-Oct.
3. Commelina crispa Wooton. Ctrley-leaved Day-flower. Finely villous or glabrate below; stems commonly branched at the base, the branches 2-9 dm. long. Leaves lanceolate or linear-lanceolate. $3-8 \mathrm{~cm}$. long, acuminate, crisped, slightly contracted at the base; sheaths pale, 12-15 mm. long, ciliate; spathes $2-2.5 \mathrm{~cm}$. long, acute or acuminate. pubescent, united at the base; sepals orbicular-elliptic ; petals various, the 2 upper light blue, with slender claws and broadly reniform blades $1-1.5 \mathrm{~cm}$. broad, the third white, lanceolate, $2-3 \mathrm{~mm}$. long ; capsules $4-5 \mathrm{~mm}$. long. 3 -celled, 2 cavities dehiscent, third cavity indehiscent ; seeds smooth. In sandy and rocky soil, Neb. to Tex. and N. Mex. Summer and fall.
4. Commelina Virgínica L. Virginia Day-flower. (I. F. f. 009.) Similar to the preceding species, somewhat pubescent, or glabrous ; stems diffusely branched. 4-9 dm. high. Leaves lanceolate or linear-lanceolate. 6-12 cm. long, acuminate at the apex; sheaths inflated. often pubescent, the orifice sometimes fringed; spathes several, usually peduncled. the 2 bracts acute or acuminate, ${ }_{15-25} \mathrm{~mm}$. long, distinct; corollas 2.5 cm . broad or less, showy; capsule 3 -celled, each cavity 1 -seeded, the dorsal one indehiscent and roughened. In moist soil. S. N. Y. to Ill. and Mich., south to Fla., Neb., Tex. and through tropical America to Paraguay. June-Sept.
5. Commelina erécta L. Slender Day-flower. (I. F. f. 908.) Somewhat pubescent. or glabrous; stems commonly tufted, erect or ascending, 3-7 dm. tall. the roots thickened. Leaves linear-lanceolate. $6-15 \mathrm{~cm}$. long, acuminate at the apex, narrowed at the base; sheaths $\mathbf{1 2 - 2 5} \mathrm{mm}$. long, often hirsute; spathes peduncled or sessile, acute or acuminate, distinct, $2-4 \mathrm{~cm}$. long ; corollas 12 mm . broad or more; ovary 3 -celled, each cavity I-ovuled ; capsule papery, all its cavities dehiscent, each I-seeded ; seeds ash-colored. nearly or quite smooth, puberulent. In moist soil, S. Penn. (according to Watson). south to Fla., Tex. and in tropical America. Aug.-Oct.
6. Commelina hirtélla Vahl. Bearded Day-flower. (I. F. f. 906.) Stem stout, erect or ascending, 5-12 dm. high. Leaves lanceolate, acuminate, roughish, 10-18 cm. long, their sheaths $12-25 \mathrm{~mm}$. long. fringed with rather stiff and long brownish hairs and sometimes pubescent ; spathes sessile or short-peduncled, often clustered at the summits of the stem and branches; bracts acute, united at the base, rather strongly cross-veined; ventral cavities of the ovary 2 -ovuled, the other I-ovuled ; capsule 5 -seeded; seeds brown, somewhat more than 2 mm . long, smooth, minutely puberulent. In moist soil, S. N. J. to Mo., south to Fla. and Tex. Aug.-Oct.

## 2. TRADESCÁNTIA L.

Somewhat mucilaginous herbs, with simple or branched stems, mostly narrow and elongated leaves, and showy regular flowers in terminal, or terminal and axillary, umbel-like cymes subtended by leaf-like or scarious bracts. Sepals 3, distinct, herbaceous. Petals 3, sessile. Stamens 6, all alike and fertile. or those opposite the petals shorter. Filaments bearded or glabrous. Ovary 3-celled, the cavities usually 2-oruled. Capsule 3-celled, loculicidally 3-valved. 3-12-seeded. [In honor of John Tradescant, gardener to Charles I, died 1638 .] About 35 species,
natives of tropical and temperate America. Besides the following, some 8 others occur in the southern U . S .

## Umbel-like cymes peduncled, subtended by small bracts. 1. T. rosea. Umbel-like cymes sessile, subtended by leaf-like bracts.

Leaves linear or linear-lanceolate, 12-50 times longer than broad.
Stems ito rarely 8 cm . long; bracts longer than the leaves. 2. T. brevicaulis.
Stems elongated, $\mathrm{I}-\mathrm{IO} \mathrm{dm}$. long; bracts mostly shorter than the leaves.
Foliage bright green; pedicels, like the sepals, pilose or villous; sepals becoming membranous.
Pedicels and sepals pilose with gland-tipped hairs.
Stems I-3 dm. tall ; bracts lanceolate, the bases sac-like, whitish, broader than the leaves.
3. T. bracteata.

Stems 3-8 dm. tall; bracts linear, the bases not sac-like, green, narrower than the leaves. 4. T. occidentalis.
Pedicels and sepals villous with non-glandular hairs.
5. T. Virginiana.

Foliage glaucous; pedicels glabrous; sepals with a tuft of hairs at the apex.
6. T. reflexa.

Leaves lanceolate, 2-10 times longer than broad.
Slender ; stems strict; cymes solitary and terminal or on corymbed branches; species Alleghenian.
7. T. montana.

Stout ; stems zigzag ; cymes terminal and sessile in the upper axils; species campestrian.
8. T. pilosa.

1. Tradescantia ròsea Vent. Roseate Spiderwort. (I. F.f. 914.) Glabrous; stem slender, erect, mostly tufted, $\mathbf{1 2 - 3 0} \mathrm{cm}$. tall. Leaves narrowly linear, grass-like, nearly erect, channeled, $10-18 \mathrm{~cm}$. long, clasping at the base; bracts very short and scarious; cymes terminal, long-peduncled, few-flowered, subtended by small pointed bracts; pedicels slender; sepals lanceolate, acute, $4^{-6} \mathrm{~mm}$. long, shorter than the petals; corolla rose-color, $\mathbf{1 2 - 1 6 ~ m m}$. broad; filaments hairy; style slender, long-exserted. In dry woods, Md. to Mo., south to Fla. and Tex. April-Aug.
2. Tradescantia brevicaùlis Raf. Short-stemmed Spiderwort. (I. F. f. 912.) Villous with long hairs; stems only $1-8 \mathrm{~cm}$. high, the plant often appearing nearly stemless; leaves mostly basal, 1.5-3 dm. long, grass-like, linear-lanceolate, acuminate, ciliate, at least at the base, glabrous, or villous toward the apex; bracts similar to the leaves, but usually more elongated; cymes $4-\mathbf{1 2}$-flowered; pedicels slender, $2.5-5 \mathrm{~cm}$. long, villous; sepals oblong; corolla about 2.5 cm . broad, blue or rose-purple. In dry soil, Ill., Ky. and Mo. April-May.
3. Tradescantia bracteàta Small. Long-bracted Spiderwort. (I. F. f. 910a.) Deep green, glabrous to the inflorescence or nearly so; stems erect, I-3 dm . tall, simple or sparingly branched; leaves linear or linear-lanceolate, $\mathrm{I}-2 \mathrm{dm}$. long, long-acuminate; sheaths paler than the leaf-blades, conspicuously ribbed, the upper often ciliate; bracts of the involucre 2, broader than the leaves, saccate at the base, ciliate, often villous on the back; cymes few-flowered; pedicels 1.2-2.5 cm . long, glandular-pubescent like the sepals; sepals ovate-lanceolate or ellipticlanceolate, involute; corolla blue or reddish, about 2.5 cm . broad. In sandy soil, Minn. to S. Dak., south to Kans. Spring and summer.
4. Tradescantia occidentàlis Britton. Western Spiderwort. Mustly glabrous to the inflorescence, bright green. Stems solitary, erect. . -8 dm . tall, simple; leaves linear, 2-3 dm. long, involutely folded, curved; sheaths $1-4 \mathrm{~cm}$. long, conspicuously ribhed, rarely with a few cilia; bracts of the involucre 2, linear, slightly unequal; pedicels rather slender, $1-2 \mathrm{~cm}$. long; sepals oblong or clliptic, apparently lanceolate by the involute edges, 8 -10 mm . long. glandular-pilose; petals blue or reddish, almost $\mathbf{I ~ c m}$. long, orbicular-ovate; capsules whovoid or oblong, 5-6 mm. long, puberulent at the apex; seeds 3 mm . long. pitted and ridged. On sand-hills, Iowa to Tex., west to the Rocky Mts. Summer. (7. I irsinama occidentalis Britton.)
5. Tradescantia Virginiàna L. Splofroort. (I. F. f. oio.) (ilabrous or slightly pubescent, bright green; stems stout, $2+$ dm. tall. Leares nearly that, linear or linear-lanceolate, long-acuminate, often mere than 3 dm. long: bracts leaflike, commonly nearly as wide as the leaves; cymes solitary and terminal, or rarely

2-4, loosely several-many-flowered: pedicels villous, slender; corolla blue or purplish. rarely white, $2-+\mathrm{cm}$. broad. very showy; sepals elliptic, ovate or ovatelanceolate, acute or obtuse. villous. $12-18 \mathrm{~mm}$. long. much longer than the capsule. In rich soil. mostly in woods and thickets, S. N. Y. to Ohi, and S. Dak., south to Va., Ky. and Ark. Escaped from cultivation in N. E. May-Aug.

6 Tradescantia refléxa Raf. Reflexed Spiderwort. (I. F. f. gita.) Glabrous to the sepals, glaucous; stems erect. 3-9 dm. tall. mostly branched, rather strict; leaves linear, $2-5 \mathrm{dm}$. long, rather rigid. long-attenuate; sheaths large. I3 cm . long: bracts of the involucres 2 , unequal. reflexed; cymes usually densely fruited; pedicels slender. $2-3 \mathrm{~cm}$. long, recurved; sepals oblong or elliptic, apparently lanceolate by the involute edges. $8-10 \mathrm{~mm}$. long, hooded with a tuft of hairs at the apex; corollas blue or red. $2-3 \mathrm{~cm}$. broad; petals suborbicular; capsule ovoid or oblong. $5^{-6 ~ m m}$. long. glabrous. In sandy or loamy suil, Minn. to Fla. and Tex. Spring and summer.
7. Tradescantia montàna Shuttlw. Mountain Spiderwort. (I. F. f. 91I.) Dark green and glabrous or nearly so; stems slender. simple or sparingly branched. 3-7 dm. tall. Leaves lanceolate or linear-lanceolate. $1-3 \mathrm{dm}$. long, most!' distant. their sheaths enlarged; bracts similar to the leaves but shorter; cymes mostly solitary and terminal. sessile in the bracts, rather lensely flowered; pedicels and calyx glabrous or pubescent; corolla less than 2.5 cm . broad: sepals apparently lanceolate by the involute edges. acute. hooded. 5-6 mm. long. In woods and thickets, mountains of southwestern Va. to Ky. and Ga. June-Aug.
8. Tradescantia pilòsa Lehm. Zigzag Spiderifort. (I. F. f. 9ij.) More or less puberulent or short-pilose; stem stout. 3-9 dm. high. commonly flexuous, often branched. Leaves broadly lanceolate, acuminate at the apex, mostly narrowed at the base. $I_{5}-25 \mathrm{~cm}$. long. dark green above, paler beneath; bracts usually narrower and -horter than the leaves; cymes $3-8$, terminal and axillary or on short axillary branches. densely many-flowered; pedicels and calyx pubescent and more or less glandular. rarelv nearly glabrous; corollas lilac-blue, $18-30 \mathrm{~mm}$. broad. In thickets and on shaded hillsides, southern Penn. to Ill. and Mo., south to Fla. JuneAug.

## Family 6. PONTEDERIÀCEAE Dumort.* Pickerel-weed Family.

Perennial aquatic or bog plants, the leaves petioled, with thick blades, or long and grass-like. Flowers perfect. more or less irregular, solitary or spiked, subtended by leaf-like spathes. Perianth free from the ovary, corolla-like, 6 -parted. Stamens 3 or 6 . inserted on the tube or the base of the perianth; filaments filiform. dilated at the base or thickened at the middle; anthers 2-celled, linear-oblong or rarely orate. Orary 3-celled with axile placentae, or I-celled with 3 parietal placentae ; style filiform or columnar ; stigma terminal, entire or minutely toothed ; orules anatropous, numerous, sometimes only i of them perfecting. Fruit a many-seeded capsule, or a I-celled, I-seeded utricle. Endosperm of the seed copious, mealy ; embryo central, cylindric. About 5 genera and 25 species, inhabiting fresh water in the warm and temperate regions of America, Asia and Africa.
2. Heteranthera.

## I. PONTEDĖRIA L.

Leaves thick with many parallel veins, the petioles long. sheathing, arisiny from a horizontal rootstock. Stem erect. I-leaved. with several sheathing bract-like leaves at the base. Flowers blue. ephemeral. numerous. spiked. the spike (or spadix) peduncled and subtended by a thin bract-like spathe. Perianth 2-lipped the upper lip of 3 ovate lobes, the middle lobe longest, the lower lip of 3 linear-ublong spreading lobes. Stamens 6, burne at unequal distances upon the

[^11]perianth-tube. 3 of them opposite the lower lip, the others opposite the upper lip ; anthers oblong, subversatile, introrse. Ovary 3 -celled, 2 of the cells abortive and empty. Fruit enclosed in the thickened tuberculate-ribbed base of the perianth. [In honor of Giulio Pontedera, 1688-1757, professor of botany in Padua.] Seven or eight species, natives of America.
I. Pontederia cordata L. Pickerel-weed. (I. F. f. 915.) Stem rather stout, 0.3 -I.I m. tall. Leaves ovate, cordate-sagittate, $\mathrm{I}-2 \mathrm{dm}$. long, $5^{-15} \mathrm{~cm}$. wide at the base, the apex and basal lobes obtuse ; basal lobes often with long narrow appendages on the sheathing petiole ; spadix and inflorescence glandularpubescent ; perianth about 8 mm . long, it and the filaments, anthers, and style bright blue, its tube curved, slightly longer than the lobes; middle lobe of the upper lip with 2 yellow spots at the base within ; ovary oblong, tapering into the style ; stigma minutely 3-6 toothed. Borders of ponds and streams, N. S. to Minn., Fla. and Tex. The flowers are trimorphous. June-Oct.

Pontederia cordàta lancifòlia (Muhl.) Morong. Leaves lanceolate, rounded or narrowed at the base, $5-25 \mathrm{~cm}$. long, 6-16 mm. wide. Ont. to N. J., Cuba and Tex.

## 2. HETERANTHÈRA R.\&P.

Herbs with creeping, ascending or floating stems, the leaves petioled, with cordate, ovate, oval or reniform blades, or grass-like. Spathes I-flowered or several-flowered. Flowers small, white, blue or yellow. Lobes of the perianth nearly or quite equal, linear. Stamens 3, equal or unequal, inserted on the throat of the perianth. Ovary fusiform, entirely or incompletely 3 -celled by the intrusion of the placentae; ovules numerous; stigmas 3 -lobed. Fruit enclosed in the withered perianth tube. Seeds ovoid, many-ribbed. [Greek, referring to the unequal anthers of some species.] About 9 species, 2 in tropical Africa, the others American; only the following in the U. S.

Leaves mostly reniform, sometimes cordate-ovate. Leaves ovate or oval, sometimes slightly cordate.
Leaves linear, grass-like, floating.

1. H. reniformis.
2. Heteranthera renifórmis R. \& P. Mud-Plantain. (I. F. f. 916.) Stems creeping in the mud, rooting at the nodes. Leaves cordate or reniformrarely cordate-ovate and acute, the blades $\mathrm{I}-3 \mathrm{~cm}$. long, $\mathrm{I} .5-3.5 \mathrm{~cm}$. wide; peti, oles sheathing, $2-10 \mathrm{~cm}$. long; spathe $2-5$-flowered; tube of the perianth slender, about 8 mm . long, its lobes shorter; flowers white or pale blue; anthers basifixed, the 2 upper oval, the other on a longer filament and linear. In mud or shallow water, Conn. to N. J., Neb. and Kans., south to La. Also in South and Central America.
3. Heteranthera limòsa (Sw.) Willd. Smaller Mud Plantain. (I. F. f. 917.) Stems commonly much branched from the base, 1.5-4 dm. long. Leaves obtuse, rounded or slightly cordate at the base, 2.5 cm . long or less; petioles $5-13 \mathrm{~cm}$. long; spathes I-flowered, often on peduncles 2 cm . long or more; flowers white or blue, usually larger than those of the preceding; filaments equal or nearly so; anthers linear, often sagittate. In mud or shallow water, Va. to Ky., Neb., Fla., La., Kans. and throughout tropical America.
4. Heteranthera dùbia (Jacq.) MacM. Water Star-grass. (I. F. f. oi 8.) Aquatic; stem slender, forked, often rooting at the nodes, $6-10 \mathrm{dm}$. long. I evaves flat, elongated, acutish, their sheaths thin, with small acute stipule-like appendages; flowers light yellow, the perianth-segments narrow; stamens nearly cqual; tube of the perianth $2-3.5 \mathrm{~cm}$. long; spathe $\mathbf{I}-2$-flowered; filaments dilated below; anthers linear, 4 mm . long, sagittate; stigma several-lohed; capsule I-celled with 3 parietal placentae, many-seeded. In still water, Ont. to Ore., Fla. and Mex. Also in Cuba. July-Oct.

## Order 8. LILIÀLES.

Monocotyledonous plants, mostly with well-developed perianth, the flowers usually regular and complete, and their parts in 3's or 6's. Ovary superior or inferior, compound. Endosperm of the seed fleshy or horny.

Ovary superior (except in Aletris of the Liliaceae, and some species of Zygadenus in the Melanthaceae).
Perianth-segments distinct, green or brown, not petal-like; herbs with grass-like leaves and small flowers. Fam. I. Juncaceae.
Perianth-segments distinct, or partly united, at least the inner petal-like.
Fruit a capsule (except in Yucca baccata, where it is large, fleshy and indehiscent).
Capsule mostly septicidal ; plants rarely bulbous. Fam. 2. Melanthaceae. Capsule loculicidal (septicidal in Calochortus) ; plants mostly bulbous.

Fam. 3. Liliaceae.
Fruit a fleshy berry.
Erect herbs; tendrils none; flowers perfect. Fam. 4. Convallariaceae.
Vines, climbing by tendrils, or rarely erect ; flowers diœcious, in axillary umbels.

Fam. 5. Smilaceae.
Ovary inferior, wholly or in part.
Stamens 3, opposite the inner corolla-segments.
Fam. 6. Haemodoraceae.
Stamens 6 in our species.
Erect perennial herbs ; flowers perfect. Fam. 7. Amaryllidaceae.
Twining vines; flowers diœcious.
Stamens 3, opposite the outer corolla-segments.

Fam. 8. Dioscoreaceal.
Fam. 9. Iridaceae.

Family 17. JUNCACEAE Vent.* Rush Family.

Perennial or sometimes annual, grass-like, usually tufted herbs, commonly growing in moist places. Inflorescence usually compound or decompound, paniculate, corymbose, cymose, or umbelloid, rarely reduced to a single flower, bearing its flowers singly, or loosely clustered, or aggregated into spikes or heads. Flowers small, regular, with or without bractlets (prophylla). Perianth 6-parted, the parts glumaceous. Stamens 3 or 6 , rarely 4 or 5 , the anthers adnate, introrse, 2 -celled, dehiscing by a slit. Pistil superior, tricarpous, I-celled or 3-celled, with 3 -many ascending anatropous ovules, and 3 filiform stigmas. Fruit a loculicidal capsule. Seeds 3-many, small, cylindric to subglobose, with loose or close seed-coat, with or without caruncular or tail-like appendages. Seven genera and about 200 species, widely distributed.

Leaf-sheaths open; capsule I- or 3-celled, many-seeded ; placentae parietal or axial.
Leaf-sheaths closed ; capsule I-celled, 3 -seeded, its placenta basal. $\begin{aligned} & \text { 1. Juncus. } \\ & \text { 2. Juncoides. }\end{aligned}$

## 1. JÚNCUS L.

Usually perennial plants, principally of swamp habitat, with glabrous herbage; stems leaf-bearing or scapose, leaf-sheaths with free margins, and leaf blades terete, gladiate, grass-like, or channeled. Inflorescence paniculate or corymbose, often unilateral, sometimes congested, bearing its flowers either singly and with 2 bractlets (prophylla), or in heads and without bractlets, but each in the axil of a bract ; bractlets almost always entire; stamens 6 to 3 ; ovary I-celled or by the intrusion of the placentae 3-celled, the placentae correspondingly parietal or axial: seeds several-many, usually distinctly reticulated or ribbed, often tailed. About 150 species, most abundant in the north temperate zone. The species bloom in summer. [Latin, from jungo, to bind, in allusion to the use of these plants for withes.
A. Lowest leaf of the inflorescence terete, not conspicuously channeled, erect, appearing like a continuation of the stem, the inflorescence therefore appearing lateral ; stem leaves none.
r. Flowers bracteolate, inserted singly on the branches of the inflorescence. Genuini. Perianth-parts green, or in age straw-colored.

Perianth-parts equalling or exceeding the capsule, all acute.
Stamens 3; leaf of the inflorescence much shorter than the stem.
Capsule without a distinct apical papilla. I. J. effusus.

$$
\begin{array}{ll}
\text { Capsule with a distinct apical papilla. } & \text { 2. J. conglomeratus }
\end{array}
$$

Stamens 6; leaf of inflorescence about equalling the stem, or longer.
3. J. filiformis.

Perianth-parts reaching only the middle of the capsule, inner obtuse.
4. J. gymnocarpus.

Perianth-parts with a chestnut-brown stripe down either side of the midrib.
5. J. Balticus.
2. Flowers not bracteolate, inserted in heads on the branches of the inflorescence. THaLassici.
Perianth-parts pale brown; seed tailless.
6. $J$. Roemerianus.

Perianth-parts green, or in age straw-colored; seed tailed.
7. J. maritimus.
B. Lowest leaf of the infloresence not appearing like a continuation of the stem, or if so, conspicuously channeled along the upper side, the inflorescence usually appearing terminal.

1. Leaf-blade transversely flattened (inserted with its flat surface facing the stem), or terete and channeled, not provided with septa.

* Flowers bracteolate, inserted singly on the branches of the inflorescence, sometimes clustered or congested, but never in true heads. Poiophylli.
Annual; inflorescence, exclusive of its leaves, more than one-third the height of the plant.

8. J. bufonius.

Perennial; inflorescence, excluding leaves, not one-third the height of the plant.
Leaf-blade flat, but sometimes involute in drying.
Inflorescence 1 - 3 -flowered; leaves with fimbriate auricles.
9. J. trifidus.

Inflorescence, except in depauperate specimens, several-many-flowered; leaves with entire auricles.

Cauline leaves 1 or 2, rarely wanting; perianth-parts obtuse.
1о. J. Gerardi.
Cauline leaves none; perianth parts acute or acuminate.
Inflorescence usually much exceeded by its lowest leaf; flowers seldom plainly secund; perianth $3.5-5.5 \mathrm{~mm}$. long, usually exceeding the capsule; capsule obovoid, broadly rounded at the apex, the placentae intruded half way to the axis.

1I. J. tenuis.
Inflorescence rarely exceeded by its lowest leaf; flowers plainly secund on the branches; perianth $2.5-4 \mathrm{~mm}$. long, equalling the capsule; capsule oblong, 3 -sided, truncate at the apex; placentae meeting at the axis.
12. $J$. secundus.

Leaf-blade terete, channeled along the upper side.
Lowest leaf of inflorescence not four lengths of the panicle; capsule oblong to obovoid.
Seed tailed. 13. J. Vaseyi.
Seed not tailed.
Perianth $2.5-3 \mathrm{~mm}$. long, plainly exceeded by the capsule.
14. J. Greenci.

Perianth $3.5-4 \mathrm{~mm}$. long, not exceeded by the capsule.
15. J. dichotomus.

Lowest leaf of the inflorescence rarely less than four times as long as the panicle; capsule globose-ovoid.
16. J. setaceus.
** Flowers not bracteolate, in true heads on branches of the inthorestence. GRaminifolif.
Stem erect ; capsule oblong or obovoid, obtuse at the apex.
Stamens 3, with red-brown anthers; capsule not mucronate.
17. J. marginatus.

Stamens 6, with yellow anthers; capsule mucronate.
18. J. Iongistylis.

Stem creeping, floating, or ascending; capsule subulate. 19. J. repens.
2. Leaf-blade not transversely flattened, commonly terete, hollow. provided with septa.

* Leaf-blade usually channeled along the upper side; septa usually imperfect, not externally evident ; inflorescence of $1-4$ heads; plants of arctic or alpine range. Alpini. Body of the seed I mm. in length or more.

Leaf-sheath not auriculate. 20. J. castaneus.
Leaf-sheath auriculate.
Body of the seed less than I mm. in length.
Lowest leaf of inflorescence foliose, erect; capsule deeply retuse at apex.
22. J. biglumis.

Lowest leaf of inflorescence membranous, spreading; capsule obtuse and mucronate at the apex. 23. J. triglumis.

*     * Leaf-blade not channeled along the upper side (except in $J$. bulbosus), the septa perfect (except in $J$. polycephalus), and usually externally evident; inflorescence, except in depauperate specimens, of several to many heads; plants not of arcticalpine range. SEPTATI.
+ Stamens 6, one opposite each perianth-part.
Heads reduced to one, or rarely two flowers. 24. J. pelocarpus.
Heads 2-many-flowered.
Epidermis not roughened.
Plants with two kinds of leaves, one normal, the other basal, submersed, and capillary.

Plant low, less than 2.5 dm . high. 25. J. bulbosus.
Plant tall, more than 2.5 dm . high.
26. J. militaris.

Plants without submerged capillary leaves.
Capsule oblong, either abruptly acuminate or bluntly acute.
Branches widely spreading; capsule sharply acute, tapering into a conspicuous tip. 27. J. articulatus.
Branches usually strict; capsule broadly acute, or obtuse, with a short tip.

Leaf-blades erect; inner-perianth-parts longer than the outer.
29. J. nodosus.

Leaf-blades abruptly divergent from the stem; outer perianth-parts longer than the inner. 30 . J. Torreyi.
Epidermis of the leaves roughened with minute tubercles. 31. J. Caesariensis.
++ Stamens 3, none opposite the inner perianth-parts.
Capsule less than three-fourths as long as the perianth. $3^{2}$. J. brachycarpus
Capsule more than three-fourths as long as the perianth.
Capsule tapering evenly into a prominent subulate beak.
Leaf-blade vertically flattened and with incomplete septa, only rarely compressed and with complete septa.
33. J. polycephalus.

Leaf-blade terete or nearly so, the septa complete.
Uppermost cauline leaf with a well-developed blade.
34. $J$. scirpoides.

Uppermost cauline leaf with a rudimentary blade rarely exceeding 3 dm . in length.
35. J. megacephalus.

Capsule obtuse to acute at the apex, sometimes mucronate, but not prolonged into a beak.

Seed o.6-2 mm. long.
Perianth about 2 mm . long, the fruiting head not more than 4 mm . high.
36. J. brachycephalus.

Perianth $3-4 \mathrm{~mm}$. long, or if shorter, the fruiting head 4 mm . high or more. 37. J. Canadensis.

Seed $0.4-0.5 \mathrm{~mm}$. long.
Perianth and mature capsule $2-4 \mathrm{~mm}$. long.
Perianth $2.5-4 \mathrm{~mm}$. long, or if less the whole plant not 5 dm . high. 38. J. acumitanus.

Perianth $2-2.5 \mathrm{~mm}$. long, the whole plant more than 5 dm . high.
39. J. robustus.
40. J. diffusissimus.
I. Juncus effùsus L. Common Rush. Bog Rush. Soft Rush. (I. F. f. 919.) Plant $0.4-\mathrm{I} .2 \mathrm{~m}$. high, tufted, erect. Rootstock branching, proliferous; stem soft, merely striate beneath the inflorescence; basal leaf-blades reduced to filiform rudiments; inflorescence many-flowered, $2-10 \mathrm{~cm}$. high, in one form congested; lowest bract of the inflorescence, $5-25 \mathrm{~cm}$. long; perianth $2-3 \mathrm{~mm}$. long, its parts green. lanceolate, acuminate; anthers shorter than the filaments: capsule obovoid, 3 -celled, muticous, regularly dehiscent; seed $0.4-0.5 \mathrm{~mm}$. in length, reticulate
in about 16 longitudinal rows. In swamps and moist places, nearly throughout N. A., except the arid and high northern portions. Also in Europe and Asia.
2. Juncus conglomeràtus L. Glomerate Rush. (I. F. f. 920.) Plant 3-6 dm. high, tufted, erect. Rootstock stout, with proliferous branches ; stem distinctly ribbed just beneath the inflorescence; leaf-blades wanting, or minute filitorm rudiments ; inflorescence congested, seldom more than 2 cm . high ; lowest bract of the inflorescence $5-15 \mathrm{~cm}$. long; perianth $2.5-4 \mathrm{~mm}$. long, its parts green, lanceolate, acuminate ; anthers shorter than the filaments; capsule obovoid, obtuse or retuse at apex, tipped with the base of the style; seed $0.4-0.5 \mathrm{~mm}$. in length, acute or abruptly apiculate at both ends, reticulate in about 16 longitudinal rows. In the sphagnum bogs of Newf. Also in northern Europe and Asia.
3. Juncus filifórmis L. Thread Rush. (I. F. f. 92 I.) Stems I-6 dm. tall, erect, from a creeping rootstock; basal leaves reduced to bladeless sheaths; inflorescence commonly with less than 8 flowers and less than 2 cm . high; perianth $2.5-3.5 \mathrm{~mm}$. long, its parts narrowly lanceolate, acute, or the inner obtuse; stamens 6, about half as long as the perianth ; style very short ; capsule obovoid, green, barely pointed, about three-fourths as long as the perianth, 3 -celled; seed about 0.5 mm . long, pointed at either end, with an irregularly wrinkled coat, seldom developing reticulations. Lab. to Br. Col., Penn., Mich., and in the Rocky Mts. to Utah and Colo. Also in Europe and Asia.
4. Juncus gymnocàrpus Coville. Pennsylvania Rush. (I. F. f. 922.) Stems erect, $3^{-6} \mathrm{dm}$. high, about 2 mm . thick, from a creeping proliferous rootstock; basal leaves reduced to bladeless clasping sheaths; panicle commonly $\mathbf{1 . 5 - 3} \mathrm{cm}$. high, spreading, its subtending leaf usually $1-2.5 \mathrm{dm}$. long ; perianth 2 mm . in length or a little less, its parts with a green midrib, equal, lanceolate, the outer acute, the inner obtuse; capsule almost twice as long as the perianth, broadly ovoid, conspicuously mucronate, brown and shining, barely dehiscent, 3 -celled; seed about 0.6 mm . long, none with perfect markings seen. In swamps, mountains of Schuylkill and Lebanon counties, Penn.
5. Juncus Balticus Willd. Baltic Rush. (I. F. f. 923.). Stems 2-9 dm. high, arising at intervals from a stout creeping rootstock; basal leaves reduced to bladeless sheaths; panicle commonly $2-6 \mathrm{~cm}$. high; perianth $3-4.5 \mathrm{~mm}$. long, its parts nearly equal, brown with a green midrib and hyaline margins; style $\mathbf{I}-2 \mathrm{~mm}$. long; stigmas a little shorter; stamens 6, about two-thirds the length of the perianth; anthers much longer than the filaments; capsule about as long as the perianth, pale to dark brown, narrowly ovoid, conspicuously mucronate, 3 -celled; seeds usually with a loose coat, nearly $\mathbf{I} \mathrm{mm}$. long, about 40 -striate. On shores, Lab. to Alaska, S. N. Y., Ohio and Neb., and far south in the western mountains. Also in Europe and Asia. Variable.
6. Juncus Roemeriànus Scheele. Roemer's Rush. (I. F. f. 924.) Stems $0.5-1.2 \mathrm{~m}$. tall, from a tough scaly rootstock $5-10 \mathrm{~mm}$. thick; inner sheaths bearing erect blades of about the same length as the stem; inflorescence $1-2.5 \mathrm{~cm}$. high, diffuse, its leaf $6-15 \mathrm{~cm}$. long ; heads 2-6-flowered; perianth pale brown, $2-3.5 \mathrm{~mm}$. long, the parts linear-oblong, the outer acuminate, the inner shorter and bluntly acute; flowers imperfectly diœcious; stamens 6, on fertile plants reduced to sterile staminodia; capsule brown, about as long as the perianth, narrowly obovoid, obtuse or truncate, mucronate, 3 -celled; seed dark brown, abruptly apiculate, indistinctly reticulate or distinctly 20 -26-ribbed and the intervening spaces imperfectly cross-lined. In brackish marshes, N. J. to Tex.
7. Juncus marítimus Lam. Sea Rush. (I. F. f. 925.) Stems $0.5-1 \mathrm{~m}$. high, from a stout horizontal rootstock. Outer basal leaves reduced to bladeless sheaths, the innermost foliose, with a long terete stout blade about equalling the stem; leaf of the inflorescence erect, sometimes 3 dm . long; panicle 0.72 dm . high. its branches, stiff, erect ; heads 2-6-flowered; perianth $3-3.5$ mun. lons, its pirts green, lanceolate, with hyaline margins; flowers perfect ; stamens 6, two-thirds as long as the perianth; filaments about as long as the anthers: capsule $3-3.5 \mathrm{~mm}$. long, narrowly ovoid, acute, mucronate, brown above, 3 -celled; sed brown, the body narrowly and obliquely oblong, 20-30-ribbed, indistimety reticulate, tailed at either end. Coney Island, N. Y. Common on the coasts of Europe.
8. Juncus bufònius L. To.n1) Rusth. (I. F. f. (1)(1.) Plant branching from the base, annual, erect, seldom exceeding 2 dm . in height; leaf-blade flat, $0.5-1 \mathrm{~mm}$.
wide, in low plants often much narrower; inflorescence with blade-bearing leaves at the lower nodes; flowers inserted singly on its branches; perianth-parts $4-7 \mathrm{~mm}$. long, lanceolate, acuminate, equal; stamens usually 6 , sometimes 3 ; anthers shorter than the filaments; capsule about two-thirds as long as the perianth, narrowly oblong, obtuse, mucronate, 3 -celled; seed broadly oblong, with straight tips, minutely reticulate in $30-40$ longitudinal rows. A cosmopolitan species, occurring throughout N. Am., except the extreme north.
9. Juncus trífidus L. Highland Rush. (I. F. f. 927.) Tufted, r-3 dm. high; stems about 0.5 mm . thick; basal leaves almost bladeless sheaths, the uppermost with a rudimentary blade and fimbriate auricles; stem leaf 1 , near the inflorescence, with a narrower blade; inflorescence a cluster of I-3 flowers, the lowest subtending bract similar to the stem leaf; perianth dark brown, $2.5-3.5 \mathrm{~mm}$. long; stamens 6; capsule equalling the perianth, coriaceous, 3 -celled, obovoid, mucro-nate-aristate; seeds few, narrowly obovoid, acute at the base, irregularly angled, minutely striate both longitudinally and transversely. Greenland and Lab., south on the higher mountains of N. Eng. and N. Y. Also in northern Europe and Asia.
10. Juncus Geràrdi Lois. Black-grass. (I. F. f. 928.) Tufted, 2-7.5 dm. high, with creeping rootstocks. Basal leaves with rather loosely clasping auriculate sheaths; cauline leaves usually 1 or 2 , similar to the basal; inflorescence paniculate; perianth $2-2.5 \mathrm{~mm}$. long, its parts oblong, obtuse, with green midrib and dark brown margins, straw-colored in age; stamens 6, barely exceeded by the perianth; anthers much longer than the filaments; capsule longer than the perianth, obovoid, mucronate, shining, 3-celled ; seed dark brown, obovate, acute at base, obtuse and often depressed at the summit, marked by 12-16 conspicuous ribs, the intervening spaces cross-lined. On salt meadows, Gulf of St. Lawrence to Fla.; rare in W. N. Y. and the vicinity of the Great Lakes. Occurs also on the northwest coast, and in Europe.
ir. Juncus ténuis Willd. Slender Rush. Yard Rush. (I. F. f. 929.) Tufted, $2-7.5 \mathrm{dm}$. high; basal leaves with blades $0.5-\mathrm{I} .5 \mathrm{~mm}$. wide, sometimes involute in drying; stem leaves none; inflorescence usually much exceeded by its lowest leaf, I dm. high or less; perianth $3.5-5 \mathrm{~mm}$. long, its parts lanceolate, acuminate, widely divergent, touching the capsule for about half their length; stamens 6 , about half as long as the perianth; capsule oblong to obovoid, rounded at the top, imperfectly 3 -celled; seed $0.4-0.5 \mathrm{~mm}$. long, narrowly oblong to obovoid, with oblique ends, reticulated in about 16 rows. In dry or moist soil, almost throughout N. Am., now migrating to all parts of the world. Variable.
12. Juncus secúndus Beauv. Secund Rush. (I. F. f. 930.) Tufted, X.54 dm . high; leaves usually less than one-third the height of the plant; inflorescence $2-10 \mathrm{~cm}$. high, the flowers secund on the branches; perianth-parts 2.5 3.5 mm . long, equalling or barely exceeding the capsule and appressed to it for about two-thirds their length; stamens 6, about one-half as long as the perianth; capsule narrowly ovoid, 3 -sided above the middle with straight sides and a truncate apex, completely 3 -celled, the placentæ meeting in the axis; seed $0.3-0.4 \mathrm{~mm}$. long, narrowly oblong to ovoid, obliquely tipped, with 12-16 longitudinal rows of areolæ. In dry soil, Me. (according to Fernald), N. J., Penn. to N. Car., and occasional in the middle Miss. Valley.
13. Juncus Vàseyi Engelm. Vasey's Rush. (I. F. f. 931.) Tufted, 36 dm . high; basal leaves with minutely auriculate sheaths, the uppermost bearing a terete channeled blade; stem leaves none; inflorescence 4 cm . in height or less, 4-40-flowered; perianth $3-4 \mathrm{~mm}$. long, the parts subulate-lanceolate, with hyaline margins; stamens 6 ; anthers shorter than the filaments; style almost wanting; stigmas short; capsule slightly exceeding the perianth, narrowly oblong, obtuse or truncate, with a short tip, 3 -celled; seed long-tailed, with a linear-oblong oblique body about 0.5 mm . long, 20-24-ribbed. Me. and Ont. to Mich., Ill. and Iowa.
14. Juncus Greènei Oakes \& Tuckerm. Greene’s Rush. (I. F. f. 932.) Tufted, $2-6 \mathrm{dm}$. high. Basal leaves with terete channeled blades one-half to twothirds the length of the stem; panicle $2-4 \mathrm{~cm}$. high, rather compact, much exceeded by its lowest bract; perianth $2.5-3 \mathrm{~mm}$. long, its parts stiff, lanceolate, sharply acute, with brownish red stripes and apex, the inner shorter; stamens 6 ; anthers about as long as the filaments; capsule one-fourth to one-half longer than the perianth, ovate-lanceolate, truncate, 3 -celled; seed obliquely oblong, $0.4-0.5 \mathrm{~mm}$. long,
slightly reticulated in about $20-24$ rows, the areolæ nearly square. N. B. to N. J., near the coast; Mich., Wis., Minn. and Ont.
15. Juncus dichótomus Ell. Forked Rush. (I. F. f. 933.) Tufted, 3-10 dm. high; leaves all basal except those of the inflorescence; blades terete, channeled along the upper side, about one-half the height of the stem; inflorescence paniculate, subsecund; perianth about 4 mm . long, its parts subulate-lanceolate, strawcolored when old; stamens 6 ; capsule slightly shorter than the perianth, oblong, obtuse, mucronate, I-celled; seed oblong, dark brown, obliquely apiculate, less than 0.5 mm . long, reticulate in about 14 longitudinal rows, the smooth areolæ about as long as broad. In dry soil, Me. to Fla, and Tex., near the coast.
16. Juncus setàceus Rostk. Awl-leaved Rush. (I. F. f. 934.) Densely tufted. Stems terete, spreading, 4-10 dm. long; leaves all basal except those of the inflorescence, the uppermost sheath usually bearing a long terete blade similar to the stem, but channeled; the other sheaths with filiform blades; involucral leaf appearing like a continuation of the stem, $\mathbf{I}-3 \mathrm{dm}$. long; inflorescence appearing lateral, 5 cm . long or less; perianth $2-5 \mathrm{~mm}$. long, its parts lanceolate, acuminate, rigid, widely divergent in fruit; stamens 6 ; capsule globose, shining, mucronate, r-celled, barely dehiscent; seed subglobose, $0.5-0.6 \mathrm{~mm}$. long, reticulate in about 12 longitudinal rows. In marshes, Del. to Fla. and Tex., near the coast, extending north in the Miss. Valley to Mo.
17. Juncus marginàtus Rostk. Grass-Leaved Rush. (I. F. f. 935.) Tufted, $1.5-7.5 \mathrm{dm}$. high from branching rootstocks. Leaf-sheaths auriculate; blades $\mathrm{I}-3 \mathrm{~mm}$. broad, $2-4$ conspicuous veins in addition to the midrib; inflorescence I dm. high or less, the panicle composed of $2-20$ turbinate to subspherical 5-10-flowered heads; perianth $2 \cdot 5-3 \cdot 5 \mathrm{~mm}$. long, the outer parts ovate, acute, the inner slightly longer, obtuse, with hyaline margins; stamens 3 ; anthers ovate, much shorter than the filaments; capsule equalling the perianth, obovoid, truncate or retuse, almost 3 -celled, the placentæ deeply intruded; seed oblong, $0.4-0.5 \mathrm{~mm}$. long, pointed at either end, 12-16-ribbed. Grassy places, Me. to Ont., Fla. and Neb.

Juncus marginàtus aristulàtus (Michx.) Coville. Taller, sometimes I.I m. high; leafblades $2-5 \mathrm{~mm}$. broad ; heads usually $20-100$, mostly $2-5$-flowered. N.Y. to Fla. and Mex., mostly near the coast; Miss. Valley to Kans. and Mich.

Juncus marginàtus setòsus Coville. Inner perianth-parts ovate or lanceolate, acute or acuminate; seeds smalier. Kans. to Mex.
18. Juncus longístylis Torr. Long-Styled Rush. (I. F. f. 936.) Stems erect, loosely tufted, $2-7.5 \mathrm{dm}$. high, slender, compressed, i-3-leaved. Leaf-blades 1.5-3 mm . wide, the midrib well defined; inflorescence 5 cm . high or less, usually of 2-10 irregular 3-8-flowered heads, or reduced to a single larger one; perianth 5-6 mm. long, the parts equal, brown, lanceolate, acuminate; stamens 6 , the yellow linear anthers longer than the filaments; style about 1 mm . long; stigmas $=-3 \mathrm{~mm}$. long; capsule shorter than the perianth, oblong, brown, angled above, obtuse or depressed at the summit, mucronate, 3 -celled; seed oblong, white-tipped, about 0.5 mm. long, 14-20-ribbed. Neb. and the Rocky Mountain region.
19. Juncus rèpens Michx. Creeping Rush. (I. F. f. 937.) Perennial by prostrate rooting branches; stems compressed, ascending, floating or prostrate, 0.5-5 dm. long. Leaves with compressed sheaths, auriculate, the blades $2-8 \mathrm{~cm}$. long. I-2 mm. broad, filiform-acuminate; inflorescence of I- $\delta$ heads, one or more heads often occurring also at the lower nodes; heads $5-10$-flowered; flowers $6-10 \mathrm{~mm}$. long; perianth-parts subulate-lanceolate, the outer keeled, about one-third shorter than the inner; stamens 3 ; filaments longer than the yellow anthers; capsule subulate, beakless, about as long as the outer perianth-parts, 3 -celled; sod oblong, acute at either end, finely reticulate. In swamps and streams, Del. to Fla., Cuba and Tex., and in Lower Cal.
20. Juncus castàneus Smith. Chestnut Rusir. (I. F. f. 03S.) Stems erect, $\mathbf{r}-5 \mathrm{dm}$. high, terete, leafless, or with a single leaf, arising singly from a slender rootstock. Basal leaves $3-5$, the outer sheaths shont, loose, the inner chasping, their blades tapering to a slender channeled acutish apex; infloresence strict, usually exceeded by its lowest bract; heads 1-3.3-12-4lowered; pedicels $1-2.5 \mathrm{~mm}$. long; perianth brown or black, 4-7 mm. long, its parts lanceolate, acute; anthers
about I mm. long; capsule brown, $1 \frac{1}{2}-2$ times as long as the perianth, narrowly oblong, tapering to an acute summit, imperfectly 3 -celled; seed $2.5-4 \mathrm{~mm}$. long, contracted into long slender tails. Newf. to Alaska, south along the Rocky Mts. to Colo. In Europe and Asia.
21. Juncus stýgius L. Moor Rush. (I. F. f. 939.) Rootstock none; stems $0.7-3 \mathrm{dm}$. high, single, or few together, erect, I -3-leaved below; leaf-sheaths $\mathbf{I}-\mathbf{2} \mathrm{cm}$. long, clasping, auriculate; blades $2-10 \mathrm{~cm}$. long, slightly compressed, channeled on the upper side, tapering to a blunt point; inflorescence of $\mathrm{I}-4$ heads; heads $\mathbf{1}-4$-flowered; perianth $3-5 \mathrm{~mm}$. long, pale, its parts lanceolate, 3 -nerved, equal; anthers oblong, shorter than the filaments; capsule $6-8 \mathrm{~mm}$. long, pale brown, spindle-shaped, mucronate, 3 -celled below, few-seeded; seed spindle-shaped, 2.5-3 mm. long, with a loose coat, narrowed into thick tails. Newf. to Me., N. N. Y., Mich. and Minn.; also in Br. Col. and Europe.
22. Juncus biglùmis L. Two-flowered Rush. (I. F. f. 940.) Stems $0.2-2 \mathrm{dm}$. high, loosely tufted on a branched rootstock, nearly terete. Leaves $\mathbf{I}-5$, all basal, the outermost sheath usually 8 mm . long or less, the innermost sometimes much longer, the blades nearly terete; inflorescence a capitate cluster of 1 -4 flowers, its lowest bract erect, foliose; perianth $3-3.5 \mathrm{~mm}$. long, dark brown, its parts oblong, obtuse, nearly equal; anthers linear-oblong; capsule longer than the perianth, cylindric-oblong, 3 -sided, retuse at the summit; purplish black, or with purple-margined valves, imperfectly 3 -celled; seed $0.5-0.6 \mathrm{~mm}$. long, fusiform, narrowed into short stout tails. Baffin Bay to Alaska and Br. Col. Also in Europe and Asia.
23. Juncus triglùmis L. Three-flowered Rush. (I. F. f. 94I.) Stems $7-17 \mathrm{~cm}$. high, loosely tufted on the branched rootstock, erect, terete. Leaves $\mathbf{1 - 5}$, all basal, with sheaths clasping and conspicuously auriculate, the blades subterete, blunt; inflorescence a capitate cluster of I-5 (usually 3) flowers; the lowest 2 or 3 bracts usually brown, obtuse and membranous; perianth $3-4 \mathrm{~mm}$. long, its parts oblong-lanceolate, obtuse; anthers linear, short; capsule about equalling the perianth, oblong, obtuse, mucronate. 3 -angled, imperfectly 3 -celled; seed about 2 mm . long, oblong, abruptly contracted into slender tails. Lab. and Newf. to Alaska, south in the Rocky Mountains to Col. Also in Europe and Asia.
24. Juncus pelocàrpus E. Meyer. Brownish-Fruited Rush. (I. F. f. 942.) Rootstock slender; stems $0.7-5 \mathrm{dm}$. high; 1-5-leaved; basal leaves 2-4, mostly with slender terete blades seldom exceeding $\mathbf{1 2} \mathrm{cm}$. in length; inflorescence $\mathbf{1 ~ c m}$. in height or less; panicle loose, with distant heads of 1 or sometimes 2 flowers; perianth $1.5-3 \mathrm{~mm}$. long, the parts linear-oblong, obtuse or the inner sometimes acute; stamens 6; anthers slightly exceeding the filaments; style commonly 1 mm . long; capsule subulate-linear, I-celled, its slender beak exceeding the perianth; seed oblong to obovoid, $0.4-0.5 \mathrm{~mm}$. long, reticulate in about 24 rows. Newf. to N. J. and Minn.

Juncus pelocàrpus subtilis (E. Meyer) Engelm. Much smaller, depressed, I-fewflowered. N. Me. and adjacent Can.
25. Juncus bulbòsus L. Bulbous Rush. (I. F. f. 943.) Tufted, $5-20 \mathrm{~cm}$. high; usually bulbous. Leaves of two kinds, the basal mostly submersed, filiform, the cauline stouter, all with auriculate sheaths, panicle of I-IO heads; heads 4-15flowered, some of the flowers often transformed into tufts of small leaves; perianth 2.5-3 mm . long, its parts nearly equal, linear-lanceolate, obtuse, brown, or with a green midrib; stamens 3 ; capsule narrowly oblong, obtuse, mucronate, slightly exceeding the perianth, brown above, I-celled; seed narrowly oblong, about 0.5 mm . long, acute at base, obtuse and apiculate above, 25-30-ribbed. Lab. and Newf. Common in Europe.
26. Juncus militàris Bigel. Bayonet Rush. (I. F. f. 944.) Stems $0.5-$ 1.2 m . high, erect, stout, $3-6 \mathrm{~mm}$. thick below, arising from a stout roctstock. Leaves of two kinds, the submersed borne in fascicles on the rootstock and developing filiform blades sometimes 5 dm . long; basal leaves reduced to loose bladeless sheaths; stem leaves I or 2 , the lower with a long stout terete blade, the upper, when present, reduced to a bladeless sheath; inflorescence $7-15 \mathrm{~cm}$. high; heads 6-12-flowered; perianth $3-3.5 \mathrm{~mm}$. long, its parts narrowly linear-subulate, the inner longer than the outer; stamens 6; capsule ovoid, acuminate, beaked, I-celled,
few-seeded, about equalling the perianth; seed obovoid, about 0.5 mm . long, reticulated in about 24 rows. Shallow margins of lakes, ponds or streams, N. S. to N. N. Y. and Md.
27. Juncus articulàtus L. Jointed Rush. (I. F.f. 945.) Rootstock branching; stems erect or ascending, 4-6 dm. high, tufted, somewhat compressed, 2-4leaved, basal blade-bearing leaves I or 2 , usually dying early; stem leaves with conspicuously septate blades; inflorescence rarely exceeding $\mathbf{I} \mathrm{dm}$. in height, its branches spreading; heads 6-I2-flowered; perianth $2-3 \mathrm{~mm}$. long, the parts nearly equal, lanceolate, acuminate, reddish brown with a green midrib or green throughout; stamens 6 ; capsule longer than the perianth, brown, 3 -angled, tapering into a conspiciuous tip, I-celled; seed oblong-obovoid, about 0.5 mm . long, reticulate in about 16-20 rows. Lab. to Mass., N. Y., Mich. and Br. Col. Also in Europe and Asia.
28. Juncus Richardsoniànus Schult. Richardson's Rush. (I. F. f. 946.) Stems erect, I.5-5 dm. high in loose tufts, from creeping rootstocks, I-2-leaved; panicle $6-20 \mathrm{~cm}$. high, sparse, its branches strict or slightly spreading; heads 3-12flowered; perianth $2-2.5 \mathrm{~mm}$. long, the inner parts shorter than the outer, obtuse, the outer paler; stamens 6; anthers much shorter than the filaments; capsule ovoidoblong, slightly exceeding the perianth, with a short tip; seed about 0.5 mm . in length, narrowly obovoid to oblong, apiculate, acute or acuminate at the base, lightly reticulate in about 20 rows. N. S. to Br. Col., Penn., Neb. and Wash.
29. Juncus nodòsus L. Knotted Rush. (I. F. f. 947.) Stems I.5-6 dm. high, erect, arising singly from thickenings of a slender rootstock; stem leaves 2-4, and like the basal ones with long erect blades; panicle seldom exceeding 6 cm ., bearing I-30 heads; heads several-many-flowered, $7-12 \mathrm{~mm}$. in diameter; perianth $2.4-3.5 \mathrm{~mm}$. long, its parts lanceolate-subulate, the inner longer than the outer; stamens 6; capsule lanceolate-subulate, 3 -sided, 1-celled, exceeding the perianth; seed oblong, acute below, apiculate above, rarely more than 0.4 mm . long, reticulate in $20-30$ rows. N. S. to Va., Neb. and Br. Col. Also in Nev.
30. Juncus Tórreyi Coville. Torrey's Rush. (I. F. f. 948.) Stems 2-IO dm . high; rootstock slender, with tuberiform thickenings; leaf-blades stout, terete, abruptly divergent from the stem; inflorescence congested, consisting of $\mathrm{I}-20$ heads; heads $10-16 \mathrm{~mm}$. in diameter; perianth $4-5 \mathrm{~mm}$. long, its parts subulate, the outer longer than the inner; stamens 6 ; capsule subulate, 3 -sided, 1 -celled, beaked; seed $0.4-0.5 \mathrm{~mm}$. in length, oblong, acute at both ends, reticulate in about 20 longitudinal rows. W. N. Y. to Tex. and the Pacific coast.

3I. Juncus Caesariénsis Coville. New Jersey Rush. (I. F. f. 949.) Stems 0.5-1 m. high, stout, erect, slightly roughened; basal leaves few, the uppermost, like the cauline, with long erect terete roughened blades; inflorescence $2-10 \mathrm{~cm}$. high, with spreading branches, its lowest bract with a small blade; heads $2-5$-flowered; perianth $4-5 \mathrm{~mm}$. long, the parts lanceolate-acuminate, stiff, green, striate, the inner longer than the outer; stamens 6; capsule lanceolate-oblong, 3 -sided, mucronate-acuminate, incompletely 3 -celled; seed tailed at both ends, altogether about 2 mm . long. Sandy swamps of S. N. J.
32. Juncus brachycàrpus Engelm. Short-fruited Rusif. (I. F. f. 050.) Stems erect, 2-9 dm. high, terete, 1-4-leaved; blades terete, 2 mm . thick or less; inflorescence sometimes $\mathbf{I} \mathrm{dm}$. high and with 20 spherical heads; perianth $3-+\mathrm{mm}$. long, its parts subulate, the inner about three-fourths as long as the outer; stamens 3 ; capsule one-half to two-thirds as long as the perianth, oblong, mucronate, r-celled; seed oblong, acute at both ends, about 0.4 mm . long, reticulate in about iS longitudinal rows. S. Ont., through the Miss. Valley to Okla., Tex. and Miss.; also from N. Car. to Md.
33. Juncus polycéphalus Michx. Many-headed Rusif. (I. F. f. 05 r.) Stems stout, about I m. high, compressed, 2-4-leaved. Leaves 0.5 m . in length or less. the upper shorter; blades vertically flattened, 3-8 mm. hroad; intlorescence $1-3.5$ dm. high; heads globose, $7-10 \mathrm{~mm}$. in diameter; perianth $3+$ mm. long, its parts subulate; stamens 3 ; capsule subulate, I-celled, exceeding the perianth; seed narrowly oblong, about 0.5 mm . long, acute at each end, with mearty straight tips. reticulate in about 12 rows. In swamps, Va. (?) to Fla. and Tex.
34. Juncus scirpoides Lam. Scrppus-thke Rish. (l. F. f. 052.) stems 2-9 dm. high, erect, terete, in clusters. Stem leaves I 3 : blates terete, 2 mm .
thick or less, usually less than 1 dm . long, the septa perfect; basal leaves similar, but with longer blades; inflorescence strict or slightly spreading, sometimes 1.5 dm . in length; heads $2-30$, globose, $6-12 \mathrm{~mm}$. in diameter; perianth $2.5-3.5 \mathrm{~mm}$. long, its parts subulate, the imer somewhat shorter; capsule subulate, I-celled, its long beak exceeding the perianth; seed oblong, abruptly apiculate at either end, reticulate in 14-20 longitudinal rows. Me. (according to Fernald), N. Y. to Fla. and La.
35. Juncus megacéphalus M. A. Curtis. Carolina Rush. (I. F. f. 953.) Stems 3-9 dm. high, tufted from a branching rootstock, stout, 2-3-leaved. Leaves with auricled sheaths, the blades of the basal 2 dm . long or less; the uppermost rarely 2 cm . in length; inflorescence 1.5 cm . high or less, its lowest leaf almost bladeless, the others scarious; panicle of 1-40 heads; heads spherical, $8-12 \mathrm{~mm}$. in diameter; perianth $3-3.5 \mathrm{~mm}$. long, its parts subulate, the outer longer than the inner; stamens 3; capsule subulate, beaked, equalling the perianth, 3 -sided, I-celled; seed oblong, acute at either end, reticulate in I2-I4 rows. Va. (?), N. Car. to Fla.
36. Juncus brachycéphalus (Engelm.) Buch. Small-headed Rush. (I. F. f. 954.) Stems 3-6 dm. high, tufted, 2-4-leaved; leaves all with well developed blades, the lower commonly $1-2 \mathrm{dm}$. long; inflorescence commonly 6-15 cm . high, with spreading branches; heads top-shaped, $2-5$-flowered; perianth $2-2.5 \mathrm{~mm}$. long, its parts lanceolate, the outer shorter than the inner; stamens 3 ; capsule reddish brown, about one-half longer than the perianth, ovoid-oblong, tipped, 3 -sided, r-celled; seed with narrowly oblong body, short-tailed at either end, 20-30-ribbed. N. Y. to Penn., Ill. and Wis.
37. Juncus Canadénsis J. Gay. CaNada Rush. (I. F. f. 955.) Stems $0.3-1.2 \mathrm{~m}$. high, erect, stout, 2-4-leaved, few in a tuft. Basal leaves usually decayed at flowering-time; stem leaves with large loose auriculate sheaths, and a stout erect blade usually I-2.5 dm. long; panicle $0.7-2.5 \mathrm{dm}$. in height; heads usually crowded, 5-40-flowered; perianth 3-4 mm. long, the parts narrowly lanceolate, acute, the inner longer than the outer; stamens 3 ; capsule lanceolate, acute, mucronate, 3 -sided, I-celled, reddish brown, exceeding the perianth; seed I-2 mm. long, tailed at either end, the body with a smooth shining coat, about 40 -striate. N. B. to Minn., Ga. and La.

Juncus Canadénsis subcaudàtus Engelm. Stems 4-7.5 dm. high, slender, frequently weak and reclining; heads few, scattered; seed with very short tails. R. I. to Penn. and Ga.

Juncus Canadénsis brevicaudàtus Engelm. Stems erect, 2-7.5 dm. tall, slender, closely tufted ; panicle contracted ; heads 2 - 6 -flowered ; seed long-tailed N. S. to Minn. and N. J.
38. Juncus acuminàtus Michx. Sharp-fruited Rush. (I. F. f. 956.) Plant 2.5-9 dm. high; rootstock short. Stems few or several in a tuft, erect, I-3-leaved; blades of the lower leaves I-2 dm. long; inflorescence $0.5-\mathrm{I} .5 \mathrm{dm}$. high, and with $5-50$ heads, rarely larger, or reduced even to a single head, its branches usually spreading; heads $3-20$-flowered; perianth $2.5-3.5 \mathrm{~mm}$. long, its parts lanceolate-subulate, nearly equal; stamens 3 ; capsule ovate-lanceolate, broadly acute, mucronate, I-celled, equalling the perianth, light brown; seed oblong, about 0.5 mm . in length, tipped at either end, reticulate in $\mathbf{1 6 - 2 0}$ longitudinal rows. Me. to S. Ont., Minn., Ga. and Mex. Also on the northwest coast. Heads often proliferous.

Juncus acuminàtus débilis (A. Gray) Engelm. Smaller, densely tufted, 2.5-5 dm. high, the stems often weak and procumbent ; perianth shorter, $2-2.5 \mathrm{~mm}$. long; capsule linear-oblong, obtuse, about one-third longer than the perianth, short-tipped. N.. J. to S. Car.
39. Juncus robústus (Engelm.) Coville. Stout Rush. (I. F. f. 957.) Plant about 9 dm . high. Stems single or few in a tuft, stout, nearly terete, I-2-leaved; blades erect, terete, conspicuously many-septate, 2-6 dm. long, usually reaching or exceeding the inflorescence; inflorescence $\mathbf{I}-2.5 \mathrm{dm}$. high, with innumerable (commonly $300-500$ ) heads; heads 2 -10-flowered; perianth $2-2.5 \mathrm{~mm}$. long, its parts nearly equal, lanceolate-subulate; stamens 3 ; capsule equalling or one-third exceeding the perianth, straw-colored, oblong, obtuse with a short tip, 3 -sided
when dry, I-celled; seed nearly as in 7. acuminatus. S. Ill. to Kans., Okla., La. and Tex.
40. Juncus diffusíssimus Buckley. Diffuse Rush. (I. F. f. 958.) Plant 3-6 dm. high. Stems few in a tuft, erect, slender, terete or slightly compressed, 2-4-leaved; blades 1-2 dm. long; inflorescence diffusely branched, $\mathbf{1 - 2 ~ d m}$. high and broad; heads $3-12$-flowered; perianth $2.5-3.5 \mathrm{~mm}$. long, its parts subulate, equal; capsule linear-lanceolate in outline, $4-5.5 \mathrm{~mm}$. long, with a short tip, 3sided, light brown, r-celled; seed oblong to obovoid, acute at the base, abruptly tipped, reticulate in about 16 rows. S. Kans. to Miss. and Tex.

## 2. JUNCOİDES Adans.

Perennial plants, with herbage either glabrous or sparingly webbed, stems leafbearing, leaf-sheaths with united margins, and leaf-blades grass-like. Inflorescence umbelloid, paniculate, or corymbose, often congested; flowers always bracteolate, the bractlets usually lacerate or denticulate; stamens 6 in our species; ovary I-celled, its 3 ovules with basal insertion; seeds 3 , indistinctly reticulate, sometimes carunculate, not distinctly tailed. [Greek, meaning like Juncus.] About 40 species, widely distributed, mostly flowering in spring.

Inflorescence umbelloid, r or 2 flowers on each of its branches. 1. $J$. pilosum.
Inflorescence theoretically paniculate, the flowers often crowded in spike-like clusters.
Outer perianth-parts shorter than the inner ; introduced species. 2. J. nemorosum.
Perianth-parts equal or nearly so ; native species.
Flowers 1-3 together, on the branches of an open panicle. 3. J. parviflorum.
Flowers crowded into one or more thick spikes or spike-like clusters.
Inflorescence nodding.
4. J. spicatum.

Inflorescence erect or spreading, or its individual branches rarely nodding.
Inflorescence of $\mathrm{I}-3$ spike-like or capitate flower-clusters, or the leafblades sharp-pointed.
Inflorescence crowded into a single cluster; leaves flat, usually with a blunt apex. 5. J. nivale.
Inflorescence in 1-4 clusters; leaves narrowed above, involutechanneled, apex very sharp.
6. J. hyperboreum. Inflorescence of ${ }^{2-12}$ spike-like or capitate clusters; leaf-blades with blunt points.
7. J. campestre.

1. Juncoides pilòsum (L.) Kuntze. Hairy Wood-rush. (I. F. f. 959.) Tufted, often stoloniferous. Stems erect, 2-4-leaved, I.5-3 dm. high; leaf-blades 3-8 mm. wide, flat, slightly webbed, acuminate into a blunt tip; inflorescence an umbelloid flower-cluster, the filiform pedicels equal or nearly so, r-flowered or sometimes 2 -flowered; perianth $2.5-3 \mathrm{~mm}$. long, its parts triangular-ovate, acuminate, brown with hyaline margins, about twice as long as the toothed bractlets; capsule about one-fourth exceeding the perianth, its valves ovate, acuminate; seed provided at the summit with a conspicuous hooked caruncle. N. B. to Alaska, N. Y., Mich. and Ore., and in the Alleghanies to N. Car. Also in Europe and Asia.
2. Juncoides nemoròsum (Poll.) Kuntze. Forest Wood-rush. (I. F. f. 960.) Loosely tufted or somewhat stoloniferous. Stems slender, 3-7 dm. high, r-6-leaved; leaf-blades $3-6 \mathrm{~mm}$. wide, ciliate, flat; inflorescence diffusely paniculate or corymbose, the few lower bracts foliose; flowers in clusters of 3 - $\S$, the bractlets ovate, entire or sparingly denticulate above; perianth about 2.5 mm . in length, its parts ovate-lanceolate, acute, the outer about one-fifth shorter than the inner; capsule ovoid, acuminate, barely equalling the perianth; seed olliquely ovoid, about $\mathbf{1 . 2} \mathrm{mm}$. long. A European species, naturalized at Riverilake, N. I.
3. Juncoides parvifiorum (Ehrh.) Coville. Small-flowerei) Woni)-RL'sh. (I. F. f. 96I.) Stems single or few in a tuft, stoloniferous, 2.5-7.5 dm. high, 2-5leaved; leaves glabrous, their blades $3-10 \mathrm{~mm}$. wide; inflorescence a notding decompound panicle, its lowest bract foliose; flowers borne singly, or sometimes 2 or 3 together, on slender pedicels; bractlets ovate, entire or rarely somewhat
 ceeded by the ovoid capsule; sced narrowly oblong, $1-1.5 \mathrm{~mm}$. in length. Lab. to Br. Col., N. H., N. Y. and Minn.; in the mountains to Ariz. and C.al. Also in Europe and Asia.
4. Juncoides spicàtum (L.) Kuntze. Spiked Wood-RUSH. (I. F. f. 962.) Closely tufted, without rootstocks. Stems erect, I-4 dm. high, distantly 1-3leaved; leaf-blades I-3 mm. broad, often involute, especially above, sparingly webby, especially at the base; inflorescence a nodding, spike-like, often interrupted panicle, commonly $\mathrm{I}-2.5 \mathrm{~cm}$. in length; bractlets ovate-lanceolate, acuminate, sparingly lacerate; perianth brown, $2-3 \mathrm{~mm}$. long, its parts lanceolate, aristate-acuminate; capsule broadly ovoid, bluntly acute, about two-thirds as long as the perianth; seed narrowly and obliquely obovoid, about 3 mm . long. Lab. to Alaska, mountains of N. Eng., N. N. Y., Colo. and Cal. Also in Europe and Asia.
5. Juncoides nivàle (Laest.) Coville. Arctic Wood-rush. (I. F. f. 963.) Stems tufted, $5-10 \mathrm{~cm}$. high, I- or 2-leaved. Leaves with sheaths glabrous at the mouth, their blades $2-4 \mathrm{~mm}$. broad, flat and tapering to a usually blunt and callous tip; inflorescence an erect oblong to ovate, spike-like cluster, $\mathbf{I} .3 \mathrm{~cm}$. in height or less; bractlet and perianth dark purple, the former ovate and sparingly lacerate at the hyaline apex; perianth-parts $1.5-2 \mathrm{~mm}$. in length, narrowly oblong; capsule subspheric, exceeding the perianth; seed narrowly oblong, about $\mathbf{I} \mathrm{mm}$. long. Baffin Bay to Alaska. Also in arctic and alpine Europe and Asia.
6. Juncoides hyperbòreum (R. Br.) Sheldon. Northern Wood-rush. (I. F. f. 964.) Stems tufted, commonly I-2 dm. high, erect, I-2-leaved. Leaves with sheaths sparingly ciliate at the mouth, the blades erect, $\mathbf{I}-3 \mathrm{~mm}$. wide at the base, usually involute in age; tapering into a very sharp tip; inflorescence erect, consisting of a single oblong cluster, or its one or two lower divisions on peduncles $\mathrm{I}-3 \mathrm{~cm}$. long; bracts and bractlets membranous, fimbriate; perianth-parts brown, paler above, about 2.5 mm . long, ovate-lanceolate, acuminate, denticulate or slightly lacerate at the apex; capsule about three-fourths as long as the perianth, ovoid. obtuse; seed rather narrowly oblong. Arctic America, Lab. and the higher mountains of N. Eng. Also in Europe and Asia.
7. Juncoides campéstre (L.) Kuntze. Common Wood-rush. (I. F. f. 965.) Stems tufted, $1-5 \mathrm{dm}$. high, 2-4-leaved. Leaf-blades flat, $2-7 \mathrm{~mm}$. broad, tapering to a blunt tip, sparingly webbed when young; inflorescence umbelloid; lower bracts foliose; floral bracts ovate, acuminate; bractlets similar but smaller, fimbriate at the apex; perianth $2-3 \mathrm{~mm}$. long, brown, its parts lanceolate-ovate, acuminate; capsule obovoid or broadly oblong; seed with an oblong body about 1 mm . in length, supported on a narrower white, loosely cellular, strophiole-like base about one-half as long. In woodlands, almost throughout the U. S. and Br. Am. Also in Europe and Asia. Variable. One of our earliest flowering plants.

Family 2. MELANTHÀCEAE R. Br.

## Bunch-flower Family.

Leafy-stemmed herbs (some exotic genera scapose), with rootstocks or rarely with bulbs, the leaves parallel-veined. Flowers regular, racemose, panicled or solitary. Perianth of 6 separate or nearly separate, usually persistent segments. Stamens 6, borne on the bases of the perianthsegments. Anthers small, z-celled, or confluently i-celled and cordate or reniform, mostly versatile and extrorsely dehiscent (introrse in Tofieldia and Abama). Ovary 3-celled, superior or rarely partly inferior; ovules anatropous or amphitropous. Styles 3, distinct, or more or less united. Fruit a capsule with septicidal dehiscence (loculicidal in Abama and Uvularia). Seeds commonly tailed or appendaged. Embryo small, in usually copious endosperm. About 36 genera and 140 species, widely distributed.

Flowers numerous in terminal erect racemes or panicles.
Anthers oblong or ovate, 2 -celled.
Anthers introrsely dehiscent.
$\begin{array}{ll}\text { Capsule septicidal; flowers involucrate by } 3 \text { bractlets. } & \text { x. Tofieldia. } \\ \text { Capsule loculicidal; flowers not involucrate. } & \text { 2. Abama. }\end{array}$

Anthers extrorsely dehiscent.
Flowers perfect.
Stem very leafy; leaves linear; seeds few.
Leaves basal, oblanceolate; seeds numerous.
Fiowers diœcious; stem leafy.
3. Xerophyllum.
4. Helonias.
5. Chamaelirium.

Anthers cordate or reniform, confluently i-celled.
Plants glabrous.
Perianth-segments not gland-bearing.
Flowers perfect; perianth-segments obtuse.
6. Chrosperma.

Flowers polygamous; perianth-segments acuminate.
7. Stenanthium.

Perianth-segments bearing 1 or 2 glands, or a spot.
8. Zygadenus.

Stem and inflorescence pubescent.
Perianth-segments clawed, free from the ovary. 9. Melanthium.
Perianth-segments not clawed, adnate to the base of the ovary.
1о. Veratrum.
Flowers solitary, terminal or opposite the leaves, drooping.
11. Uvularia.

## r. TOFIELLDIA Huds.

Perennial herbs, with short erect or horizontal rootstocks, fibrous roots, slender erect stems leafless above or nearly so, linear leaves clustered at the base, and small perfect white or green flowers in a terminal raceme. Pedicels bracted at the base, solitary or clustered. Flowers usually involucrate by 3 scarious somewhat united bractlets. Perianth-segments oblong or obovate, subequal, persistent, glandless. Stamens 6; filaments filiform; anthers ovate, sometimes cordate, introrse. Ovary sessile, 3-lobed at the summit; styles 3, short, recurved. Capsule 3-lobed, 3beaked, septicidally dehiscent to the base, many-seeded. Seeds tailed or appendaged in most species. [Dedicated to Tofield, an English correspondent of Hudson.] About 15 species, natives of the north temperate zone, 1 or 2 in the Andes of South America. Besides the following another occurs in the southeastern States and two in northwestern America.

Stem glabrous; seeds unappendaged.
Stem viscid-pubescent; seeds appendaged.
Capsule oblong, 6 mm . high; perianth-segments thin.
Capsule ovoid, $3-4 \mathrm{~mm}$. high; perianth-segments rigid in fruit.
I. T. palustris.
2. T. glutinosa.
3. T. racemosa.
r. Tofieldia palústris Huds. Scottish Asphodel. (I. F. f. 966.) Stems slender, leafless or bearing a few leaves near the base, 5-25 cm. tall. Leaves $1-4 \mathrm{~mm}$. wide; raceme oblong or subglobose in flower, dense, elongating to an inch or less in fruit, the lower flowers first expanding; pedicels usually solitary, minutely involucrate, $\mathbf{1}-2 \mathrm{~mm}$. long in fruit; flowers greenish white, 2 mm . broad; perianthsegments obovate, obtuse, much shorter than the oblong-globose minutely beaked capsule. Greenland and Lab. to Alaska, Quebec, Lake Superior, and the Canadian Rocky Mts. Also in Europe and Asia. Summer.
2. Tofieldia glutinòsa (Michx.) Pers. Glutinous Tofieldia. (I. F. f. 967.) Stem viscid-pubescent with black glands, 1.5-5 dm. tall, bearing 2-4 leaves near the base. Basal leaves $2-6 \mathrm{~mm}$. wide; raceme oblong and $\mathbf{I}-3 \mathrm{~cm}$. long in flower, longer in fruit, the upper flowers first expanding; pedicels commonly clustered in 3's (I's-4's), becoming $4-12 \mathrm{~mm}$. long in fruit; involucral bracts minute, united nearly or quite to their apices, flowers $6-8 \mathrm{~mm}$. broad; perianth-segments oblong. mostly obtuse; capsule oblong, about 6 mm . high, twice as long as the perianth; seeds tailed at each end. In bogs, Newf. to Alaska, Me., Ohio, Mich., Wyo. and Ore., and in the southern Alleghenies. May-June.
. Tofieldia racemòsa (Walt.) B. S. P. Viscid Tofieldia. (I. F. f. nos.) Similar to the preceding but rather stouter and taller; the glutinous pubesconce rougher. Leaves $1.5-4.5 \mathrm{dm}$. long, 3-6 mm . wide; raceme $2-10 \mathrm{~cm}$. long in flower, often loose, the uppermost flowers first expanding; pedicels mostly clustered in 3 's, ascending; involucral bractlets about I mm . long, united to abowe the middle; perianth-segments narrowly obovate, obtuse, rigid; capsule avoid. 3 mm . long, little longer than the calyx; seeds tailed at each end. In swamps, S. N. J. to Fla. and Ala. June-Sept.

## 2. ABÀMA Adans.

Perennial herbs, with creeping or horizontal rootstocks, fibrous rents, crect simple stems and linear grass-like basal leaves, those of the stem short and distant.

Flowers small, greenish-yellow, perfect, borne in a terminal raceme. Pedicels bracted at base and usually bearing a small bractlet. Perianth-segments persistent, linear or linear-lanceolate, obscurely 3-5-nerved, glandless. Stamens 6; filaments subulate, woolly; anthers linear-oblong, erect. introrse. Ovary sessile; style very short or none; stigma slightly 3-lobed. Capsule oblong, loculicidally dehiscent, many-seeded, the linear seeds tailed at each end. [Greek, signifying without step, the plants reputed to cause lameness in cattle.] Four known species, natıves of the northern hemisphere. Besides the following, another occurs in northwestern America.
I. Abama Americàna (Ker) Morong. American Bog-asphodel. (I. F. f. 969.) Glabrous; stems wiry, stiff, $2.5-4.5 \mathrm{dm}$. tall. Basal leaves 2 mm . wide or less; lower stem leaves $1-5 \mathrm{~cm}$. long; raceme $2-5 \mathrm{~cm}$. long, dense; perianthsegments $4-6 \mathrm{~mm}$. long, slightly exceeding the stamens; pedicels ascending, 6-8 mm . long in fruit; capsule about $\mathbf{I} \mathrm{cm}$. long, tapering to a subulate beak. In pine barren swamps, S. N. J. June-Sept.

## 3. XEROPHÝLLUM Michx.

Tall herbs, with thick short woody rootstocks, simple erect leafy stems, the leaves narrowly linear, rough-margined. Flowers very numerous, white, in a large dense terminal raceme, the lower ones first expanding. Perianth witheringpersistent, its segments oblong or ovate, 5-7-nerved, spreading, glandless. Stamens 6, rather shorter than the perianth-segments; filaments subulate, glabrous; anthers oblong. Ovary sessile, 3 -grooved; styles 3, filiform, reflexed or recurved; ovules only 2-4 in each cavity. Capsule ovoid, 3 -grooved, loculicidally and sometimes also septicidally dehiscent. Seeds 5, oblong, not at all appendaged, or only minutely so. [Greek, signifying a dry leaf.] Three species, the following of the southeastern U. S., the others of western America.
I. Xerophyllum asphodeloìdes (L.) Nutt. Turkey-beard. (I. F. f. 970.) Stem o.6-1. 4 m . tall, densely leafy below, sparsely leafy above. Leaves slightly dilated at the base, the lower $1.5-4.5 \mathrm{dm}$. long, 2 mm . wide or less, except at the broader base; flowering raceme $5-8 \mathrm{~cm}$. in diameter, its summit conic; flowering pedicels spreading, filiform, $1.8-3.5 \mathrm{~cm}$. long, in fruit erect; perianth-segments obtuse, about 6 mm . long; capsule ellipsoid, obtuse, 4 mm . long. In dry pine barrens, S. N. J. to E. Tenn. and Ga. May-July.

## 4. HELÒNIAS L.

A perennial glabrous bog herb, with a stout rootstock, thick fibrous roots, basal oblanceolate persistent leaves and rather large perfect purple flowers, racemed at the summit of an erect hollow bracted scape. Perianth-segments spreading, spatulate, persistent. Stamens 6. hypogynous, longer than the perianth-segments; filaments filiform; anthers ovate. Ovary ovoid, 3-grooved. 3-celled, slightly 3 -lobed, many-ovuled; styles 3, stigmatic along the inner side, deciduous. Capsule obovoid, deeply 3 -lobed, the lobes divergent, ventrally dehiscent above. Seeds numerous, linear, white-appendaged at each end. [Name from the Greek, in allusion to its growth in swamps.] A monotypic genus of eastern N. Am.
I. Helonias bullàta L. Swamp Pink. (I. F. f. 971.) Leaves dark green, thin, clustered, I.5-4 dm. long, I.5-5 cm. wide. Scape stout, its bracts lanceolate, acute or acuminate; raceme dense, becoming $1-2 \mathrm{dm}$. long in fruit; perianthsegments about 6 mm . long; capsules about 6 mm . long, the valves papery; seeds $3-4 \mathrm{~mm}$. long. In bogs, N. N. J., S. N. Y., and E. Penn. (?) to Va. Local. April-May.

## 5. CHAMAELÍRIUM Willd.

Glabrous, slightly fleshy herbs with bitter tuberous rootstocks. Basal leaves spatulate. Flowers small, white, dioecious, in a long bractless spike-like raceme. Perianth of 6 I-nerved segments. Staminate flowers with 6 stamens, the anthers subglobose, 2 -celled; pistillate flowers with a 3 -celled oblong ovary, 3 short styles, stigmatic along the inner side, and usually with 6 staminodia. Capsule oblong, slightly 3 -lobed, loculicidally 3 -valved. Seeds 6-12 in each cavity, broadly winged at both ends, narrowly winged on the sides. [Greek, signifying a low lily.] Only the following species, natives of eastern N. Am.

Capsule oblong, pedicels slender, barely club-shaped.

1. Chamaelirium lùteum (L.) A. Gray. Blazing-star. (I. F. f. 972.) Staminate plant 3-7 dm. tall, the pistillate often taller and more leafy. Basal leaves $5-20 \mathrm{~cm}$. long, tapering into a long petiole; stem leaves lanceolate, the linear acute or acuminate; staminate raceme finally erect, $7-22 \mathrm{~cm}$. long, the pedicels spreading; pistillate raceme erect; flowers nearly 6 mm . broad; capsules oblong, 7-10 mm. long. In moist meadows and thickets, Mass. to Ont., Mich., Fla. and Ark. Spring.
2. Chamaelirium obovale Small. Similar to the preceding. Pistillate flowers slightly larger; capsules obovoid or oblong-obovoid, $12-14 \mathrm{~mm}$. long, the stout club-shaped pedicels about the same length. In open woods, N. Y. to W. Va. and N. C. Spring.

## 6. CHROSPÉRMA Raf.

An erect glabrous herb, with an ovoid-oblong coated bulb, and numerous long blunt basal leaves, a few short ones on the stem. Flowers perfect, white, in a dense terminal raceme, the lower ones first expanding. Perianth of 6 distinct glandless persistent obtuse segments. Stamens inserted on the bases of the segments; anthers small, reniform. Ovary ovoid, 3-lobed, 3 -celled. Capsule 3 -celled, dehiscent above the middle, the cavities $1-2$-seeded, its 3 divergent lobes tipped with the subulate styles. Seeds ovoid, reddish brown. [Greek, referring to the colored seeds.] A monotypic genus of eastern N. Am.

1. Chrosperma muscaetóxicum (Walt.) Kuntze. Fly-poison. (I. F. f. 973.) Bulb nearly 2.5 cm . in diameter. Stem 4-12 dm. tall. Basal leaves shorter than the stem, the upper bract-like; raceme becoming cylindric, $5-13 \mathrm{~cm}$. long; pedicels ascending, $8-20 \mathrm{~mm}$. long; bractlets ovate; sepals obtuse, $4-6 \mathrm{~mm}$. long; filaments filiform; capsule 4-6 mm. in diameter, scarcely as long. In dry sandy woods, L. I. to E. Penn., Fla., Tenn. and Ark. May-July.

## 7. STENÁNTHIUM Kunth.

Erect glabrous bulbous herbs, with small white or greenish, polygamous flowers in an ample terminal panicle. Leaves linear, keeled. Perianth-segments lanceolate, acuminate, glandless, spreading, persistent, adnate to the base of the ovary. Stamens shorter than the perianth-segments; anthers cordate or reniform. Ovary ovoid. Capsule ovoid-oblong, 3-lobed, finally dehiscent to the base, the lobes with short beaks. Seeds about 4 in each cavity, oblong. [Greek, in allusion to the narrow perianth-segments.] The genus comprises only the two following species:
Leaves $4^{-6} \mathrm{~mm}$. wide; capsule reflexed. 1. S. gramineum.
Leaves $6-20 \mathrm{~mm}$. wide ; capsule erect.
2. S. robustum.

## I. Stenanthium gramíneum (Ker) Morong. Grass-leaved Stenanthium.

 (I. F.f. 974.) Stem 9-12 dm. tall. Leaves grass-like, often 3 dm . long; the upper reduced to small linear-lanceolate bracts; panicle open, simple or somewhat compound, 3-6 dm. long, its branches nearly filiform, spreading or drooping; flowers 8-12 mm. broad; capsule ovoid-oblong, with a top-shaped base, $6-8 \mathrm{~mm}$. long. In dry soil, Va. and Ky. to Fla. and Ala. Aug.-Sept.2. Stenanthium robústum S . Wats. Stout Stenanthium. (I. F. f. 675.) Stem stout, 9-15 dm. tall, usually leafy. Leaves often 3 dm . long or more: panicle denser than that of the preceding, commonly longer, usually compound, its branches spreading or ascending; flowers greenish or white, $12-10 \mathrm{~mm}$. broad; capsule ovoid-oblong, $8-12 \mathrm{~mm}$. long, erect, the very short beaks recurved-spreading. In moist soil, S. Penn. and Ohio to S. Car. and Tenn. July-Sept.
3. ZYGADENNUS Michx.

Glabrous erect perennial herbs, from bulbs or rootstocks, with leafy stems. Leaves linear. Flowers greenish, yellowish or white, in a terminal panicle or raceme. Perianth withering-persistent, its segments separate or united below, bearing 1 or 2 glands or a spot just above the narrowed base. Stamens free from the perianth segments; anthers cordate or reniform. Capsule 3 -lobed, 3 -celled,
the cavities not diverging. dehiscent to the base. Seeds oblong or linear, angled. [Greek, referring to the two glands of some species.] About io species, natives of North America and Mexico, I in Siberia.
Plant with a thick rootstock ; glands of the perianth-segments 2 , orbicular.

1. Z. glaberrimus.

Plants bulbous ; gland only 1 , sometimes faint or a mere spot.
Gland distinctly obcordate: perianth-segments $8-10 \mathrm{~mm}$. long. 2. Z. elegans.
Gland not obcordate ; perianth-segments $4^{-8} \mathrm{~mm}$. long.
Gland with a poorly defined or irregular margin : perianth free from the ovary western species.

Leaves $6-16 \mathrm{~mm}$. wide ; flowers mostly perfect. 3. Z. Nuttallii.
Leaves $4^{-6} \mathrm{~mm}$. wide ; flowers polygamous. 4. Z. venenosus.
Gland a mere yellow spot ; perianth adnate to the ovary ; eastern coast species.
5. Z. leimanthoides.

1. Zygadenus glabérrimus Michx. Large-flowered Zygadenus. (I. F. f. 976.) Slightly glaucous; stem stout. 6-12 dm. tall. Leaves $6-12 \mathrm{~mm}$. wide, channeled. uften 3 dm . long or more, the upper appressed. passing into the bracts of the panicle : panicle $1.5-3 \mathrm{dm}$. long, its branches ascending; pedicels longer than the bractlets ; flowers white. mostly perfect. $2.5-3.5 \mathrm{~cm}$. broad; perianth-segments lanceolate or oblong-lanceolate, narrowed into a short claw; styles subulate; capsule shorter than the perianth. In swamps, Va. to Fla. July-Sept.
2. Zygadenus élegans Pursh. Glatcol's Zygadents. II. F. f. 977. ) Very glaucous; bulb about 2.5 cm . long. Stem slender. I.5-9 dm. tall : leaves $4^{-1}+\mathrm{mm}$. wide. keeled. the lower $\mathrm{I}-3 \mathrm{dm}$. long ; bracts green or purplish ; inflorescence sometimes 3 dm . long. upen. its branches ascending; flowers greenish, 1.62 cm . broad : perianth-segments oval or oborate. obtuse. united below and adnate to the base of the ovary ; capsule oblong, exceeding the perianth. In moist places.工. B. to Alaska. Vt.. N. Y.. Mo.. and in the Rocky Mts. to 工.. Mex. June-Aug.
3. Zygadenus Nuttallii (A. Graỹ) S. Wats. Nuttall's Zygadentes. (I. F. f. 978.) Light green. scarcely glaucous; stem 3-6 dm. high. Leaves $6-16 \mathrm{~mm}$. wide. shorter than the stem. strongly conduplicate; inflorescence racemose or paniculate ; bracts shorter than the slender pedicels ; flowers mostly perfect, about i2 mm . broad; perianth-segments oval or ovate, ubtuse, free from the ovary, thin, short-clawed; capsule $8-12 \mathrm{~mm}$. long. On prairies. Kans. and Colo to Tex. May-June.
4. Zygadenus venenòsus S. Wats. Poisonots Zygadents. (I. F. f. 979.) Pale green ; stem slender, I.5-6 dm. tall, from a small coated bulb. Leaves conduplicate, roughish, 4-6 mm. wide. shorter than the stem ; inflorescence a raceme. $5-10 \mathrm{~cm}$. long in flower, elungating in fruit, the pedicels longer than the bracts; flowers yellow or yellowish. polygamous, about 8 mm . wide ; perianth-segments ovate or elliptic. short-clawed. free from the ovary. bearing a roundish gland with an irregular margin; fruiting pedicels erect; capsule longer than the perianth. S. Dak. and Mont. to Br. Col., Neb., Utah and Cal. May-June.
5. Zygadenus leimanthoides (A. Gray) S. Wats. Pine-barrein Zygadewus. (I. F. f. 980.) Stem slender. 3-12 dm. high, from a fibrous-cuated bulb. Leares $4-8 \mathrm{~mm}$. wide, green on both sides. blunt. or the upper acuminate: panicle I-3 dm. long, its branches densely many-flowered. spreading or ascending; bractlets much shorter than the pedicels; flowers mostly perfect. white or greenish. about 8 mm . broad; perianth-segments ohlong, obtuse. not clawed. adnate to the base of the ovary, bearing a basal yellowish spot; capsule ovoid. much longer than the perianth. In swamps or wet soil, S. N. J. to Ga. July-Aug.

## 9. MELÁNTHIUM L.

Tall leafy herbs, perenmal by thick rootstocks, the stem, at least its upper part. pubescent. Leaves oval. oblanceolate or linear. Flowers greenish. white or cream-colored. darker in withering. monœcious or polygamous, in a large terminal panicle. Perianth of 6 separate persistent clawed segments, free from the ovary. Stamens shorter than the segments and adnate to them; anthers cordate or reniform. their sacs confluent. Ovary-ovoid: styles 3. subulate. Capsule 3-lobed. 3-celled, the cavities several-seeded. Seeds flat and winged, several in each cavity: [Greek, signifying black flower.] The genus comprises the following species and one in Florida :

Perianth-segments with 2 glands at the base of the blade.
Blade of the perianth-segments oblong, entire; leaves linear. 1. M. Virginic.ın.
Blade of the perianth-segments nearly orbicular, undulate; leaves oblanceolate.
2. M. latifolium.

Perianth-segments oblanceolate, glandless; leaves oval.
3. M. parviftorum.
I. Melanthium Virgínicum L. Bunch-flower. (I. F. f. 981.) Stems 7-15 dm. high. Leaves linear, often 3 dm . long, $8-5 \mathrm{~mm}$. wide, the lower sheathing, the upper smaller, sessile; panicle 1.5-4.5 dm. long. its branches ascending; pedicels much longer than the bracts; flowers $1.2-2 \mathrm{~cm}$. broad, greenish yellow, turning brown; perianth-segments obtuse, the blade oblong, flat, entire, sometimes obcordate, twice as long as the claw; capsule $\mathbf{I}-\mathbf{1} .5 \mathrm{~cm}$. long, the persistent styles erect; seeds 8 -Io in each cavity. In meadows, wet woods and marshes, R. I. to N. Y., Minn., Fla. and Tex. June-Aug.
2. Melanthium latifòlium Desr. Crisped Bunch-flower. (I. F. f. 982.) Stem 6-12 dm. tall. Leaves oblanceolate, acute, 2.5 cm . wide, the lower clasping; panicle usually 3 dm . long or more, its branches ascending or spreading; pedicels 6-16 mm. long; flowers $12-16 \mathrm{~mm}$. broad; greenish white, turning darker; blade of the perianth-segments orbicular or ovate, undulate and crisped, bearing 2 glands at the base; capsule $12-16 \mathrm{~mm}$. long, its cavities $4-8$-seeded; flowers fragrant. In dry woods and on hills, Conn. to Penn. and S. Car. July-Aug.

Melanthium latifòium longipedicellàtum A. Brown. Lower leaves $\mathrm{I}-2 \mathrm{~cm}$. wide, and upper pedicels 2.5 cm . long. W. Va.
3. Melanthium parvifiòrum (Michx.) S. Wats. Small-flowered Melanthium. (I. F. f. 983.) Stem slender, $3-\mathrm{I}_{5} \mathrm{dm}$. tall. Lower leaves broadly oval or oblanceolate, acute, $1-2 \mathrm{dm}$. long, $4-10 \mathrm{~cm}$. wide, with narrow sheathing bases, the upper narrowly linear-lanceolate; panicle 3-6 dm. long, open, its slender branches divergent or ascending; pedicels filiform, much longer than the bracts, somewhat longer than the perianth-segments; flowers 8 -10 mm . broad, greenish ; perianth-segments oblanceolate, glandless, short-clawed or sessile; capsule 1012 mm . long. In dry woods, mountains of Va. to S. Car. June-Aug.

## 10. VERÀTRUM L.

Tall perennial herbs, with short poisonous rootstocks, the leaves mostly broad, clasping, strongly veined and plaited, the stem and inflorescence pubescent. Flowers greenish, yellowish or purple. polygamous or monœcious, on short pedicels in large terminal panicles. Perianth-segments 6, glandless or nearly so, not clawed, adnate to the base of the ovary. Stamens opposite the perianth-segments and free from them, short, mostly curved. Anthers cordate, their sacs confluent. Ovary ovoid; styles 3, persistent. Capsule 3-lobed, 3-celled, the cavities several-seeded. Seeds flat, broadly winged. [Ancient name of the Hellebore.] About io species, natives of north temperate zone. Besides the following another occurs in the southern U. S. and two on the Pacific coast.
$\begin{array}{ll}\text { Flowers yellowish green; perianth-segments pubescent, ciliate. } & \text { 1. V. viride. } \\ \text { Flowers purple; perianth-segments glabrous or nearly so. } & \text { 2. V. Woodii. }\end{array}$
Flowers purple; perianth-segments glabrous or nearly so.

## 1. Veratrum víride Ait. American White Hellebore. Indian Poke.

 (I. F. f. 984.) Rootstock erect, 5-8 cm. long, 2-5 cm. thick. Stem stout, 0.62.8 m . tall, very leafy; leaves acute, the lower broadly oval or elliptic, $1.5-3 \mathrm{dm}$. long, o.7-1.5 dm. wide, short-petioled or sessile, sheathing, the upper successively narrower; panicle 2-6 dm. long, densely many-flowered, its lower branches spreadi:ig or drooping; pedicels mostly shorter than the bracts; flowers $1.5-25 \mathrm{~cm}$. broad; perianth-segments oblong or oblanceolate, twice as long as the stamenns; ovary glabrous; capsule $2-2.5 \mathrm{~cm}$. long. In swamps and wet woods, Quebec to Alaska, Ga., Tenn., Minn. and Br. Col. May-July.2. Veratrum Woòdii Robbins. Woon's False Helleboke. (I. ₹. f. 085.) Rootstock short, erect. Stem slender, o.6-1.5 m. tall; leaves mostly bas.al, oblongr or oblanceolate, $5-10 \mathrm{~cm}$. wide, narrowed into sheathing petioles; upper leaves small and linear-lanceolate; panicle open, 3-6 dm. long, its branches ascending; pedicels shorter than the perianth; flowers $12-16 \mathrm{~mm}$. broad, purple: perianth. segments oblanceolate, obtuse, entire, little longer than the stamens: orary pubes.
cent when young; capsule $12-16 \mathrm{~mm}$. long. In dry woods and on hills, S. Ind. to Mo. June-July.

## ii. UVULÀRIA L.

Erect forked herbs, perennial by rootstocks. Stem leafy above, scale-bearing below, the leaves alternate, sessile or perfoliate. Flowers large, solitary at the ends of the branches or rarely 2 together, peduncled, drooping. Perianth bellshaped or narrower; segments distinct, deciduous, each bearing a nectary at the base. Stamens 6, free, or adnate to the very bases of the perianth-segments; filaments filiform; anthers linear, the sacs longitudinally dehiscent. Ovary 3-lobed, 3 -celled, short-stalked or sessile; styles united to about the middle, stigmatic along the inner side above; ovules several in each cavity. Capsule ovoid or obovoid, 3 -angled or 3 -winged, loculicidally dehiscent. Seeds globose, 1-3 in each cavity. [Name Latin, from uvula, a palate, in allusion to the hanging flowers.] Five or six species, natives of eastern N. Am.
Capsule obtusely 3-angled, truncate or rounded; leaves perfoliate.
Glabrous, glaucous ; perianth-segments papillose within.

1. U. perfoliata.

Leaves pubescent beneath; perianth-segments smooth.
2. U. grandiflora.

Capsule acutely $3^{\text {-angled }}$ or 3 -winged, acute at each end; leaves sessile.
Leaves thin, slightly rough-margined, narrowed at both ends. 3. U. sessilifolia.
Leaves firm, manifestly rough-margined, sometimes subcordate. 4. U. puberula.
I. Uvularia perfoliàta L. Perfoliate Bellwort. (I. F. f. 986.) Glabrous and glaucous or pale green. Stems $1.5-5 \mathrm{dm}$. high, slender, usually with I-3 leaves below the fork; leaves oval, oblong or ovate-lanceolate, acute at the apex, rounded or sometimes narrowed at the base, smooth-margined, $5-10 \mathrm{~cm}$. long when mature; flowers $2-2.6 \mathrm{~cm}$. long, pale yellow; perianth-segments granularpapillose within; stamens shorter than the styles or equalling them, the connective sharp-tipped; capsule obovoid, truncate, thicker than long, 8-10 mm. long, obtusely 3 -angled, with concave sides and grooved angles. In moist woods and thickets, Quebec and Ont. to Fla. and Miss. Flowers fragrant. May-June.
2. Uvularia grandifòra J. E. Smith. Large-flowered Bellwort. (I. F. f. 987.) Stems rather stouter than that of the preceding, naked or with $\mathbf{I}$ or 2 leaves below the fork. Leaves perfoliate, oblong, oval or ovate, pubescent beneath, at least when young; flowers lemon-yellow, $2.5-3.4 \mathrm{~cm}$. long; perianth-segments smooth on both sides or slightly granular within; stamens exceeding the styles, the connective blunt; capsule obtusely 3 -angled, truncate. In rich woods, Quebec to Minn., Ga., Tenn. and Iowa. April-June.
3. Uvularia sessilifòlia L. Sessile-Leaved Bellwort. (I. F. f. 988.) Glabrous; stem slender, naked or bearing I or 2 leaves below the fork. Leaves oblong or oblong-lanceolate, $3-8 \mathrm{~cm}$. long when mature, thin, sessile, acute at each end, roughish-margined, pale or glaucous beneath; flowers greenish yellow, 1.63 cm . long; perianth-segments smooth; styles exceeding stamens; anthers blunt; capsule sharply 3 -angled, narrowed at both ends, short-stipitate, about 2.5 cm . long. In moist woods and thickets, N. B. and Ont. to Minn., Ga. and Ark. May-June.

Uvularia sessilifolia nítida (Britton) Morong. Leaves smaller, bright green on both sides; flowers light yellow; capsule scarcely stipitate. Pine barrens of N. J.
4. Uvularia pubérula Michx. Mountain Bellwort. (I. F. f. 989.) Stem sparingly rough-pubescent with short hairs. Leaves oblong, oval or ovate, roughmargined, firm, sessile, acute at the apex, obtuse, subcordate or sometimes narrowed at the base, shining, green on both sides, the midvein sometimes pubescent; Bowers light yellow, about 2.5 cm . long; styles exceeding the stamens; capsule sharply 3 -angled, acute at both ends, sessile or very nearly so on the short peduncle. In mountain woods, Va. and W. Va. to S. Car. May-June.

## Family 3. LILIẢCEAE Adans. <br> Lily Family.

Scapose or leafy-stemmed herbs from bulbs or corms, or rarely with rootstocks or a woody caudex (Yucca), the leaves various. Flowers soli-
tary or clustered, regular, mostly perfect. Perianth parted into 6 distinct or nearly distinct segments, or these more or less united into a tube inferior or partly superior (Aletris). Stamens 6, hypogynous or borne on the perianth or at the bases of its segments ; anthers 2-celled, mostly introrse, sometimes extrorse. Ovary 3-celled; ovules few or numerous in each cavity, anatropous or amphitropous; styles united; stigma 3-lobed or capitate. Fruit a loculicidal capsule (septicidal in Calochortus), or in Yucca sometimes fleshy and indehiscent. Seeds various, winged or wingless. Embryo in copious endosperm. About 125 genera and 1300 species, widely distributed.

* Plants bulbous, or with rootstocks, or fibrous-fleshy roots.

Ovary superior, not adnate to the perianth.
Roots fibrous-fleshy; scape tall : flowers orange or yellow. I. Ilemerocallis.
Low fleshy herb with a short rootstock; flowers white.
2. Leucocrinum.

Plants with bulbs or cormis:
Flowers umbelled.
Perianth 6-parted.
Odor characteristically onion-like ; ovules $\mathbf{I}$ or 2 in each cavity.
3. Allium.

Odor not onion-like ; ovules several in each cavity. 4. Nothoscordum.
Perianth funnelform, the tube about as long as the lobes. 5. Androstephium. Flowers solitary, racemed, corymbed or panicled.

Anthers not introrse.
Perianth-segments all alike or nearly so ; capsule loculicidal.
Anthers versatile ; tall herbs.
6. Lilium.

Anthers not versatile ; low herbs.
Stem leafy; flowers leafy-bracted. 7. Fritillaria.
Leaves only 2 , appearing basal ; flowers bractless.
8. Erythronium.

Outer segments narrower than the inner; capsule septicidal.
9. Calochortus.

Anthers introrse.
Perianth of 6 separate segments. Filaments filiform. Filaments flattened. Perianth globose, oblong or urn-shaped.
10. Quamasia.
11. Ornithogalum.
12. Muscari. Ovary half inferior; roots fibrous; flowers racemed.
13. Aletris.
** Stem a woody caudex; leaves rigid, mostly bearing marginal fibres.
14. Yucca.

## 1. HEMEROCÁLLIS L.

Tall glabrous herbs, with fibrous fleshy roots, basal linear leaves and large flowers clustered at the ends of leafless scapes. Perianth funnelform, its lobes oblong or spatulate, much longer than the cylindric tube. Stamens 6 , inserted at the summit of the perianth-tube, shorter than the lobes, declined; filaments filiform ; anthers linear-oblong, the sacs introrsely dehiscent. Ovary oblong, 3-celled; ovules numerous in each cavity; style slender, declined, tipped with a small capitate stigma. Capsule oblong or ovoid, thick-walled, 3 -angled, transversely wrinkled, loculicidally 3 -valved. [Greek, signifying beautiful for a day.] About 5 species, natives of Europe and Asia.

1. Hemerocallis fúlva L. Day Lily. (I. F. f. 990.) Scapes 9-18 dm. high, mostly longer than the leaves. Leaves $8-12 \mathrm{~mm}$. wide, channeled; flowers 6-15, short-pedicelled, tawny orange, $\mathbf{I}-\mathbf{I} .2 \mathrm{dm}$. lonig, opening for a day; tube of the perianth $2.5-4 \mathrm{~cm}$. long, the lobes oblong, netted-veined. In meadows and along streams, N. B. and Ont. to Va. and Tenn. Escaped from cultivation. Native of Europe and Asia. June-Aug.

Hemerocallis fliva L., the Yellow Day Lily, with bright yellow flowers, their lobes parallel-veined, is occasionally found near old gardens.

## 2. LEUCÓCRINUM Nutt.

A low acaulescent herb, from a short rootstock, the roots thick, fibrous. Outer leaves membranous, acute, short; inner leaves linear. elongated, the innermost reduced to bracts. Flowers large, white, umbellate from the subterranean axis.

Pedicels filiform. Perianth with a very narrow tube and a salverform limb, persistent, the 6 linear-oblong lobes spreading, nerved, shorter than the tube. Stamens borne near the top of the perianth-tube, shorter than the lobes; filaments filiform; anthers linear, their sacs introrsely dehiscent. Ovary ovoid, 3-celled; style filiform; stigma small. Capsule oval or obovoid, 3-angled, sessile, obtuse. loculicidal. Seeds several in each cavity, angled. [Greek, meaning white lily.] A monotypic genus of northwestern N. Am.

1. Leucocrinum montànum Nutt. Leucocrinum. (I. F. f. 991.) Inner leaves $5-25 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; flowers $3-8$; perianth-limb about 1.2 cm . broad, the lobes acute; perianth-tube $2-5 \mathrm{~cm}$. long, less than 2 mm . in diameter; anthers coiled, at least when dry; capsule $6-8 \mathrm{~mm}$. long, erect, leathery. In sandy soil, S. Dak. and western Neb. to Cal. April.June.

## 3. ÁLLiUM L

Bulbous herbs, characteristically odorous (alliaceous), the bulbs solitary, or clustered on short rootstocks. Leaves narrowly linear, or rarely lanceolate or oblong, sheathing, basal, or sometimes also on the stem. Stem (usually a scape) simple, erect. Flowers white, purple, pink or green, in a terminal simple umbel, subtended by 2 or 3 membranous separate or united bracts. Pedicels slender, not jointed. Perianth persistent, the 6 segments separate, or united by their very bases. Stamens inserted on the bases of the perianth-segments; filiments filiform or dilated, sometimes toothed; anther-sacs introrsely dehiscent. Ovary sessile or nearly so, completely or incompletely 3-celled; style filiform, jointed, usually deciduous; stigmas small; ovules I-6 in each cavity. Capsule loculicidal. [Latin for garlic.] About 275 species of wide distribution. Besides the following, some 40 others occur in the western U. S.
Leaves oblong-lanceolate, absent at flowering time. .. A. tricoccum.
Leaves linear, present at flowering time.
Bulb-coats membranous, not fibrous-reticulated.
Umbel capitate; pedicels shorter than the flowers. 2. A. Sibiricum.
Umbel loose ; pedicels much longer than the flowers.
Flowering umbel nodding.
Perianth campanulate, white or pink; outer segments acute.
3. A. cernuum.

Perianth urn-shaped, purple; outer segments obtuse or notched.
4. A. Allegheniense.

Flowering umbel erect.
Leaves flat or channeled, all nearly basal. 5. A. stellatum.
Leaves terete, hollow, several on the stem ; flowers often replaced by bulblets.
6. A. vineale

Bulb-coats fibrous-reticulated.
Capsule not crested.
Flowers mostly replaced by bulblets ; scape $3-6 \mathrm{dm}$. tall. 7. A. Canadense. Flowers rarely replaced by bulblets.

Scape $3^{-6} \mathrm{dm}$. tall ; pedicels $16-24 \mathrm{~mm}$. long ; perianth segments thin.
8. A. mutabile.

Scape $1-2 \mathrm{dm}$. tall ; pedicels $8-12 \mathrm{~mm}$. long ; perianth-segments rigid in fruit.
Capsule-valves with 2 short crests.
9. A. Nuttallii.
10. A. reticulatum.
I. Allìum tricóccum Ait. Wild Leek. (I. F. f. 992.) Bulbs ovoid, clustered, their coats fibrous-reticulated. Leaves oblong-lanceolate or elliptic, appearing early in the spring, but withering before flowering time, 1.5-3 dm. long, $2-5 \mathrm{~cm}$. wide, tapering into a long petiole; scape $1-4 \mathrm{dm}$. tall; bracts of the umbel usually 2 , membranous, acuminate, deciduous; umbel many-flowered, erect; pedicels $1-2 \mathrm{~cm}$. iong; flowers white; perianth-segments obtuse, 4-6 mm. long; ovule I in each cavity of the ovary; capsule deeply 3 -lobed, about 6 mm . broad; seeds globose, black, smooth. In rich woods, N. B. to Minn., N. Car. and Tenn. June-July.
2. Allium Sibíricum L. (I. F. f. 993.) Bulbs narrowly ovoid, their coats not fibrous-reticulated. Scape 3-7 dm. high, bearing 1 or 2 elongated terete hollow reaves: basal leaf I: bracts of the umbel 2, ovate; umbel many-flowered, capitate,
the pedicels $2-6 \mathrm{~mm}$. long; flowers rose-color, longer than the pedicels; perianth narrowly campanulate, its segments $8-\mathbf{1 2} \mathbf{~ m m}$. long, lanceolate, acuminate; stamens much shorter than the perianth; ovules 2 in each cavity; capsule obtusely 3-lobed. In moist soil, N. B. to Alaska, Me., N. N. Y.. Mich., Wyo. and Wash. Also in Europe and Asia. June-July. (A. Schoenoprasum Ill. Fl., not L.)
A. Schoenóprasum, the Chives of the gardens, a smaller plant, with several narrow basal leaves and openly campanulate perianth, occasionally escapes from cultivation.
3. Allium cérnuum Roth. Nodding Wild Onion. (1. F. f. 994.) Bulbs narrowly ovoid, with a long neck. Scape slightly ridged, 3-6 dm. high; leaves 2-4 mm. wide; umbel many-flowered, nodding in flower; pedicels filiform, 1.5-3 dm . long; flowers white, rose or purple; perianth-segments ovate-oblong, 4-6 mm. long; stamens longer than the perianth; ovules 2 in each cavity; capsule 3 -lobed, rather shorter than the perianth, each valve bearing 2 short processes near the summit. On banks and hillsides, N. Y. to Minn. and Br. Col., W. Va., Ky., S. Dak., and in the Rocky Mts. to N. Mex. Variable. July-Aug.
4. Allium Allegheniénse Small. Allegheny Onion. Bulbs ovoid. Leaves few, with narrowly linear blades $2-3 \mathrm{dm}$. long; scapes $3-5 \mathrm{dm}$. tall, 2 -edged at least at maturity; umbel nodding, $\mathbf{1 2}$-40-flowered; pedicels $15-26 \mathrm{~mm}$. long, filiform, becoming thicker in age; perianth purple, mostly urn-shaped, $4-5 \mathrm{~mm}$. high, the segments oval, the outer obtuse or notched, shorter than the inner; capsule 4-5 mm. high, with 2 large processes on each valve. On cliffs or in rocky soil, Va. to N. Car., Tenn. and Ga. Summer and fall.
5. Allium stellàtum Ker. Prairie Wild Onion. (I. F. f. 995.) Bulbs
 wide, nearly flat; umbel erect, subtended by 2 lanceolate or ovate bracts; pedicels filiform, $\mathrm{I}-2 \mathrm{~cm}$. long; flowers rose-color; perianth-segments ovate-oblong, acute, 4-6 mm. long; filaments slightly widened at the base; capsule shorter than the perianth, 3 -lobed, about 6 -seeded, each valve bearing 2 erect processes below the apex. On rocky banks, Ill. and Minn. to Mo. and Kans. July-Aug.
6. Allìum vineàle L. Wild Garlic. Field Garlic. Crow Garlic. (I. F. f. 996.) Bulb ovoid, 2.5 cm . high or less. Stem 3-9 dm. tall, bearing 2-4 terete hollow leaves below the middle at flowering time, the early basal leaves similar; bracts 2, lanceolate, deciduous; umbel erect, the flowers often wholly or in part replaced by small bulblets which are tipped with a long capillary appendage; pedicels $6-25 \mathrm{~mm}$. long, filiform; flowers green or purple, about 4 mm . long; filaments flattened, broad, the 3 interior ones bearing a tooth on each side just below the anther; capsule 3 -lobed. In fields and meadows, Conn. to Ohio, Mo. and Va. Naturalized from Europe. June-July.
7. Allium Canadénse L. Meadow Garlic. (I. F. f. 997.) Bulb ovoid, the outer coats fibrous-reticulated. Scape terete, 2-6 dm. tall; leaves basal or nearly so, narrowly linear, slightly convex beneath, $2-3 \mathrm{~mm}$. wide; bracts white. ovate, acuminate; flowers often replaced by ovoid bulblets; flowers pink or white, the perianth-segments oblong-lanceolate, acute. In meadows and thickets, Me. to Minn., Fla., La. and Ark. May-June.
8. Allium mutábile Michx. Wild Onion. (I. F. f. 998.) Bulbs ovoid, their coats prominently fibrous-reticulated. Scape terete, 3-6 dm. tall; leaves basal. channeled, $2-4 \mathrm{~mm}$. wide; bracts long-acuminate; umbel rarely bulblet-bearing: pedicels $16-24 \mathrm{~mm}$. long; flowers pink, rose or white, $5-8 \mathrm{~mm}$. long: perianthsegments thin, longer than the stamens; capsule rather shorter than the perianth. In moist soil, N. Car. to Ncb., Fla. and Tex. April-June.
9. Allium Nuttallii S. Wats. Nuttall's Wild Onion. (I. F. f. (e)(e).) Bulbs ovoid, their coats fibrous-reticulated. Culm slender, $1-2 \mathrm{dm}$. tall; le.wes basal, 1-2 mm. wide; bracts 3 or 2 , acute or acuminate; pedicels slender, S-12 mm. long; flowers rose or white, about 6 mm . long; perianth-segments acute or acuminate, becoming rigid in fruit; capsule shorter than the perianth. On prairies, Neb. and Col. to Tex. and Ariz. April-June.
10. Allium reticulatum Don. Fraser's Wili Onion. (I. f. f. IOOC.) Similar to the preceding, the bulb rather larger. Scape slemder; leaves usually less than 2 mm . wide; bracts mostly 2, acuminate; pedicels slender. o 12 mm .
long; flowers white or pink, $5-6 \mathrm{~mm}$. long; perianth-segments thin; capsule shorter than the perianth, each of its valves bearing 2 short crests just below the summit. Assiniboia and S. Dak. to N. Mex. and Ariz. May-July.

## 4. NOTHOSCÓRDUM Kunth.

Scapose herbs, similar to the onions, but without alliaceous odor, with mem-branous-coated bulbs, narrowly linear basal leaves and small yellow or yellowish green flowers in an erect 2 -bracted umbel. Perianth 6-parted. withering-persistent, its segments I-nerved. Stamens 6, inserted on the bases of the perianth-segments; anther-sacs introrsely dehiscent. Ovary sessile, 3 -celled; ovules several in each cavity; style filiform, jointed near the base, but commonly persistent; stigma small, capitate. Capsule 3-lobed, loculicidal. Seeds angled or flattish, black. [Greek, signifying false garlic.] About 10 species, the following in the southern U. S. and Mex., 8 or 9 in tropical and S. Am., I Chinese.
r. Nothoscordum biválve (L.) Britton. Yellow False Garlic. (I. F. f. 100I.) Bulb globose. Leaves I-5 mm. wide, flat; bracts lanceolate, acuminate, persistent; umbel 6-12-flowered; pedicels filiform, $2-5 \mathrm{~cm}$. long in fruit; flowers 1o-12 mm . long; perianth-segments thin, oblong-lanceolate, longer than the stamens; capsule obovoid or somewhat depressed. 4-6 mm. high, the style as long or slightly longer. In sandy soil, Va. to Tenn. and Neb., Fla., Tex. and Mex. March-July.

## 5. ANDROSTEPHIUM Torr.

Scapose herbs from a small membranous-coated corm. Leaves basal, narrowly linear. Flowers rather large, blue, in a terminal several-bracted umbel. Perianth funnelform, withering-persistent, the tube about as long as the 6 oblong lobes. Stamens 6, inserted on the throat of the perianth; filaments dilated, united to the middle or above into an erect crown-like tube with toothed lobes alternating with the linear-oblong anthers. Ovary sessile, 3 -celled; ovules several in each cavity; style filiform; stigma 3-grooved. Capsule membranous, 3 -angled, loculicidal. Seeds few, large, oval, black. [Greek, referring to the crown.] Two species, natives of the southwestern U.S.
I. Androstephium coerùleum (Scheele) Greene. Androstephitur. (I. F. f. 1002.) Corm subglobose. Scape $0.5^{-2} \mathrm{dm}$. tall; leaves $2-4 \mathrm{~mm}$. wide, half terete; bracts $2-4$, scarious, acuminate, persistent; umbel 2-7-flowered; pedicels $0.6-3 \mathrm{~cm}$. long; perianth $2-3 \mathrm{~cm}$. long, the lobes about as long as the tube; filament-tube about I cm. long; style about as long; capsule $8-12 \mathrm{~mm}$. high; seeds thin, narrowly winged. Prairies, Kans. to Tex. March-April.

## 6. LíLiUM L.

Tall bulbous herbs, with simple leafy stems, and large erect or drooping showy flowers. Perianth funnelform or campanulate, deciduous, of 6 separate spreading or recurved segments, each with a nectar-bearing groove at its base within. Stamens 6, hypogynous; filaments filiform or subulate; anthers linear, versatile, their sacs longitudinally dehiscent. Ovary 3-celled; ovules numerous; style long, somewhat club-shaped above; stigma 3-lobed. Capsule loculicidally dehiscent. Seeds numerous, flat, horizontal. packed in 2 rows in each cavity. [Latin, from the Greek name of the Lily, said to be from the Celtic li, white.] About 45 species, natives of the north temperate zone. Besides the following, some 8 others occur in western N. Am.

## Flower or flowers erect; perianth-segments narrowed into long claws.

Perianth-segments merely acute.
Leaves lanceolate, nearly all verticillate. I. L. Philadelphicum.
Leaves narrowly linear, nearly all alternate.
2. L. umbellatum.

Perianth-segments long-acuminate; leaves all alternate, appressed.
3. L. Catesbaez.

Flowers drooping or spreading; perianth-segments not clawed.
Leaves or most of them verticillate, their axils not bulbiferous; native species.
Leaves finely roughened on the veins beneath.
Perianth-segments recurved or spreading. 4. L. Canadense.
Perianth-segments not recurved; mountain species. 5. L. Grayi.

Leaves perfectly smooth ; perianth-segments recurved.
Leaves lanceolate ; stem $0.9-3.2 \mathrm{~m}$. tall ; flowers $\mathrm{I}-40$.
6. L. superbum.

Leaves oblanceolate ; stem 6-9 dm. tall ; flowers $\mathbf{1 - 3}$.
7. L. Carolinianum.

Leaves all alternate, crowded, the upper axils bulb-bearing ; escaped from gardens.
8. L. tigrinum.
I. Lilium Philadélphicum L. Red Lily. Wood Lily. Philadelphia Lily. (I. F. f. IOO3.) Bulb composed of jointed fleshy scales. Stem 3-9 dm. tall, leafy above; leaves acute at both ends or the lower sometimes obtuse, 2-10 cm . long, $6-14 \mathrm{~mm}$. wide; thin, the margins finely roughened; flowers $\mathrm{I}-5$, erect, $6-10 \mathrm{~cm}$. high; perianth reddish orange, its segments spatulate, somewhat spreading, purple spotted below; capsule obovoid-oval, $4-5 \mathrm{~cm}$. high. In dry woods and thickets, Me. to Ont., N. Car. and W. Va. June-July.
2. Lilium umbellàtum Pursh. Western Red Lily. (I. F. f. 1004.) Similar to the preceding species; stem usually more slender. Leaves linear, blunt, or the upper acute, ascending, or sometimes appressed, $2-8 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, all alternate or the uppermost verticillate; flowers $1-3$, erect, $5-8 \mathrm{~cm}$. high; peri-ianth-segments red, orange or yellow, spotted below, the claw shorter than the blade; capsule oblong, $7-10 \mathrm{~cm}$. long. In dry soil, Ohio to Minn. and the N. W. Terr., Mo., Ark. and Colo. June-July.
3. Lilium Catesbaèi Walt. Southern Red Lily. (I. F. f. 1005.) Bulb composed of leaf-bearing scales, their leaves linear, $5-10 \mathrm{~cm}$. long, often falling away before the plant flowers. Stem leaves alternate, acute or acuminate, erect or appressed, $2-8 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide; flower erect; perianth-segment scarlet with a yellow purple-spotted base and a slender claw, spreading or somewhat recurved, $7-13 \mathrm{~cm}$. long, long-acuminate, wavy-margined; capsule 2.5 cm . high. In pine barrens, N. Car. to Fla. and Ala. Reported from Ky. and Mo. July-Aug.
4. Lilium Canadénse L. Wild Yellow Lily. Canada Lily. (I. F. f. 1006.) Bulbs subglobose, composed of numerous thick white scales. Stem 6-15 dm. tall; leaves lanceolate, verticillate in 4's-10's or some of them alternate, acuminate, $5-15 \mathrm{~cm}$. long, roughened on the margins and on the veins beneath; flowers 1-16, nodding on long peduncles; perianth-segments $5-8 \mathrm{~cm}$. long, yellow or red, spotted below, recurved or spreading; capsule erect. In swamps, meadows and fields, N. S. to Ont., Minn., Ga. and Mo. Red-flowered forms with slightly spreading perianth-segments resemble the following species, and forms with strongly recurved segments, L. superbum. June-July.
5. Lilium Gràyi S. Wats. Asa Gray's Lily. (I. F. f. Ioo7.) Rootstock bearing small bulbs with thick scales. Stem slender, 6-9 dm. high; leaves oblonglanceolate, acute or acuminate, narrowed at the base, $5-10 \mathrm{~cm}$. long, verticillate in 3 's -8 's or the lowest commonly smaller and scattered, all roughened on the veins beneath; flowers 1-3, long-peduncled, spreading or slightly drooping, $5-8 \mathrm{~cm}$. long, red or tinged with yellow at the base; perianth-segments oblong-spatulate, not clawed. acute, spotted; capsule fig-shaped. Peaks of Otter, Va., and on the higher mountain summits in N. Car. July-Aug.
6. Li ilum supérbum L. Turk's-Cap Lily. (I. F. f. 1008.) Bulbs globose on short rootstocks, their scales white, ovate. Stem 0.9-2.5 m. high; leaves lanceolate or linear-lanceolate, smooth, acuminate at both ends, $5-15 \mathrm{~cm}$. long, verticillate in 3's-8's or the upper alternate; flowers orange, orange-yellow or rarely red, 3-40, nodding, long-peduncled, forming, when numerous, a large panicle; peri-anth-segments $6-10 \mathrm{~cm}$. long, lanceolate, acuminate, purple-spotted, at length usually strongly recurved from below the middle; capsule ohovoid. In meadows and marshes, Me. to Ont., Minn., N. Car. and Tenn. July-Aug.
7. Lilium Caroliniànum Michx. Carolina Lily. (I. F. f. ioon.) Bulbs borne on short rootstocks, globose, composed of fleshy scales. Stem 6-0 dm. high; leaves oblanceolate or obovate, smooth, verticillate, or the upper and lower alternate, narrowed at the base, the veinlets prominently anastomosing; flowers 1 - 3 . orange-red, $7-10 \mathrm{~cm}$. long, long-peduncled, nodding; perianth-segments lanceo. late, acuminate, purple-spotted below, strongly arched backward with their tips sometimes connivent. In dry woods, Va. to Fla. and La. Aug.
8. Lilium tigrìnum Andr. Tiger Lily. (I. F. f. 10io.) Bulb globose,
composed of numerous scales. Stem stout, purple, or nearly black, white-pubescent above, $6-15 \mathrm{dm}$. tall; leaves lanceolate, all alternate, $\mathbf{I}-1.5 \mathrm{dm}$. long, $\mathrm{I}-2 \mathrm{~cm}$. wide, the upper bearing blackish bulblets in their axils; flowers 5-25, orange-red, nodding, $7-\mathbf{I I} \mathrm{cm}$. long; perianth-segments lanceolate, papillose, recurved, purplespotted. Escaped from gardens, Me. and Mass. Native of China and Japan. Summer.

## 7. FRITILLÀRIA L.

Bulbous herbs with simple stems, and nodding, leafy-bracted flowers. Perianth mostly campanulate, deciduous, of 6 separate and nearly equal segments, each with a nectar-pit or spot at the base. Stamens 6, hypogynous; anthers linear or oblong. Ovary nearly or quite sessile, 3-celled; ovules numerous in each cavity; style slender or filiform, 3 -lobed or 3 -cleft ; capsule obovoid or globose, 6 -angled, loculicidally dehiscent. Seeds numerous, flat, margined or winged. [Latin, from fritillus, a dice-box or chess-board, in allusion to the form or to the checkered markings of the perianth in some species.] About 50 species, natives of the north temperate zone. Besides the following, about 12 others occur in western N. Am.

1. Fritillaria atropurpùrea Nutt. Purple Fritillaria. (I. F. f. ioif.) Stem I.5-4 dm. high, slender, leafless below; leaves linear, alternate, sessile, $3-10 \mathrm{~cm}$. long; flowers $1-6$, purple or purplish green and mottled; perianth-segments narrowly oblong, obtusish, $\mathbf{1 . 2 - 2} \mathrm{cm}$. long; stamens shorter than the perianth; style 3 -cleft; capsule erect, acutely angled, $10-12 \mathrm{~mm}$. high. N. Dak. to Neb., Wyo. and Cal. June-July.

## 8. ERYTHRONIUM L.

Low herbs, from deep membranous-coated corms, sometimes propagated by offshoots, the stem simple, bearing a pair of unequal leaves, usually below the middle, the leaves thus appearing basal. Flowers large, nodding, bractless, solitary, or several in some western species. Perianth-segments separate, lanceolate, oblong or oblanceolate, deciduous, with nectariferous groove, and sometimes 2 short processes at the base. Stamens 6, hypogynous, shorter than the perianth; anthers not versatile. Ovary sessile, 3 -celled; style 3 -lobed or 3 -cleft. Capsule obovoid or oblong, somewhat 3 -angled, loculicidal. [Greek, in allusion to the red flowers of some species.] About I2 species, all but one North American. The species are erroneously called Dog's-tooth Violet.

Stem with no offshoot; flowers $2-5 \mathrm{~cm}$. long.
Offshoots produced at the base of the corm; perianth-segments recurved. Flowers yellow ; stigmas very short.

1. E. Americanum. Flowers white, blue or purple; stigmas 2-3 mm. long, recurved.
2. E. albidum.

No offshoots, propagating by basal corms; perianth-segments not recurved.
3. E. mesachoreum. Stem with a fleshy offshoot below the leaves; flowers rose, about $\mathbf{x} .2 \mathrm{~cm}$. long.
4. E. propullans.

1. Erythronium Americànum Ker. Yellow Adder's-tongue. (I. F. f. 1012.) Corm ovoid, $\mathbf{I - 2} \mathrm{cm}$. high, producing offshoots from its base. Stem 1.5-3 dm. long; leaves oblong or oblong-lanceolate, $7-20 \mathrm{~cm}$. long, flat, usually mottled with brown, narrowed into clasping petioles; peduncle about as long as the leaves; flower yellow, or rarely purplish tinged; perianth-segments oblong, $2-5 \mathrm{~cm}$. long, recurved, dotted within, the 3 inner auricled at the base; style club-shaped; capsule obovoid; seeds curved, pointed at both ends. In moist woods and thickets, N. S. to Ont., Minn., Fla., Mo. and Ark. March-May.
2. Erythronium álbidum Nutt. White Adder's-tongue. (I. F. f. Io13.) Similar to the preceding, the leaves sometimes rather narrower. Flower white, blue or purple; perianth-segments oblong, recurved, none of them auricled at the base; style somewhat thickened upward; stigmas linear, finally recurving, $2-3 \mathrm{~mm}$. long; capsule obovoid or oblong. In moist woods and thickets, Ont. to Minn., Ga., Tenn. and Tex, March-May.
3. E:ythronium mesachòreum Knerr. Midland Adder's-tongue. (I. F. f. 1014.) Corm ovoid, not developing offshoots; new corms formed at or within the
base of the old one. Leaves narrowly oblong, not mottled, $1-2.5 \mathrm{~cm}$. long, somewhat folded; flower lavender tinted, $2-5 \mathrm{~cm}$. long; perianth-segments not recurved; style slender; stigmas recurved; capsule obovoid, $1-3 \mathrm{~cm}$. high. On prairies, Iowa to Mo., Neb. and Kans.
4. Erythronium propúllans A. Gray. Minnesota Adder's-tongue. (I. F. f. IO15.) Corm ovoid, not developing offshoots. Stem I.5-2 dm. long, bearing a fleshy curved offshoot $2-5 \mathrm{~cm}$. long from a slit near the base of the petiolesheath; leaves oblong, acute, o.5-1 dm. long, slightly mottled or green; flower rose or pink, about 1.2 cm . long, on a filiform peduncle shorter than the leaves; perianth-segments with a yellow base, apparently not recurved, none of them auricled; stigmas mere ridges. In rich woods, Minn. Also in S. Ont. (according to Macoun) and reported from New York. May.

## 9. CALOCHÓRTUS Pursh.

Herbs, with coated corms, linear leaves and large peduncled flowers. Perianthsegments spreading or connivent, yellow, blue, purple, white or variegated; the 3 outer sepal-like, narrow; the 3 inner petaloid, gland-bearing, and barbed or spotted within. Stamens 6, hypogynous; anthers linear or oblong. Ovary 3-celled; ovules numerous; style very short or none; stigmas 3, recurved. Capsule 3-angled, mostly septicidal, the valves sometimes 2 -cleft. Seeds flat. [Greek, signifying beautiful herb.] About 35 species, natives of western N. Am. and Mex.

Anthers obtuse; gland of inner perianth-segments orbicular or oval. Anthers acute; gland transverse, curved or reniform.

1. C. Nuttallii.
2. C. Gunnisoni.
3. Calochortus Nuttàllii T. \& G. Nuttall's Mariposa Lily. (I. F. f. 1016.) Corm 1-2 cm. high. Stem few-leaved, o.7-4 dm. tall; leaves $2-8 \mathrm{~cm}$. long, $2-5 \mathrm{~mm}$. wide, the lowest commonly bearing a bulb in its axil; outer perianthsegments lanceolate or ovate-lanceolate, acute or acuminate, shorter than the inner; inner perianth-segments obovate-cuneate, $\mathbf{1}-2.5 \mathrm{~cm}$. wide, white, lilac or yellowish, with a yellow base and a purple or purplish spot, the gland orbicular or oval; filaments $6-8 \mathrm{~mm}$. long; about equalling the oblong sagittate anthers; capsule $6-8 \mathrm{~mm}$. thick, acuminate. S. Dak. to Neb. and Cal. June-July.
4. Calochortus Gunnisòni S. Wats. Gunnison’s Mariposa Lily. (I. F. f. 1017.) Stem I.5-4 dm. high. Leaves usually less than 2 mm . wide, involute, at least when dry; outer perianth-segments lanceolate or oblong-lanceolate, scariousmargined, acuminate; inner perianth-segments similar to those of the preceding, lilac, yellowish below the middle, purple-lined and banded, the gland transverse, oblong, curved or reniform, pubescent; anthers acute: capsule narrowly oblong, narrowed at both ends. S. Dak. and Neb. to Ariz. and N. Mex. June-July.

## ro. QUAMÀSIA Raf.

Scapose herbs, with membranous-coated edible bulbs, linear basal leaves, and rather large, blue, purple or white bracted flowers in a terminal raceme. Perianth of 6 separate equal persistent $3-7$-nerved segments. Pedicels jointed at the base of the flower. Stamens inserted at the bases of the perianth-segments; filaments filiform; anthers oblong or linear-oblong, versatile, introrse. Ovary 3-celled, sessile; ovules numerous in each cavity; style filiform, its base persistent; stigma 3 -lobed. Capsule oval, 3-angled, loculicidal. Seeds black, shining. |From quamash, the Indian name.] About 4 species, natives of N. Am.

1. Quamasia hyacínthina (Raf.) Britton. Wild Hyicinth. (I. F. f. ro18.) Bulb ovoid, its outer coat usually nearly black. Scape slender, $3-6$ dm. tall; basal leaves acuminate, shorter than the scape, $3^{-8} \mathrm{~mm}$. wide; racome open; flowers several or many; pedicels filiform, about as long as the bracts and the perianth; bracts long-acuminate; perianth-segments narrowly oblong, $3-5$-nerved, blue or nearly white, longer than the stamens; capsule about 8 mm . high, the valves transversely veined. In meadows and along streams, l'enn. to Minn., Ala. and Tex. April-May.
2. ORNITHÓGALUM L.

Scapose herbs, with coated bulbs, narrow basal fleshy leaves, and large white or yellow flowers in a terminal bracted corymb or raceme. Perianth-segments
equal or nearly so, separate, white, or sometimes green without, persistent. Stamens hypogynous; filaments flattened, often broad; anthers versatile, introrse. Ovary 3 -celled, sessile; ovules several or numerous in each cavity; stigma capitate, 3 -lobed or 3 -ridged. Capsule subglobose, 3 -sided or 3 -lobed, loculicidal. Seeds black. [Greek, signifying bird's milk, said to be in allusion to the egg-white color of the flowers in some species.] About 75 species, natives of Europe, Asia and Africa.

Flowers corymbose, erect; pedicels long, slender. Flowers racemose, drooping; pedicels very short, stout.

1. O. umbellatum. 2. O. nutans.
2. Ornithogalum umbellàtum L. Star-of-Bethlehem. (I. F. f. iorg.) Tufted; bulbs ovoid. Scape slender, $1-3 \mathrm{dm}$. high; leaves $2-5 \mathrm{~mm}$. wide, dark green with a light midvein, blunt; flowers corymbose, opening in sunshine; bracts linear-lanceolate, mostly shorter than the pedicels; pedicels erect or ascending ; perianth-segments oblong-lanceolate, acute, white above, green with white margins beneath, $\mathrm{I}-2 \mathrm{~cm}$. long, about twice as long as the stamens; filaments not toothed. In fields and meadows, N. H. to Penn. and Va. Naturalized from Europe. MayJune.
3. Ornithogalum nùtans L. Drooping Star-of-Bethlehem. (I. F. f. 1020.) Bulb ovoid, $2-5 \mathrm{~cm}$. long. Scape stout, 3-6 dm. high; leaves blunt, $4-8 \mathrm{~mm}$. wide; flowers racemose, nodding; raceme loose; pedicels stout, $4-12 \mathrm{~mm}$. long; bracts lanceolate, long-acuminate, much longer than the pedicels; perianthsegments oblong-lanceolate, about 2.5 cm . long, nearly twice as long as the stamens; filaments 2-toothed at the apex. Escaped from gardens, Penn. to D. C. Native of Europe. April-May.

## 12. MUSCARI Mill.

Low bulbous scapose herbs, with basal linear fleshy leaves, and nodding bracted racemose flowers, deep blue (rarely white) in the following species. Perianth globose, urn-shaped, or oblong, with 6 teeth or short lobes. Stamens 6, inserted on the perianth-tube, included; anthers ovate, versatile, introrse. Ovary 3-celled, sessile; ovules 2 in each cavity; style short; stigma 3-lobed. Capsule 3 -sided or 3 -winged, loculicidal. Seeds black, angled. [From the musk-like odor of the flowers of some species.] About 40 species, natives of Europe, Asia and Africa.
Perianth globose, $2-3 \mathrm{~mm}$. in diameter ; leaves erect.

1. M. botryoides. Perianth oblong, urn-shaped, $4^{-6} \mathrm{~mm}$. long ; leaves recurved.
2. M. racemosum.
I. Muscari botryoìdes (L.) Mill. Grape-Hyacinth. (I. F. f. iozi.) Scape $\mathbf{I}-2.5 \mathrm{dm}$. high; leaves about as long as the scape, $2-8 \mathrm{~mm}$. wide, channelled; raceme oblong-cylindric, $2-3 \mathrm{~cm}$. long, dense, or becoming longer and looser in fruit; pedicels shorter than the faintly odorous flowers; valves of the capsule obovate. In meadows and thickets and along roadsides, escaped from gardens, N. H. to Ohio and Va. Naturalized or adventive from southern Europe. Native also of Asia. April-June.
3. Muscari racemòsum (L.) Mill. Starch Grape-Hyacinth. (I. F. f. 1022.) Leaves $2-4 \mathrm{~mm}$. wide, recurved or spreading, channelled above; raceme oblong or ovoid, many-flowered, dense; pedicels shorter than the starchy-scented flowers or sometimes equalling them, slender; perianth constricted at the throat, with 6 deltoid recurved white teeth; capsule-valves suborbicular, retuse. Escaped from gardens S. N. Y. to Penn. and Md. Native of southern Europe. AprilMay.

## 13. ÁLETRIS L.

Scapose perennial bitter fibrous-rooted herbs, with basal lanceolate leaves, and small, white or yellow, bracted perfect flowers in a terminal spike-like raceme. Perianth oblong or campanulate, roughened without, 6 -lobed, its lower part adnate to the ovary. Stamens 6, inserted on the perianth at the bases of the lobes, included; anthers introrse. Ovary 3-celled; ovules numerous, anatropous; style 3 -cleft above; stigmas minutely 2 -lobed. Capsule ovoid, enclosed by the persistent perianth, 3 -celled, many-seeded, loculicidal. Seeds oblong, ribbed. Embryo small. Endosperm fleshy. [Greek, signifying to grind corn, apparently in allu
sion to the rough, mealy flowers.] About 8 species, natives of eastern N. Am. and Asia.
Perianth white, oblong or cylindric.

1. A. farinosa.

Perianth yellow, bell-shaped or ovoid-globose.
I. Aletris farinòsa L. Star-grass. Colic-root. (I. F. f. Io23.) Roots tough; scape 4-9 dm. tall, slender, terete, striate. Basal leaves lanceolate or linearlanceolate, acuminate at the apex, narrowed to the base, spreading, pale, yellowish green, $5-\mathbf{I} 5 \mathrm{~cm}$. long, $6-20 \mathrm{~mm}$. wide; raceme $\mathbf{I}-3 \mathrm{dm}$. long in flower, or longer in fruit, dense, erect; pedicels 2 mm . long or less; bracts subulate; perianth white, or the oblong lobes yellowish, $6-8 \mathrm{~mm}$. long; style subulate, capsule ovoid, about 4 mm . long, loculicidal above. In dry, mostly sandy soil, Me. to Ont., Minn., Fla. and Tenn. May-July.
2. Aletris àurea Walt. Yellow Colic-Root. (I. F. f. 1024.) Basal leaves shorter than those of the preceding, acuminate, narrowed into short petioles. Scape 3-8 dm. tall; raceme 2-6 dm. long, usually loose; pedicels 2 mm . long or less, shorter than the bracts; perianth bell-shaped or ovoid-globose, $4-6 \mathrm{~mm}$. long, its lobes oval ; style short; capsule ovoid, about as long as the perianth. S. N. J. (according to Gray and to Rusby) ; Va. to Fla. and Tex. June-Aug.

## 14. YÚCCA L.

Large plants, with a short sometimes subterranean caudex, or tall woody and leafy stem, or bracted scape, the leaves linear or lanceolate, usually rigid and sharppointed, bearing long marginal thread-like fibres in our species. Flowers large. nodding in a terminal raceme or panicle. Perianth campanulate, or nearly globular, white in our species, of 6 ovate, or ovate-lanceolate united segments. Stamens hypogynous, shorter than the perianth; filaments thickened above; anthers small, versatile. Ovary sessile, 3 -celled, or imperfectly 6 -celled; ovules numerous; style columnar, short, with 3 stigmatic lobes. Fruit a capsule, or fleshy, or spongy and indehiscent. Seeds numerous, flattened, horizontal. [The Haytien name.] About 16 species, natives of North and Central America.
Fruit fleshy, indehiscent, drooping.

1. Y. baccata. Fruit an erect capsule.

Leaves $4-10 \mathrm{~mm}$. wide; scape short, bearing a long raceme. 2. Y. glauca.
Leaves $2-5 \mathrm{~cm}$. wide; scape $0.6-3 \mathrm{~m}$. high, bearing a large panicle.
3. $\boldsymbol{Y}$. filamentosa.
I. Yucca baccàta Torr. Spanish Bayonet. (I. F. f. 1025.) Caudex very short, or sometimes 2.5 m . tall, covered with the reflexed dead leaves. Leaves $4-9 \mathrm{dm}$. long, $2-5 \mathrm{~cm}$. wide, with a much wider base, and a stout brown tip, concave, the marginal fibres $5-12 \mathrm{~cm}$. long; panicle peduncled; pedicels stout; flowers I-I. 2 dm . broad; perianth-segments $\mathbf{I} .5-2.5 \mathrm{~cm}$. wide; style slender; fruit oval, dark purple, indehiscent, edible, drooping 5-8 cm . long, with a 6 -grooved beak. W. Kans. (?), S. Colo. to Tex., Cal. and Mex. April-June.
2. Yucca glaùca Nutt. Bear-grass. (I. F. f. 1o26.) Caudex very short; leaves basal, narrowly linear, smooth, very stiff, sharp-pointed, 4-10 mm . wide, with a broader base, concave, at least when dry, the marginal fibres filiform; scape short; flowers $3-7 \mathrm{~cm}$. broad, racemose; perianth-segments ovate, $2.5-4 \mathrm{~cm}$. long: style short; pedicels stout, erect ; capsule oblong, about 2.5 cm . thick, 6 -sided. In dry soil, Iowa to S. Dak., Wyo., Mo., Tex. and Ariz. May-June.
3. Yucca filamentòsa L. Adam's Needle. (I. F. f. IO27.) Caudex short. Leaves lanceolate, narrowed above the broad base, acuminate and sharp-pointed. flat, roughish, $3-8 \mathrm{dm}$. long, $1.5-5 \mathrm{~cm}$. wide; scape $0.6-3 \mathrm{~m}$. high; panicle large, its branches divergent or ascending; flowers numerous; perianth-segments $3-0 \mathrm{~cm}$. long, ovate; capsule oblong, about 2 cm . thick. In sandy soil, Md. to Fla., Tenn. and La. Escaped from gardens in Penn. May-July.

> Family 4. CONVALLARIACEAE. Link.
> Lily-of-the-Valley Family.

Scapose or leafy-stemmed herbs, with simple or branched rouistocks. Flowers solitary, racemose, panicled or umbelled, regular and perfect.

Leaves broad, parallel-veined and sometimes with cross-veinlets, in Asparagus and its allies reduced to scales bearing filiform or flattened branchlets in their axils. Perianth inferior, 4-6-parted with separate segments, or oblong, cylindric or urn-shaped and 6-lobed or 6-toothed. Stamens 6, rarelv 4 . hypogynous or borne on the perianth; anthers introrsely. extrorselv or laterally dehiscent. Ovary 23 -celled, superior ; ovuies anatropous or amphitropous: style slender or short: stigma mostly 3 -1obed. Fruit a fleshy berry. Seeds few or numerous. Embryo small. Endosperm copious. About 23 genera and 215 species, widely distributed.
Leaves reduced to scales; leaf-like branchlets filiform. I. Asparagus.
Leaves broad; stems simple or somewhat branched.
Leaves alternate or basal.
Leaves basal ; flowers umbelled or solitary. 2. Clintonia.
Leaves alternate (solitary in flowerless plants of no. 4).
Perianth-segments separate.
Flowers racemed, umbelled, panicled or solitary, terminal. Flowers racemed or panicled.

Perianth-segments 6. 3. Vagnera.
Perianth-segments 4.
Flowers umbelled or solitary.
Flowers solitary or two together, axillary. Perianth cylindric or oblong, 6 -toothed.
Leaves nearly basal; flowers racemed; perianth 6-toothed.
Leaves in I or 2 whorls below the flower or flowers.
Leaves in $\mathbf{2}$ whorls; flowers umbelled.
Leaves in I whorl; flowers solitary.
4. Unifolium.
5. Disporum.
6. Streptopus.
7. Salomonia.
8. Convallaria.
9. Medeola.

1. Trillium.

## 1. ASPÁRAGUS L.

Stem at first simple, fleshy, scaly, at length much branched; the branchlets filiform and mostly clustered in the axils of the scales in the following species, flattened and linear. Flowers small, solitary, umbelled or racemed. Perianth-segments alike, separate, or slightly united at the base. Stamens inserted at the bases of the perianth-segments; anthers introrse. Uvary sessile, 3 -celled; ovules 2 in each cavity; style short; stigmas 3, short, recurved. Berry globose. Seeds few, rounded. [Ancient Greek name.] About 100 species, natives of the Old World.
I. Asparagus officinalis L. Asparagus. (I. F. f. Io28.) Rootstock much branched. Young stems edible, stout, later branching, and becoming $1-2 \mathrm{~m}$. tall, the filiform branchlets $6-18 \mathrm{~mm}$. long. Flowers mostly solitary at the nodes, green, drooping on filiform jointed peduncles; perianth campanulate, about 6 mm . long, the segments linear; stamens shorter than the perianth ; berry red, about 8 mm . in diameter. Escaped from cultivation and naturalized, especially along salt marshes, N. B. to Va. and locally in waste places in the interior. Native of Europe. May-June.

## 2. CLINTÒNIA Raf.

Somewhat pubescent scapose herbs, with slender rootstocks, erect simple scapes, and few broad petioled sheathing basal leaves, the bractless flowers umbelled at the summit of the scape in our species. Perianth-segments equal or nearly so. Stamens 6 , inserted at the bases of the perianth-segments; filaments filiform; anthers laterally dehiscent. Ovary $2-3$-celled; ovules 2 -several in each cavity; stigma obscurely 2-3-lobed. Berry globose or oval. [Name in honor of De Witt Clinton, 1769-1828, American naturalist, Governor of the State of New York.] Six species, the following of eastern North America, two Asiatic.

Flowers greenish yellow, drooping, $\mathrm{r} .6-2 \mathrm{~cm}$. long ; berry blue. Flowers white, not drooping, 8 -10 mm . long; berry black.

I C. borealis.
2. C. umbellulata.
I. Clintonia boreàlis (Ait.) Raf. Yellow Clintonia. (I. F. f. rozg.) Scape 1.5-4 dm. high. Leaves 2-5, oval, oblong or obovate, thin, ciliate, shortacuminate or cuspidate; umbel 3 -6-flowered ; pedicels $6-30 \mathrm{~mm}$. long, slender, erect or ascending in fruit; stamens about as long as the perianth ; ovary 2 -celled;
ovules numerous, in 2 rows in each cavity; style slender, somewhat thickened above; berry oval, several-seeded, about 8 mm . in diameter. In moist woods and thickets Newf. to Ont. and Minn., N. Car. and Wis. May-June.
2. Clintonia umbellulàta (Michx.) Torr. White Clintonia. (I. F. f. iozo.) Scape $2-4.5 \mathrm{dm}$. high. Leaves $2-5$, oblong, oblanceolate or obovate, acute or cuspidate, ciliate, umbel several-many-flowered; pedicels ascending or erect, slender, pubescent, becoming $\mathbf{1}-3 \mathrm{~cm}$. long in fruit ; flowers white, odorous, often purplish dotted; perianth-segments obtusish; ovary 2-celled; ovules 2 in each cavity; style slender; berry globose, few-seeded. In woods, N. Y. and N. J. to Ga. and Tenn. May-June.

## 3.'VÀGNERA Adans.

Stem scaly below, leafy above, the leaves alternate, short-petioled or sessile. Inflorescence a terminal raceme or panicle. Flowers white or greenish white, small. Perianth of 6 spreading equal segments. Stamens 6, inserted at the bases of the perianth-segments; filaments filiform or slightly flattened; anthers introrse. Ovary 3 -celled, sessile ; ovules 2 in each cavity; style columnar; stigma 3-grooved or 3lobed. Berry globular. Seeds usually 1 or 2, subglobose. [Named in honor of Wagner.] About 25 species, natives of North America, Central America, and Asia. Besides the following, one or two others occur in the western U. S.

Flowers numerous, panicled.
Flowers few-several, racemose.
Plant $2.5-4.5 \mathrm{dm}$. high: leaves numerous.
Plant $0.5-4 \mathrm{dm}$. high; leaves 2-4.

1. V. racemosa.
2. $V$. stellata.
3. $I$. trifolia.
I. Vagnera racemòsa (L.) Morong. Wild Spikenard. (I. F. f. iozi.) Rootstock fleshy. Stem somewhat angled, leafy, finely pubescent above, or nearly glabrous, 3-9 dm. high. Leaves oblong-lanceolate or oval, sessile or the lower short-petioled, o. $.7-1.5 \mathrm{dm}$. long, acuminate, finely pubescent beneath, their margins minutely ciliate; panicle densely many-flowered, $2-10 \mathrm{~cm}$. long, peduncled; flowers about 4 mm . broad; perianth-segments oblong; berry red, aromatic, speckled with purple, $4^{-6} \mathrm{~mm}$. in diameter. In moist woods and thickets, N. S. to Br. Col., Ga., Mo. and Ariz. May-July.
4. Vagnera stellàta (L.) Morong. Star-flowered Solomon's Seal. (I. F. f. IO32.) Rootstock stout, fleshy. Stem glabrous, 2-5 dm. tall, leafy. Leaves oblong lanceolate or lanceolate, sessile and somewhat clasping, minutely pubescent beneath, $5-13 \mathrm{~cm}$. long, flator somewhat concave; raceme $2-5$ long cm . long, severalflowered; pedicels $2-8 \mathrm{~mm}$. long; perianth-segments oblong, obtuse; style about as long as the ovary; berry green with 6 black stripes, or black, 6-10 mm. in diameter. In moist soil, Newf. to Br. Col., Va., Ky., Kans. and Cal. Also in northern Europe. May-June.
5. Vagnera trifòlia (L.) Morong. Three-leaved Solomon's Seal. (I. F. f. IO33.) Glabrous; rootstock slender. Stem slender, o.5-4 dm. high, 2-4-leaved (usually 3-leaved); leaves oval, oblong or oblong-lanceolate, sessile, sheathing, $5^{-1} 3$ cm . long, acute or acuminate at the apex, narrowed at the base; raceme few-flowered, peduncled ; perianth-segments oblong or oblong-lanceolate, obtuse, finally somewhat reflexed; berry dark red, $5-6 \mathrm{~mm}$. in diameter. In bogs and wat words, Newf. to Br. Col., N. J., Penn. and Mich. Also in northern Asia. May-June.

## 4. UNIFÒLIUM Adans.

Low herbs, with slender rootstocks, simple few-leaved stems, and small white flowers in a terminal raceme, the pedicels commonly $2-3$ together. Perianth of 4 separate spreading segments. Stamens 4 , inserted at the bases of the segments; filaments filiform; anthers introrse. Ovary sessile, 2 -celled; ovules 2 in eath cavity; style about as long as the ovary, 2 -lobed or 2 -cleft. Rerry globular, i 2 seeded. [Many plants bear only a solitary long-petioled leat, arising from the rootstock, whence the Latin name.] Two known species, the following of eastern N. Am., the other of Europe, Asia and N. W. America.
 leaved Solomon's Seal. (I. F. f. 1034.) Stem slender, i-3-leaved (usually 2 -
leaved), $5-18 \mathrm{~cm}$. high; leaves ovate or ovate-lanceolate, $2-8 \mathrm{~cm}$. long, cordate, with a narrow or closed sinus, sessile, short-petioled; solitary leaves of the stemless plants on petioles $2-10 \mathrm{~cm}$. long; raceme many-flowered, $2-5 \mathrm{~cm}$. long; perianthsegments becoming reflexed, about 2 mm . long; berry pale red, speckled, about 4 mm . in diameter. In moist woods and thickets, Newf. to the N. W. Terr., N. Car., Iowa and S. Dak. May-July.

## 5. DÍSPORUM Salisb.

Herbs with slender rootstocks, branching stems, leafy above, and alternate sessile or clasping leaves, the flowers terminal, drooping, whitish or greenish yellow, solitary or in simple umbels. Perianths of 6 narrow deciduous segments. Stamens 6, hypogynous; filaments filiform or somewhat flattened; anthers extrorse. Ovary 3 -celled; ovules 2 or sometimes several in each cavity; style slender; stigma 3-cleft or entire. Berry ovoid or oval. [Greek, referring to the 2 ovules in each cavity of the ovary, in most species.J About 15 species, natives of N. Am. and Asia. Besides the following, some 5 others occur in western N. Am.

Stamens shorter than the perianth; fruit smooth, $2-6$-seeded. Stamens as long as the perianth; fruit roughened, 4-18-seeded.

1. D. lanuginosum.
2. D. trachycarpum.
I. Disporum lanuginòsum (Michx.) Nicholson. Hairy Disporum. (I. F. f. 1035.) Finely and rather densely pubescent, 3-7 dm. high. Leaves ovate-lanceolate, or oblong-lanceolate, $5-11 \mathrm{~cm}$. long, long-acuminate at the apex, rounded at the base, 7-15-nerved; flowers solitary or $2-3$ together, greenish, $12-18 \mathrm{~mm}$. long; pedicels filiform; perianth narrowly campanulate, its segments linear-lanceolate, acuminate, glabrous; ovary oblong; style slender, 3 -cleft; berry oval, red, IO-I4 mm. long. In woods, Ont. to W. N. Y. and Tenn. May-June.
3. Disporum trachycàrpum (S. Wats.) B. \& H. Rough-fruited Disporum. (I. F. f. 1036.) Puberulent, 3-6 dm. high. Leaves ovate, oval or oblonglanceolate, 3-9 dm. long, acute or short-acuminate at the apex, rounded or subcordate at the base, 5-II-nerved; flowers yellowish white, $8-14 \mathrm{~mm}$. long; perianth narrowly campanulate, its segments acute, little spreading; style slender, 3 -lobed; berry depressed-globose or somewhat obovoid, 8 -10 mm. in diameter, $4-\mathrm{r} 8$-seeded. Manitoba and the N. W. Terr. to S. Dak., Neb., Wash. and Ariz. May-Aug.

## 6. STRÉPTOPUS. Michx.

Branching herbs, with thin sessile or clasping alternate leaves. Flowers solitary or 2 together, extra-axillary, slender-peduncled, greenish, rose or purplish, small, nodding. Peduncles bent or twisted at about the middle. Perianth campanulate, its 6 segments recurved or spreading, deciduous, the outer flat, the inner keeled. Stamens 6, hypogynous; filaments short, flattened; anthers sagittate, extrorse. Ovary 3-celled; ovules numerous in 2 rows in each cavity; style slender. Berry globose or oval, red, many-seeded. [Greek, twisted stalk, in reference to the bent or twisted peduncles.] About 5 species, natives of the north temperate zone. Besides the following, another occurs on the Pacific Coast.

Leaves glaucous beneath, clasping; flowers greenish-white. i. S. amplexifolius.
Leaves green on both sides, sessile; flowers purple or rose.
2. S. roseus.
I. Streptopus amplexifòlius (L.) DC. Clasping-Leaved Twisted-stalk. (I. F. f. 1037.) Rootstock short, stout. Plant 4-9 dm. high; stem usually branching below the middle; leaves $5^{-13} \mathrm{~cm}$. long, acuminate at the apex, cordate-clasping at the base, glabrous; peduncles $\mathrm{I}-2$-flowered; flowers $8-12 \mathrm{~mm}$. long; peri-anth-segments narrowly lanceolate, acuminate; anthers subulate-pointed; stigma simple, obtuse or truncate; berry oval, $10-16 \mathrm{~mm}$. long. In moist woods, Lab. to Alaska, N. Car., Ohio, Mich. and N. Mex. May-July.
2. Streptopus ròseus Michx. Sessile-Leaved Twisted-stalk. (I. F. f. 1038.) Plant 3-8 dm. high. Branches sparingly pubescent; leaves $5^{-1 I ~ c m . ~}$ long, acuminate at the apex, sessile, rounded, or slightly clasping at the base, their margins finely ciliate ; peduncles usually pubescent ; flowers purple or rose, 8-12 mm . long ; perianth-segments lanceolate, acuminate; anthers 2 -horned; style 3 -cleft, the spreading branches stigmatic along the inner side; berry globose or
ova', $10-12 \mathrm{~mm}$. in diameter. In moist woods, Lab. to Alaska, Ga., Mich. and Ore. May-July.

## 7. SALOMONIA Heist.

Herbs, with thick jointed and scarred rootstocks, simple stems, scaly below, leafy above, the leaves sessile and alternate in our species. Flowers greenish or pinkish, axillary, drooping, peduncled, solitary or $2-10$ in an umbel, the pedicels jointed at the base of the flower. Perianth 6-lobed. Stamens 6, included; filaments adnate to the perianth for half their length or more; anthers sagittate, introrse. Ovary 3-celled; ovules 2-6 in each cavity ; style slender ; stigma small, capitate or slightly 3 -lobed. Berry globular, dark blue or nearly black, with a bloom, in our species. [Named in honor of Salomon.] About 20 species, natives of the north temperate zone. (Polygonatum Adans.)
Leaves pubescent beneath; filaments filiform, roughened. I. P. biflorum. Plant glabrous throughout; filaments smooth, somewhat flattened. 2. P. commutatum.

1. Salomonia biflòra (Walt.) Britton. Hairy Solomon's Seal. (I. F. f. 1039.) Stem slender, glabrous, $2-9 \mathrm{dm}$. high. Leaves $4-10 \mathrm{~cm}$. long, $1.2-5 \mathrm{~cm}$. wide, acute or acuminate at the apex, sometimes obtuse at the base, pubescent especially on the veins and pale beneath, glabrous above; peduncles I-4-flowered (often 2 -flowered); perianth $8-12 \mathrm{~mm}$. long; filaments filiform, adnate to the perianth for about three-fourths its length, papillose-roughened; berry $6-8 \mathrm{~mm}$. in diameter. In woods and thickets, N. B. to Ont., Mich., Fla. and W. Va. AprilJuly. (P. biflorum Ell.)
2. Salomonia commutàta (R. \& S.) Britton. Smooth Solomon’s Seal. (I. F. f. 1040.) Glabrous throughout ; stem $0.3-2.5 \mathrm{~m}$. high. Leaves $3-15 \mathrm{~cm}$. long, $7-10 \mathrm{~cm}$. wide, narrowed, rounded or somewhat clasping at the base ; peduncles I-8-flowered, glabrous; perianth $12-20 \mathrm{~mm}$. long ; filaments somewhat flattened, smooth, adnate to the perianth for half its length or more; berry 8-12 mm . in diameter. In moist woods and along streams, rarely in dry soil, R. I. to Ont., Manitoba, Ga., La., Utah and N. Mex. May-July. (P. commutatum Dietr.)

## 8. CONVALLÀRIA L.

A low glabrous herb, with horizontal rootstocks and 2 or sometimes 3 erect leaves, narrowed into sheathing petioles, the lower part of the stem bearing sheath. ing scales. Flowers white (rarely pink), fragrant, nodding. Raceme I-sided. Perianth globose-campanulate, 6-lobed, deciduous, the short lobes recurved. Stamens 6, included ; filaments short, adnate to the lower part of the perianth; anthers introrse. Ovary 3-celled; ovules several in each cavity; style slender, 3-grooved; stigma small, capitate, slightly 3-lobed. Berry globose. [Latin from convallis, valley, and the Greek for lily.] A monotypic genus of Europe, Asia and the higher Alleghenies.
I. Convallaria majàlis L. Lily-of-the-valley. (I. F. f. IO4i.) Stem r-2.3 dm. high. Leaves oblong, or oval, appearing nearly basal, acute at both ends, $1.2-3 \mathrm{dm}$. long, $2-6 \mathrm{~cm}$.. wide; basal scales large, one of them subtending an erect angled scape shorter than the leaves; raceme $2-10 \mathrm{~cm}$. long, loosely several flowered; pedicels filiform, recurved, $6-12 \mathrm{~mm}$. long; perianth $6-8 \mathrm{~mm}$. long; filaments shorter than the anthers; berry about 6 mm . in diameter. On the higher mountains of Va., N. Car. and S. Car. Common in cultivation. May-June.

## 9. MEDEOLA L.

A slender erect unbranched herb, loosely provided with deciduous wool. Rootstock thick, white, tuber-like, with somewhat the odor and taste of cucumbers. Leaves of flowering plants in 2 (rarely 3) whorls; lower whorl of 4 -10 oblonglanceolate or obovate leaves; upper whorl of 3-5 ovate or oval leaves, subtending the sessile umbel of small greenish yellow declined flowers. Perianth of 6 separate equal recurved segments. Stamens 6, hypogynous; filaments slender, longer than the oblong extrorse anthers. Ovary 3 -celled; ovules several in each cavity; styles 3, recurved. Berry globose. [Name from Midict, a someress, referring to the supposed healing properties.] A monotypic genus of castern N. Am.

1. Medeola Virginiàna L. Indian Cucumber-root. (I. F. f. 1042.) Rootstock $2-8 \mathrm{~cm}$. long. Stem $3-8 \mathrm{dm}$. tall, bearing the lower whorl of leaves above the middle, or in flowerless plants at the summit; leaves of the lower whorl sessile, $5-13 \mathrm{~cm}$. long, acuminate, narrowed at the base, 3 - 5 -nerved and reticulate-veined; leaves of the upper whorl $2-5 \mathrm{~cm}$. long; umbel 2-9-flowered; pedicels filiform, $2-5$ cm . long or less, declined in flower, erect or ascending in fruit; perianth-segments 6 -10 mm . long, obtuse; berry dark purple, $8-15 \mathrm{~mm}$. in diameter. In moist woods and thickets, N. S. to Ont., Minn., Fla. and Tenn. May-June.

## r. TRÍLLIUM L.

Glabrous erect unbranched herbs, with short scarred rootstocks, and 3 leaves whorled at the summi ${ }^{\text {o }}$ of the stem, subtending the bractless flower. Solitary longpetioled leaves are sometimes borne on the rootstock. Perianth of 2 series of segments, the outer 3 (sepals) green, persistent, the inner 3 (petals) white, pink, purple or sometimes greenish, deciduous or withering. Stamens 6, hypogynous; filaments short; anthers linear ; ovary sessile, 3-6-angled or lohed, 3-celled; ovules several or numerous in each cavity; styles 3. Berry many-seeded. Seeds horizontal. [Latin, in allusion to the 3-parted flowers and the 3 leaves.] About 20 species, natives of N. Am. and Asia. Besides the following, some 7 others occur in the southern and western parts of N. Am. Phyllody, i. e., the reversion of petals or sepals to leaves, is occasional in the genus, and the floral parts are sometimes in 4's instead of 3's.

## Flower sessile.

Leaves sessile; sepals not reflexed.
Flowers purple; petal-blades lanceolate. I. T. sessile.

Flowers green; petal-blades linear.
Leaves petioled; sepals reflexed.
Flower peduncled.
Leaves oval or ovate, obtuse or obtusish, $2-5 \mathrm{~cm}$. long.
Leaves broadly ovate or rhombic, acuminate, $5^{-1} 7 \mathrm{~cm}$. long.
Leaves sessile, or narrowed at the base and short-petioled.

> Petals obovate or oblanceolate, $3-6 \mathrm{~cm}$. long.
> Petals ovate or lanceolate, $1-3 \mathrm{~cm}$. long.

Peduncle $3-10 \mathrm{~cm}$. long, erect or declined; petals spreading.
6. T. erectum.

Peduncle 3 cm . long or less, recurved beneath the leaves; petals recurved. 7. T. cernuum.
Leaves distinctly petioled, obtuse or rounded at the base. 8. T. undulatum.
I. Trillium séssile L. Sessile-flowered Wake-robin. (I. F. f. io43.) Stem I-3 dm. tall. Leaves ovate or oval, cuspidate at the apex, $4-15 \mathrm{~cm}$. long, often blotched; sepals lanceolate, spreading, $\mathbf{I}-5 \mathrm{~cm}$. long; petals lanceolate, some. what longer than the sepals, erect-spreading, purple; anthers longer than the filaments, the connective prolonged beyond the sacs; berry globose, 6 -angled, about 1.2 cm . in diameter. In moist woods and thickets, Penn. to Ohio, Minn., Fla. and Ark. April-May.
2. Trillium víride Beck. Green Wake-roben. (I. F. f. 1043a.) Light green. Stems I-4 dm. tall, rough-pubescent near the top, or glabrous in age; lea ves oblong to ovate, $5-10 \mathrm{~cm}$. long, usually blotched, more or less pubescent on the nerves beneath; sepals linear or linear-lanceolate, bright green; petals clawed, the blades linear or nearly so, surpassing the sepals, light green or purplish green; filaments flattened. In woods and glades, Mo. and Tenn, to Miss. and Ark.
3. Trillium recurvàtum Beck. Prairie Wake-robin. (I. F. f. IO44.) Stems 1.5-4.5 dm. tall. Leaves ovate, oval or oblong, $4-10 \mathrm{~cm}$. long, acute, narrowed into petioles, sometimes blotched; flower erect; sepals lanceolate, acuminate, $1.2-3 \mathrm{~cm}$. long, reflexed; petals spatulate or oblong, nearly erect, clawed, acute or acuminate, equalling the sepals or somewhat longer; anthers $8-14 \mathrm{~mm}$. long, much longer than the filaments, the connective prolonged beyond the sacs; berry ovoid, 6 -winged above, about I .8 cm . long. In woods and thickets, Ohio to Minn., Miss. and Ark. April-June.
4. Trillium nivale Riddell. 「irly Wake-robin. (I. F. f. 1045.) Stem 5-12 cm. high. Leaves $2-5 \mathrm{~cm}$. long, obtuse; petioles 4-12 mm. long; peduncle
erect, bent, or recurved; sepals narrowly oblong or oblong-lanceolate, obtuse; petals white, oblong or oval, obtuse, longer than the sepals, erect-spreading; anthers about as long as the filaments, the connective not prolonged beyond the sacs; styles slender; berry globose, 3 -lobed. In woods and thickets, Penn. to Ohio, Minn., Ky. and Neb. March-May.
5. Trillium grandifìrum (Michx.) Salisb. Large-flowered Wake-robin. (I. F. f. Io46.) Stems usually stout, 2-4.5 dm. high. Leaves rhombic-ovate or rhombic-oval, $6-15 \mathrm{~cm}$. long, acuminate, narrowed to the sessile or nearly sessile base; peduncle $3-8 \mathrm{~cm}$. long; sepals acuminate, $2-5 \mathrm{~cm}$. long, spreading; petals erect-spreading, obtuse or cuspidate, strongly veined, white or pink, thin, longer than the sepals; anthers longer than the filaments; styles slender, berry globose, black, slightly 6 -lobed, $1.5-2.5 \mathrm{~cm}$. in diameter. In woods, Quebec to Ont., Minn., Fla. and Mo. May-June.
6. Trillium eréctum L. Ill-scented Wake-robin. (I. F. f. ro47.) Stem stout, 2-4 dm. high. Leaves broadly rhombic, $7-\mathrm{I} 8 \mathrm{~cm}$. long, often as wide or wider, acuminate at the apex, narrowed at the base ; peduncle erect inclined or declined beneath the leaves; sepals lanceolate, acuminate, spreading; petals acute or acutish, spreading, equalling the sepals or a little longer, dark purple, pink, greenish or white ; anthers longer than the filaments ; styles short ; berry ovoid, somewhat 6 -lobed, reddish, $1.5-2.5 \mathrm{~cm}$. long. In woods, N. S. to James Bay, Manitoba, N. Car., Tenn. and Mo. Flowers unpleasantly scented. April-June.
7. Trillium cérnuum L. Nodding Wake-robin. (I. F. f. 1048.) Stem $2-5 \mathrm{dm}$. high. Leaves broadly rhombic, acuminate at the apex, narrowed at the base, sessile, or with the petioles $2-4 \mathrm{~mm}$. long; peduncle recurved beneath the leaves, the flower drooping; sepals acuminate; petals white or pink, rolled backward, wavy-margined, equalling the sepals, or a little longer; anthers about as long as the filaments; berry ovoid, red-purple. In rich woods, N. S. to Ont. and Minn., Ga. and Mo. April-June.
8. Trillium undulatum Willd. Painted Wake-robin. (I. F. f. IO49.) Stem 2-6 dm. high. Leaves ovate, o.7-2 dm. long, petioled, long-acuminate, at the apex, obtuse or rounded at the base; flower peduncled, erect or somewhat inclined, $2-6 \mathrm{~cm}$. long; sepals acuminate, $1.8-3 \mathrm{~cm}$. long; petals ovate or ovatelanceolate, acuminate or acute, white, with purple veins or stripes, thin, longer than the sepals, wavy-margined; styles slender; berry ovoid, obtuse, bluntly 3 -angled, bright red, shining, $1.2-2 \mathrm{~cm}$. in diameter. In woods, N. S. to Ont. and Wis., Ga. and Mo. May-June.

## Family 5. SMILÀCEAE Vent.

## Smilax Family.

Mostly vines with woody or herbaceous, often prickly stems. Leaves alternate, netted-veined, several-nerved, petioled. Petiole sheathing, bearing a pair of slender tendril-like appendages, persistent, the blade falling away. Flowers small, mostly green, diœccious, in axillary umbels, Perianth-segments 6. Stamens mostly 6, distinct; filaments ligulate ; anthers basifixed, 2-celled, introrse. Ovary 3-celled, the cavities opposite the inner perianth-segments; ovules I or 2 in each cavity, orthotropous ; style very short or none ; stigmas I-3. Fruit a globose berry containing I-6 brownish seeds. Endosperm horny, copious ; embryo small, oblong, remote from the hilum. Genera 3, only the following in N. A.; species about 200 , in warm and temperate regions.

## r. SMILAX L.

Rootstocks usually large and tuberous, stems usually twining, and climbing by means of the coiling appendages of the petiole. Lower leaves reduced to scales. Flowers regular. Perianth-segments distinct, deciduous. Pedicels horne on a globose or conic receptacle, inserted in small pits, generally among minute bract-
lets. Filaments inserted on the bases of the perianth-segments. Staminate flowers without an ovary. Pistillate flowers usually smaller than the saminate, usually with I-6 abortive stamens. Berry black, red or purple rarely white), with 3 strengthening bands of tissue running through the outer part of the pulp, connected at the base and apex. Embryo lying under a tubercle at the upper end of the seed. [Ancient Greek name, perhaps not originally applied to these plants.] About $\mathbf{1} 95$ species of wide distribution, most abundant in tropical America and Asia. Besides the following, about five others occur in the southern U. S., and one in Cal. and Ore.

Stem annual, herbaceous, unarmed.
Petioles tendril-bearing; stems climbing.
Leaves usually ovate, thin.
Leaves glabrous.
Leaves pubescent beneath.

1. S. herbacea.

Leaves usually hastate, coriaceous.
Petioles without tendrils or nearly so ; stems erect.
2. S. $_{\text {. pulverulenta. }}$
perennial, woody, usually armed with prickles.
Berries black or bluish-black.
Fruit ripening the first year.
Leaves glaucous.
Leaves green on both sides.
Leaves rounded or lanceolate, 5 -nerved. 6. S. rotundifolia.
Leaves ovate, 7-nerved. 7. S. hispida.
Leaves round-ovate, often narrowed at the middle, 7 - 9 -nerved.
8. S. Pseudo-China.

Leaves deltoid or deltoid-hastate, 5-7-nerved, often with 1 or 2 additional nerves on each side.
9. S. Bona-nox.

Fruit ripening the second year; leaves elliptic or lanceolate, evergreen.
10. S. laurifolia.

Berries red.
Leaves ovate or ovate-lanceolate, base rounded; berries bright red.
11. S. Walteri.

Leaves lanceolate, acute at the base; berries dull red. I2. S. lanceolata.

1. Smilax herbàcea L. Carrion-flower. (I. F. f. iO50.) Tubers short, thick, numerous. Stem herbaceous, glabrous, unarmed. Leaves ovate, rounded, or lanceolate, acute, acuminate or cuspidate at the apex, obtuse or cordate at the base, thin, $7-9$-nerved, $3-13 \mathrm{~cm}$. long; peduncles usually $6-10$ times as long as the petioles, flattened; umbels 15 -8o-flowered; pedicels $6-16 \mathrm{~mm}$. long; flowers carrion-scented; filaments $2-3$ times as long as the anthers; berries bluish black, $2-4$-seeded, 6-8 mm. in diameter. In woods and thickets, N. B. to Ont., Dak., Fla., La. and Neb. April-June.
2. Smilax pulverulénta Michx. Hairy Carrion-flower. Similar to the preceding; stems elongated, climbing; leaves ovate to elliptic-ovate, $8-15 \mathrm{~cm}$. long, short-acuminate, usually 9 -nerved, pubescent beneath, cordate at the base; petioles often as long as the blades; peduncles as long as the petioles or longer: pedicels 5-12 mm. long; berries subglobose, $8-10 \mathrm{~mm}$. in diameter. In alluvial soil, Ont. to Wis., N. Car. and Mo. Spring.
3. Smilax tamnitòlia Michx. Halberd-leaved Smilax. (I. F. f. Io5r.) Glabrous, herbaceous; stem and branches unarmed. Leaves coriaceous, mostly ovate-hastate, with broad obtuse lobes at the base, slightly narrowed at about the middle, truncate or subcordate at the base, green on both sides, $2.5-8 \mathrm{~cm}$. long, 5-7-nerved; peduncles 1-3 from the same axil, $2-10 \mathrm{~cm}$. long, usually much longer than the leaves; umbels 10 - 30 -flowered; pedicels $4^{-6} \mathrm{~mm}$. long; filaments $\mathbf{1 - 2}$ times as long as the anthers; berries black, $4-6 \mathrm{~mm}$. in diameter, $\mathbf{r}-3$-seeded. In dry soil, S. N. J. and Penn. to S. Car. and Tenn. May-July.
4. Smilax ecirrhàta (Engelm.) S. Wats. Upright Smilax. (I. F. f. IO52.) Stem herbaceous, glabrous, simple, erect, 1.5-6 dm. tall. Leaves often whorled at the summit of the stem, ovate, rounded or cordate at the base, thin, 5-9-nerved, more or less pubescent beneath and erose-denticulate on the margins; petioles 2-3.6 cm . long; peduncles long, often pubescent; pedicels $4-10 \mathrm{~mm}$. long. In dry soil, Va. to Minn. and Fla. May-June.
5. Smilax glaùca Walt. Glaucous-leaved Greenbrier. (I. F. f. IO53.) Rootstock deep, knotted and tuberous. Stem terete; branches and twigs angled,
armed with rather stout prickles, or sometimes unarmed; petioles $6-12 \mathrm{~mm}$. long, tendril-bearing; leaves ovate, acute or cuspidate at the apex, sometimes cordate at the base, entire, mostly 5 -nerved, $3-15 \mathrm{~cm}$. long; peduncles flattened; umbels 6-12-flowered; pedicels $4^{-8} \mathrm{~mm}$. long; berries bluish black, about 6 mm . in diameter, 2-3-seeded. In dry sandy soil, E. Mass. to Fla., Kans. and Tex. May-June.
6. Smilax rotundifòlia L. Greenbrier. Catbrier. Horsebrier.
(I. F. f. I054.) Rootstocks long, sparingly tuberous. Stem woody, terete, the branches often 4 -angled, glabrous; prickles scattered, sometimes none; petioles $6-12 \mathrm{~mm}$. long; leaves thick and shining when mature, acute or acuminate at the apex, obtuse or cordate at the base, entire or the margins erose-denticulate, 5 -nerved, $5-15 \mathrm{~cm}$. long; peduncles flattened; umbels $6-25$-flowered; pedicels $2-8$ mm . long; perianth-segments pubescent at the tip; filaments $2-3$ times as long as the anthers; berries black, $\mathbf{I}-3$-seeded, about 6 mm . in diameter. In woods and thickets, Ont. to Minn., Fla. and Tex. April-June.
7. Smilax híspida Muhl. Hispid Greenbrier. (I. F. f. 1055.) Glabrous; stem commonly thickly hispid with numerous slender prickles, the branches more or less angled; petioles $8-18 \mathrm{~mm}$. long, tendril-bearing; leaves thin, ovate, abruptly acute and cuspidate at the apex, obtuse or subcordate at the base, 7 -nerved, $5-13$ cm . long; peduncles flattened; umbels $10-26$-flowered; pedicels $4-6 \mathrm{~mm}$. long; filaments a little longer than the anthers; berries bluish black. In thickets, Ont. to Minn., Neb., Va. and Tex. May-July.
8. Smilax Pseùdo-Chìna L. Long-stalked Greenbrier. (I. F. f. io56.) Glabrous; rootstock often bearing large tubers; stem terete, the branches angled. L, wer part of the stem beset with straight prickles, the branches mostly unarmed; petioles $6-25 \mathrm{~mm}$. long; leaves firm, ovate, often narrowed at about the middle or lobed at base, acute or cuspidate at the apex, $7-9$-nerved, $6-13 \mathrm{~cm}$. long; peduncles flattened, $2-8 \mathrm{~cm}$. long, umbels $12-40$-flowered ; pedicels $6-8 \mathrm{~mm}$. long ; stamens $6-10$; berries black, 4-6 mm. in diameter. In dry or sandy thickets, Md. to Neb., Fla. and Tex. March-Aug.
9. Smilax Bòna-nóx L. Bristly Greenbrier. (I. F. f. 1057.) Rootstocks bearing large tubers; stem terete or slightly angled, the branches often 4 -angled. Prickles often wanting on the branches; petioles $6-12 \mathrm{~mm}$. long; leaves thick, ovate or commonly deltoid-hastate, glabrous, green on both sides, often spiny on the margins and the veins beneath, acute or abruptly cuspidate at the apex, obtuse, truncate or cordate at the base, 5-9-nerved, $3-1 \mathbf{1 I} \mathrm{~cm}$. long; peduncles slender, flattened, $1.4-3 \mathrm{~cm}$. long; umbels $15-45$-flowered; pedicels $4-8 \mathrm{~mm}$. long ; stigmas I-3; berries 4-6 mm. in diameter, mostly I-seeded. In thickets, Mass. to Kans., Fla. and Tex. April-July.
10. Smilax laurifòlia L. Laurel-leaved Greenbrier. (I. F. f. io58.) Rootstocks bearing tubers sometimes I. 5 dm . thick; stem high-climbing, terete, armed with strong straight prickles, the branches angled, mostly unarmed. Petioles stout, $6-16 \mathrm{~mm}$. long; leaves leathery, evergreen, elliptic or oblong-lanceolate, acute or abruptly cuspidate at the apex, narrowed at the base, entire, 3-nerved, or sometimes with an additional pair of nerves near the margins, $5-11 \mathrm{~cm}$. long; peduncles stout, angled, $4-20 \mathrm{~mm}$. long; umbels 6 -30-flowered ; pedicels $4^{-6} \mathrm{~mm}$. long; anthers usually about one-third shorter than the filaments; stigma I, sometimes 2 ; berries black, ovoid, 4-6 mm. thick. In moist woods and thickets, S. 工. J. to Fla. and Tex., north in the Miss. Valley to Ark. March-Sept.
II. ¿ milax Walteri Pursh. Walter's Greenbrier. (I. F. f. IO50.) Glabrous; stem angled, prickly below; branches commonly unarmed. Petioles $4-12$ mm . long, angled; leaves ovate or ovate-lanceolate, rarely lobed at the base, cordate or subcordate, entire, $5-7$-nerved, $5-13 \mathrm{~cm}$. long, $2-8 \mathrm{~cm}$. wide; peduncles 4-10 mm. long, flattened; umbels 6-15-flowered; pedicels very slender, +0 mm . long; berries globose, coral-red (rarely white), 6-8 mm. in diameter, $2-3$-seeded. In wet soil, pine barrens of N. J. to Fla., Tenn. and La. April-June.
11. Smilax lanceolàta L. Lance-lfatel (irefnbrifr. (I. F. f. iogo.) Glabrous, stem terete, usually prickly, the branches slender, long, mostly unarmed. Petioles 2-4 mm. long; leaves rather thin, lanceolate, acute or acuminate at the apex, narrowed at the base, entire, shining above, 5 -nerved, $5-10 \mathrm{~cm}$. long: peduncles thick, angled, $6-16 \mathrm{~mm}$. long; unilels $\mathrm{S}^{-}$-fo-flowered; pealicels $4^{-1+\mathrm{mm}}$.
long ; filaments longer than the anthers ; berries dark red, globose, $4-6 \mathrm{~mm}$. in diameter, usualiy 2 -seeded. In thickets, Va. to Ark., Fla. and Tex, March-Aug.

## Family 6. HAEMODORACEAE R. Br.

## Bloodwort Fainily.

Perennial herbs with erect stems, narrowly linear leaves, and regular or somewhat irregular small perfect flowers in terminal cymose panicles. Perianth 6-parted or 6-lobed, adnate to the ovary, persistent. Stamens 3 , opposite the 3 inner perianth-segments. Ovary wholly or partly inferior, 3-celled or rarely i-celled ; ovules usually few in each cavity, halfanatropous; style mostly slender; stigma small, entire or 3-grooved. Fruit a loculicidally 3 -valved capsule. Seeds few or rarely numerous; embryo small, in fleshy endosperm. About 9 genera and 35 species, mostly natives of South Africa and Australia, a few in tropical America; only the following genus in the north temperate zone.

## 1. GYROTHECA Salisb.

A rather stout herb, with a short rootstock, red fibrous roots and equitant leaves, the basal ones longer than those of the stem. Flowers numerous, yellowish, small, in a dense woolly cymose panicle. Perianth 6-parted to the summit of the ovary, the outer segments smaller than the inner. Filaments filiform, longer than the perianth; anthers linear-oblong, versatile. Ovary 3-celled; ovules few in each cavity, borne on fleshy placentæ ; style very slender, declined. Capsule enclosed by the withering-persistent perianth, nearly globular, 3 -valved. Seeds about 6 in each cavity, flattened, nearly orbicular, peltate. (Greek, referring to the round fruit.) A monotypic genus of southeastern N. Am. and the W. I.
I. Gyrotheca tinctòria (Walt.) Salisb. Red-Root. (I. F. f. IO6r.) Stem $4-8 \mathrm{dm}$. tall, glabrous below, pubescent or woolly above. Leaves $4-10 \mathrm{~mm}$. wide, acuminate, the basal ones shorter than the stem, the upper reduced to bracts; panicle $5-13 \mathrm{~cm}$. broad, almost capitate when young, white-woolly; flowers $8-10 \mathrm{~mm}$. broad, bracteolate, the perianth yellow and glabrous within; style about as long as the stamens; pedicels stout, about as long as the capsule; capsule about 6 mm . in diameter. In swamps, E. Mass. to N. J. and Fla., mostly in pine barrens near the coast. Also in Cuba. July-Sept. (Gyrotheca capitata Morong.)

## Family 7. AMARYLLIDÀCEAE Lindl.

## Amaryllis Family.

Perennial herbs (some tropical species woody or even arboreous), with bulbs or rootstocks, scapose or sometimes leafy stems and usually narrow and entire leaves. Flowers perfect, regular or nearly so. Perianth 6 -parted or 6-lobed, the segments or lobes distinct, or united below into a tube which is adnate to the surface of the ovary (adnate only to the lower part of the ovary in Lophiola). Stamens 6 in our genera, inserted on the bases of the perianth-segments or in the throat of the perianth opposite the lobes. Anthers versatile or basifixed, 2 -celled, the sacs usually longitudinally dehiscent. Ovary wholly or partly inferior, usually 3-celled. Style filiform, entire, lobed, or cleft into 3 stigmas at the summit. Ovules usually numerous, rarely only I or 2 in each cavity of the ovary, anatropous. Fruit capsular, rarely fleshy. Seeds mostly black, the embryo small, enclosed in fleshy endosperm. About 70 genera and 800 species, principally natives of tropical and warm regions, some in the temperate zones.

Bulbous herbs with flowers on scapes.
Flower solitary (in our species); perianth with a crown. 1. Narcissus.
Flower solitary ; perianth without a crown.
Anthers versatile; tube of the perianth not greatly elongated.
2. Atamosco.

Anthers erect ; tube of the perianth several times the length of its lobes.
3. Cooperia.

Flowers clustered; perianth with a membranous crown connecting the lower parts of the filaments.
4. Hymenocallis. Bulbless herbs, with rootstocks or corms.

Perianth adnate to the whole surface of the ovary; leaves mostly basal.
Tall, fleshy-leaved; anthers versatile.
5. Agave.
Low, linear-leaved; anthers not versatile.
6. Hypoxis.

Perianth adnate only to the lower part of the ovary; stem leafy; flowers woolly.
7. Lophiola.

## r. NARCÍSSUS L.

Bulbous herbs, the flowers solitary or several on leafless scapes, the leaves linear, basal. Flowers subtended by a deciduous spathe; perianth 6 -parted, bearing a cup-like funnelform or cylindric crown in the throat. Stamens inserted on the tube of the perianth; ovary 3-celled. About 20 species, natives of the Old World.

1. Narcissus Pseudo-Narcíssus L. Daffodil. Scape about 3 dm . high, 2-edged. Leaves narrowly linear, about as long as the scape; flower bright yellow, $5-8 \mathrm{~cm}$. broad; crown crenate, rather longer than the perianth-tube. Escaped from cultivation, Penn. and N. J. April-May. Flowers often double.

## 2. ATAMÓSCO Adans.

Glabrous herbs with coated bulbs, narrow leaves, and erect scapes, the flower large, erect, pink, white or purple. Perianth funnelform, naked in the throat, with 6 membranous equal erect-spreading lobes united below into a tube, subtended by an entire or 2-cleft bract. Stamens inserted on the throat of the perianth, equal or nearly so. Ovary 3 -celled; style long, filiform, 3 -cleft at the summit; ovules numerous, in 2 rows in each cavity. Capsule subglobose or depressed, 3 -lobed, loculicidally 3 -valved. Seeds mostly flattened, black or nearly so. [Greek, signifying wind-flower.] About 30 species, natives of America. Besides the following, 4 others occur in the southern U. S. (Zephyranthes Herb.)
I. Atamósco Atamásco (L.) Greene. Atamasco Lily. (I. F. f. 1062.) Bulb ovoid, about 2.5 cm . long. Leaves fleshy, shining, 1.5-4 dm. long, $3-6 \mathrm{~mm}$. wide, blunt, usually shorter than the scape; scape terete, erect; bract 2 -cleft into acuminate lobes, longer than the ovary; flowers $5-9 \mathrm{~cm}$. high, white with a purplish tinge or somctimes light purple; perianth-segments oblong-lanceolate, acute, shorter than the tube; stamens shorter than the tube; style longer than the stamens; capsule depressed, about $\mathbf{1 . 2} \mathrm{cm}$. high. In moist places, S. Penn. (?), E. Va. to Fla. and Ala. Perianth rarely 8-lobed. March-June. (Zephyranthes Atamasco Herb.)

## 4. COOPERIA Herb.

Low herbs with coated bulbs, grass-like leaves and I-flowered scapes, the flower large, long, erect, subtended by a spathe-like bract. Perianth salverform, with 6 spreading lobes. Stamens inserted on the throat of the perianth; filaments short; anthers linear. Ovary 3-celled; style filiform; stigma slightly 3-lobed; ovules numerous, in 2 rows of each cavity of the ovary. Capsule depressed, 3 . Whed. loculicidally 3 -valved. Seeds numerous, horizontal, black. [In honor of l)aniel Cooper, 1817?-1842, Curator, Botanical Society of London.] Two known specie's. natives of the southwestern U. S. and Mex.

1. Cooperia Drummóndii Herb. Drummond's Cooper1a. (I. F. f. 1063.) Bulb globose, about 2.5 cm . in diameter. Leaves $1.5-3 \mathrm{dm}$. long. +6 mm . wide. erect; scape slender, hollow, about as long as the leaves; spathe-like bract $2-5 \mathrm{~cm}$. long, 2 -cleft above into acuminate lobes; flower $7-13 \mathrm{~cm}$. high, white or pinkish; tube of the perianth very slender, about 3 mm . in diameter, slightly expanded just below the limi; segments oblong, nearly 2.5 cm . long; ovary sessile; capsule somewhat obovoid, about 1 cm . in diameter, deeply lobed. ()n prairies, Kins, to La., Tex., Mex. and N. Mex. April-July.

## 4. HYMENOCÁLLIS Salisb.

Mostly tall bulbous herbs with usually lanceolate or linear-oblong leaves, and large white umbelled flowers on solid scapes, each flower subtended by 2 membranous bracts. Perianth of 6 spreading or recurved narrow equal elongated lobes, united below into a long cylindric tube. Stamens inserted in the top of the perianthtube, the lower parts of the long filaments connected by a membranous crown; anthers linear, versatile. Ovary 3-celled; ovules only 1 or 2 in each cavity; style filiform, long-exserted; stigma small, entire or nearly so. Capsule rather fleshy. Seeds usually only I or 2, large, green, fleshy. [Greek, beautiful membrane, referring to the crown.] About 30 species, all American. Besides the following, 10 others occur in the Southern States.

1. Hymenocallis occidentàlis (Le Conte) Kunth. Hymenocallis. (I.F.f. 1064.) Bulb large. Leaves linear-oblong, narrowed at each end, fleshy, glaucous, 3-6 dm. long, $\mathrm{I} .5-5 \mathrm{~cm}$. wide ; scape equalling or longer than the leaves; bracts linear-lanceolate ; umbel several-flowered ; perianth-tube $3-4 \mathrm{~mm}$. in diameter, 7-13 cm. long, the linear lobes nearly as long; crown funnelform, narrowed below, $2.5-3 \mathrm{~cm}$. long, its margins entire, erose or 2-toothed between the filaments ; free part of the filaments about 2.5 cm . long, white ; anthers I mm. wide, yellow; style extending for $5-8 \mathrm{~cm}$. beyond the crown, green; fruit $1.2-2 \mathrm{~cm}$. in diameter. In moist soil, Ga. to S. Ill. and Mo. July-Sept.

## 5. AGÀVE L.

Fleshy herbs, some tropical species very tall, with a short crown-like or erect rootstock (caudex) and tall bracted scapes, the leaves large, thick, sometimes spinytoothed, basal, or clustered at the top of the caudex, and large bracted flowers in terminal spikes or compound clusters. Perianth tubular or funnelform, witheringpersistent, of 6 equal or nearly equal lobes, united below into a tube. Stamens inserted on the perianth at the bases of the lobes, exserted. Ovary 3-celled; style slender, exserted, 3 -lobed; ovules numerous, in 2 rows in each cavity of the ovary. Capsule 3-lobed, thick-walled, many-seeded. Seeds compressed, somewhat cuneate, black. [Greek, signifying noble.] About 140 species, all American. Besides the following, some 12 others occur in the southwestern States.

1. Agave Virgínica L. False Aloe. (I. F. f. 1065.) Glabrous throughout ; rootstock a short crown. Scape 6-i2 dm. tall, sometimes nearly 1.2 cm . in diameter at the base, its bracts distant, long-acuminate ; leaves narrowly oblong, 1.5-6 dm. long, acuminate, their margins entire or denticulate; spike 3-6 dm. long, loose ; flowers greenish yellow, odorous, solitary in the axils of short bracts; perianth slightly expanded above, $1.5-2.5 \mathrm{~cm}$. long, the tube about twice as long as the erect lobes ; capsule I-I. 6 cm . in diameter, abruptly contracted into a short stalk. In dry soil, Md. to Ind., Mo., Fla. and Tex. Summer.

## 6. HYPOXIS L.

Low, mostly villous herbs, with a corm or short rootstock, grass-like leaves and slender few-flowered scapes, the flowers rather small. Perianth 6-parter, its segments equal or nearly so, separate to the summit of the ovary, witheringpersistent, the 3 outer ones greenish on the lower side in our species. Stamens inserted on the bases of the perianth-segments ; filaments short ; anthers erect, sagittate or entire. Ovary 3 -celled ; style short ; stigmas 3 , erect ; ovules numerous, in 2 rows in each cavity. Capsule thin-walled, not dehiscent by valves. Seeds globular, black, laterally short-beaked by their stalks. [Greek, originally given to some plant with sour leaves.] About 50 species, widely distributed. Besides the following, two others occur in the southern States.

1. Hypozis hirsùta (L.) Coville. Stargrass. (I. F. f. 1066.) Corm 6-12 mm. in diameter. Leaves basal, narrowly linear, 2-5 mm. wide, more or less villous, mostly longer than the scapes; scapes slender, erect, villous above, $5-15 \mathrm{~cm}$. high; flowers I-6, umbellate ; bracts subulate, shorter than the pedicels; perianthsegments narrowly oblong, spreading, mostly obtuse, bright yellow within, villous without, $6-10 \mathrm{~mm}$. long; stamens somewhat unequal; style 3 -angled, the stigmas decurrent on the angles; capsule about 3 mm . in diameter. In dry soil, Me. and Ont. to Assiniboia, Fla. and Tex. May-Oct.

## 7. LOPHİOLA Ker.

An erect perennial herb with slender rootstocks, erect sparingly leafy stems, the leaves narrowly linear and mostly basal, and numerous small yellowish flowers in a terminal woolly cymose panicle. Perianth campanulate, persistent, of 6 nearly equal woolly segments, slightly united at the base. Stamens inserted on the bases of the perianth-segments ; filaments filiform, short ; anthers basifixed. Ovary 3 -celled; style subulate, at length 3 -cleft; ovules numerous, in 2 rows in each cavity. Capsule ovoid, finally loculicidally 3 -valved at the summit. Seeds oblong, numerous, ribbed. [Greek, referring to the tufts of wool on the perianth.] A monotypic genus of southeastern N. A.
I. Lophiola Americàna (Pursh) A. Wood. Lophiola. (I. F. f. I067.) Stem stiff, terete, glabrous below, white-woolly above, 3-6 dm. tall. Leaves equitant, glabrous, much shorter than the stem, the upper ones reduced to scales ; panicle densely white-woolly, composed of numerous few-several-flowered cymes; pedicels short, rather stout ; perianth-segments linear-lanceolate, about 4 mm . long, longer than the stamens and with a tuft of wool at the base within ; capsule about as long as the persistent style. Pine barren bogs, N. J. to Fla. June-Aug.

## Family 8. DIOSCOREÀCEAE Lindl.

## Yam Family.

Herbaceous or slightly woody twining vines with fleshy or woody rootstocks, slender stems, petioled, mostly cordate, several-nerved and reticulate-veined leaves, and small inconspicuous diœcious or monœcious (in some exotic genera perfect) regular flowers in spikes, racemes or panicles. Perianth 6-parted, that of the pistillate flowers persistent. Staminate flowers with 6 or 3 stamens, sometimes with a rudimentary ovary. Pistillate flowers with an inferior 3 -celled ovary, 3 styles and 3 terminal stigmas, sometimes also with 3 or 6 staminodia; ovules 2 (rarely I) in each cavity of the ovary, pendulous, anatropous or amphitropous. Fruit a 3 -valved, 3 -angled capsule in the following genus. Endosperm of the seed fleshy or cartilaginous, enclosing the small embryo. About 9 genera and 175 species, mostly natives of America, a few in the Old World.

## 1. DIOSCOREA L.

Characters of the family as defined above. [Name in honor of the Greek natturalist Dioscorides.] About 160 species, most numerous in tropical regions, a few in the temperate zones.
I. Dioscorea villòsa L. Wild Yam-root. (I. F. f. io68.) Rootstuck knottedhorizontal, woody, $1.5-3 \mathrm{dm}$. thick. Stem 2-5 m. long, glabrous; leaves ovate, entire, slender-petioled, alternate or the lower opposite or in 4's, acuminate, cordate at the base, $5-15 \mathrm{~cm}$. long, 9-1 3 -nerved, thin, pale and more or less pubescent bencath; flowers greenwish yellow, nearly sessile, the staminate $2-3 \mathrm{~mm}$. broad in drooping panicles, the pistillate about 6 mm . long in drooping spicate racemes; capsules membranous, 1.5-2.5 cm. long, strongly 3-winged. In moist thickets, R. I. to Ont., Minn., Fla. and Tex. June-July. Fruit ripe Sept., persistent on the vines into the winter.

## Family 9. IRIDÀCEAE Lindl.

Iris Family.
Perennial herbs with narrow equitant 2-ranked leaves and perfect, mostly clustered flowers subtended by bracts. Perianth of 6 segments or 6-lobed, its tube adnate to the ovary, the secments or lobes in two series, convolute in the bud, withering-persistent. Stamens 3, inserted on the perianth opposite its outer series of segments or lobes; filaments
filiform, distinct or united; anthers 2-celled, extrorse. Ovary inferior, mostly 3 -celled ; ovules mostly numerous in each cell, anatropous; style 3 -cleft, its branches sometimes divided. Capsule 3-celled, loculicidally dehiscent, 3 -angled or 3 -lobed (sometimes 6-lobed), many-seeded. Endosperm fleshy or horny ; embryo straight, small. About 57 genera and Iooo species, of wide distribution.

Style-branches opposite the anthers, very broad, petal-like.
Style-branches alternate with the anthers, slender or filiform. Style-branches, 2 -cleft ; plants bulbous.
Style-branches undivided; plants not bulbous. Filaments all distinct; seeds fleshy. Filaments united; seeds dry.

1. Iris.
2. Nemastylis.
3. Gemmingia.
4. Sisyrinchzum.
I. IRIS L.

Herbs, with creeping or horizontal, often woody rootstocks, erect stems, erect or ascending equitant leaves, and large regular terminal sometimes panicled flowers. Perianth of 6 clawed segments united below into a tube, the three outer dilated, spreading or reflexed, the 3 inner narrower, smaller, usually erect, or in some species about as large as the outer. Stamens inserted at the base of the outer peri-anth-segments; anthers linear or oblong. Ovary 3-celled; divisions of the style petal-like, arching over the stamens, bearing the stigmas immediately under their mostly 2 -lobed tips; style-base adnate to the perianth-tube. Capsule oblong or oval, $3-6$-angled or lobed. Seeds numerous, vertically compressed. in 1 or 2 rows in each cavity. [Greek, rainbow, referring to the variegated flowers.] About 100 species, mostly in the north temperate zone. Besides the following, some 8 others occur in the southern and western parts of N. Am.
Stems tall, usually several-flowered, leafy; outer perianth-segments larger than the inner.
Flowers blue, variegated with yellow, white or green (rarely all white).
None of the perianth-segments crested; native species.
Leaves $1-2.5 \mathrm{~cm}$. wide.
Leaves somewhat glaucous.
r. I. versicolor.

Leaves bright green, not glaucous.
Guter perianth-segments 7 -10 cm . long; flowers sessile.
2. I. hexagona.

Outer perianth-segments $6-7 \mathrm{~cm}$. long; flowers pedicelled.
3. I. Caroliniana.

Leaves much narrower, $4-8 \mathrm{~mm}$. wide.
Capsule obtusely angled, $3^{-6}$-lobed.
Capsule 3-lobed; northern. 4. I. Hookeri.
Capsule 6-lobed; western. 5. I. Missouriensis.
Capsule sharply 3 -angled.
Outer perianth-segments strongly crested; introduced.
6. I. prismatica.

Flowers reddish or red-brown.
7. I. Germanica.
8. I. fulva.

Flowers bright yellow; introduced species.
9. I. Pseudacorus.

Stems low, seldom over 1.5 dm . tall, $\mathrm{I}-3$-flowered; outer and inner perianth-segments nearly equal.
Outer perianth-segments crested; leaves lanceolate.
Perianth-tube very slender, exceeding the bracts. Io. I. cristata.
Perianth-tube expanded above, not exceeding the bracts. II. I. lacustris
Outer perianth-segments crested, claws slightly pubescent; leaves linear.
12. I. verna.
I. Iris vesrícolor L. Larger Blue Flag. (I. F. f. 1069.) Rootstock fleshy. Stem terete or nearly so, 6-10 dm. tall, leafy; leaves erect. shorter than the stem. somewhat glaucous. $12-25 \mathrm{~mm}$. wide; bracts commonly longer than the pedicels; flowers violet-blue, variegated with yellow. green and white; perianth-segments glabrous, crestless, the outer ones spatulate, $5-8 \mathrm{~cm}$. long, longer and wider than the inner; perianth-tube shorter than the ovary; capsule oblong, obscurely 3 -lobed, about 3 cm . long and 1.5 cm . in diameter; seeds $4-6 \mathrm{~mm}$. broad. in 2 rows in each cavity. In marshes, thickets, and wet meadows, Newf. to Manitoba. Fla. and Ark. May-July.
2. Iris hexagòna Walt. Southerin Blue Flaf. (I. F. f. 1070.) Rootstock stout, thick. Stems terete, usually simple, leafy, 3-9 dm. tall; leaves I-3
cm . wide, green, not glaucous, the lower often 6-9 dm. long; flowers solitary in the upper axils, sessile, similar to those of $I$. versicolor, but larger, the broader outer crestless perianth segments often I dm. long and over 2.5 cm . wide, much wider than the erect inner ones; perianth-tube rather longer than the ovary; capsule oblong-cylindric, 6 -angled, about 5 cm . long; seeds in 2 rows in each cavity. In swamps, S. Car. and Fla. to Ky., Mo. and Tex. April-May.
3. Iris Caroliniàna S. Wats. Carolina Blue Flag. (I. F. f. Iołi.) Rootstock stout, fleshy. Stem $6-10 \mathrm{dm}$. tall ; leaves bright green, $1.5-3 \mathrm{~cm}$. wide; flowers solitary or 2 or 3 together, lilac, variegated with yellow, purple and brown, pedicelled ; outer perianth-segments broadly spatulate, $6-8 \mathrm{~cm}$. long, with narrow claws, the inner narrower and nearly erect; perianth-tube about 1.2 cm . long above the ovary ; capsule oblong, obtusely 3 -angled, $3-5 \mathrm{~cm}$. long ; seeds in I row in each cavity, $8-10 \mathrm{~mm}$. broad. In swamps, S. Va. and E. N. Car. May-June.
4. Iris Hóokeri Penny. Hooker's Blue Flag. (I. F. f. 1072.) Rootstock rather slender. Stems slender, terete, 2.5-5 dm. tall. Leaves mostly basal, narrowly linear, bright green, $4-8 \mathrm{~mm}$. wide ; flowers solitary or 2 together, pedicelled, the pedicels shorter than the bracts ; perianth-segments glabrous, crestless, the inner ones oblanceolate, much shorter and smaller than the outer; capsule short-oblong, $2-3 \mathrm{~cm}$. long, thin-walled, transversely veined, obtusely 3 -lobed; seeds in 2 rows in each cavity, about 3 mm . broad. On river shores, Newf. to Quebec and Me. Summer.
5. Iris Missouriénsis Nutt. Western Blue Flag. (I. F. f. 1073.) Rootstock stout. Stem rather slender, terete, $\mathbf{1 . 5 - 6 ~ d m}$. tall, $\mathbf{I}-2$-flowered; leaves mostly basal, green, sometimes purplish below, $4-8 \mathrm{~mm}$. wide ; flowers pale blue and variegated, pedicelled ; pedicels slender, $1-5 \mathrm{~cm}$. long, usually shorter than the scarious bracts ; perianth-segments glabrous, crestless, the outer ones $5-6 \mathrm{~cm}$. long, the inner somewhat shorter, the tube $6-8 \mathrm{~mm}$. long above the ovary; capsule oblong, $2.5-3 \mathrm{~cm}$. long, obtusely 6-angled, faintly veined. In wet soil, S. Dak. to Mont., Nev., Colo. and Ariz. May-July.
6. Iris prismática Pursh. Slender Blue Flag. (I. F. f. Io74.) Rootstock rather slender, tuberous-thickened. Stems slender, often flexuous, 3-9 dm. tall, usually simple, bearing 2 or 3 leaves; leaves almost grass-like, $3-5 \mathrm{~mm}$. wide; flowers solitary or 2 together, blue, veined with yellow, slender-pedicelled; pedicels commonly longer than the bracts ; outer perianth-segments $3-5 \mathrm{~cm}$. long, glabrous and crestless, the inner smaller and narrower, the tube 4-6 mm. long above the ovary ; capsule narrowly oblong, acute at each end, sharply 3 -angled, $2.5-3.5 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. thick; seeds about 2 mm . broad, thick, borne in I row in each cavity. In wet grounds, N. B. to Penn. and N. Car. May-June.
7. Iris Germánica L. Fleur-de-Lis. (I. F. f. 1075.) Rootstock thick. Stems stout, usually branched and several-flowered, 4-9 dm. tall, bearing several leaves. Leaves glaucous, $\mathbf{I} .5-2.5 \mathrm{~cm}$. wide, the basal ones mostly shorter than the stem ; bracts scarious; flowers nearly sessile, large and showy, deep violetblue veined with yellow and brown or sometimes white ; outer perianth-segments broadly obovate, $7-10 \mathrm{~cm}$. long, their claws strongly crested; inner perianthsegments narrower, arching. Escaped from gardens to roadsides in Va. Native of Europe. May-June.
8. Iris fúlva Ker. Red-brown Flag. (I. F. f. Io76.) Rootstock stout, fleshy. Stems slender, 6-9 dm. tall, several-flowered and bearing 2-4 kaves; leaves pale green and somewhat glaucous, $6-16 \mathrm{~mm}$. wide; pedicels 12.5 cm . long, shorter than the bracts; flowers reddish brown, variegated with blue and green; perianth-segments glabrous, crestless, the outer ones 35 cm . lons, the inner smaller, spreading ; style-branches $4^{-6} \mathrm{~mm}$. wide. In swamps. S. Ill. to (ia.. La., Mo., Ark. and Tex. May-June.
9. Iris Pseudácorus L. Yellow Flag. (I. F. f. 1077.) Rootstock thick. Stems 3-9 dm. high, usually several-flowered; leaves pale green and glamous, stiff, $8-16 \mathrm{~mm}$. wide ; flowers bright yellow, short-pedicelled; perianth-serments glabrous and crestless, the outer broadly obovate, $5^{-0} \mathrm{~cm}$. long. the inner oblong. nearly erect, scarcely longer than the claws of the outer ones; capsule whong, 5-S cm . long. In marshes, Mass. to N. Y. (Ohio?) and N. J. Nat. or adw. from Europe. May-July.
10. Iris cristàta Ait. Cresten Dwarf Ikis. (I. F. f. 1~ブS.) Rootstock
slender, branched, creeping, tuberous-thickened. Stems only 2-8 cm. high, I-2. flowered; leaves lanceolate, bright green. I-2 dm. long. $6-18 \mathrm{~mm}$. wide, much exceeding the stems; stem flattened; flowers blue, pedicelled; perianth-segments obovate, $2.5-3.3 \mathrm{~cm}$. long, the outer crested, little longer than the naked inner ones, the tube very slender, $3-6 \mathrm{~cm}$. long above the ovary, longer than the bracts; capsule oval, sharply triangular, narrowed at each end, $1.2-2 \mathrm{~cm}$. high. On hillsides and along streams, Md. to S. Ohio, Ind., Ga., Tenn. and Mo. April-May.
if. Iris lacústris Nutt. Dwarf Lake Iris. (I. F. f. io79.) Similar to the preceding in size and foliage, or the leaves rather narrower, sometimes wavymargined. Flowers blue ; perianth-tube only $\mathrm{I}-2.5 \mathrm{~cm}$. long, shorter than the bracts and the sometimes yellowish perianth-segments, somewhat expanded up. ward; capsule ovoid, about 1.5 cm . high, borne on a pedicel of about its own length. Shores of Lakes Huron and Superior. Local. May.
12. Iris vérna L. Dwarf Iris. (I. F. f. 1o80.) Rootstock slender. Stems $2-8 \mathrm{~cm}$. high, usually r-flowered. Leaves narrowly linear. $0.7-2 \mathrm{dm}$. high, 4-10 mm . wide; flowers violet-blue or rarely white, pedicelled; perianth-segments crestless. the outer about 3 cm . long, obovate, narrowed ints slightly pubescent slender yellow claws, the inner somewhat smaller, glabrous; capsule obtusely triangular, short. Cn shaded hillsides and in woods, S. Penn., V'a., Ky. and Ga. AprilMay.

## 2. NEMASTYLIS Nutt.

Bulbous herbs, with erect slender terete usually branched stems, and elongated linear folded leaves. Flowers rather large, in our species blue or purple, solitary or several together, fugacious, subtended by 2 herbaceous bracts. Perianth of 6 spreading nearly equal obovate segments, distinct nearly or quite to the summit of the ovary. Filaments more or less united; anthers short; style short. its branches slenderly 2 -parted; stigmas small, terminal. Capsule loculicidally dehiscent at the summit. [Greek. referring to the thread-like stylle-branches.] About io species, natives of America. Besides the following, some 3 others occur in the southern U. S.
I. Nemastylis acùta (Bart.) Herb. Northery Nemastylis. (I. F. f. ro8r.) Bulb dark colored, ovoid, scaly, 2.5 cm . long or less. Stem 3-6 dm. tall, bearing 3 or 4 leaves $0.7-2.5 \mathrm{dm}$. long, $3-5 \mathrm{~mm}$. wide; bracts lanceolate, each pair subtending I or 2 flowers; flowers light blue or purple. $2-5 \mathrm{~cm}$. broad, slenderpedicelled; pedicels rather shorter than the bracts; perianth-segments obtuse; stylebranches exserted between the free parts of the filaments, their filiform divisions $4^{-6} \mathrm{~mm}$. long ; capsule obovoid, $10-12 \mathrm{~mm}$. high. On prairies, Tenn. to Kans., Ark., La. and Tex. April-June.

## 3. Gemmíngia Fabr.

An erect perennial herb, with stout rootstocks and Iris-like leaves. Flowers in terminal bracted clusters, rather large, crimson and purple-mottled. Perianth of 6 oblong spreading nearly equal withering-persistent segments, distinct very nearly to the summit of the ovary. Stamens inserted on the bases of the segments; anthers linear-oblong. Style very slender, enlarged above, the 3 slender undivided branches alternate with the anthers. Capsule fig-shaped, obovoid, thin-walled, loculicidally 3 -valved, the valves recurving, finally falling away, exposing the mass of black fleshy seeds, borne on a central axis. A monotypic genus of eastern Asia.
I. Gemmingia Chinénsis (L.) Kuntze. Blackberry Lily. (I. F.f. io82.) Stem stout, o.4-1.2 m. tall. leafy. Leaves equitant, $2-2.5 \mathrm{dm}$. long, $\mathrm{I} .6-2.5 \mathrm{~cm}$. wide, the two sides united above the middle; upper bracts scarious; flowers several or numerous, $3-5 \mathrm{~cm}$. broad; perianth-segments obtuse, mottled with crimson and purple, persistent; capsule about 2.5 cm . high, the persistent mass of globose black seeds resembling a blackberry. On hills and along roadsides, S. N. Y. to Ga., Ind. and Mo. Nat. from Asia. June-July.

## 4. SISYRÍNCHIUM L.*

Perennial mostly tufted slender herbs with fibrous ronts from contracted rootstocks, simple or branched 2 -winged or 2 -edged stems, and linear grass-like leaves.

[^12]Flowers from terminal spathes consisting of mostly one pair of opposite conduplicate herbaceous bracts enclosing membranous scales; perianth blue, violet, or white with a yellow eye, rarely all yellow, the 6 oblong or obovate segments spreading and arıstulate; filaments monadelphous; anthers linear or oblong, the sacs distinct at base; style threadform, the branches filiform or obsolete; ovary 3-celled; capsule globose, oval or obovoid, usually trigonous, loculicidally 3 -valved; seeds globose to obovoid, often angled, pitted or smooth. Flowers fugacious, opening successively in sunlight, each usually lasting but a day. Probably not less than 125 species, nearly all American. Besides the following many others occur in the Southern and Western States.

Filaments free above, anthers over 3.5 mm . long ; spathes twin, sessile, terminating the subterete wingless stem. I. S. hastile.
Filaments monadelphous to the top; anthers under 2.5 mm . long.

Spathes twin, sessile, terminating the winged stem.
Spathes single.
Flowers yellow ; primary bract long and foliaceous, stem simple.
Flowers blue, violet or whitè.
Stems mostly simple with a sessile terminal spathe.
Capsules $4-6 \mathrm{~mm}$. high, leaves $2^{-6} \mathrm{~mm}$. wide. 6. S. anguistifolium. Bracts glabrous, the outer one united-clasping below, flowers deep violet blue, rarely white.
5. S. mucronatum.

Capsules $2-4 \mathrm{~mm}$. high, leaves $0.5-2 \mathrm{~mm}$. wide.
Bracts scabrous, puberulent, sometimes glabrous, the outer one not united-clasping at base or scarcely so ; flowers pale blue or white. 3. S. campestre.

Stems both simple and branched, broadly winged; spathes mostly purplish.
7. S. intermedium.

Stems mostly branched above, bearing two or more pedunculate spathes.
Tufts fibrose-coated at base.
Plant turning dark when dry ; capsules dark and thick-walled ; peduncles mostly over 1 mm . wide; coastwise.
8. S. arenicola.

Plant not turning dark when dry ; capsules pale and thin-walled; peduncles mostly under 0.5 mm . wide.
9. S. Farwellii.

Tufts not fibrose-coated at base.
Plant usually turning dark in drying; stem broadly winged; pedicels spreading or recurved. 10. S. graminoides.
Plant not turning dark when dry; pedicels not recurved; spreadin: Capsules dark and thick-walled.

Spathes $13-20 \mathrm{~mm}$. long; capsules longer than broad, not apiculate; inner bract obtuse. II. S. Atlanticum.
Spathes $10-13 \mathrm{~mm}$. long; capsules broader than long, apiculate. 12. S. apiculatum. Capsules pale and thin-walled; peduncles closely erect: inner bract acute. 13. S. strictum.

1. Sisyrinchium hástile Bicknell. Spear-like Sisyrinchium. Very slender and stiffly erect, dull green, 3-4 dm. high. Stems I mm. wide or less, compressed-subterete and bluntly two-edged, not at all winged, closely striate, minutely granulose-roughened; leaves similar to the stems, usually shorter, thickedged, obtusely slender-pointed, the conduplicate broadened base smooth and membranous; spathes usually two in a close pair at the top of the stem. each usually 4 -bracted, the bracts lanceolate-attenuate, the inner ones $2-2.5 \mathrm{~cm}$. long: primary bract slenderly much prolonged; interior scales ample, sometimes slightly. exserted; flowers few, on pedicels not longer than the inner bracts. Fruit and color of flower unknown. Sandy shores of Belle Isle in the Detroit River, Mich. Early June.
2. Sisyrinchium álbidum Raf. White Bude-even Grass. Green and glaucescent, the spathes often purplish, $1.5-4.5 \mathrm{dm}$. high. Leaves half the height of the stems or longer, $1-3.5 \mathrm{~mm}$. wide, very acute, mostly smooth-edged : stem:s usually broadly winged, $1-3 \mathrm{~mm}$. Wide, the edges serrulate to smooth ; pathe's sessile in a close terminal pair, the prominent outer bract $2.5-7 \mathrm{~cm}$. long. its edses free to the base; inner bracts acuminate, often ciliolate on the keel, mostly 15-20 mm . long; flowers white to pale blue; perianth \& 12 mm . hong: capsules pah: depressed-subglobose, $2-3 \mathrm{~mm}$. hign, on erect-spreading pedicels usuaily shorter
than the inner bracts; seeds globose, 1 mm . or less in diameter, umbilicate, dis. tinctly pitted. Mo. to Mich., La., Ala. and N. Car. April-June.
3. Sisyrinchium campéstre Bicknell. Pratrie Blue-eyed Grass. Similar to S. mucronatum Michx., but often stiffer and more glaucous, with always smoothedged stems and leaves, usually broader, more gibbous spathes, and pale blue or frequently white flowers. Stem usually less than 1 mm . wide, the leaves rather broader; spathes green to dull pink-purple, the bracts commonly scabrous-puberulent all over, but sometimes glabrous, the outer one usually less slenderly prolonged than in S. mucronatum, and not united-clasping at base, or but slightly so, 2.5-4.5 cm . long, rarely more than twice longer than the inner bract, which emerges more abruptly from the base of the spathe than in $S$. mucronatum, and has more broadly hyaline edges ; capsules pale, trigonous-subglobose, 2-4 mm. high. Wis. to N. Dak., La. and N. Mex., mostly on prairies. May-June.

Sisyrinchium campéstre Kansanum Bicknell. Becoming stouter and broader-leaved than the type with larger, longer-bracted spathes and coarser roots; pale green and glaucous, usually without any purplish tinge, the flowers apparently always white. Stems rather broadly winged, $\mathrm{I}-2 \mathrm{~mm}$. wide, the stiff often falcate leaves becoming 2.5 mm . wide; bracts mostly smooth, sometimes obscurely roughened, the margins conspicuously white-hyaline, the outer one slenderly prolonged often for more than twice the length of the inner one, sometimes 6.5 cm . long; capsules apparently not larger than in the type. Kans. and Oklohoma.
4. Sisyrinchium flavifiòrum Bicknell. Yellow-flowered Sisyrinchium. About 2.5 dm . high, dull green, glaucescent. Leaves sometimes equalling the stems, smooth-edged or nearly so, acute, the larger ones broadened upward, $\mathbf{I}-\mathbf{2 . 5} \mathbf{~ m m}$. wide ; stems rather prominently winged, $\mathrm{I}-3 \mathrm{~mm}$. wide, broader at the base of the spathe, smooth-edged; bracts of the spathe membranous, smooth, the outer one much prolonged and foliaceous, mostly about 6 cm . long and surpassing the inner bract $3-4 \mathrm{~cm}$., the narrowly hyaline margins free to the base; flowers lemonyellow, on pedicels $10-15 \mathrm{~mm}$. long, sometimes only half the length of the inner bract; perianth about 12 mm . long. Fruit not known. Missouri. June.
5. Sisyrinchium mucronàtum Michx. Michaux's Blue-eyed Grass. More cæspitose than S. angustifolium and decidedly more slender and delicate, with smaller spathes and capsules, sometimes scarcely glaucescent and the spathes often bright red-purple. Stem and leaves from capillaceous to 1.5 mm . wide, ra ely wider, the edges very smoath to denticulate-scabrous, the stems narrowly winged or merely margined, sometimes not longer than the leaves; spathes often slightly bent, the bracts thin, glabrous, hyaline-margined, the outer one slenderly prolonged, I. $5-6 \mathrm{~cm}$. long, united-clasping for I-6 mm. at base; inner bract scarious, obtuse to attenuate, $10-20 \mathrm{~mm}$. long, gradually emerging from the outer one, flowers deep violet blue, rarely white; perianth $6-14 \mathrm{~mm}$. long; capsules pale and thin-walled, subglobose to obovate-oblong, trigonous, 2-4 mm. high, on slender subspreading exserted pedicels. In meadows and fields, southeastern Mich. to N. J. and Va. May-June.
6. Sisyrinchium angustifòlium Miller. Northern Blue-eyed Grass. (I. F. f. 1085.) Stiff and erect, pale and glaucous, $8-55 \mathrm{~cm}$. high. Leaves half the height of the stem or longer, $1-3.5 \mathrm{~mm}$. wide, acute, the edges minutely serrulate; stem simple or rarely branched, $\mathrm{I}-3 \mathrm{~mm}$. wide, winged, the edges minutely serrulate; spathes green or slightly purplish, the outer bract rarely less than twice the length of the inner one, $2-6.5 \mathrm{~cm}$. long, obscurely hyaline-margined, united-clasping for $2-6 \mathrm{~mm}$. at base; inner bract attenuate, $15-30 \mathrm{~mm}$. long; flowers deep violetblue; the perianth $10-12 \mathrm{~mm}$. long ; capsules broadly oval to globose, $4-6 \mathrm{~mm}$. high, pale, often purplish-tinged, on erect pedicels usually shorter than the inner bract. Fields and hillsides, Newf. to N. J. and on the mountains to Va., west to Saskatchewan and Colo. May-June.
7. Sisyrinchium intermèdium Bicknell. Intermediate Blue-eyed Grass. Dull green and glaucescent, drying dark, the spathes usually purp'.e. Tufts not fibrose at base, $10-40 \mathrm{~cm}$. high ; stems either simple or branched above into two peduncles; leaves very thin and weak-nerved, $1.5-2.5 \mathrm{~mm}$. wide, often smoothedged; stems erect but frail, mostly $\mathbf{I} .5 \mathrm{~mm}$. wide, very flat, the thin wings serrulate ; peduncles usually shorter than the subtending reaf, $5-8 \mathrm{~cm}$. long, the outer oric
divergent; bracts of the spathe thin, cuspidate-acute; the outer one attenuately prolonged, $2-6 \mathrm{~cm}$. long, on simple stems sometimes three times the length of the inner one; flowers few, 3-6, pale blue; perianth $8-12 \mathrm{~mm}$. long; capsules dark, subglobose, about 4 mm . high, on slenderly exserted finally spreading pedicels. S. N. J. to N. Car. May-June. Intermediate in appearance between S. angustifolium, or S. mucronatum, and S. graminoides.
8. Sisyrinchium arenícola Bicknell. Sand Blue-eyed Grass. Deep green or glaucescent, often purplish-tinged, the base of the tufts coarsely fibrous. Leaves stiff, attenuate, cuspidate-acute, $\mathbf{1}-3 \mathrm{~mm}$. wide, closely striate; usually serrulate; stem erect, often curved, $20-40 \mathrm{~cm}$. high, $\mathbf{1 . 5 - 3 ~ \mathrm { mm } \text { . wide, stiff, the firm wings }}$ striate, mostly serrulate ; node commonly only one, its erect leaf conspicuous, attenuate-acute, the compressed broadened base strongly striate; peduncles 2-4, curved, subequal and approximate, $3-\mathbf{1 2} \mathrm{cm}$. long, mostly $\mathbf{I ~ m m}$. wide or more; spathes erect, the acute bracts firm and strongly striate, slightly unequal; flowers sometimes as many as 12 , deep violet-blue; perianth $8-10 \mathrm{~mm}$. long; capsules dark and thick-walled on erect slightly exserted pedicels, broadly oval or obovoid, $3-5 \mathrm{~mm}$. high. L. I., Staten I. and N. J., in sandy soil on or near the coast. June-July.
9. Sisyrinchium Farwèllii Bicknell. Farwell's Blue-eyed Grass. Dull green and glaucescent, not turning dark when dry, the thin tufts fibrous-coated at base. Leaves much shorter than the stems, $\mathbf{I}-3 \mathrm{~mm}$. wide, firm, membranous, at-tenuate-acute, the edges serrulate to smooth. Stems flexuous-erect, $20-30 \mathrm{~cm}$. high, $\mathbf{I}-2 \mathrm{~mm}$. wide, winged, the edges usually serrulate; nodes one or two, their leaves shorter than the two or three peduncles, slenderly attenuate; peduncles very slender, $4-$ II cm . long, mostly less than 0.5 mm . wide; spathes pale, narrow, 17-20 mm . long, the bracts subequal, papery, sometimes only obscurely nerved, slenderpointed or subaristulate. Flowers very small, pale blue. Capsules pale and thinwalled, subglobose, $2-3 \mathrm{~mm}$. high on slender, flexuously erect, much exserted pedicels. Southeastern Mich.
10. Sisyrinchium graminoìdes Bicknell. Common Blue-eyed Grass. (I. F. f. 1083.) Sometimes not at all tufted, bright green, often glaucescent, drying dark. Stem and leaves thin and grass-like, $2-6 \mathrm{~mm}$. wide, the edges minutely serrulate; leaves usually half the height of the stem; stem broadly winged, forking into two winged peduncles $5-20 \mathrm{~cm}$. long, subtended by a conspicuous erect acuminate leaf; nodes sometimes two ; spathes mostly green, erect, the bracts subequal or sometimes the outer one foliaceously prolonged, the inner one acute or attenuate, $15-20 \mathrm{~mm}$. long; flowers $3-6$, blue, the perianth $8-10 \mathrm{~mm}$. long; capsules dark and thin-walled, subglobose, $4-5 \mathrm{~mm}$. high, on slender exserted flexuously spreading or finally recurved pedicels. Mass. and N. H. to Minn., Fla. and Tex. May-June.
11. Sisyrinchium Atlánticum Bicknell. Eastern Blue-eyed Grass. (I. F. f. Io84.) Very pale and glaucous, not drying dark, the narrow stems and leaves firm and very smooth, mostly $\mathbf{I}-\mathbf{2} \mathbf{~ m m}$. wide, rarely 3 mm . Leaves attenuate, commonly about half the height of the stem ; stem margined or narrowly winged, often somewhat geniculate at the one or two nodes; peduncles $\mathbf{I}$ - 3 , slender, usually "short ; spathes often bent sideways, usually slightly purplish. the thin bracts subequal, the outer one usually acute, the inrer one scarious-obtuse, mostly $\mathbf{1 2 - 1 5} \mathrm{mm}$. long; flowers $3-10$, violet-blue; perianth $6-12 \mathrm{~mm}$. long; capsules dark and thick-walled, more or less oblong, $2-4.5 \mathrm{~mm}$. high, contiguous on crect little-exserted pedicels. Mass. and Vt., along and near the coast to Fla.. usually in or near brackish marshes. May-June.
12. Sisyrinchium apiculàtum Bicknell. Apiculate Bide-fyen Griss. l'ale green and glaucescent, keeping its color when dry, about fo (m. high, mot fibrous at base. Leaves about half the height of the stems, hecoming over 2 mm . wide, acute, firm, withering-persistent, the edges very smooth; stem $1-2 \mathrm{~mm}$. wide, narrowly winged, the edges smooth; nodes mostly two, supporting 1 3 sle:der peduncles $3-8 \mathrm{~cm}$. long; leaf of upper node very short; spathes siven, often deflected, short and rather broad, $10-13 \mathrm{~mm}$. long, the subequal bracts contwa. strongly striate, acute or the inner one obtuse, the margins rather broally whitehyaline ; flowers small, violet-blue; capsules dark, broally subghonse, distinctly apiculate, $2.5-3.5 \mathrm{~mm}$. high, sparsely puberulent, on loosely erect well-exsertei margined pedicels. Muskegon Co., Mich. June.
13. Sisyrinchium stríctum Bicknell. Strict Blue-eyed Grass. About 30 cm . high in erect tufts not fibrose at base, pale light green and glaucous, not changing color when dry. Stems and leaves I-2 mm . wide, mostly serrulate, the leaves thin, tapering-acute, over half the height of the stems; node only one, its erect leaf closely united-clasping below, subequal with the two short approximate peduncles, $4-7 \mathrm{~cm}$. long; spathes sometimes much tinged with red-purple, erect, narrow, $16-20 \mathrm{~mm}$. long, the bracts subequal, sharp-pointed, the outer one rather abruptly narrowed above ; flowers rather small, deep violet-blue; capsules pale and thin-walled, somewhat obovoid, about 4 mm . high, on suberect, slightly exserted margined pedicels. In sandy soil, Montcalm Co., Mich. June.

## Order 9. SCITAMINÀLES.

Large monocotyledonous herbs with very irregular flowers. Ovary inferior, composed of several united carpels. Seeds with endosperm.

## Family I. MARANTACEAE Lindl. Arrowroot Family.

Tall herbs, perennial by rootstocks or tubers, or sometimes annual, with scapose or leafy stems, mostly large entire long-petioled sheathing leaves, often swollen at the base of the blade, the veins pinnate, parallel. Flowers perfect, or sometimes polygamous, in panicles, racemes or spikes. Perianth superior, its segments distinct to the summit of the ovary, or united into a tube, normally in 2 series of 3, the outer (sepals) usually different from the inner (petals). Perfect stamen I; anthers I-2-celled. Staminodia mostly 5, often petal-like, very irregular. Ovary i-3-celled, inferior; ovule I in each cavity, anatropous; style slender, curved, terminal ; stigma simple. Fruit capsular or berry-like. Seed solitary in each cavity. Embryo central, in copious endosperm. About 12 genera and i60 species, mostly tropical.

## ェ. Thàlia l.

Annual (or perennial?) herbs, with long-petioled basal leaves, erect scapes and terminal panicled spikes of bracted flowers. Sepals 3, membranous, separate, equal. Petals 3, separate or somewhat coherent at the base. Staminodia slightly united below, one of them (labellum) broad, crested. Anther I-celled. Ovary I-celled or with 2 additional small empty cavities. Base of the style adnate to the base of the stamen-tube. Stigma 2-lipped, dorsally appendaged. Capsule globose or ovoid. Seed solitary, erect. Embryo strongly curved. [In honor of Johann Thalius, German naturalist of the sixteenth century.] About 7 species, all American. Besides the following, another occurs in the Southern States.
I. Thalia dealbata Roscoe. Powdery Thalia. (I. F. f. 1086.) Plant white-powdery nearly all over. Scapes terete, $9-18 \mathrm{dm}$. tall ; petioles $3-8 \mathrm{dm}$. long ; leaves ovate-lanceolate, acute or acuminate, I.5-3 dm. long; panicle 2-4.5 dm . long, its spikes numerous; bracts narrow, deciduous, not longer than the spikes; bractlets ovate, unequal, coriaceous, about 12 mm . long; flowers purple, longer than the bractlets; capsule ovoid, about 8 mm . in diameter. In ponds and swamps, S. Car. to La., Mo. and Tex.

## Order io. ORCHIDÀLES.

Monocotyledonous herbs, many tropical species epiphytes. Flowers very irregular, or in Burmanniaceae regular, mostly complete and perfect, their parts in 3's or 6's. Ovary inferior, compound. Seeds very numerous and minute, without endosperm.
Flowers regular ; stem leaves reduced to scales,
Fam. 1. Burmanniaceae Flowers very irregular.

Fam. 2, Orchidaceae.

## Family I. BURMANNIACEAE Blume. Burmannia Family.

Low annual herbs, with filiform stems and fibrous roots. Leaves basal or reduced to cauline scales or bracts. Flowers regular, perfect, the perianth with 6 small thick lobes, its tube adnate to the ovary. Stamens 3 or 6 , included, inserted on the tube of the perianth; anthers 2 -celled, the sacs transversely dehiscent. Style slender; stigmas 3, dilated; ovary inferior, with 3 central or parietal placentæ. Ovules numerous. Capsule many-seeded. Seeds minute, oblong; endosperm none. Ten genera and about 60 species, widely distributed in tropical regions. The family is represented in N. Am. by the following genus and Apteria of the Gulf States.

## ェ. BURMÁNNIA L.

Erect herbs, with simple stems and small alternate scale-like or bract-like leaves. Tube of the perianth strongly 3 -angled or 3 -winged, the 3 outer lobes longer than the inner. Stamens 3 , opposite the inner perianth-lobes. Filaments very short; connective of the anthers prolonged beyond the sacs into a 2 -cleft crest. Ovary 3 -celled, with 3 thick 2 -lobed central placentæ; stigmas globose or 2 -lobed. Capsule crowned by the persistent perianth, opening by irregular lateral ruptures. [In honor of Johann Burmann, Dutch botanist of the eighteenth century.] About 20 species, natives of warm regions. Besides the following another occurs in the southeastern States.
I. Burmannia bifìra L. Northern Burmannia. (I. F. f. 1087.) Stems very slender, $5-\mathbf{1 5} \mathrm{cm}$. high, simple or forked above. Flowers $\mathbf{I}$ or several, terminal; angles of the perianth-tube conspicuously winged, the outer lobes ovate, acute, the inner linear and incurved ; seeds very numerous, oblong-linear, sparingly striate. In swamps and bogs, Va. to Fla, and La. Sept.-Nov.

## Family 2. ORCHIDÀCEAE Lindl.* Orchid Family.

Perennial herbs, with corms, bulbs or tuberous roots, sheathing entire leaves, sometimes reduced to scales, the flowers perfect, irregular, bracted, solitary, spiked or racemed. Perianth superior, of 6 segments, the 3 outer (sepals) similar or nearly so, 2 of the inner ones (petals) lateral, alike; the third inner one (lip) dissimilar, often markedly so, usually larger, often spurred, sometimes inferior by torsion of the ovary or pedicel. Stamens variously united with the style into an unsymmetrical column ; anther I or in Cypripedium 2, 2-celled; pollen in 2-8 pear-shaped, usually stalked masses (pollinia), united by elastic threads, the masses waxy or powdery, attached at the base to a viscid disk (gland). Style often terminating in a beak (rostellum) at the base of the anther or between its sacs. Stigma a viscid surface, facing the lip beneath the rostellum, or in a cavity between the anther-sacs (clinandrium). Ovary inferior, usually long and twisted, 3 -angled, i-celled; ovules numerous, anatropous, on 3 parietal placentæ. Capsule 3 -valved. Seeds very numerous, minute, mostly spindle shaped, the loose coat hyaline, reticulated : endosperm none; embryo fleshy. About 410 genera and 5000 specics, of wide distribution, most abundant in the tropics, many of those of warm regions epiphytes.

[^13][^14]Glands not enclosed in a pouch.
Lip not fringed nor cut-toothed.
Stem leafy; anther-sacs mostly parallel.
Valves of the anthers dilated at the base enclosing the glands below.
4. Perularia.

Valves not dilated at the base.
Glands surrounded by a thin membrane. 5. Cologlossum. Glands naked.

Beak of the stigma with 2 or 3 appendages.
6. Gymnandeniopsis,

Beak of the stigma not appendaged. 7. Limnorchis.
Stem scapiform; leaves $1-2$ basal ; anther-sacs divergent.

Basal leaves 2 ; ovary straight.
Basal leaf I ; ovary arcuate.
Lip fringed or parted and cut-toothed.
8. Lysias.
9. Lysiella.
10. Blephariglottis.

Pollinia not produced into a caudicle (except apparently in No. 23). Pollinia granulose or powdery.

Flowers comparatively large, solitary or few ; anthers incumbent on a long column.
Leaves not grass-like; lip free.
Flowers terminal; lip crested.
Leaves alternate. II. Pogonia.
Stem-leaves whorled.
12. Isotria.

Flowers axillary; lip not crested.
13. Triphora.

Leaves grass-like.
Flowers solitary, terminal; lip adherent to the base of the column. 14. Arethusa.

Flowers racemose; lip free.
15. Limodorum.

Flowers small, numerous, in spikes or racemes; anthers erect, jointed to a short column.
Anther operculate; leaves broad, alternate. 16. Epipactis.
Anther not operculate.
Leaves green, borne on the stem.
Leaves alternate; spike mostly twisted. 17. Gyrostachys.
Leaves 2, opposite ; spike not twisted. 18. Listera.
Leaves white-reticulated, basal. 19. Peramium.
Pollinia smooth and waxy.
Plants with corms or solid bulbs, rarely with coralloid roots ; leaves basal or cauline.
Leaves unfolding before or with the flowers.
Leaf cauline ; lip ovate, or auricled at the base.
Leaf or leaves basal.
Leaves 2 ; lip flat; flowers racemed. 21. Leptorchis.
Leaf 1 ; lip saccate; flower solitary. 22. Calypso.
Leaf I , basal, unfolding after the flowering time.
Flowers long-spurred ; lip 3-lobed. 23. Tipularia.
Flowers not spurred; lip 3-ridged. 24. Aplectrum.
Plants with coralloid roots, bulbless; the leaves reduced to scales.
Pollinia 4, in 2 pairs ; flowers gibbous or spurred.
25. Corallorhiza.

Pollinia 8, united ; flowers not gibbous nor spurred.
26. Hexalectris.

## r. CYPRIPEDIUM L.

Glandular-pubescent herbs, with leafy stems or scapes, and tufted roots of thick fibres. Leaves large, broad, many-nerved. Flowers solitary or several, drooping. large, showy. Sepals spreading, separate, or 2 of them united under the lip. Lip a large inflated sac. Column declined, bearing a sessile or stalked anther on each side and a dilated petaloid sterile stamen above, which covers the summit of the style. Pollinia granular, without a caudicle or glands. Stigma terminal, broad, obscurely 3-lobed. [Name Greek, Venus' sock or buskin.] About 40 species, natives of temperate and tropical regions. Besides the following, some 5 others occur in western North America.

Sepals separate ; stem leafy, r-flowered.
Lateral sepals more or less united.
Plant 2-leaved; scape i-flowered.
Stem leafy to the top, 1 -several-flowered.
Sepals and petals not longer than the lip.

1. C. arietinum.
2. C. acaule.
3. C. reginae.

Sepals and petals longer than the lip. Sterile stamen lanceolate; lip white. Sterile stamen triangular; lip yellow. Lip $3-5 \mathrm{~cm}$. long, vertically flattened, pale yellow. 5. C. hirsutum. Lip $1.5-3 \mathrm{~cm}$. long, laterally flattened, bright yellow. 6. C. parviflorum.
I. Cypripedium arietinum R. Br. Ram's-head Ladies' Slipper. (I. F.f. 1088.) Stem 2-3 dm. high, I-flowered. Leaves 3 or 4, elliptic or lanceolate, 5-10 cm . long, $1-7 \mathrm{~cm}$. wide; sepals separate, lanceolate, longer than the lip; petals linear, greenish brown, about as long as the sepals; lip $14-16 \mathrm{~mm}$. long, red and white, veiny, prolonged at the apex into a long blunt spur, somewhat distorted at the upper end which resembles a ram's head. In cold and damp woods, Quebec to Ont., N. Y. and Minn. May-Aug.
2. Cypripedium acaùle Ait. Moccasin Flower. Noah's Ark. Stemless Ladies' Slipper. (I. F.f. Io89.) Scape 1.5-3 dm. high, i-flowered. Leaves 2, basal, elliptic, $\mathbf{1 5}^{5-20} \mathrm{~cm}$. long, thick; occasionally a smaller leaf is borne on the scape ; sepals greenish purple, spreading, $3-5 \mathrm{~cm}$. long, lanceolate; petals narrower and somewhat longer than the sepals; lip often over 5 cm . long, pink with darker veins or sometimes white, the upper part of its interior surface crested with long white hairs; sterile stamen triangular, acuminate, keeled inside. In sandy or rocky woods, Newf. to Ont., N. Car., Ky. and Minn. Flower fragrant. May-June.
3. Cypripedium regìnae Walt. Showy Ladies' Slipper. (I. F. f. iogo.) Stem stout, $3^{-6 ~ d m}$. high, leafy to the top. Leaves elliptic, acute, $7-18 \mathrm{~cm}$. long; flowers 1-3; sepals round-ovate, white, not longer than the lip, the lateral ones united for their whole length; petals somewhat narrower than the sepals, white; lip much inflated, over 2.5 cm . long, variegated with purple and white stripes; stamen cordate-ovate. In swamps and woods, N. S. to Ont. and Minn., south to Ga. June-Sept.
4. Cypripedium cándidum Willd. Small White Ladies' Slipper. (I. F. f. rog 1.) Stem 1.5-3 dm. high, leafy. Leaves 3 or 4, elliptic or lanceolate, acute or acuminate, $7-12 \mathrm{~cm}$. long; bracts $3-5 \mathrm{~cm}$. long, lanceolate; flower solitary; sepals lanceolate, longer than the lip, greenish, purple-spotted; petals somewhat longer and narrower than the sepals, wavy, twisted, greenish; lip white, striped with purple inside, about 2 cm . long; sterile stamen lanceolate. In bogs and meadows, N. Y. and N. J. to Minn., Neb. and Mo. May-July.
5. Cypripedium hirsùtum Mill. Large Yellow Ladies' Slipper. (I. F. f. 1092.) Stems leafy, 3-6 dm. high. Leaves oval or elliptic, $7-12 \mathrm{~cm}$. long, acute or acuminate; sepals ovate-lanceolate, usually longer than the lip, yellowish or greenish, striped with purple; petals narrower, usually twisted; lip much inflated, $2-5 \mathrm{~cm}$. long, pale yellow with purple lines; sterile stamen triangular. In woods and thickets, N. S. to Ont., Minn., Ala. and Neb. May-July.
6. Cypripedium parviflòrum Salisb. Small Yellow Ladies' Slipper. (I. F. f. Io93.) Stems 3-6 dm. high, slender, leafy. Leaves oval, elliptic or lanceolate, $5-15 \mathrm{~cm}$. long; sepals and petals longer than the lip; petals usually twisted; lip 14-30 mm. long, bright yellow, more or less marked with purple stripes, spots or blotches; sterile stamen triangular, yellow and purple spotted like the lip. In woods and thickets, Newf. to Br. Col., Wash., Ga. and Mo. MayJuly.

## 2. ÓRCHIS L.

Plants with biennial fleshy tubers, or in our species with a rootstock and numerous fleshy roots; stem in our species scape-like. I-leaved at the base. Flowers in short terminal spikes. Sepals separate, subequal, spreading. l'etals similar to the sepals. Lip connate with the base of the column, 3 -lobed, produced below into a spur. Column short, scarcely extending beyond the base of the lip. Anther 2-celled, the sacs contiguous and slightly divergent; pollinia sranulose, i large mass in each sac, produced into a slender caudicle, the end of which is attached to a small gland. Stigma a hollowed surface between the anther-sacs, the rostellum a knob-like projection under the anther. (ilands enclosed in a pouch. Capsule oblong, erect, without a beak. [Name ancient.] Dhout So species, natives of the north temperate zone, only two known in N. Am. In hathit the following difiors somewhat from the typical Old World species.
I. Orchis rotundifolia Pursh. Small Round-leaved Orchis. (I. F. f. 1095.) Stem $2-2.5 \mathrm{dm}$. high. Leaf varying from nearly orbicular to oval, $3-7 \mathrm{~cm}$. long, with 1 or 2 sheathing scales below it; spike 2-6-flowered ; flowers $12-16 \mathrm{~mm}$. long, subtended by small bracts ; sepals and petals oval, rose-color ; lip white, purple spotted, longer than the petals, 3 -lobed, the middle lobe larger, dilated, 2 -lobed or notched at the apex; spur slender, shorter than the lip. In damp woods, Greenland to the Rocky Mts., Me., N. Y. and Minn. June-July.

## 3. GALEORCHIS Rydb.

Rootstock very short ; root of numerous fleshy fibres. Stem scape-like, with 2 large rounded leaves at the base. Flowers in a short loose spike with large leaflike bracts surpassing them. Sepals united above, forming a kind of galea, or hood. Petals connivent, somewhat adnate to the sepals. Lip entire, wavy, produced below into a spur. Column short, scarcely extending beyond the base of the lip. Anthers 2 -celled, the sacs divergent : pollinia granulose, I large mass in each sac, produced into a slender caudicle. Glands enclosed in a pouch. [Compound word of which the first part refers to the hood-like united sepals.]

A monotypic genus, native of North America. It was established by Rafinesque in 1836, under the name Galearis, which is antedated by Galearia Presl, of 1830.
I. Galeorchis spectábilis (L.) Rydb. Showy Orchis. (I. F. f. Io94.) Stem $2-3 \mathrm{dm}$. high, thick, fleshy, 5 -angled. Leaves with I or 2 scales below them, obovate, sometimes 2 dm . long and I dm. wide, but usually smaller, clammy to the touch ; spike 3-6 flowered; flowers about $2-5 \mathrm{~cm}$. long, violet-purple mixed with lighter purple and white; bracts foliaceous, sheathing the ovaries; lip whitish, divergent, entire, about as long as the petals; spur obtuse, about $\mathbf{1} .6 \mathrm{~cm}$. long; column violet on the back; capsule about $2-5 \mathrm{~cm}$. long, strongly angled. In rich woods, N. B. to Ont. and Minn., south to Ga., Ky. and Neb. April-June. [Orchis spectabilis L.]

## 4. PERULÀRIA Lindl.

Leafy-stemmed plants, from a cluster of thick fibrous roots. Flowers small, greenish, in a long open spike with long bracts. Sepals and petals broad, spreading. Lip lanceolate, with a tooth on each side at the base, and a central tubercle at the middle of the base. Spur slender, straight, longer than the lip, but shorter than the ovary. Valves of the anthers horizontal, opening upward, dilated at the base so as to form an oblong cavity, enclosing the orbicular incurved gland. Polinia granulose, produced at the base into a caudicle. A genus of 2 or 3 boreal, nearly related species, often included in Habenaria. [Latin, a little wallet.]
I. Perularia flàva (L.) Rydb. Tubercled Orchis. Small Pale-green Orchis. (I. F. f. 1105.) Stem rather stout, 3-6 dm. high, leafy. Leaves lanceolate or elliptic, acute or obtuse, I-3 dm. long; bracts acuminate, longer than the ovaries ; petals greenish ; sepals and petals ovate or roundish, about 6 mm . long ; sepals greenish yellow; lip a little longer than the petals; capsule about 8 mm . long. In moist soil, N. H. to Minn., south to Fla., La. and Mo. June-July. [Habenaria flava (L.) Gray.]

## 5. COEloglóssum Hartman.

Leafy plants, with biennial 2 -cleft tubers. Flowers greenish in a long leafybracted spike. Sepals free, somewhat arcuate, bent together and forming a hood. Petals narrow. Lip oblong, obtuse, $2-3$-toothed at the apex. Spur much shorter than the lip, blunt, sac-like. Column short. Pollinia with long caudicles. Glands small, scarcely wider than the caudicle, surrounded by a thin membrane. A boreal genus of 2 or 3 species, often included in Habenaria or Platanthera. [Name Latin, compound, heaven-tongue.]

1. Coeloglossum bracteàtum (Willd.) Parl. Long-bracted Orchis. (I. F. f. IIO3.) Stem leafy, I.5-6 dm. high. Leaves lanceolate, ovate or oval, or the lowest sometimes obovate, $5-12 \mathrm{~cm}$. long, the upper much smaller; bracts longer than the ovaries, the lower ones 2 or 3 times as long ; spike $7-12 \mathrm{~cm}$. long, loosely flowered ; flowers green or greenish; sepals ovate-lanceolate, dilated or somewhat gibbous at the base, about 6 mm . long ; petals very narrow, sometimes thread-like ; lip 6-8 mm. long, oblong-spatulate, $2-3$-toothed or lobed at the apex,
more than twice as long as the white sac-like spur; anther-sacs divergent at the base. In woods and meadows, N. B. to Br. Col., south to N. Car. and Neb. Also in Europe. May-Sept. [Habenaria bracteata (Willd.) R. Br.]

## 6. GYMNANDENIOPSIS Rydb.

Leafy plants, with fleshy fibrous or somewhat tuberous roots, and a short spike of small flowers. Sepals free and spreading. Lip entire or 3 -toothed at the apex, much exceeded by the long filiform or clavate spur. Beak of the stigma with 2-3 oblong or clavate appendages. Anther-sacs parallel and approximate, their glands naked and contiguous. Pollinia granular, with short caudicles. A North American genus, nitherto included in Habenaria. It is closely related to the European genus Gymnandenia, from which it differs in the appendages of the stigma; hence the name.
Spur filiform; lip entire; stem leafy.
Ovary not twisted; spur longer than the ovary; flowers white.
Ovary twisted; spur shorter than the ovary, flowers orange.
Spur clavate; lip 3-toothed; stem 1-2-leaved.
I. Gymnandeniopsis nívea (Nutt.) Rydb. Southern Small White Orchis. (I. F. f. 1099.) Stem slender, angled, 3-3.5 dm. high. Leaves linearlanceolate, acuminate, I-2 dm. long, the upper much shorter and passing into the bracts of the spike; spike $5-10 \mathrm{~cm}$. long, loosely many-flowered; flowers small, white; lateral sepals broadly oblong, dilated or slightly eared at the base, spreading, about 6 mm . long; petals and upper sepal smaller; stigma appendaged by 2 small horns affixed to the back of the anther; ovary straight. In pine barren bogs, Del. to Fla. and Ala. Aug. [Habenaria nivea (Nutt.) Spreng.]
2. Gymnandeniopsis integra (Nutt.) Rydb. Small Southern Yellow Orchis. (I. F. f. iIO2.) Stem 3-6 dm. high, angled, with 1-3 linear-lanceolate leaves below, and numerous bract-like ones above. Lower leaves $5-20 \mathrm{~cm}$. long, acute; spike $2-7 \mathrm{~cm}$. long, densely flowered; flowers orange-yellow; upper sepal and petals connivent; lateral sepals longer, oval or obovate, spreading; lip oblong, mostly crenulate or erose, sometimes entire; stigma with 2 lateral fleshy appendages and a narrow beak. In wet pine barrens, N. J. to Fla. and La. The upper surface of the leaves is often reticulated with hexagonal cells. July. [Habenaria integra (Nutt.) Spreng.]
3. Gymnandeniopsis clavellàta (Michx.) Rydb. Small Green Wood Orchis. (I. F. f. IrO4.) Stem 2-5 dm. high, angled, r-leaved near the base, often with several small bract-like leaves above, or one of these larger. Basal leaf oblanceolate, $5^{-1} 5 \mathrm{~cm}$. long; bracts shorter than the ovaries; spike $1-2.5 \mathrm{~cm}$. long, loosely flowered; flowers small, greenish or whitish; sepals and petals ovate; lip dilated and 3 -toothed at the apex; the teeth often small and inconspicuous; spur longer than the ovary, incurved, clavate; stigma with 3 club-shaped appendages; capsule ovoid, nearly erect. In wet or moist woods, Newf. to Minn., south to Fla. and La. July-Aug. [Habenaria clavellata (Michx.) Spreng.]

## 7. LIMNÓRCHIS Rydb.

Leafy plants with thick fleshy roots and small greenish or whitish flowers in a long spike. Sepals and petals free and spreading. Lip entire. Beak of the stigma without appendages. Anther-sacs nearly parallel, wholly adnate. Glands maked. Pollinia granular. A North American genus of about a dozen species, diffiring from Lysias in the general habit and the almost parallel anther-sacs. [lireck, Marsh-orchis.]
Lip lanceolate, slightly if at all dilated at the base ; flowers greenish or purplish.
Spur shorter than the lip, much thickened at the end, obtuse. I. L. hyperborea.
Spur slightly exceeding the lip, slightly if at all thickened at the end. Plant stout ; flowers comparatively large ; sepals $4^{-6} \mathrm{~mm}$. long.
2. L. media.

Plant slender; flowers smaller; sepals $2.5-4 \mathrm{~mm}$. long. 3. L. Huronensis.
Lip decidedly rhomboid-dilated at the base ; flowers white.
Flowers not very fragrant ; sepals $2-3 \mathrm{~mm}$. wide, not strongly striate.
4. L. dilatata.

Flowers very fragrant ; sepals $1.5-2 \mathrm{~mm}$. wide, strongly striate. 5. l. fragrans.

1. Limnorchis hyperbòrea (L.) Rydb. Tall Leafy Green Orchis. (I. F. f. i100.) Stem rather stout, 2-6 dm. high. Leaves lanceolate, mostly acute, 5-30 cm . long; spike narrow, $7-20 \mathrm{~cm}$. long; flowers small, divaricate, greenish or greenish yellow; sepals and petals ovate, obtuse, 4-6 mm. long; upper sepal crenulate at the apex; lip lanceolate, entire, obtuse, about 7 mm . long; spur seldom equalling the lip, blunt, slightly incurved, decidedly clavate ; glands small; ovary more or less twisted; pod 1 cm . long, 5 mm . wide. In bogs and wet woods, N. S. to Alaska, south to N. J. May-Aug. [Habenaria hyperborea (L.) R. Br.]
2. Limnorchis média Rydb. n. sp. Intermediate Bog Orchis. Stem stout, 4-8 dm. high. Leaves lanceolate, acute, I-2 dm. long; spike long, densely flowered; bracts rather large and with scabrous margins; flowers divaricate, greenish or purplish; sepals ovate-oblong, 4-6 mm. long; petals lanceolate, obtuse; lip lanceolate, entire, obtuse, slightly dilated at the base, $5-7 \mathrm{~mm}$. long ; spur slightly exceeding the lip, curved, obtuse, scarcely at all thickened at the apex; ovary somewhat twisted ; pod about $\mathbf{I} \mathrm{cm}$. long and 5 mm . in diameter. It has been confused with L. hyperborea and L. dilatata. In bogs, Can. and N. Y., west to Minn. Type specimen from Quebec. June-Aug.
3. Limnorchis Huronénsis (Nutt.) Rydb. Huron Orchis. Stem slender, $2-3 \mathrm{dm}$. high. Lower leaves oblanceolate, obtuse; upper lanceolate and acute; spike long, rather lax; bracts lanceolate, the lower often twice as long as the flowers; flowers almost erect, light green ; sepals oblong, r.5-2 mm. long; lip linear-lanceolate, entire; spur generally exceeding the lip, scarcely clavate, curved, often acutish; pod about $\mathbf{I ~ c m}$. long and 3 mm . in diameter. It resembles a slender $L$. hyperborea, differing in the smaller erect flowers, longer and narrower spur and pod. In swamps, Can. to N. Y.; apparently also in the Black Hills of S. Dak. JuneJuly. [Orchis Huronensis Nutt.]
4. Limnorchis dilatàta (Pursh) Rydb. Tall White Bog Orchis. (I. F. f. íri.) Stem slender, leafy, 3-6 dm. high. Leaves lanceolate, 7-20 cm. long, obtuse or acute; spike $5-25 \mathrm{~cm}$. long; bracts acute, the lower longer than the ovary, the upper shorter; flowers small, white ; sepals ovate, obtuse, nearly 6 mm . long and $2-3 \mathrm{~mm}$. wide; lip entire, dilated or obtusely 3 -lobed at the base, obtuse at the apex, shorter than the blunt incurved slightly clavate spur; glands close together, strap-shaped, nearly as long as the pollinia and caudicle; stigma with a trowelshaped beak between the bases of the anther-sacs. In bogs and wet woods, N. S. to Sask., south to Me., N. Y. and Neb. June-Sept. [Habenaria dilatata (Pursh) Hook.]
5. Limnorchis frágrans Rydb. n.sp. Fragrant Orchis. Stem very slender, leafy above, $2-3 \mathrm{dm}$. high. Leaves linear, about I dm . long and $8-\mathrm{ro} \mathrm{mm}$. wide, acute; spike slender and lax; bracts lanceolate, acuminate, the lower longer than the flowers; flowers small, pure white, very fragrant; sepals lanceolate, often acutish, 1.5-2 mm. wide and strongly striate; lip about 5 mm . long, narrowly linear, dilated at the base, obtuse, shorter than the curved filiform spur; otherwise as the preceding. In bogs, Willoughby Mountains, Vt. July.

## 8. LÝSIAS Salisb.

Plants with tubers or fleshy roots; stem scapose. Leaves 2, basal. Flowers greenish or white ; sepals free, large and spreading ; petals small and narrow ; lip entire, linear or nearly so ; spur long and slender, generally longer than the elongated, straight ovary. Beak of the stigma without appendages. Anther-sacs widely diverging, their narrow beak-like bases projecting forward; stalk of the pollen-mass laterally affixed to the back of the orbicular gland, whose face is turned inward. Pod cylindric-clavate, distinctly stipitate. A circumboreal genus of about half a dozen species, separated independently by Salisbury in $18 \mathbf{1 2}$ as Lysias and by Richard in 1818 under the name Platanthera.
Scape bracted.
Scape naked.

1. L. orbiculata.
2. L. Hookeriana.
r. Lysias orbiculàta (Pursh) Rydb. Large Round-Leaved Orchis. (I. F. f. 1096.) Scape stout, bracted, 3-6 dm. high, occasionally bearing a small leaf. Leaves orbicular, spreading flat on the ground, shining green above, silvery be-
neath, $\mathbf{1 0 - 1 7} \mathbf{c m}$. in diameter; raceme loosely many-flowered; pedicels about 1 cm . long, the fruiting ones erect ; flowers greenish white ; lateral sepals falcate-ovate, obtuse, $8-10 \mathrm{~mm}$. long; lip about 12 mm . long ; spur much longer than the ovary, often 3.5 cm . long ; anther-sacs prominent, converging above; glands small, orbicular, nearly 5 mm . apart, their faces turned toward the axis. In rich woods, Newf. to Br. Col., N. Car. and Minn. July-Aug. [Habenaria orbiculata (Pursh) Torr.]
3. Lysias Hookeriàna (A. Gray) Rydb. Hooker's Orchis. (I. F. f. 1097.) Scape 2-4 dm. high, not bracted. Leaves fleshy, shining, spreading or ascending, oval, orbicular or obovate, o.7-1.4 dm. long; raceme rather loosely many-flowered, 1-2 dm. long : bracts acute, about as long as the yellowish green flowers; lateral sepals greenish, lanceolate, acute, spreading, about 8 mm . long; petals narrowly linear or awl-shaped; lip linear-lanceolate, acute, 8 -10 mm . long; anther-sacs widely diverging below ; glands small, their faces turned inward; spur slender, acute, 16 mm . long or more, as long as the ovary or considerably longer. In woods, N. S. to Minn., N. J., Penn. and Iowa. June-Sept. [Habenaria Hookeriana, A. Gray.]

## 9. LYSIÉLLA Rydb.

Small plant with a short rootstock and thick root-fibers. Stem scapose, naked, with a single obovate leaf at the base : flowers greenish yellow. Upper sepal round-ovate, erect, surrounding the broad column; lateral sepals reflexed, spreading; petals lanceolate smaller; lip entire linear-lanceolate, deflexed; spur slightly curved, shorter than the arcuate ovary. Beak of stigma not appendaged. Anther-sacs widely diverging, wholly adnate, arcuate; glands small, their faces turned inward. Pod obovoid. A monotypic genus, mostly of North America. [Name diminutive of Lysias.]
I. Lysiella obtusàta (Pursh) Rydb. Small Northern Bog Orchis. (I. F. f. Iog8.) Scape slender, naked, $8-20 \mathrm{~cm}$. high, 4 -angled. Leaf solitary, basal, obovate, $4-10 \mathrm{~cm}$. long, $10-24 \mathrm{~mm}$. wide ; spike $2-5 \mathrm{~cm}$. long, loose ; flowers greenish yellow, about 6 mm . long; upper sepal erect, round-ovate, green with whitish margins ; lateral sepals spreading-reflexed, oblong, obtuse or acute ; petals shorter, dilated or obtusely 2 -lobed at the base, connate with the base of the column; lip entire, linear-lanceolate, obtuse, deflexed, about 6 mm . long; spur about as long as the lip, slender, curved, blunt. In bogs, N. B. to Br. Col., south to Me., N. Y. and Colo. Also in northern Norway. July-Sept. [Habenaria obtusata (Pursh) Richards.]

## 9. BLEPHARIGLÓTTIS Raf.

Plants with tall and leafy stems and fleshy or tuberous roots. Flowers several or numerous in an open spike with foliaceous bracts; corolla white, yellow or purplish; sepals broad and spreading or reflexed; lip variously fringed or 3 -parted and cut-toothed; spur longer than the lip. Anther-sacs widely separated and usually diverging, their narrow beak-like bases supported by the arms of the stigma, strongly projecting forward and upward; gland naked; pollinia granular. A North American genus of perhaps a dozen species. [Name Greek, meaning fringed throat.]
Lip not 3-parted, pectinately fringed.
Spur half as long as the ovary; flowers yellow. I. B. cristata.
Spur longer than the ovary.
Flowers bright yellow. 2. B. ciliaris.
Flowers white.
3. B. blephariglottis.

Lip 3-parted.
Segments of the lip deeply fringed.
Segments narrow; fringe of a few threads.
4. B. lacera.

Segments broadly fan-shaped; fringe copious.
Segments fringed to the middle or deeper ; flowers white.
5. B. leucophaea.

Segments not fringed beyond the middle; flowers lilac, rarely white. Raceme $4-5 \mathrm{~cm}$. thick; lip $1-2 \mathrm{~cm}$. broad. 6. B. grandiflora. Raceme $1-3 \mathrm{~cm}$. thick; lip $8-12 \mathrm{~mm}$. broad. 7. B. psycodes. Segments of the lip cut-toothed; flowers violet-purple. 8. B. peramoena.
I. Blephariglottis cristàta (Michx.) Raf. Crestro Villow Orchis. (I. F. f. Iro6.) Stem slender, angled, 2-6 dm. high. Leaves nartuwly lanconlate, $5-20 \mathrm{~cm}$. long, the upper much smaller, similar to the bracts; bracts as long as the
flowers; spike $5-10 \mathrm{~cm}$. long, dense; flowers orange ; sepals roundish ovate, about 3 mm . long; petals narrower, pectinate-fringed; lip slightly longer than the sepals, deeply fringed to the middle or beyond ; spur $4-6 \mathrm{~mm}$. long, about half as long as the ovary. In bogs, N. J. to Fla. and La. July-Aug. [Habenaria cristàta (Michx.) R. Br.]
2. Blephariglottis ciliàris (L.) Rydb. Yellow-fringed Orchis. (I. F. f. 1107.) Stem slender, 3-7 dm. high. Leaves lanceolate, acute, I-2 dm. long, the upper smaller; spike closely many-flowered, $7-15 \mathrm{~cm}$. long, sometimes 7 cm . thick; flowers orange or yellow, large, showy; sepals orbicular or broadly ovate, oblique at the base, $4-8 \mathrm{~mm}$. long; petals much smaller, oblong or cuneate, usually toothed; lip oblong, $10-14 \mathrm{~mm}$. long, copiously fringed more than half-way to the middle : spur $25-35 \mathrm{~mm}$. long, very slender. In meadows, Vt. (?) and Ont. to Mich., south to Fla. and Tex. July-Aug. [Habenaria ciliaris (L.) R. Br.]
3. Blephariglottis blephariglóttis (Willd.) Rydb. White-fringed Orchis. (I. F. f. IIO8.) Stems and leaves similar to those of the preceding species. Spikes densely or rather loosely many-flowered; flowers pure white, usually a little smaller than those of $H$. ciliaris; lip narrower, oblong; petals toothed or somewhat fringed at the apex: fringe of the lip copious or sparse. In bogs and swamps, Newf. to Minn. and N. J. Intermediate forms [B. bicolor Raf.] between this and the preceding species, with light yellow flowers, are probably hybrids. Blooms a few days earlier than ciliaris where the two grow together. July-Aug. [H. blephariglottis (Willd) Torr.]

Blephariglottis blephariglóttis holopétala (Lindl.) Rydb. One or both of the petals entire ; lip often sparingly fringed. With the type. Probably a mere form.
4. Blephariglottis lácera (Michx.) Rydb. Ragged Orchis. (I. F. f. IIO9.) Stem rather slender, 3-6 dm. high. Leaves firm, lanceolate, $12-20 \mathrm{~cm}$. long, the upper gradually smaller; spike $5-15 \mathrm{~cm}$. long, loose; flowers greenish yellow; sepals ovate, obtuse, about 6 mm . long, the upper one a little broader than the others; petals linear, entire, obtuse, about as long as the sepals; segments of the lip narrow. deeply fringed, the fringe of a few threads, about Icm . long; spur $\mathrm{I} 4-16 \mathrm{~mm}$. long, curved, shorter than the ovary, clavate at the apex ; glands oblong-linear, hyaline, as long as the caudicle. In swamps and wet woods, N. S. to Minn., south to Ga. and Mo. June-July. [H. lacera (Michx.) R. Br.]
5. Blephariglottis leucophaèa (Nutt.) Rydb. Prairie White-fringed Orchis. (I. F. f. ilio.) Stem stout, angled, 5-8 dm. high. Leaves lanceolate, I-2 dm. long ; spike $7-\mathrm{I} 2 \mathrm{~cm}$. long, very thick, loosely flowered; flowers large, white, fragrant, sometimes tinged with green; sepals broadly ovate; petals obovate, minutely cut-toothed, about 6 mm . long; lip i2-14 mm . long, the segments broadly wedge-shaped and copiously fringed ; spur $25-35 \mathrm{~mm}$. long, longer than the ovary; caudicles long and slender ; glands transversely oval ; ovary often recurved. On moist prairies, western N. Y. to Minn., Ky., Ark. and Neb. July. [H. leucophaea (Nutt.) Gray.]
6. Blephariglottis grandifiòra (Bigel.) Rydb. Large Purple-fringed Orchis. (I. F. f. iliti.) Stem 3-15 dm. high. Leaves oval or lanceolate, I-2.5 dm . long, obtuse, or the upper smaller and acute; raceme $7-35 \mathrm{~cm}$. long, sometimes 6 cm . thick, densely flowered ; flowers lilac or purplish, sometimes whitish, fragrant; upper sepal and petals erect, connivent; petals oblong or oblanceolate, more or less toothed, Icm . long ; lip $\mathrm{I}-2.5 \mathrm{~cm}$. broad, about I cm . long, the segments broadly fan-shaped, copiously fringed nearly to the middle; glands orbicular, turned inward; spur filiform, clavate, $25-35 \mathrm{~mm}$. long. In rich woods and meadows, N. B. to Ont. and Mich., south to N. Car. June-Aug. [H. grandiflora (Bigel.) Torr.]
7. Blephariglottis psycòdes (L.) Rydb. Smaller Purple-fringed Orchis. (I. F. f. III2.) Stem rather slender, 3-9 dm. high. Leaves oval, elliptic or lanceolate, $5-25 \mathrm{~cm}$. long, the upper smaller ; raceme $5-15 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. thick, loosely or densely several-many-flowered; flowers lilac, rarely white, fragrant; lower sepals ovate, obtuse, about 8 mm . long, the upper one a little narrower; petals oblong or oblanceolate, toothed on the upper margin; lip $8-12 \mathrm{~mm}$. broad, the segments fan-shaped and copiously fringed; spur somewhat clavate at the apex, about 16 mm . long, longer than the ovary. In meadows, swamps and wet woods, Newf. to Minn., south to N. Car. and Ind. July-Aug. [H. psycodes (L.) A. Gray.]
8. Blephariglottis peramoèna (A. Gray) Rydb. Fringeless Purple Orchis. (I. F. f. III3.) Stem 3-7 dm. high. Leaves elliptic or lanceolate, I-2 dm. long, the upper gradually smaller; spike $5-15 \mathrm{~cm}$. long, $2.5-3.5 \mathrm{~cm}$. thick, densely or rather loosely many-flowered; flowers large, showy, violet-purple; lateral sepals round-ovate, $6-8 \mathrm{~mm}$. long, the upper one smaller ; petals smaller, roundobovate, clawed, entire, or slightly erose ; lip 14-20 mm. long, the segments fanshaped, cut-toothed, not fringed, the middle one 2 -lobed; spur about as long as the ovary, curved, clavate; glands orbicular, oblique. In moist meadows, N. J. to Ill., Va. and Ky. July-Aug. [H. peramoena Gray.]

## II. POGÒNIA Juss.

Mostly low herbs with slender rootstocks and fibrous roots, the flowers terminal, solitary, the leaves alternate. Sepals and petals separate, erect or ascending. Lip erect from the base of the column, spurless, crested. Column elongated, club-shaped at the summit. Anther terminal, stalked, attached to the back of the column, its sacs parallel ; pollinia 2, I in each sac, powdery-granular, without a caudicle. Stigma a flattened disk below the anther. Capsule oblong or ovoid, erect. [Greek, bearded, from the bearded lip of the type species.] Only the following North American species are known :
$\begin{array}{ll}\text { Sepals and petals nearly equal and alike; lip bearded. } & \text { 1. P. ophioglossoides. } \\ \text { Sepals longer and narrower than the petals; lip not bearded. } & \text { 2. P. divaricata. }\end{array}$

1. Pogonia ophioglossoìdes (L.) Ker. Rose Pogonia. Snake-mouth. (I. F. f. III4.) Stem $2-3.8 \mathrm{dm}$. high, I-3-leaved, not rarely with a long-petioled basal leaf. Stem leaf or leaves $1-4 \mathrm{~cm}$. long, lanceolate or ovate, erect, bluntly acute ; flowers fragrant, pale rose-color, slightly nodding, large, solitary or occasionally in pairs, subtended by a foliaceous bract; sepals and petals about equal, elliptic or oval, $\mathbf{1 2 - 2 0 ~ m m}$. long; lip spatulate, free or somewhat appressed to the column below, fringed. Propagates by running rootstocks. In meadows and swamps, Newf. to Ont., Fla. and Kans. June-July.
2. Pogonia divaricata (L.) R. Br. Spreading Pogonia. (I. F. f. III6.) Stem 2-6 dm. high, bearing a leaf near the middle, and a foliaceous bract near the flower. Leaf lanceolate, or narrowly elliptic, obtuse, clasping, $5-10 \mathrm{~cm}$. long ; flower terminal, solitary; sepals linear, longer and narrower than the petals, diverging, dark-colored; petals flesh-color, lanceolate, narrowed at the apex; lip as long as the petals, 3 -lobed, crenulate or wavy-margined, greenish, veined with purple, not bearded, the upper lobe long. In swamps, southern N. T. to Fla. and Ala. Reported from Wisconsin. July.

## 12. ISÒTRIA Raf.

Low herbs with a rootstock and fibrous roots. Flowers terminal. Leaves 5 in whorl near the top of the plant. Sepals and petals separate, ascending, the former generally longer than the latter. Lip erect from the base of the column, crested, spurless, sessile. Anthers and pollinia as in Pogonit. Capsule oblong, erect. [Greek, in equal threes.] Only the following species are known :
Lip crested along a narrow line down the face; peduncle as long as the capsule or longer.
I. I. verticillata.

Lip crested over the whole face and lobes ; peduncle shorter than the capsule.

> 2. I. affinis.
I. Isotria verticillàta (Willd.) Raf. Whorled Pogonia. (I. F. f. 1117.) Stem 2.5-3 dm. high, from long fleshy roots. Leaves obovate, abruptly pointed at the apex, sessile, $2-4 \mathrm{~cm}$. long; flower solitary, erect or declined; peduncle 12-10 mm . long, in fruit usually equalling or exceeding the capsule; sepals linear, 35 cm . long, spreading, dark purple; petals linear, erect, obtusc, greenish yellow. about 20 mm . long; lip 3 -lobed, crested along a narrow band, the upper part expanded, undulate; capsule erect, 2.5 cm . long or more. In moist wonds. E. Mass. to Ont., Wis., Ind. and Fla. May-June. [Posonia rerticillata (Milht.) Nutt.]
2. Isotria affinis (Austin) Rydb. Smaller Whorifi Pminila. (I. F.f. 1118.) Smaller than the preceding species, stem 22.5 dm. high. Leaves $2-5$ cm . long; flowers 2 or solitary, greenish ycllow; pedurick 5-10 cm. hong, much
shorter than the ovary and capsule; sepals equalling the petals, or but little longer, somewhat narrowed at the base; lip crested over nearly the whole face and lobes; capsule erect, about 2 cm . long. In moist woods, Conn. to S. N. Y., Penn., and N. J. Rare and local. June. [Pogonia affinis Austin.]

## 13. TRÍPHORA Nutt.

Low herbs with fleshy tubers and axillary flowers. Sepals and petals separate, ascending, subequal. Lip erect, slightly clawed, and more or less 3 -lobed, not crested, spurless. Column elongated, club-shaped at the summit. Anther terminal, stalked, attached to the back of the column, its sacs parallel; pollinia 2, I in each sac, powdery-granular, without caudicles. Stigma a flattened disk below the anther. Capsule oval, drooping. [Greek, bearing three, in allusion to the usual 3 flowers.] A genus of 8 species of North and tropical America, only the following found in the United States.
I. Triphora trianthóphora (Sw.) Rydb. Nodding Pogonia. (I. F. f. III5.) Stems glabrous, $7-20 \mathrm{~cm}$. high, from a tuberous root, often clustered. Leaves 2-8, alternate, ovate, $6-18 \mathrm{~mm}$. long, clasping; flowers 1-7, axillary, peduncled, pale purple, at first nearly erect, soon drooping; perianth $12-16 \mathrm{~mm}$. long; sepals and petals about equal, connivent, elliptic, obtuse; lip clawed, somewhat 3 -lobed, roughish or crisped above, about as long as the petals; capsule oval, drooping, about 12 mm . long. In rich woods, Can. (? ), Vt. to Fla., Wis. and Kans. Aug.Sept. [Pogonia trianthóphora (Sw.) B. S. P.]

## 14. ARETHUSA L.

Low herbs, with small bulbs and mostly solitary flowers on slender scapes, the solitary leaf linear, hidden at first in the upper scale, protruding after flowering. Sepals and petals about equal, connivent and hooded above, coherent below. Lip dilated and recurved-spreading at the apex, crested on the face with straight somewhat fleshy hairs, slightly gibbous at the base. Column adherent to the lip below, linear, narrowly winged and dilated at the summit. Anther operculate, of 2 approximate sacs incumbent upon the column; pollinia 4. 2 in each sac, powderygranular. Capsule erect, ellipsoid, strongly angled. [Dedicated to the nymph Arethusa.] Two known species, the following occurring in North America, the other in Japan.
I. Arethusa bulbòsa L. Arethusa. (I. F. f. III9.) Scape glabrous, 1225 cm . high, bearing $\mathrm{I}-3$ loose sheathing bracts. Leaf linear, many-nerved, becoming $10-15 \mathrm{~cm}$. long; flower solitary (rarely 2 ), arising from between a pair of small unequal scales, rose-purple, $2-5 \mathrm{~cm}$. high; sepals and petals linear to elliptic, obtuse, arched over the column; lip usually drooping beneath the sepals and petals, the apex broad, rounded, variegated with purplish blotches; capsule ellipsoid, strongly 6 -ribbed, rarely maturing. In bogs, Newf. to Ont. and Minn., south to N. Car. and Ind. May-June.

## 15. LIMODÒRUM L.

Scapose herbs, with round solid bulbs which arise from the bulb of the previous year, a leaf appearing the first season, succeeded in the following year by the scape. Flowers several in a loose terminal spike or raceme. Sepals and petals nearly alike, separate, spreading. Column elongated, 2 -winged above. Anther terminal, operculate, sessile; pollinia solitary, $\mathbf{1}$ in each sac, loosely granular. Lip spreading, raised on a narrow stalk, dilated at the apex, bearded on the upper side with long club-shaped hairs. [Greek, a meadow-gift.]
I. Limodorum tuberòsum L. Grass-pink. Calopogon. (I. F. f. i145.) Scape slender, naked, 3-5 dm. high. Leaf linear-lanceolate, 2-3 dm. long, 6-20 mm . wide, sheathing, with several scales below it; spike 1-4 dm. long, 3-15-flowered; flowers about 2 cm . long, purplish pink, subtended by small acute bracts; sepals obliquely ovate-lanceolate, acute, about 2 cm . long; petals similar; column incurved; lip as long as the column, broadly triangular at the apex, crested along the face with yellow, orange and rose-colored hairs; capsule oblong, nearly erect. In bogs and meadows. Newf. to Ont. and Minn., south to Fla. and Mo. June-July.

## 16. EPIPÁCTIS R. Br.

Tall stout herbs with fibrous roots and simple leafy stems. Leaves ovate or lanceolate, plicate, clasping. Flowers leafy-bracted, in terminal racemes. Sepals and petals all separate. Spur none. Lip free, sessile, broad, concave below, constricted near the middle, the upper portion dilated and petal-like. Column short, erect. Anther operculate, borne on the margin of the clinandrium, erect, ovate or semiglobose, its sacs contiguous. Pollinia 2 -parted, granulose, becoming attached to the glandular beak of the stigma. Capsule oblong, beakless. [Greek name for Helleborine.] About 10 species, widely distributed. Besides the following, another occurs in the western United States.
I. Epipactis viridiflòra (Hoffm.) Reichb. Helleborine. (I. F. f. ilizo.) Stem 3-6 dm. high, glabrous below, pubescent above. Leaves ovate or lanceolate, obtuse or acute, $4-7 \mathrm{~cm}$. long; flowers greenish yellow to purple; pedicels $4-6 \mathrm{~mm}$. long; sepals 8 -10 mm. long, lanceolate; petals narrower; lip expanded into a slightly undulate apex, tapering to a point; bracts lanceolate, longer than the flowers. Ont., Mass. and N. Y.; also in Europe. July-Aug.

## 17. GYRÓSTACHYS Pers.

Erect herbs, with fleshy-fibrous or tuberous roots and slender stems or scapes, leaf-bearing below or at the base. Flowers small, spurless, spiked, I-3-rowed, the spikes more or less twisted. Sepals free, or more or less coherent, or sometimes united with petals into a galea. Lip sessile or clawed, concave, erect, embracing the column and often adherent to it, spreading and crisped, or rarely lobed or toothed at the apex, bearing minute callosities at the base. Column arched below, obliquely attached to the top of the ovary. Anther without a lid, borne on the back of the column, erect. Stigma ovate, prolonged into an acuminate beak, at length bifid, covering the anther and stigmatic only underneath. Pollinia 2, 1 in each sac, powdery. Capsule ovoid or oblong, erect. [Greek, referring to the twisted spikes.] About 80 species, widely distributed in tropical and temperate regions. Besides the following, two occur in the Southern States and three or four on the Pacific Coast. The flowers are often fragrant.

Flowers 3 -ranked; stems not twisted, or but slightly so.
Sepals and petals more or less connivent into a hood.

1. G. stricta.

Lateral sepals separate, free.
Spike short, about 5 cm . long, 8-1o mm. thick; callosities none, or mere thickenings of the basal margins of the lip.
2. G. plantaginea.

Spike $10-15 \mathrm{~cm}$. long, $12-20 \mathrm{~mm}$. thick; callosities nipple-shaped.
Spike $12-14 \mathrm{~mm}$. thick; callosities hairy, straight.
Flowers yellowish; spike acute; lower bracts longer than the flowers.
3. G. ochroleuca.

Flowers white; spike obtuse; lower bracts shorter than the flowers.
4. G. cernua.

Spike $16-20 \mathrm{~mm}$, thick; callosities glabrous, incurved. 5. G. odorata. Flowers merely alternate, appearing secund from the spiral twisting of the stem.

Stem leafy; lower leaves elongated, mostly persistent through the flowering season. Outer sepals lanceolate ; bracts lanceolate to ovate, scarcely scarious-margined.
6. G. praecox.

Outer sepals linear; bracts broadly ovate, scarious-margined. 7. G. linearis.
Stem a scaly scape; leaves basal, mostly withering before the flowering seasom.
Root a single tuber ; spike about 2.5 cm . long.
8, G. simplex.

Root a cluster of tubers; spike $2-7 \mathrm{~cm}$. long.
9. G. gracilis.

1. Gyrostachys strícta Rydb. n. sp. Hooded Ladies' Tresses. (I. F. f. 1121.) Stem 1.5-3.5 dm. high, glabrous, leafy helow, bracted above, the inthorestence rarely puberulent. Lower leaves $7-20 \mathrm{~cm}$. long, linear or linear-oblancoolate; spihe $5-10 \mathrm{~cm}$. long, $8-14 \mathrm{~mm}$. thick; bracts shorter than the flowers; flowers white or greenish, ringent, $6-8 \mathrm{~mm}$. long, spreading horizontalls, very fragrant; upper stpal broad, obtuse or merely acutish at the apex; lip oblimg hroad at the hase. contracted below the dilated crisped apex, thin, transparent, veined; callositics mere thickenings of the basal margins of the lip, or nome. It has hitherto been confused with the Alaskan $G$. Romanooffiana, which has a vory short spike 1-2 cm. hong. upper portion of the sape densely glandular, the sepals united to near the apea,
and acuminate. G. stricta may be the true Ophrys cernua L. from the character "petalis superioribus confluentibus." In bogs, Newf. to Idaho, south to Me., Penn., Minn. and Colo. July-Aug.
2. Gyrostachys plantagínea (Raf.) Britton. Wide-leaved Ladies' Tresses. (I. F. f. II22.) Stem $1-2.5 \mathrm{dm}$. high, glabrous or pubescent, bracted above, bearing 4 or 5 lanceolate or oblanceolate leaves below. Leaves $3-12 \mathrm{~cm}$. long; spike $2-5 \mathrm{~cm}$. long, $8-10 \mathrm{~mm}$. thick, dense; floral bracts mostly much shorter than the flowers; flowers spreading, about 6 mm . long ; petals and sepals white; lip pale yellow on the face, oblong, not contracted at the middle, the wavy apex rounded, crisped or fringed, the base short-clawed; callosities none, or mere thickenings of the lip margins. Moist banks and woods, N. B. to Minn., south to Va. and Mich. June-Aug.
3. Gyrostachys ochroleùca Rydb. n. sp. Yellow Ladies' Tresses. Stem $3-5 \mathrm{dm}$. high, densely pubescent above. Basal leaves linear, tapering to both ends, distinctly petioled, $1-2 \mathrm{dm}$. long ; lower stem leaves similar but often sessile ; upper stem leaves bract-like, lanceolate; spike 5-15 cm. long, $15-20 \mathrm{~mm}$. in diameter, densely flowered, generally acute ; flowers ochroleucous or greenish yellow, strongly fragrant, about I cm. long ; bracts lanceolate or ovate-lanceolate, acuminate, the lower generally longer than the flowers. Otherwise as in $G$. cernua. Hillsides, N. H. to N. Car., and Penn. Type from Mt. Washington, Mass. Aug.-Sept,
4. Gyrostachys cérnua (L.) Kuntze. Nódding Ladies' Tresses. (I. F. f. 1123.) Stem 2-6 dm. high (rarely taller), usually pubescent above, mostly bearing 2-6 acuminate bract-like stem leaves. Basal leaves from linear-oblanceolate to linear, $7-35 \mathrm{~cm}$. long, the blade narrow; spike $10-12 \mathrm{~cm}$. long, $12-14 \mathrm{~mm}$. thick; bracts ovate, acute, generally not longer than the flowers; flowers white, fragrant, nodding or spreading, about 10 mm . long; lip oblong, or sometimes ovate, the broad apex rounded, crenulate or crisped; callosities nipple-shaped, straight, hairy. In meadows and swamps, N. S. to Ont. and Minn., south to Fla. and La. Aug.-Oct.
5. Gyrostachys odoràta (Nutt.) Kuntze. Fragrant Ladies' Tresses. (I. F. f. II24.) Stem stout, 3-6 dm. high, strongly pubescent above. Lower and basal leaves $2-4 \mathrm{dm}$. long, $15-50 \mathrm{~mm}$. wide, tapering into sheathing petioles, the upper reduced to bracts; spike $\mathbf{1 2 - 1 5} \mathbf{~ c m}$. long, $16-20 \mathrm{~mm}$. thick; floral bracts often exceeding the flowers, long-acuminate; flowers yellowish white, fragrant, 10 mm . long; lip as long as the petals, oblong, broad at the base, contracted above the middle, the dilated apex crisped or toothed; callosities nipple-shaped, incurved, glabrous. On river banks, often in water, Va. to Ky., Fla, and La. Sept.-Oct.
6. Gyrostachys praècox (Walt.) Kuntze. Grass-leaved Ladies' Tresses. (I. F. f. I125.) Stem slender, 2.5-6 dm. high, glandular-pubescent above, leafy. Leaves linear, I-3 dm. long, with narrow grass-like blades and long sheathing petioles, mostly persistent through the flowering season, the upper smaller; spike usually much twisted, 5-20 cm. long, 8-12 mm. thick; bracts ovate, about as long as the ovaries; flowers white or yellowish, about 8 mm . long, spreading; lip about 6 mm . long, short-clawed, oblong, contracted above, the dilated apex obtuse, crenulate, often dark-striped in the middle; callosities small, glabrous. In grassy places, S. N. Y. to Fla. and La. July-Aug.
7. Gyrostachys lineàris Rydb. n. sp. Linear-leaved Ladies' Tresses. Stem slender, $4-5 \mathrm{dm}$. high, glandular-pubescent above, leafy. Leaves narrowly linear, $5-10 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, mostly persistent, the upper small and bractlike; spike $4-10 \mathrm{~cm}$. long, $8-10 \mathrm{~mm}$. thick; bracts broadly ovate, scarious-margined, abruptly contracted into a cusp; flowers yellowish, about 8 mm . long, spreading; lateral sepals free, linear, placed so as to leave an open space between them and the upper one, the latter connivent with the petals; lip as in the preceding, but generally less curved. In meadows, N. Y. to Va Type from Closter, N. J. July-Aug.
8. Gyrostachys símplex (A. Gray) Kuntze. Little Ladies' Tresses. (I. F. f. II26.) Stems very slender, $12-25 \mathrm{~cm}$. high, with small deciduous bracts above. Leaves basal, ovate or oblong, short, abruptly narrowed into a petiole, mostly disappearing at or before the flowering time; spike slender, about $2-3 \mathrm{~cm}$. long and 6 mm . thick, glabrous, little twisted; flowers white, $2-3 \mathrm{~mm}$. long; lip. thin, striped, obovate-oblong, crisped at the summit, short-clawed; callosities nippleshaped, slender; root a solitary spinidle-shaped tuber. In dry sandy soil, Mass. to Md., E. Ky. and Tenn. Aug.-Sept.
9. Gyrostachys grácilis (Bigel.) Kuntze. Slender Ladies’ Tresses. (I. F. f. I127.) Stem slender, 2-6 dm. high, from a cluster of spindle-shaped tuberous roots. glabrous, or rarely pubescent above, bearing small deciduous bracts. Leaves basal, obovate, or ovate-lanceolate, petioled, the blades $\mathbf{I}-5 \mathrm{~cm}$. long, $8-20 \mathrm{~mm}$. wide, mostly perishing before the flowering season; spike $2-6 \mathrm{~cm}$. long, $8-12 \mathrm{~mm}$. thick, loose, usually much twisted; flowers white, fragrant, 4-5 mm. long; sepals a little longer than the lip; lip about 4 mm . long, oblong, dilated and crenulate or wavy-crisped at the apex, usually thick and green in the middle, white and hyaline on the margins; callosities small, nipple-shaped. In dry fields and open woods, N. S. to Minn., Fla., La. and Kans. Aug.-Oct.

## 18. LÍSTERA R. Br.

Small herbs, with fibrous or sometimes rather fleshy-fibrous roots, bearing a pair of opposite green leaves near the middle, and I or 2 small scales at the base of the stem. Flowers in terminal racemes, spurless. Sepals and petals nearly alike, spreading or reflexed, free. Anther without a lid, erect, jointed to the column. Pollinia 2, powdery, united to a minute gland. Capsule ovoid or obovoid. [Name in honor of Martin Lister, 1638 (?)-1712, a correspondent of Ray.] About 12 species, natives of the north temperate and arctic zones. Besides the following, another occurs in northwestern North America.

Lip broadly wedge-shaped, retuse or 2 -lobed at the apex.
Leaves oval ; pedicels and ovaries glandular.
Leaves reniform; pedicels and ovaries glabrous.
Lip oblong or linear.
Lip broad, 2 -cleft $1 / 4-1 / 3$ its length; base auricled.
Lip 2 -cleft about $1 / 2$ its length.
Lip twice as long as the petals, with lateral teeth.
Lip 4-8 times as long as the petals, with auricles at the base
5. L. australis.
I. Listera convallarioìdes (Sw.) Torr. Broad-lipped Twayblade. (I. F. f. 1128.) Stem I-2 dm. high, glandular-pubescent above the leaves. Leaves smooth, round-oval or ovate, obtuse or apiculate at the apex, sometimes slightly rounded at the base, 3-9-nerved. Raceme $3-7 \mathrm{~cm}$. long, loosely $3-12$-flowered; flowers greenish yellow; pedicels filiform, glandular, bracted, $6-8 \mathrm{~mm}$. long; petals and sepals linear-lanceolate, much shorter than the lip; lip wedge-shaped, retuse at the dilated apex, generally with a tooth on each side at base; column elongated, but shorter than the lip, a little incurved, with 2 short projecting wings above the anther. In woods, N. S. to Alaska, south to Vt., Mich., and Cal. June-Aug.
2. Listera Smállii Wiegand. Small's Twayblade. (I. F. f. $1128 a$.) Stem slender, $15-20 \mathrm{~cm}$. high, glandular above the leaves. Leaves at or below the mid dle of the stem, ovate-reniform, apiculate or short-acuminate; raceme open, rachis glandular, but pedicels and ovaries glabrous or nearly so; sepals and petals lanceolate, longer than the ovary; lip large, 9 mm . long, broadly obovate or werlgeshaped, broadly 2 -lobed at the apex and with prominent lateral teeth near the hase; column rather short and thick. In damp woods, in the mountains from Penn. to N. Car. June-Aug. [Listera reniformis, Small, not G. Don.]
3. Listera auriculàta Wiegand. Auricled Twayblade. Stem slender, 10 18 cm . high, glabrous below, glandular above the leaves. Leaves large, 3.5-5 cm . long, oval or elliptic-ovate, borne above the middle of the stem; raceme many-flowered; rachis pubescent, pedicels and ovaries glabrous; sepals lance-nvate; petals oblong-linear, longer than the ovary, spreading, obtuse; lip slightly ciliate, oblong, broadest at the auricled base, cleft $\frac{1}{5}-\frac{1}{8}$ its length; column rather stout, 2.5 mm . long. In cedar swamps of Quebec, N. H. and Me. July.
4. Listera cordàta (L.) R. Br. Heart-leayen Twaliliade. (I. F. f. ir 29.) Stem very slender, glabrous or nearly so, 7-25 cm. high. Laves sessile, cordate or broadly ovate, mucronate, $\mathbf{1}-2.5 \mathrm{~cm}$. long; raceme rather lowse, 15 cm . long, 4-20-flowered; flowers purplish, minute; pedicels glabrous, bracted, about 2 mm . long; sepals ovate and petals oblong, scarcoly 2 mm . long; lip narrow, often with a subulate tooth on each side of the basc, iwice as long as the petals. z-eleft, the segments linear or setaceous and ciliolate; column very small, the clinandrium just
appearing above the anther. In moist woods, Lab. to Alaska, N. J. and Ore. Also in Europe and Asia. June-Aug.
5. Listera austràlis Lindl. Sottheri Twayblade. (I. F. f. ifizo.) Stem slender, I-2.5 dm. high, more or less pubescent above. Leaves ovate. acutish, mucronate, glabrous. shining, $14-25 \mathrm{~mm}$. long, 3-7-nerved; raceme $5-7 \mathrm{~cm}$. long. loosely $8-15$-flowered; flowers yellowish green with purplish stripes; sepals and petals minute; lip 6-10 mm. long, 2-parted. split halfway to the base or deeper, 4-8 times as long as the petals, its segments linear-setaceous; column very small. In bogs, N. Y. and N. J. to Fla., and Ala. and La. Feb.-June. A third leaf is rarely borne below the flowers.

## 19. PERAMIUM Salisb.

Herbs with bracted erect scapes, the leaves basal, tufted, often blotched with white, the roots thick fleshy fibres. Flowers in bracted spikes. Lateral sepals free, the upper one united with the petals into a galea. Lip sessile, entire, roundish ovate, concave or saccate, without callosities, its apex reflexed. Anther without a lid, erect or incumbent, attached to the column by a short stalk; pollinia i in each sac, attached to a small disk which coheres with the top of the stigma, composed of angular grains. About 25 species, widely distributed in temperate and tropical regions.

## Lip evidently saccate.

Spike loosely flowered; lip with recurved margins. Spike I-sided; beak shorter than the stigma proper.

Blotches white, mostly along the cross-veins; galea strongly recurved.

1. P. ophioides.

Blotches pale, mostly along the ribs; galea not strongly recurved.
2. $P$. repens.

Spike spiral ; beak as long as the stigma proper or longer.
Spike dense, not 1 -sided; margins of the lip not recurved.
Lip scarcely saccate, with incurved margins.
3. $P$. tessellatum.
4. $P$. pubescens.
5. P. Menziesii.
i. Peràmium ophioìdes (Fernald) Rydb. White-blotched Rattlesnake Plaintain. Scape $\mathrm{I}-2 \mathrm{dm}$. high, glandular-pubescent. Leaf-blade $\mathrm{I}-2 \mathrm{~cm}$. long, broadly ovate, abruptly contracted into a short winged petiole, dark green. generally with the white blotches most conspicuous along the cross-veins; flowers greenish white, $4-5 \mathrm{~mm}$. long; galea concave with a short strongly recurved tip; lip deeply saccate, with recurved margins and tip; anthers blunt. In cold, mossy woods from Prince Edward Island to Man. and N. Car. July-Sept. [Goodyera repens ophioides Fernald.]
2. Peramium rèpens (L.) Salisb. Northern Rattlesnake Plaintain. (I. F. f. II3I.) Scape I-2.5 dm. high. Leaves ovate, the blade I-3 cm. long, somewhat reticulated with pale blotches, tapering into a sheathing petiole; spike short, I-sided; flowers greenish white, $5-6 \mathrm{~mm}$. long; galea concave, ovate, with a short spreading or slightly recurved tip; lip saccate, with a narrow recurved or spreading apex; column very short; anther 2 -celled, blunt. In woods, N. S. to Alaska (?), south to Mass. and Colo. Also in Europe and Asia. July-Aug.
3. Peramium tessellàtum (Lodd.) Rydb. Checkered Rattlesnake Plañtain. Scape 2 dm . high or more. Leaves from 2 to 7 mm . long, ovate to oblonglanceolate, dark green with pale blotches, or sometimes not blotched; spike about 6 cm . long; flowers 6-8 mm. long; galea with a slightly recurved tip; lip less saccate than in the preceding and with the tip less recurved; anthers acuminate; beak as long as the body of the stigma or longer. In words, seldom in bogs, from Newf. i. Lake Superior, south to N. Y. Aug. [Goodyera tessellata Lodd.]
a. Peramium pubéscens (Willd.) Mac\I. Downy Rattlesnake Plantain. II. F. f. II32.) Usually larger than the preceding species, scape $15-60 \mathrm{~cm}$. high, densely glandular-pubescent, bearing 5 -10 lanceolate scales. Leaves $2-5 \mathrm{~cm}$. long, 15-25 mm . wide, strongly white-reticulated, oval or ovate; spike not I-sided; flowers $6-8 \mathrm{~mm}$. high, greenish white; lateral sepals ovate; galea ovate, its short tip usually not recurved; lip strongly saccate with a short broad obtuse recurved or spreading tip. In dry woods, Newf. to Ont. and Minn., south to Fla. and Tenn. July-Aug.
5. Peramium Menzièsii (Lindl.) Morong. Menzies' Rattlesnake Plantain. (I. F. f. II 33.) Scape stout, 2-4 dm. high, glandular-pubescent. Leaves ovate-lanceolate, $4-6 \mathrm{~cm}$. long, $\mathbf{I}_{5}-30 \mathrm{~mm}$. wide, the blade acute at both ends, often without white blotches or reticulations ; spike not I-sided ; flowers 7-9 mm. long ; galea concave, ovate-lanceolate, the tip long, usually recurved; lip swollen at the base : anther ovate, pointed, on the base of the column, which is prolonged above the stigma into a gland-bearing awl-shaped beak. In woods, Quebec to Br. Col., N. H., N. Y., Minn., Ariz., and Cal. Aug.

## 20. ACHROÁNTHES Raf.

Low herbs, from a solid bulb, our species r-leaved, and with I-several scales at the base of the stem. Flowers small, white or green, in a terminal raceme. Sepals spreading, separate, the lateral ones equal at the base. Petals filiform or linear, spreading. Lip cordate or eared at the base, embracing the column. Anther erect between the auricles, 2 -celled; pollinia 4, smooth and waxy, 2 in each sac, the pairs cohering at the summit, without caudicles or glands. Capsule oval, sometimes nearly globose, beakless. [Greek, in allusion to the green flowers?] About 40 species, widely distributed. Besides the following, about 4 others occur in the southern and western parts of North America.

| Leaf sheathing the base of the stem. | I. A. monophylla. |
| :--- | :--- |
| Leaf clasping the stem near the middle. | 2. A. unifolia. |

I. Achroanthes monophýlla (L.) Greene. White Adder’s-mouth. (I. F. f. 1134.) Stem slender, $10-15 \mathrm{~cm}$. high, smooth, glabrous, striate. Leaf sheathing the stem at its base, the blade $2-5 \mathrm{~cm}$. long, $\mathrm{I}-4 \mathrm{~cm}$. wide ; raceme $2-7 \mathrm{~cm}$. long, narrow, 6-10 mm . thick; flowers whitish, about 2 mm . long ; pedicels nearly erect, bracted, $2-4 \mathrm{~mm}$. long ; sepals acute; lip triangular or ovate, acuminate, the lateral lobes obtuse ; capsule oval, about 6 mm . long. In woods, Quebec to Minn., Penn., and Neb. July.
2. Achroanthes unifòlia (Michx.) Raf. Green Adder's-mouth. (I. F. f. 1135.) Stem glabrous, striate, $10-25 \mathrm{~cm}$. high. Leaf clasping the stem near the middle, oval or nearly orbicular, $2-5 \mathrm{~cm}$. long; raceme $2-7 \mathrm{~cm}$. long, sometimes 2 cm . thick; flowers greenish, about 2 mm . long, the pedicels very slender, spreading, $6-10 \mathrm{~mm}$. long ; sepals oblong; lip broad, 2 -lobed at the apex, with a small tooth in the sinus; capsule oval or subglobose. In woods and thickets. Newf. to Ont. and Minn., south to Fla., Ala. and Mo. July.

## 21. LEPTÓRCHIS Thouars.

Low herbs, with solid bulbs, the base of the stem sheathed by several scales and 2 broad shining leaves. Flowers in terminal racemes. Sepals and petals nearly equal, linear, spreading, petals usually very narrow. Column elongated. incurved. thickened and margined above. Pollinia 2 in each sac of the anther, smooth and waxy, the pairs slightly united, without stalk, threads or glands. Lip nearly flat. often bearing 2 tubercles above the base. [Greek, signifying a slender orchid.] About 100 species, widely distributed in temperate and tropical regions; only the following known to occur in North America:

Raceme many-flowered; lip as long as the petals.
Raceme few-flowered; lip shorter than the petals.

1. Leptorchis liliifòlia (L.) Kuntze. Larce Twayblade. (I. F. f. in 6.) Scape 1-2.5 dm. high, 5-10-striate. Leaves ovate or oval, 5-12 cm . longe ohtuse. keeled below, the sheaths large and loose. Raceme sometimes 15 cm . long; flowers numerous, showy; petals very narrow or thread-like; lip erect, large, $10-12 \mathrm{~mm}$. long, about as long as the petals, wedge-obovate; column $:$ mm. lons, incurved, dilated at the summit; capsule somewhat club-shaped, about 12 mm . long, the pedicel thickened in fruit. In moist woods and thickets, Me. to Minn.. Ga. and Mo. May-July.
2. Leptorchis Loesèlii (L.) MacM. Fen (Orchis. lomes. 's Twiybl imf. (I. F. f. II 37.) Scape $5-20 \mathrm{~cm}$. high, strongly 57 -ribbed. !cives elliptic or
elliptic-lanceolate, $5-15 \mathrm{~cm}$. long, obtuse; raceme few-flowered; flowers greenish, smaller than those of the preceding species, 4-6 mm. long; sepals narrowly lanceolate, spreading; petals linear, somewhat reflexed; lip obovate, pointed, its tip incurved; column half as long as the lip or less; capsule about 10 mm . long, wingangled, on a thickened pedicel. In wet thickets and on springy banks, N. S. to the N. W. Terr., south to Md. and Mo. Also in Europe. May-July.

## 22. CALÝPSO Salisb.

Bog herb, with a solid bulb and coralloid roots, the low I -flowered scape sheathed by 2 or 3 loose scales and a solitary petioled leaf at the base. Flower large, showy, terminal, bracted. Sepals and petals similar, nearly equal. Lip large, saccate and swollen, 2 -parted below. Column dilated, petal-like, bearing the lid-like anther just below the summit. Pollinia 2, waxy, each 2-parted, without caudicles, sessile on a thick gland, the stigma at the base. [Dedicated to the goddess Calypso.] A monotypic genus of the cooler portions of the north temperate zone.
I. Calypso bulbòsa (L.) Oakes. Calypso. (I. F. f. 1138.) Bulb $\mathbf{I} \mathrm{cm}$. in diameter or less. Scape $7-15 \mathrm{~cm}$. high; leaf round-ovate, $2-3.5 \mathrm{~cm}$. long, nearly as wide, obtusely pointed at the apex, rounded or subcordate at the base; flowers variegated, purple, pink and yellow, the peduncle jointed; petals and sepals linear, erect or spreading, Io- 14 mm . long, with 3 longitudinal purple lines; lip large, saccate, 2 -divided below, spreading and drooping, with a patch of yellow woolly hairs near the point of division; capsule about I cm. long, many-nerved. Labrador to Alaska, south to Me., Mich., Cal. and Ariz. Also in Europe. Flower somewhat resembling that of a small Cypripedium. May-June.

## 23. TIPULARIA Nutt.

Slender scapose herbs, with solid bulbs, several generations connected by offsets, the flowers in a long loose terminal raceme. Leaf solitary, basal, unfolding long after the flowering season (in autumn), usually after the scape has perished. Scape with several thin sheathing scales at the base. Flowers green, nodding, bractless. Sepals and petals similar, spreading. Lip 3-lobed, produced backwardly into a very long spur. Column erect, wingless or very narrowly winged. Anther terminal, operculate, 2 -celled. Pollinia 4, ovoid, waxy, 2 in each anther-sac, separate, affixed to a short stipe, which is glandular at the base. [Latin, similar to Tipula, a genus of insects, in allusion to the form of the flower.] Two known species, the following of eastern North America, the other Himalayan.
I. Tipularia unifòlia (Muhl.) B. S. P. Crane-fly Orchis. (I. F. f. iI44.) Scape glabrous, 4-5 dm. high, from a hard, often irregular solid bulb or corm. Leaf arising in autumn from a fresh lateral corm, ovate, $5-7 \mathrm{~cm}$. long, dark green, frequently surviving through the winter; raceme $12-25 \mathrm{~cm}$. long, very loose; flowers green, tinged with purple; sepals and petals $6-8 \mathrm{~mm}$. long, narrow; lip mostly shorter than the petals, the middle lobe narrow, prolonged, dilated at the apex, the lateral lobes short, triangular; spur often twice as long as the flower; column shorter than the petals, the beak minutely pubescent; capsule ellipsoid, 6 -ribbed. In woods, Vt. to Mich., south to Fla. and La. Local and rare. JulyAug.

## 24. APLÉCTRUM Nutt.

Scapose herbs, from a corm, produced from the one of the previous season by an offset and sometimes with coralloid fibres; the scape clothed with several sheathing scales. Leaf solitary, basal, developed in autumn or late summer, broad, petioled. Flowers in a terminal raceme, the pedicels subtended by small bracts. Petals and sepals similar, narrow. Lip clawed, somewhat 3 -ridged, spur none. Column free, the anther borne a little below its summit. Pollinia 4, lens-shaped, oblique. [Greek, meaning without a spur.] A North American genus of 2 or 3 species.

1. Aplectrum spicàtum (Walt.) B. S. P. Adam-and-Eve. Putty-root. (I. F. f. II47.) Scape glabrous, $3-6 \mathrm{dm}$. high, bearing about 3 sheathing scales. Leaf arising from the corm, at the side of the scape, elliptic or oval, $10-15 \mathrm{~cm}$. long, $\mathrm{I}-5$ cm . wide, usually lasting over winter; raceme $5-10 \mathrm{~cm}$. long, loosely several-flowered: bracts lanceolate, $2-6 \mathrm{~mm}$. long; flowers dull yellowish brown mixed with purpre, a oout 2.5 cm . long, short-pedicelled; sepals and petals linear-oblanceolate, about 1 cm . long, $2-2.5 \mathrm{~mm}$. wide, acute or rarely obtuse; lip shorter than the petals, obtuse, somewhat 3 -lobed and undulate; column slightly curved, shorter than the lip; capsule oblong-ovoid, angled, about 2 cm . long. In woods and swamps, Vt. and Ont. to the N. W. Terr., south to Ga. Several old corms usually remain attached to the latest one. Specimens with yellowish green, unspotted flowers have been collected by Prof. Underwood at Jamesville, N. Y. May-June.
2. Aplectrum Shórtii Rydb. n. sp. Short's Putty-root. Like the preceding, but stems stouter, the sheaths of the scales of the stem loose, inflated; leaves broadly oval or obovate, often 7 cm . wide; sepals and petals much broader, very obtuse, 3-4 mm . wide, and lip more gibbous at the base; bracts ovate, $\mathbf{x}-3 \mathrm{~mm}$. long. The only specimens seen were collected by Dr. C. W. Short in Ky.

## 25. CORALLORHÌZA R. Br.

Scapose herbs, saprophytes or root-parasites, with large masses of coralloid branching roots, the leaves all reduced to sheathing scales. Flowers in terminal racemes. Sepals nearly equal, the lateral ones united at the base with the foot of the column, forming a short spur or gibbous protuberance, the other one free, the spur adnate to the summit of the ovary. Petals about as long as the sepals, $\mathrm{I}-3$-nerved. Lip I-3-ridged. Column nearly free, slightly incurved, somewhat 2 -winged. Anther terminal, operculate. Pollinia 4, in 2 pairs, oblique, free, soft-waxy. [Greek, from the coral-like roots.] About I5 species, widely distributed in the north temperate zone. Besides the following, some 4 others occur in the southern and western parts of North America.

Spur small or sac-like, adnate to the top of the ovary.
Lip not deeply 3 -lobed.
Lip 2-toothed or 2-lobed above the base. 1. C. Corallorriza.
Lip entire, or merely denticulate.
Flowers about 6-8 mm. long; lip not notched; column narrowly winged.
2. C. odontorhiza. Flowers 14 mm . long; lip notched; column manifestly winged.
3. C. Wisteriana.

Lip deeply 3 -lobed; flowers $\mathbf{1 2 - 1 8} \mathrm{mm}$. long.
No spur or sac.
4. C. multiflora.
5. C. striata.

1. Corallorhiza Corallorhìza (L.) Karst. Early Coral-root. (I. F. f. 1139.) Scape glabrous, $\mathbf{1}-4 \mathrm{dm}$. high, clothed with $2-5$ closely sheathing scales. Raceme $2-7 \mathrm{~cm}$. long, $3-\mathbf{1 2}$-flowered; flowers dull purple, about $\mathbf{I} \mathrm{cm}$. long; sepals and petals narrow, about 6 mm . long; lip shorter than the petals, oblong, whitish. 2 -toothed or 2 -lobed above the base; spur, a sac or small protuberance adnate to the summit of the ovary; capsule $8-12 \mathrm{~mm}$. long, oblong or somewhat obovoid. In woods, N. S. to Alaska, south to N. J., in the mountains to Ga., and to Neb. and Wash. Also in Europe. May-June.
2. Corallorhiza odontorhiza (Willd.) Nutt. Small-floweren CoralRoot. (I. F. f. ri4o.) Scape slender, purplish, I.5-3.5 dm. high. Raceme 5-10 cm. long, $6-20$-flowered; flowers $6-8 \mathrm{~mm}$. long, purplish; sepals and petals lancoolate. 4 mm . long or less, marked with purple lines; lip as long as the petals, broadly oval or obovate, entire or denticulate, narrowed at the base, mot notched, whitish; spur, a small sac adnate to the top of the ovary; wings of the column very narrow. In woods, Mass. to Mich., Fla. and Mo. July-Sept.
3. Corallorhiza Wisteriàna Conrad. Wister's Coral-Ront. (I. F. f. IIfr.) Stem stouter than that of the preceding species, $2+d m$. high, bearing soveral sheathing scales. Raceme $5-12 \mathrm{~cm}$. long, loose, $6-15$-thwered; flowers ahout it mm . long, slender-pedicelled; lip broadly oval or whovate. S-10 mm. long and wide, abruptly clawed, white with crimson spots, crenulate, notched at the apex: spur, a somewhat conspicuous protuberance adnate to the top of the ovary; column
strongly 2 -winged toward the base; capsule about 10 mm . long. In woods, Mass. to Ohio, Fla. and Tex. Feb.-May.
4. Corallorhiza multifiora Nutt. Large Coral-root. (I. F. f. II42.) Scape 2-5 dm. high. purplish, clothed with several appressed scales. Raceme $5-20 \mathrm{~cm}$. long, 10-30-flowered; flowers $12-18 \mathrm{~mm}$. long, brownish purple, shortpedicelled; sepals and petals somewhat connivent at the base, linear-lanceolate, about 6 mm . long; lip white, spotted and lined with purple, oval or ovate in outline, deeply 3 -lobed, crenulate, the middle lobe broader than the lateral ones, its apex curved; spur manifest, yellowish; capsule ovoid or oblong, $10-16 \mathrm{~mm}$. long. In woods, N. S. to Br. Col., south to Fla., Mo. and Cal. July-Sept.
[^15]
## 5. Corallorhiza striàta Lindl. Striped Coral-root. (I. F. f. II43.)

 Scape stout, purplish, 2-5 dm. high. Raceme $5-15 \mathrm{~cm}$. long, $10-25$-flowered. Flowers dark purple; sepals and petals narrowly elliptic, striped with deeper purple lines, 12-14 mm. long, spreading; lip oval or obovate, entire or a little undulaie, somewhat narrowed at the base, about as long as the petals; spur none, but the perianth has a gibbous saccate base; capsule ellipsoid, reflexed, $16-20 \mathrm{~mm}$. long. In woods, Ont. and N. N. Y. to Mich., Ore. and Cal. July.
## 26. HEXALÉCTRIS Raf.

Scapose herbs, from thick scaly rootstocks and fleshy coralloid roots, the leaves reduced to purplish scales, sheathing the scape. Flowers bracted in a loose terminal raceme. Perianth not gibbous or spurred at the base, the petals and sepals similar, nerved, spreading. Lip obovate, with several crested ridges down the middle, somewhat 3 -lobed, the middle lobe a little concave. Column free, thick, slightly incurved. Pollinia 8, united in a cluster. Capsule ellipsoid, the fruiting pedicels thick. [Greek, signifying six crests.] A monotypic genus of the southeastern United States and Mexico.
I. Hexalectris aphyllus (Nutt.) Raf. Crested Coral-root. (I. F. f. ir46.) Scape stout, $2-5 \mathrm{dm}$. high, its upper scales lanceolate, the lower sheathing and truncate or acute. Raceme $10-18 \mathrm{~cm}$. long, 8 -12-flowered; flowers large, brownish purple, 25 mm . high or more; pedicels short, stout; sepals and petals narrowly elliptic, obtuse or acutish, spreading, striped with purple veins, $12-18 \mathrm{~mm}$. long, longer than the broad lip; middle lobe of the lip rounded or crenulate, the lateral ones shorter, rounded; column slightly spreading at the summit, shorter than the lip; capsule ellipsoid, about 2 cm . long. In rich woods, N. Car. to Ky. and Mo., south to Fla. and Northern Mexico. Aug.

## Sub-class 2. DICOTYLÉDONES.

Embryo of the seed with two cotyledons (in a few genera one only, as in Cyclamen, Pinguicula and some species of Capnoides), the first leaves of the germinating plantlet opposite. Stem exogenous, of pith, wood and bark (endogenous in structure in Nymphaeaceae), the wood in one or more layers surrounding the pith, traversed by medullary rays and covered by the bark. Leaves usually pinnately or palmately veined, the veinlets forming a network. Parts of the flower rarely in 3's or 6's.

Dicotyledonous plants are first definitely known in Cretaceous time. They constitute between two-thirds and three-fourths of the living angiospermous flora.

## Series I. Choripetalae.

## Petals separate and distinct from each other, or wanting.

The series is also known as Archichlamideae, and comprises most of the families formerly grouped under Apetalae (without petals) and Polypetalae (with separate petals). Exceptions to the typical feature of separate petals are found in the

Papilionaceae, in which the two lower petals are more or less united; in the Fumariaceae, where the two inner petals or all four of them are sometimes coherent; the Polygalaceae, in which the three petals are united with each other, and with the stamens; Oxalis in Geraniaceae; and Ilicaceae, whose five petals are sometimes joined at the base.

## Order I. CASUARINALES,

comprising only the family Casuarinaceae, is confined to tropical seacoasts.

## Order 2. PIPERÀLES.

Dicotyledonous herbs, with neither petals nor sepals, the spicate flowers bracteolate.

## Family I. SAURURACEAE Lindl. <br> Lizard's-tail Family.

Perennial herbs with broad entire alternate petioled leaves, and small perfect incomplete bracteolate flowers, in peduncled spikes. Perianth none. Stamens 6-8, or sometimes fewer, hypogynous ; anthers 2-celled, the sacs longitudinally dehiscent. Ovary 3 -4-carpelled; the carpels distinct or united, I-2-ovuled; ovules orthotropous. Fruit capsular or berry-like, composed of 3 or 4 mostly indehiscent carpels. Seeds globose or ovoid, the testa membranaceous. Endosperm copious, mealy. Embryo minute, cordate, borne in a small sac near the end of the endosperm. Three genera and 4 species, natives of N. Am. and Asia.

## 1. SAURURUS L.

Marsh herbs, with slender rootstocks, jointed stems and cordate leaves, their petioles sheathing the stem at the nodes, and small white flowers, in $\mathbf{I}$ or 2 dense elongated spikes opposite the leaves. Bractlets adnate to the flowers or to their minute pedicels. Stamens 6-8; filaments filiform, distinct. Carpels united at the base. Styles as many as the carpels, recurved, stigmatic along the inner side. Fruit rugose, depressed-globose, separating into 3 or 4 one-seeded carpels. [Name Greek, meaning the tail of a lizard, in allusion to the long slender spike.] Two species, the following of eastern N. Am., the other of eastern Asia.
I. Saururus cérnuus L. Lizard's-tail. (I. F. f. II48.) Somewhat pubescent when young, becoming glabrous; stem erect, sparingly branched, 6-15 dm. high. Leaves ovate, thin, palmately 5-9-ribbed and with a pair of strong ribs above, dark green, acuminate, $7-15 \mathrm{~cm}$. long, $5-9 \mathrm{~cm}$. wide; petioles stout, shorter than the blades; spikes few, very dense, longer than their peduncles, $10-15 \mathrm{~cm}$. long, the apex drooping in flower; flowers fragrant; stamens white, spreading, about 4 mm . long; fruit 3 mm . in diameter, strongly wrinkled when dry. In swamps and shallow water, Conn. to Fla., S. Ont., Minn. and Tex. June-Aug.

## Order 3. SALICÀLES.

Trees or shrubs, with imperfect small flowers in aments. Sepals and petals none. Leaves simple. Fruit a many-seeded capsule. Seeds with a tuft of hairs at one end.

## Family 1. SALICÀCEAE Lindl.* <br> Willow Family.

Liocious trees or shrubs with light wood, bitter bark, brittle twigs, and alternate stipulate leaves, the stipules often minute and caducous.

[^16]Flowers solitary in the axil of each bract. Staminate flowers consisting of from one to numerous stamens inserted on the receptacle, subtended by a gland-like or cup-shaped disk; anthers 2 -celled, the sacs longitudinally dehiscent. Pistillate aments sometimes raceme-like; pistillate flowers of a I-celled ovary subtended by a minute disk; placentae 2-4, parietal; ovules usually numerous, anatropous; stigmas $2-4$, simple or 2-4cleft. Seeds small or minute, provided with a dense coma of long, mostly white, silky hairs. Endosperm none. Cotyledons plano-convex. Radicle short. The family includes only the 2 following genera, consisting of 200 species or more, mostly natives of the north temperate and arctic zones.

Rracts fimbriate or incised; stamens numerous.
Bracts entire; stamens 2-10.

1. Populus. 2. Salix.

## 1. PÓPULUS L.

Trees with scaly resinous buds, and usually long-petioled leaves, the stipules minute, fugacious. Disk cup-shaped, oblique. Staminate aments dense, pendulous. Staminate flowers with from 4 to 60 stamens, their filaments distinct. Pistillate aments sometimes raceme-like through the elongation of the pedicels. Orary sessile; style short; stigmas 2-4, entire or 4-lobed. Capsule 2-4-valved. Cumat of the seeds often very long and conspicuous. [Name ancient, used for these trees by Pliny.] About 25 species, natives of the northern hemisphere. Besides the folluwing, some 3 others occur in the western part of N. Am.
Petioles terete or chanelled, scarcely or not at all flattened laterally.
Leaves persistently and densely white-tomentose beneath, lobed or coarsely sinuatedentate.

1. P. alba.

Leaves glabrous or nearly so when mature, crenate.
Foliage densely tomentose when young; capsule slender-pedicelled.
2. P. heterophylla.

Foliage not tomentose; capsule short-pedicelled.
Leaves broadly ovate, truncate or cordate at the base; petioles and nerves usually puberulent.
3. P. candicans.

Leaves ovate to lanceolate, acute or obtuse at the base; petioles glabrous. Leaves ovate or broadly lanceolate; petiole fully half as long as the blade. Leaves green on both sides, abruptly acuminate.
6. P. acuminata.

Leaves pale beneath, acute or somewhat acuminate.
4. P. balsamifera.

Leaves lanceolate; petiole about one-third the length of the blade or less. 5. P. angustifolia.

Petioles strongly flattened laterally.
Leaves broadly deltoid, abruptly acuminate. Young leaves pubescent; capsule nearly sessile. 7. P. nigra. Young leaves not pubescent; capsule slender-pedicelled. 8. P. deltoides.

Leaves broadly ovate or suborbicular.
Leaves coarsely sinuate-dentate.
Leaves crenulate-denticulate.
9. P. grandidentata.
10. $P$. tremuloides.
i. Populus álba L. Abele. White or Silver-leaf Poplar. (I. F. f. ii64.) A large tree, with smooth light gray bark, attaining a maximum height of about 35 m . and a trunk diameter of 1.5 m . Young foliage densely white-tomentose, the leaves becoming glabrate and dark green above, broadly ovate or nearly orbicular in outline, apex acute. base truncate or subcordate, 3-5-lobed or irregularly dentate, $6-10 \mathrm{~cm}$. long; petiole shorter than the blade; staminate aments $3-5 \mathrm{~cm}$. long. In yards and along roadsides, springing up from suckers of older trees, N. B. to Va. Native of Europe and Asia. March-May.
2. Populus heterophylla L. Swamp or Downy Poplar. (I. F. f. in68.) An irregularly branching tree, sometimes 25 m . high and with a trunk I m. in diameter, the bark rough. Leaves long-petioled, broadly ovate, obtuse or subacute at the apex, rounded, truncate or subcordate at the base, crenulate-denticulate, 1215 cm . long, or those of young plants much larger, glabrous or somewhat floccose beneath when mature; bracts glabrous or nearly so; staminate aments stout, 7-10 cm . long, $18-25 \mathrm{~mm}$. in diameter, drooping; stamens numerous; pistillate aments
raceme-like, peduncled; capsules ovoid, acute, 2-valved, $8-12 \mathrm{~mm}$. long, shorter than or equalling their pedicels. In swamps, S. Conn. and N. Y. to Ga., west to La., north in the Miss. Valley to Ind. and Ark. April-May.
3. Populus cándicans Ait. Balm of Gilead. A large tree, reaching a height of 30 m . and a trunk diameter of 2 m ., with spreading branches; the buds large and very resinous. Leaves broadly cordate, dark green above, pale beneath, acuminate, more coarsely crenate than in the next with gland-tipped teeth, 6-15 cm . long, $3-12 \mathrm{~cm}$. wide, pubescent when young, generally glabrous in age, with the exception of the ciliate margins and pubescent veins and petioles; otherwise like the following. N. B. to N. J. west to Minn., but mostly escaped from cultivation. (P. balsamifera candicans A. Gray.)
4. Populus balsamífera L. Tacamahac. Balsam Poplar. (I. F. f. i165.) A large tree, with nearly smooth gray bark, reaching a maximum height of about 25 m . and a trunk diameter of 2 m ., the branches stout, ascending. the large buds very resinous, the foliage glabrous. Leaves broadly ovate, dark green and shining above, pale beneath, acute or acuminate at the apex, rounded or acute at the base, crenulate, $7-12 \mathrm{~cm}$. long; aments and bracts somewhat pubescent; stamens 18-30; lobes of the stigmas broad; capsule ovoid, 2-valved, short-pedicelled. In moist or dry soil, especially along streams and lakes, Newf. to Hudson Bay and Alaska, south to N. Y., Neb. and Nev. April.
5. Populus angustifòlia James. Narrow-leaved or Black Cottonwood. (I. F. f. II66.) A slender tree, maximum height about 20 m. , trunk diameter 6 dm .; crown narrowly pyramidal, branches ascending; foliage glabrous. Twigs terete, gray; leaves lanceolate, ovate-lanceolate or ovate, spreading, drying brownish, gradually acuminate or acute at the apex or some of them obtuse, narrowed, rounded or rarely subcordate at the base, $5-12 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~cm}$. wide, finely crenulate from base to apex; petioles plano-convex, not flattened laterally, $6-12 \mathrm{~mm}$. long; lateral veins $8-15$ on each side of the blade; staminate aments oblong-cylindric, $2-6 \mathrm{~cm}$. long; lobes of the stigmas broad; capsules ovoid, short-pedicelled. In moist soil, especially along streams, N. W. Terr. to Neb., N. Mex., and Ariz. April-May.
6. Populus acuminàta Rydberg. Rydberg's Cottonwood. (I. F. f. II67.) A slender tree, with terete twigs, reaching approximately the dimensions of $P$. angustifolia, the crown broadly pyramidal with spreading branches, the foliage glabrous. Leaves rhomboid-lanceolate, spreading or drooping, drying green. abruptly or gradually long-acuminate at the apex, cuneate, obtuse or rounded at the base, $5-15 \mathrm{~cm}$. long, $2-6 \mathrm{~cm}$. wide, crenulate or the base entire; petioles slender, $2-6 \mathrm{~cm}$. long; staminate aments about 3 cm . long; pistillate aments slender, drooping, $7-12 \mathrm{~cm}$. long; capsules ovoid, obtuse, distinctly pedicelled. Black Hills, S. Dak. to Utah, south to N. Mex. April-May.
7. Populus nigra L. Black Poplar. (I. F. f. iifi.) A large tree, sometimes 30 m . tall and the trunk 12 dm . in diameter, usually much smaller. Twigs terete; young foliage somewhat pubescent, the mature leaves firm, nearly or quite glabrous; petioles slender, flattened laterally; leaves broadly deltoid, abruptly acuminate at the apex, broadly cuneate or obtuse at the base, crenate, $5-10 \mathrm{~cm}$. long; staminate aments $3-5 \mathrm{~cm}$. long; stamens about 20; pistillate aments $5-12$ cm . long in fruit, spreading; capsules oblong, very obtuse, borne on pedicels of much less than their own length. Valleys of the Hudson and Delaware Rivers, naturalized from Europe. April-May.

The Lombardy Poplar, Populws dilatata, commonly planted for ornament, occasionally spreads by sending up shoots from its subterranean parts.
8. Populus deltoìdes Marsh. Cottonwood. Necklace Poplar. (I.'F. f. 1172.) A large tree, the greatest of the poplars, attaining a maximum height of 45 m . and a trunk diameter of 2.2 m ., the bark grayish-green, somewhat rough when old. Foliage glabrous; leaves broadly deltoid-ovate, abruptly acuminate at the apex, crenulate, truncate at the base, $10-17 \mathrm{~cm}$. long; petiole flattened haterally, stout, about as long as the blade; bracts glabrous, deeply fimbriate: staminate aments drooping, $7-12 \mathrm{~cm}$. long, $10-12 \mathrm{~mm}$. in diameter; pistillate aments loosely
flowered, becoming $15-25 \mathrm{~cm}$. long in fruit; capsules ovoid, acute, 8 -10 mm. long, $2-4$-valved, shorter than or equalling their pedicels. In moist soil, especially along streams and lakes, Quebec to Man., south to Fla. and Tenn. April-May. Also called Carolina Poplar.

Populus deltoides occidentalis Rydb. Leaves with longer acumination, broader base and coarser teeth; young branches light yellow and shining. Sask. to Alb., south to Kan., and N. Mex.
9. Populus grandidentàta Michx. Large-toothed Aspen. (I. F. f. 1169.) A forest tree with smooth, greenish-gray bark, maximum height about 20 m ., and trunk diameter 7 dm . Leaves of very young plants densely whitetomentose beneath, sometimes 3 dm . long, with irregularly denticulate margins, those of older trees tomentose when young, glabrous when mature, short-acuminate, obtuse or truncate at the base, $6-10 \mathrm{~cm}$. long; petioles slender; bracts silky, irregularly 4-7 cleft; staminate aments $4-10 \mathrm{~cm}$. long, about 1 cm . in diameter, drooping; pistillate aments somewhat pubescent, dense, $7-12 \mathrm{~cm}$. long in fruit, also drooping; stigma-lobes narrow; capsule conic, acute, 2 -valved, about 6 mm . long, papillose. In rich woods, N. S. to Ont. and Minn., south to N. J. and in the Alleghanies to N. Car. and Tenn. April.
10. Populus tremuloìdes Michx. American Aspen. (I. F. f. 1ipo.) A slender tree, with smooth, light green bark, reaching a maximum height of about 30 m . and a trunk diameter of 1 m ., the young foliage glabrous, excepting the ciliate margins of the leaves. Petioles very slender, causing the leaves to quiver in the slightest breeze; leaves usually short-acuminate at the apex, finely crenulate all around, truncate, rounded or subcordate at base, $2-6 \mathrm{~cm}$. broad, or those of very young plants much larger; bracts silky, deeply $3-5$-cleft into linear lobes; aments drooping, the staminate $4-6 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. in diameter, the pistiliate longer, dense; stigma-lobes linear; capsule like that of the preceding species, but somewhat smaller. In dry or moist soil, Newf. to Hudson Bay and Alaska, soutn to N. J., Ky., Neb., in the Rocky Mountains to Mexico and to Lower California. March-May.

## 2. SALIX L.

Trees or shrubs, with single-scaled buds, the scales with an adherent membrane within, mostly narrow and short-petioled leaves and persistent or early deciduous broad or minute stipules. Bracts of the aments entire. Disk gland-like, small or minute. Staminate aments dense, erect, spreading or drooping. Staminate flowers with 1-10, mostly 2, stamens, their filaments distinct or sometimes united. Pistillate aments usually erect or spreading. Ovary sessile or short-stipitate. Style short or filiform. Stigmas 2, entire or 2-cleft. Capsule mostly 2-valved. [Name ancient.] About 200 species, of wide geographic distribution throughout the north temperate and arctic zones, a few in the southern hemisphere. Besides the following, many others occur in the northern and western parts of North America. Numerous hybrids between the species have been recorded.

## Stamens 2.

Filaments hairy at the base; bracts caducous, yellow.
Pedicels in fruit $\mathrm{I}-3 \mathrm{~mm}$. long.
Stigma sessile; leavés linear or lance-linea-.
Leaves finely and almost permanentiy silky.

Leaves coarsely silky when young, glabrate in age.
Leaves linear-lanceolate; bracts ovate or obovate, obtuse.
21. S. fuviatilis.

Leaves narrowly linear, bracts lanceolate, acute. 22. S. linearifolia.

Style evident, but short ; leaves lanceolate. 5. S. fragilis.
Pedicels in fruit less than 1 mm . long; stigma sessile.
Branches not drooping ; leaves lanceolate. 6. S. alba.
Branches drooping ; leaves linear-lanceolate. 7. S. Babylonica.
Filaments glabrous; bracts persistent. Mature leaves glabrous.

Pedicels in fruit $\mathrm{x}-3 \mathrm{~mm}$. long; capsule $5-9 \mathrm{~mm}$. long.
Length of leaf-blade less than three times it breadth.
Mature leaves thin, dull. 8. S. balsamifera.
Mature leaves thick, firm, dark green and shining above. 9. S. glaucophylla.

Length of leaf-blade three times its breadth or more.
Leaves dark green above; young branches not light yellow. Pedicels 2-4 times as long as the fuscous bracts; mature leaves slightly serrate. 1о, S. Mackenziana. Pedicels not longer than the bracts; mature leaves strongly serrate.
Bracts pale; leaves not whitish beneath. II. S. cordata.

Bracts fuscous; leaves whitish beneath. 12. S. Missouriensis.

Leaves yellowish green ; young branches light yellow. 13. S. lutea.

Pedicels in fruit less than 1 mm . long; capsule $3-5 \mathrm{~mm}$. long. 14. S. acutidens.

Mature leaves densely silky-pubescent ; capsule subsessile. 15. S. adenophylla.
2. Very low shrubs with serrate or crenate, obtuse leaves; filaments glabrous. Leaves oblong, obovate or cuneate.

Low shrub with erect branches and closely serrate or crenate leaves. 16. S. myrtillifolia.

Depressed shrub with distantly crenate or subentire leaves.
17. S. Uva-ursi.
18. S. herbacea.

Leaves nearly orbicular.
3. Low shrub with entire-margined leaves ; filaments glabrous. 19. S. myrtilloides.
**Capsule silky or tomentose.
I. Filaments distinct.
$A$. Capsule distinctly pedicelled, rostrate; style none or short.
a. Mature leav, not densely hairy beneath.

Leaves linear or linear-lanceolate.
Filan $\epsilon$ nts hairy; capsule slightly silky when young, in age glabrate. Leaves finely and almost permanently silky.
20. S. luteosericea.

Leaves coarsely silky when young, glabrate in age.
Leaves linear-lanceolate; bracts ovate or obovate, obtuse.
21. S. fuviatilis.

Leaves narrowly linear; bracts lanceolate, acute. 22. S. linearifolia.

Filaments glabrous; capsule permanently hairy.
23. S. petiolaris.

Leaves oblong, elliptic, or ovate-lanceolate.
Bracts fuscous, obovate or cuneate, long-hairy.
Mature leaves rather thin, obovate or oblanceolate, irregularly or indistinctly toothed; young branches glabrous or slightly puberulent.
Mature leaves oblong, firm, dentate.
Young branches densely hairy; aments short and dense. 25. S. eriocephala.

Young branches glabrous; aments long, laxer. 26. S. prinuides.

Bracts yellow, linear oblong or lanceolate.
Pedicel scarceiy longer than the elongated gland.
27. S. latiuscula.

Pedicel much longer than the gland.

Bracts longer than the pedicels; aments erect.
28. S. squamata.

Bracts much shorter than the pedicels ; aments drooping. Mature leaves thin, glabrous. 29. S. perrostrata. Mature leaves firm, pubescent or tomentose beneath. 30. S. Bebbiana.
b. Mature leaves densely white-hairy beneath.

Leaves white-tomentose beneath.
Style, if any, less than 1 mm . long.
Leaves ovate-lanceolate, slender-petioled.
Leaves oblanceolate, short-petioled.
Leaves $5-10 \mathrm{~cm}$. long; fruiting aments $2-3 \mathrm{~cm}$. long. 3r. S. humilis.
Leaves $2-5 \mathrm{~cm}$. long ; fruiting aments about 1 cm . long.
32. S. tristis.

Style over 1 mm . long; leaves linear or lanceolate. 33. S. candida.
Leaves silvery silky beneath.
Style shorter than the stigma; leaves serrulate. 34. S. sericea.
Style longer than the stigma; leaves entire-margined.
35. S. argyrocarpa.
B. Capsule subsessile.

Style long.
Tree with linear-lanceolate acuminate silvery leaves. 36. S. viminalis.
Low shiubs.
Leaves glabrous, or when young covered with long white hairs parallel to the midrib.

Bracts fuscous, obovate, densely white-silky.
Aments naked, from lateral buds.
Aments ending short leafy branches.
Leaves and young twigs darkening in drying.
Leaf-blade 10-20 mm. long; aments $10-20 \mathrm{~mm}$.
3S. S. Groenlandica.
Leaf-blade 25-50 mm. long ; aments 25-80 mm.
Leaves broadly obovate or obcordate, obtuse.
39. S. arctica.

Leaves narrowly obovate or obovate-lanceolate, often acute.
40. S. anglorum.

Leaves and yellowish or light brown twigs not darkening in drying.

Leaves obovate or oblanceolate, acute.
41. S. vacciniformis.

Leaves broadly obovate, obtuse. 42. S. callicarpaea.
Bracts yellow, oblong, white-silky.
Capsule conic, $7^{-8} \mathrm{~mm}$. long, grayish pubescent.
43. S. glauca.

Capsule ovoid-conic, 5 mm . long, densely white-villous.
Leaves broadly obovate, obtuse, not turning black in drying.
44. S. Waghornei.

Leaves broadly oblanceolate, acute, turning black in drying.
45. S. atra.

Leaves permanently hairy.
Leaves silky-pubescent, oblanceolate or lanceolate.
46. S. stricta.

Leaves with scattered villous hairs spreading in all directions, broadly ovate.
47. S. Labradorica.

Style very short, or generally none.
Mature leaves covered with long silky hairs beneath.
48. S. vestita.

Leaves, at least in age, not silky beneath.
Bracts broadly obovate, fuscous, the upper portion at least glabrous.
49. S. orbicularis.

Bracts oblong, yellow, densely hairy.
2. Filaments united ; pedicel and style none.
50. S. reticulata.
r. Salix nigra Marsh. Black Willow. (I. F. f. in73.) A tree, with rough flaky dark brown bark, attaining a height of 40 m . and a trunk diameter of I m. Leaves narrowed at the base, serrulate, somewhat pubescent when young, glabrous and green above, somewhat paler, and sometimes pubescent on the veins beneath, $6-12 \mathrm{~cm}$. long, $4-\mathrm{I} 8 \mathrm{~mm}$. wide; aments expanding with the leaves, on short lateral branches, the staminate $3-5 \mathrm{~cm}$. long, the pistillate $4-8 \mathrm{~cm}$. long and
spreading in fruit; stamens 3-7, distinct, their filaments pubescent below; stigmas nearly sessile; capsule ovoid, acute, about twice as long as its pedicel. Along streams and lakes, N. B. to W. Ont., Fla. and Cal. Hybridizes with S. alba. April-May.

Salix nigra falcàta (Pursh) Torr. Leaves narrower, $4^{-6} \mathrm{~mm}$. wide, falcate, green on both sides. Mass. to Ohio and Fla.
2. Salix lóngipes Anders. Ward's Willow. (I. F. f. 1174.) A tree, sometimes 10 m . high, the trunk reaching 2 dm . in diameter, the branches spreading or drooping, the bark dark reddish brown, covered with small scales. Leaves lanceolate or oblong-lanceolate, rounded, subcordate, or narrowed at the base, 6-18 cm . long, $\mathrm{x}-4 \mathrm{~cm}$. wide, somewhat pubescent beneath; stipules often large, sometimes persistent; aments expanding with the leaves, terminal, the staminate 5-10 cm . long, the pistillate as long or shorter; capsule conic. Along streams and lakes, Md. to Mo., south to Fla. and Tex. Wood dark brown. March-May. (S. Wardii Bebb.)
3. Salix amygdaloìdes Anders. Peach-leaved Willow. (I. F. f. 1175.) A small tree, sometimes 20 m . high and the trunk 6 dm . in diameter, the brown bark scaly. Leaves pubescent when young, glabrous when old, dark green above, paler and slightly glaucous beneath, narrowed at the base, $8-12 \mathrm{~cm}$. long, about 2 cm . wide, sharply serrulate; petioles 6-15 mm. long, glandless; stipules commonly fugacious; aments appearing with the leaves, terminal on short lateral branches, the staminate $3-5 \mathrm{~cm}$. long, the pistillate loose, spreading and $6-10 \mathrm{~cm}$. long in fruit; stigmas nearly sessile; capsule narrowly ovoid, acute, glabrous, at length about as long as its filiform pedicel. On lake and river shores, Quebec to Br. Col., N. Y., Mo. and N. Mex. April-May.
4. Salix lùcida MuhI. Shining Willow. Glossy Willow. (I F. f. II76.) A tall shrub, or sometimes a tree 6 m . high, the bark smooth or slightly scaly, the twigs yellowish brown, shining. Leaves lanceolate, ovate-lanceolate or ovate, mostly long-acuminate, narrowed or rounded at the base, sharply serrulate all around, green and glossy on both sides or bearing a few scattered hairs when very young, $7-12 \mathrm{~cm}$. long, $2-7 \mathrm{~cm}$. wide when mature; stipules small, semi-cordate or oblong, very glandular, commonly persistent; petioles stout, $6-12 \mathrm{~mm}$. long, glandular at the base of the blade; aments on short lateral leafy branches, the staminate stout, $2-5 \mathrm{~cm}$. long, the pistillate dense, $5-7 \mathrm{~cm}$. long in fruit, often long-persistent; stigmas nearly sessile; capsule narrowly ovoid, acute, glabrous, much longer than its pedicel. In swamps and along streams and lakes, Newf. to the N. W. Terr., N. J., Ky. and Neb. A most beautiful willow. April-May.
5. Salix frágilis L. Crack Willow. Brittle Willow. (I. F. f. 1177.) A tall, slender tree, with roughish gray bark, attaining a height of about 25 m . and a trunk diameter of 2 m .; twigs reddish green, very brittle at the base. Leaves lanceolate, long-acuminate, narrowed at the base, sharply serrulate, glabrous on both sides, rather dark green above, paler beneath, $8-15 \mathrm{~cm}$. long, $\mathbf{I}-3 \mathrm{~cm}$. wide, glandular at the base of the blade; petioles $6-16 \mathrm{~mm}$. long, glandular above; stipules semicordate, fugacious; staminate aments $2-5 \mathrm{~cm}$. long; stamens 2 , or sometimes 3 or 4; pistillate aments $7-12 \mathrm{~cm}$. long in fruit, rather loose; stigmas nearly sessile; capsule long-conic. Escaped from cultivation, Mass. to N. J. and Penn. Native of Europe. Hybridizes with the following species. The twigs break away and grow into new plants. April-May.

Salix frágilis decípiens (Hoffm.) Anders., with yellowish or red twigs and smaller, brighter green leaves, appears to be known only in cultivation within our area.
6. Salix álba L. White Willow. Huntingdon Willow: (I. F. f. ir7S.) A large tree, sometimes 30 m . tall and a trunk diameter of 2.5 m .; hark gray, rough; twigs brittle at the base. Leaves narrowed at the base, scrrulate, silkypubescent on both sides when young, less so and pale or glancous beneath when mature, $5^{-13} \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide; stipules ovate-lanceolate, deciduous; petioles $4-8 \mathrm{~mm}$. long, glandless or sparingly glandular; aments on short lateral leatybranches; pistillate aments linear-cylindric, $3-6 \mathrm{~cm}$. long; stigmas nearly sessile; capsule ovoid, acute. In moist soil, especially along streams, N. R. and Ont. to Penn., sparingly escaped from cultivation. Native of Europe. April-May.

Salix álba coerùlea (J. E. Smith) Koch. Mature leaves bluish green, glabrous, glaucous beneath. Occasional in the Eastern States.

Salix álba vitellina (L.) Koch. Mature leaves glabrous above; twigs yellowish green. The commonest form in North America.
7. Salix Babylónica L. Weeping Willow. Ring Willow. (I. F. f. 1179.) A large tree, with rough gray bark, sometimes attaining a height of 20 m . and a trunk diameter of 18 dm ., the twigs slender, green, elongated, drooping. Lraves serrulate all around, narrowed at the base, sparsely pubescent when young, glabrous when mature, green above, paler beneath, $10-18 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. wide, sometimes curling into rings; petioles $6-12 \mathrm{~mm}$. long, glandular above; aments appearing on short lateral leafy branches; bracts ovate-lanceolate; style almost none; capsule ovoid-conic. Widely cultivated and sometimes spreading by the distribution of its twigs. Native of Asia.... April-May.
8. Salix balsamífera (Hook.) Barratt. Balsam Willow. (I. F. f. r201.) A shrub, $12-30 \mathrm{dm}$. high, the twigs glabrous, shining, the youngest foliage pubescent. Mature leaves elliptic, ovate-oval or obovate, thin, glabrous, acute or some of them obtuse at the apex, rounded or subcordate at the base, dark green above, glaucous and prominently reticulate-veined beneath, $5-8 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide, slightly crenulate-serrulate, the minute teeth glandular; stipules minute or none; petioles slender, $6-12 \mathrm{~mm}$. long; aments expanding with the leaves, leafy-bracted at the base, cylindric, the staminate dense, about 2 cm . long, the pistillate rather loose, $5-7 \mathrm{~cm}$. long in fruit; bracts villous, persistent; style very short; capsules very narrow, acute, $4-5 \mathrm{~mm}$. long. In swamps, Lab. to Man., south to Me. and Minn. May.
9. Salix glaucophýlla Bebb. Broad-Leaved Willow. (I. F.f. rig9.) A shrub, I-3 m. high; foliage glabrous or when young sparingly pubescent. Mature leaves ovate, obovate or oblong-lanceolate, white-glaucous beneath, short-acuminate, the base rounded or acute, serrulate with gland-tipped teeth, $5-10 \mathrm{~cm}$. long, $\mathrm{I}-3 \mathrm{~cm}$. wide; stipules large, persistent; petioles stout, $6-12 \mathrm{~mm}$. long; aments expanding before the leaves, leafy-bracted at the base, the staminate $3-5 \mathrm{~cm}$. long, the pistillate $4-7 \mathrm{~cm}$. long in fruit; bracts densely white-villous, persistent; style filiform; capsule beaked from an ovoid base, acute. On sand dunes, Lake Michigan, N. Ill. and Wis. April.
10. Salix Mackenziàna Barratt. Mackenzie's Willow. A small tree, with smooth pale yellowish or grayish bark. Young branches glabrous or slightly puberulent, yellow or often tinged with bright red; mature leaves oblanceolate or lanceolate, cuneate at the base, finely crenulate-serrate or entire; stipules large, oblique, reniform and somewhat persistent; aments on short leafy-bracted branches, the pistillate $4-6 \mathrm{~cm}$. long in fruit; style very short; capsule ovoid, acute, $6-8 \mathrm{~mm}$. long. In damp soil from Man. to N. W. Terr. and N. Cal. April.
in. Salix cordàta Muhl. Heart-leaved Willow. (I. F. f. i198.) A shrub, $15-35 \mathrm{dm}$. high, the twigs puberulent or glabrous; young leaves pubescent; mature leaves oblong-lanceolate, green on both sides or paler beneath, acuminate at the apex, narrowed, obtuse or subcordate at the base, sharply serrulate with glandular teeth; stipules oblique, serrulate, usually large and persistent; petioles 8 -18 mm . long; aments bracted at the base, expanding before the leaves, the staminate about 2 cm . long, the pistillate $4-6 \mathrm{~cm}$. in fruit; style short; capsules narrowly ovoid, acute. In wet soil, N. B. to Br. Col., south to Va., Mo., Colo. and Cal. Hybridizes with $S$. sericea and other species. April-May.

Salix cordàta angustàta (Pursh) Anders. Leaves narrower, linear-lanceolate. Range of the type.

Salix cordàta rígida (Muhl.) Carey. Leaves broad, sharper serrate especially at the cordate base, strongly veined; pedicels little if at all longer than the bracts; stigmas subsessile. N. B. to Penn.
12. Salix Missouriénsis Bebb. Missouri Willow. (I. F. f. 1200.) A tree, often 15 m . high, the trunk sometimes 4.5 dm . in diameter, the thin gray bark with small appressed scales. Twigs of the season pubescent or puberulent; leaves lanceolate, or oblanceolate, acuminate, finely serrate with minute glandtipped teeth, rounced or narrowed at the base, pubescent when young, glabrous or nearly so when mature, green above, pale and usually glaucous beneath, $7-15 \mathrm{~cm}$.
long, $1-3 \mathrm{~cm}$. wide; petioles $\mathbf{1} \mathrm{cm}$. long or less; stipules often $\mathbf{I} \mathrm{cm}$. long. persistent or deciduous; aments unfolding long before the leaves, the staminate about 3 cm . long, the pistillate $7-10 \mathrm{~cm}$. long; style very short; capsule narrowly ovoid. On river banks, Mo. and Neb. Wood dark brown. March-April.
13. Salix lútea Nutt. Yellow Willow. A shrub, 2-5 m. high, with light gray rough bark; twigs very light yellow, slender and shining, perfectly glabrous; leaves lanceolate, $4-7 \mathrm{~cm}$. long, $10-18 \mathrm{~mm}$. wide, long-acuminate at the apex, cuneate at the base, finely serrate, yellowish green and shining above, glaucous beneath, rather thin; stipules small and generally deciduous; aments on short lateral branches, short; the pistillate $2-3 \mathrm{~cm}$. long in fruit; style very short; capsule ovoid. On river banks and springy grounds from Neb. to Assiniboia and Mont.
14. Salix acútidens Rydb. Sharp-toothed Willow. Shrub, 2-3 m. high, bark green or on the younger branches often purplish; leaves rather thin, 6-12 cm . long, 3-4 cm. wide, oblong, long-acuminate, rounded or acute at the base, shining above, more or less glaucous beneath, very sharply dentate, the teeth tipped with a small gland; stipules obliquely ovate, large, toothed and persistent; aments leafy-bracted below; fertile ones slender, in fruit $3-4 \mathrm{~cm}$. long; bracts yellow, obovate, hairy; style about 1 mm . long; capsule ovoid. The form of the leaves is intermediate between that of $S$. cordata and $S$. eriocephala with the texture of that of S. balsamifera; but the small glabrous short-pedicelled capsule distinguishes the species. Swamps of Conn., N. Y. and Penn. (S. myricoides Torr. Fl. N. Y. 2: 207; not Muhl.)
15. Salix adenophylla Hook. Furry Willow. (I. F. f. 1203.) A straggling shrub, $\mathbf{I}-2.5 \mathrm{~m}$. high, the twigs, petioles, stipules and leaves densely silky-tomentose, the silky hairs falling away from the leaves when old. Leaves ovate, acute or short-acuminate, or the lower obtuse at the apex, cordate or rounded at the base, finely serrulate with gland-tipped teeth, $2-5 \mathrm{~cm}$. long, $15-30 \mathrm{~mm}$. wide; petioles stout, $3-6 \mathrm{~mm}$. long, dilated at the base; stipules ovate-cordate, obtuse, serrulate, persistent; aments leafy-bracted at the base, dense, expanding with the leaves, the staminate about 2 cm . long, the pistillate $3-10 \mathrm{~cm}$. long in fruit; style filiform; capsule ovoid-conic, acute, $3-4 \mathrm{~mm}$. long. On lake and river shores, Lab. to Ont., Penn. and Ill. Hybridizes with S. cordata. April-May.
r6. Salix myrtillifòlia Anders. Bilberry Willow. A shrub generally less than 1 m. high, with erect branches, much resembling Vaccinium Myrtillus in general habit and form of the leaves. Leaves obovate or oblong, $2-6 \mathrm{~cm}$. long, light green, rather thin, obtuse, seldom acute, closely and finely crenate; stipules small, deciduous; aments on short leafy branches; the staminate $1-2 \mathrm{~cm}$. long. the pistillate $2-3 \mathrm{~cm}$. long in fruit; bracts obovate, fuscous, slightly hairy; capsule subsessile, ovate, tapering into a short style. From Lab. to Lower Mackenzie River and Alberta.
17. Salix Ùva-úrsi Pursh. Bearberry Willow. (I. F. f. 1205.) A depressed or prostrate glabrous shrub, the terete brown branches $15-30 \mathrm{~cm}$. long, diffuse from a deep central root. Leaves obovate or elliptic, obtuse or acute at the apex, narrowed at the base, crenulate-denticulate or entire, $8-20 \mathrm{~mm}$. long. 4 -10 mm . wide, prominently veined, deep green and shining above, pale beneath; petioles $2-4 \mathrm{~mm}$. long; aments leafy-bracted at the base, dense, about I cm . long in flower, the pistillate $2-5 \mathrm{~cm}$. long in fruit; bracts obovate, obtuse, densely silky; stamens usually solitary, rarely 2 ; style short; capsule ovoid-conic, acute, glabrous, very short-pedicelled. Lab. and Hudson Bay, south to the summits of the mountains of N. Y. and N. Eng. May-June.
18. Salix herbàcea L. Dwarf Willow. (I. F. f. 1206.) A depressed matted shrub, with very slender angled twigs $2-15 \mathrm{~cm}$. long, the youngest foliage somewhat pubescent. Mature leaves glabrous, suborbicular. rounded or retuse at the apex, cordate or rounded at the base, thin, crenulate-denticulate all around, finely reticulate-veined, bright green and shining on both sides. $1-2 \mathrm{~cm}$. in diameter; petioles very slender, $4-8 \mathrm{~mm}$. long; aments terminating 2 -leaved hramehlets. 4-1o-flowered, 4-8 mm. long; bracts obovate, obtuse, persistent, gharous or nearly so; stamens 2; style rather longer than the z-cleft stigmas; capsule narrowly conic, glabrous, nearly sessile. Lab, and Quebec, through Arctic America, and on the White Mountains of N. H. and Mt. Katahdin, Me. Also in Europe and Asia. Summer.
19. Salix myrtillordes L. Bog Willow. (I. F. f. 1204.) An erect slender glabrous shrub, 3-IO dm. high, the twigs light brown, terete. Leaves oblong, elliptic or somewhat obovate, obtuse or acute at the apex, entire, mostly narrowed at the base, $2-4 \mathrm{~cm}$. long, $8-16 \mathrm{~mm}$. wide, short-petioled, bright green above, pale or glaucous beneath, their margins slightly revolute; aments expanding with the leaves, leafy-bracted at the base, rather dense, 2 cm . long or less, or the pistillate longer in fruit; bracts persistent, obtuse, slightly villous; style shorter than or equalling the stigmas; capsule oblong-conic, obtuse, glabrous, 5 mm . long, 2-3 times as long as the filiform pedicel which slightly exceeds the bract. In bogs, N. B. and Quebec to Br. Col., south to N. J. and Iowa. Also in northern Europe. April-May.

Salix myrtilloìdes pedicellàris Anders. Leaves narrower, oblong-linear or oblanceolate; pedicels sometimes longer. Range of the type.
20. Salix luteosericea Rydb. n. sp. Silvery Sandbar Willow. A shrub, with grayish bark, I-6 m. high, occasionally monœcious; leaves linear-lanceolate or linear, entire, or slightly and remotely denticulate, acute, $2-8 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide, permanently yellowish silky; aments at the ends of leafy branches, the staminate $2-3 \mathrm{~cm}$. long, pistillate $3-5 \mathrm{~cm}$.; bract of staminate flowers obovate; of the pistillate ones broadly lanceolate; capsule elongated-ovoid, slightly silky when young, soon glabrate, $4-5 \mathrm{~mm}$. long. On sandbars, Saskatch. and Br . Col. to Neb., Ind. Terr., and Ariz. Type from Nebraska.
21. Salix fluviátilis Nutt. Sandbar Willow. River-bank Willow. (I. F. f. II8I.) A much-branched shrub, I-4 m. high, forming thickets, or sometimes a slender tree, $6-9 \mathrm{~m}$. tall, and with a trunk 3 dm . in diameter; branches brown or grayish. Leaves $6-10 \mathrm{~cm}$. long, $5-10 \mathrm{~mm}$. wide, acuminate, remotely denticulate with somewhat spreading teeth, short-petioled, bright green; petioles not glandular: stipules minute or none; aments on short leafy branches, the staminate dense, $2-4 \mathrm{~cm}$. long, the pistillate looser, about 5 cm . long in fruit; capsule ovoid-conic, finely silky when young, glabrate in age, about 5 mm . long. Along streams and lakes, Quebec to the N. W. Terr., south to Va., Ky. and Tex. AprilMay.
22. Salix linearifòlia Rydb. Linear-leaved Willow. A low shrub, very soon glabrous, with red branches; leaves $4-10 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, remotely dentate, narrowly linear; stipules minute, deciduous; aments loosely flowered at the ends of leafy branches, the staminate about 3 cm ., the pistillate $3-4 \mathrm{~cm}$. long; capsule almost glabrous from the beginning, conic, $3-4 \mathrm{~mm}$. long; bract nearly as long as the pistil, almost glabrous. Sandbars, from Minn. and Saskatch. to Ind. Terr. and Colo. (S. rubra Richards.; not Smith.)
23. Salix petiolàris J. E. Smith. Slender Willow. (I. F. f. II89.) A shrub, similar to $S$. sericea, but the young leaves only slightly silky, the branches slender, upright or ascending. Mature leaves lanceolate, acuminate at both ends, serrulate with blunt cartilaginous teeth, remaining green in drying, $8-16 \mathrm{~mm}$. wide; petioles $4-10 \mathrm{~mm}$. long; stipules deciduous; aments expanding before the leaves, the pistillate short-peduncled, usually rather loose, about 2 cm . long in fruit; stigmas nearly sessile; capsule tapering from an ovoid or oblong base, $4-6 \mathrm{~mm}$. long, about twice as long as the filiform pedicel. In swamps, N. B. to the N. W. Terr., south to Tenn. and Wis. May.

Salix petiolàris grácilis Anders. Pedicels nearly as long as the capsules; leaves rather narrower. Range of the type.
24. Salix díscolor Muhl. Glaucous Willow. (I. F. f. 1187.) A shrub or low tree, maximum height 7 m ., trunk diameter 3 dm .; young leaves sometimes pubescent. Mature leaves rather thin, usually glabrous, bright green above, glaucous and nearly white beneath, oblong-oblanceolate, acute at both ends, irregularly serrulate or nearly entire, slender-petioled, $4-10 \mathrm{~cm}$. long, $1.5-3 \mathrm{~cm}$. wide; petioles 6-24 mm. long; stipules obliquely lanceolate or semicordate, commonly deciduous; aments unfolding much before the leaves, dense, the pistillate $4-7 \mathrm{~cm}$. long in fruit; capsule narrowly conic, tapering to a slender beak, 5-8 mm. long. In swamps or on moist hillsides, N. S. to Man., Del. and Mo. March-April.
25. Salix eriocéphala Michx. Pussy Willow. A shrub or low tree, much resembling the preceding. Mature leaves rather firm, green and shining above, glaucous and generally hairy beneath, especially on the veins, quite often ferruginuus, $6-10 \mathrm{~cm}$. long, $2-4 \mathrm{~cm}$. wide; stipules semicordate, often deciduous; aments unfolding before the leaves, dense and short, the staminate $\mathbf{I}-2 \mathrm{~cm}$. long, yellowish silky-hairy, the pistillate ones $3-4 \mathrm{~cm}$. in fruit ; capsule as in the preceding, often io mm. long. In wet places from N. Eng. to Penn. and Ill. This has been confused with S. discolor, as intermediate forms apparently occur.

Salix eriocéphala amplifòlia Rydb. Leaves broadly oval, 4-5 cm. wide. Conn. and N. Y.
26. Salix prinoìdes Pursh. Chestnut-oak Willow. Shrub resembling the preceding, but branches slender, glabrous; mature leaves lighter colored above and less glaucous beneath, narrower and more tapering at buth ends, serrate; a ments longer, 4 cm . long or more, rather lax, sparingly silky; capsule conic, finely silky, with a more evident style. N. Y. to Va.
27. Salix latiúscula Anders. Newfoundland Willow. (I. F. f. I202.) A low shrub, with dark brown glabrous twigs, the young shoots pubescent. Leaves oval or obovate, subcordate at the base, short-pointed at the apex, serrulate, when mature bright green above, pale beneath, about 4 cm . long, 2.5 cm . wide; stipules ovate-cordate, acute; aments unfolding with the leaves, borne at the ends of short branches, dense, spreading or erect, the staminate 2 cm . long, the pistillate $5-8 \mathrm{~cm}$. long in fruit; bracts yellow, obtuse, persistent, slightly villous; capsule ovoid-conic, sparsely tomentose, acute, 6 mm . long; style very short. Summer. Newf. (according to Andersson). [S. Barkleyi latiuscula Anders.]
28. Salix squamata Rydb. n.sp. Long-bracted Willow. A shrub or low tree, resembling closely $S$. eriocephala, but young branches only slightly pubescent, Mature leaves firm, green and shining above, glaucous and glabrous beneath, 6-10 cm . long, distinctly dentate-serrate, acute at both ends; aments on more or less leafy branches, erect, the fertile ones in fruit 3-7 cm. long, rather loose; bracts yellowish or reddish, lanceolate, acute, three-fourths as long as the pistil; capsule conic; style short; stigmas short and almost entire. N. J. and Penn. Summer. Type from Sparta Junction, N. J.
29. Salix perrostràta Rydb. $n$. $s p$. Long-beaked Willow. A shrub, $\mathrm{I}-4 \mathrm{~m}$. high with grayish, rough and scaly bark; branches yellow or the youngest tinged with red, at first finely pubescent; leaves obovate-lanceolate or oblanceolate, when young finely silky, in age glabrate, $2-4 \mathrm{~cm}$. long, $\mathbf{I}-\mathbf{1} .5 \mathrm{~cm}$. wide, acute at both ends, and with undulate margins, light green above and paler beneath; petioles 2-6 mm .; stipules minute, deciduous; aments somewhat leafy-bracted, almost sessile; the staminate $\mathbf{I - I . 5} \mathrm{cm}$. long, the pistillate in fruit $2-3 \mathrm{~cm}$. ; capsule conic, longrostrate; stigma subsessile. Black Hills of S. Dak., Pine Ridge, Neb. and Wyoming. May-June. (S. Bebbiana Rydb. Cont. U. S. Nat. Herb. 3: 523, mainly, not Sarg.)
30. Salix Bebbiàna Sarg. Bebb's Willow. (I. F. f. ir84.) A shrub, 2-6 m . tall, or sometimes a tree 8 m . high, the twigs pubescent or puberulent, terete. Leaves elliptic, oblong or oblong-lanceolate, acute, acuminate or some of them blunt at the apex, rounded or narrowed at the base, sparingly serrate or entire, dull green and puberulent above, pale, reticulate-veined and tomentose beneath or nearly glabrous on both sides when very old; petioles $4-12 \mathrm{~mm}$. long, stipules scmicordate, acute, deciduous; aments sessile, expanding with or before the leaves, dense, the staminate $2-3 \mathrm{~cm}$. long, the pistillate 5 cm . long in fruit; capsule very narrowly long-conic, twice as long as the filiform pedicel. In dry soil and along streams, Anticosti to Hudson Bay and Br. Col, south to N. J., Penn., Neb, and Utah. April-May.
31. Salix hùmilis Marsh. Prairie Willow. (I. F. f. ifis5.) A shrub, I2.5 m . long, the twigs tomentose or pubescent, terete. Leaves oblanceolate, petioled. $5-10 \mathrm{~cm}$; long, $8-16 \mathrm{~mm}$. wide, acute at both ends or the lower broader and ohtuse at the apex, sparingly denticulate, the margins slightly revolute, the upper surlace dark green, dull, puberulent or glabrous; petioles 4-6 mm . long; stipules obliquely lanceolate or ovate, acute, commonly persistent; aments unfolding much before the leaves, sessile, ovoid-oblong, short, dense; stigmas nearly sessile; capsule narrowly conic. In dry soil, N. S. to western Ont., south to N. Car., Tenn, and Neb. Hybridizes with $S$. discolor. April-May.
32. Salix trístis Ait. Dwarf Gray Willow. Sage Willow. (I. F. f. 1186.) A tufted, slender shrub, 3-6 dm. tall, the twigs terete, puberulent, the roots long and thick. Leaves oblanceolate or linear-oblong, acute or obtusish, somewhat undulate, green and puberulent or glabrous above, crowded, $2-5 \mathrm{~cm}$. long, their margins revolute; petioles about 2 mm . long; stipules minute, deciduous; aments expanding much before the leaves, dense, very small, sessile; bracts persistent; stigmas sessile or nearly so; capsule ovoid with a long, slender beak, tomentulose, about 6 mm . long. In dry soil, N. S. (?), Me. to Minn., south to Fla. and Tenn. March-April.
33. Salix cấndida Fluegge. Hoary Willow. (I. F. f. ir93.) An erect shrub, $6-15 \mathrm{dm}$. tall, the older twigs red or purple and terete, the younger densely white-tomentose. Leaves green and loosely tomentose or becoming glabrate above when mature, oblong or oblong-lanceolate, thick, sparingly repand-denticulate or entire, acute at both ends or the lower obtuse at the apex, $5-10 \mathrm{~cm}$. long, $6-16 \mathrm{~mm}$. wide, their margins slightly revolute; petioles $3-4 \mathrm{~mm}$. long; stipules lanceolatesubulate, about equalling the petioles, deciduous; aments expanding before the leaves, dense, cylindric, the staminate about 2.5 cm . long, the pistillate $3-5 \mathrm{~cm}$. long in fruit; bracts villous, persistent; capsule ovoid-conic, acute, $5-6 \mathrm{~mm}$. long. In bogs, Lab. to N. W. Terr., south to N. J., Iowa and Mont. Hybridizes with S. petiolaris and S. cordata. May.
34. Salix serícea Marsh. Silky Willow. (I. F. f. ir88.) A shrub, 2-4 m. tall, with slender purplish puberulent twigs, the young leaves densely silky-pubescent. Mature leaves glabrous or nearly so, lanceolate, acuminate, narrowed or obtuse at the base, serrulate all around with gland-tipped teeth, dark green above, paler and somewhat glaucous beneath, turning brown or black in drying, $6-10 \mathrm{~cm}$. long, $\mathrm{I}-2 \mathrm{~cm}$. wide; stipules narrow, deciduous; petioles $4-14 \mathrm{~mm}$. long, sometimes glandular; aments expanding before the leaves, sessile, usually with a few leafy bracts at the base, dense, the staminate about 2 cm . long, the pistillate $2-4 \mathrm{~cm}$. long in fruit; bracts villous, persistent; capsule ovoid-oblong, obtuse, pubescent, about 4 mm . long. In swamps and along streams, Me. to Mich. and Va. May.

Salix sericea subsericea (Anders.) Rydb. Leaves less silky, more sharply serrate; capsule smaller. N. Y. to Mich. (S. petiolaris subsericea Anders.).
35. Salix argyrocàrpa Anders. Silver Willow. (I. F. f. I190.) An erect or diffuse shrub, I.5-6 dm. high, the twigs dark green, nearly terete, shining. Leaves oblong or oblanceolate, acute at each end or the lower obtuse, short-petioled, entire or crenulate, bright green and glabrous above, persistently silvery-silky beneath, $3-5 \mathrm{~cm}$. long, $6-12 \mathrm{~mm}$. wide, the margins slightly revolute; aments unfolding with the leaves, leafy-bracted at the base, dense, 2.5 cm . or less long; scales persistent, villous; capsule oblong-conic, acute, $2-3 \mathrm{~mm}$. long, about twice as long as its pedicel. Lab. and Quebec to the White Mountains of N. H. Hybridizes with S. chlorophylla. June-July.
36. Salix viminàlis L. Osier Willow. (I. F. f. ir94.) A small slender tree or shrub, with terete green twigs. Leaves sparingly repand-crenulate or entire, revolute-margined, short-petioled, dark green and glabrous above, persistently silvery-silky beneath, $7-15 \mathrm{~cm}$. long, $4-16 \mathrm{~mm}$. wide; stipules narrow, deciduous; aments expanding before the leaves, dense, the pistillate $5-7 \mathrm{~cm}$. long and $\mathbf{I} \mathrm{cm}$. in diameter in fruit; capsule narrowly ovoid-conic, acute, about 6 mm . long. Cultivated for wickerware and occasionally escaped into wet places in the Eastern and Middie States. Native of Europe and Asia. April-May.
37. Salix chlorophylla Anders. Tea-leaved Willow. (I. F. f. I195.) A shrub, 3-30 dm. high, much branched, the twigs glabrous, dark purple-green. sometimes glaucous. Leaves oblong, lanceolate or elliptic, acute or obtuse at the apex, minutely repand-crenulate or entire, narrowed at the base, bright green and shining above, pale and glaucous beneath, $3-7 \mathrm{~cm}$. long, $\mathbf{I}-2 \mathrm{~cm}$. wide; petioles $6-16 \mathrm{~mm}$. long; stipules minute, fugacious, or wanting; aments sessile, dense, oblong-cylindric, the staminate 2 cm . or less long, the pistillate $2-5 \mathrm{~cm}$. long in fruit; bracts villous, persistent; capsule conic, acute, 5 mm . long. Swamps, Lab. to Br. Col.. and the White Mountains of N. H.. and Colo. Summer. [S. phyllir cifolia Bebb, not L.]
38. Salix Groenlándica (Anders.) Lundst. Greenland Willow. A low
cespitose shrub, 1-2 dm. high, much branched, with short stout branches and dark brown or purplish bark. Leaves crowded, obovate, when young covered with long white hairs, soon glabrate above, more tardily so below, entire, obtuse, bright green: petioles short, $2-5 \mathrm{~mm}$. long; aments short and very dense, oblong-obovoid; capsule ovoid, densely white-villous. Geeenland, Baffin Bay region, and Labrador.
39. Salix àrctica Pall. Arctic Willow. Ground Willow. (I. F. f. 1197.) A low branching shrub, I-3 dm., seldom 1-2 m., high, the twigs terete or nearly so. Leaves glabrous, elliptic or broadly obovate, entire, obtuse and usually rounded at the apex, narrowed or rounded at the base, long-petioled, pale and glaucous beneath; petioles slender, $\mathbf{I}-3 \mathrm{~cm}$. long; aments dense, oblong; capsule conic, villous. Arctic America and Asia. Summer.
40. Salix anglòrum Cham. Robert Brown's Willow. (I. F. f. i196.) A low, branched shrub with prostrate branches, the twigs 4 -angled, slender. Leaves glabrous, slightly silky when young, acute or the lower obtuse at the apex, entire or wavy, narrowed at the base, the lower surface pale or glaucous, the margins not revolute; petioles only $10-15 \mathrm{~mm}$. long ; stipules narrow, deciduous; capsule ovoidconic, tomentose, acute, about 5-8 mm. long. Labrador, Greenland and Anticosti to Alaska. Summer. (S. Brownii Bebb:)

4I. Salix vaccinifòrmis Rydb. Blueberry Willow. A small shrub, with numerous ascending, light brown branches, which are glabrous, or very soon glabrate; leaves small, resembling those of Vaccinium uliginosum, about 2 cm . long, dark and shining above, paler beneath; aments $2-3 \mathrm{~cm}$. long, rather loose; capsule 7-8 mm., loosely villous, ovoid. Anticosti, Hudson Bay and Labrador. (S. Macounii Rydb.; not S. Richardsonii Macouniana Bebb.)
42. Salix callicarpaèa Trautv. Trautvetter's Willow. A very low depressed shrub with the habit of $S$. Uva-ursi, with light yellow glabrous twigs; leaves small, about 1.5 cm . long and $\mathbf{I} \mathrm{cm}$. wide, bright green above, a little glaucous beneath, strongly reticulated; petioles $\mathbf{I}-5 \mathrm{~mm}$. long; aments about 2 cm . long, dense; capsule 4-6 mm., grayish tomentose, ovate. Mt. Gaspé, Quebec and Labrador.
43. Salix glaùca L. Northern Willow. (I. F. f. II92.) A low arctic shrub, with terete brown twigs, the young shoots and leaves densely silky, becoming glabrate when old, turning black in drying. Leaves elliptic or obovate, entire, obtuse or acute at the apex, narrowed at the base, $3-7 \mathrm{~cm}$. long, $\mathbf{1}-2 \mathrm{~cm}$. wide; petioles $\mathbf{1}$-10 mm . long; stipules deciduous; the staminate aments dense, about 2 cm . long, the pistillate $4-7 \mathrm{~cm}$. long in fruit, rather loose. Arctic America from Labrador to Alaska. Also in arctic and alpine Europe and and Asia. Summer.
44. Salix Wághornei Rydb. Waghorne's Willow. A low shrub, I-3 dm. high, with brown shining bark; branches at first slightly silky, soon glabrate; leaves $2-3 \mathrm{~cm}$. long and $1.5-2 \mathrm{~cm}$. wide, at first somewhat silky, soon glabrate, obtuse or rounded at the base, rounded at the apex, light green above, slightly glaucous beneath, thin, entire; petioles $\mathbf{I}-5 \mathrm{~mm}$. long; aments dense, short; the staminate ones $\mathbf{I - 2} \mathrm{cm}$. long; pistillate in fruit $2-2.5 \mathrm{~cm}$. Labrador. August.
45. Salix àtra Rydb. Blackening Willow. A low shrub, with ascending dark brown branches, which are more or less villous when young; leaves small, $\mathbf{1} .5-\mathbf{2 . 5} \mathrm{cm}$. long, when young covered with long white appressed hairs, dark green above, pale beneath, blackening in drying; aments $1.5-3 \mathrm{~cm}$. long, rather clense; capsule ovoid. Labrador and Hudson Bay.
46. Salix strìcta (Anders.) Rydb. Drummond's Willow. (I. F. f. in ini.) A shrub, 2-5 dm. high, with purplish-green or yellowish twigs. Leaves oblong or oblanceolate, acute at the apex and cuneate at the base or the lower ohtuse at both ends, entire or nearly so, short-petioled, tomentose on both sides or slabrate above when old, $\mathbf{1}-5 \mathrm{~cm}$. long, 4-8 mm . wide; stipules fugacious; aments expanding with the leaves, dense, $\mathbf{I - 2} \mathbf{c m}$. or less long, leafy-bracted at the base; capsule ovoid-conic, acute, densely tomentose, about 5 mm . long. Anticnsti and Quehec to western arctic America, south along the Rocky Mountains to Colo. Summer. ( $S$. desertorum Bebb; not Richards.)
47. Salix Labradorica Rydb. Labrador Witiow. A low shrub; older bark dark brown and shining; young shoots more or less densely villous; leaves broadly ovate, often obtuse or subcordate at the base, firm, dark and glossy ahowe. more or less glaucous beneath, on both surfaces invested with villous hairs, hlacken-
ing in drying; aments densely many-flowered, about 3 cm . long; bracts oblong, brown, villous; capsule 6-8 mm. long, ovoid-conic, densely white-villous. Lab. Summer.
48. Salix vestita Pursh. Hairy Willow. (I. F. f. ir83.) A low shrub, r-2 dm. seldom 5 dm . high, the twigs 4 -sided, green. Leaves obovate, thick, mostly retuse or emarginate at the apex, slightly crenulate, narrowed or rounded at the base, dark green and glabrous above, persistently tomentose-silky beneath, shortpetioled, $2-5 \mathrm{~cm}$. long; petioles $4-8 \mathrm{~mm}$. long, channeled, not glandular; aments slender, stalked; pistillate $3-5 \mathrm{~cm}$. long in fruit; capsules narrowly ovoid-conic, sessile, densely silky-tomentose, about 6 mm . long. Lab. and Quebec to the N. W. Terr. and Ore. June.
49. Salix orbiculàris Anders. Round-leaved Net-veined Willow. A low shrub, closely resembling $S$. reticulata, but stems more purplish; leaves generaily more rounded, often subcordate at the base, purple or brown-veined, but most easily distinguished by the broadly obovate bracts. Lab. to Alaska and Br. Col. (S. reticulata of American authors, mostly.)
50. Salix reticulàta L. Net-veined Willow. (I. F. f. i182.) A procumbent shrub, 5-3 dm. high, often sending out roots from the twigs, the young shoots 4 -sided, purple-green. Leaves elliptic or obovate, thick, obtuse, narrowed or rounded at the base, obscurely crenulate or entire, slender-petioled, glabrous or somewhat silky-pubescent when young, dark green above, not shining, glaucous and strongly reticulate-veined beneath, $2-4 \mathrm{~cm}$. long; petioles $8-20 \mathrm{~mm}$. long, channeled; stipules oblong, obtuse; aments terminal, long-stalked, dense; filaments pubescent at the base; capsule ovoid-conic, tomentose, about 6 mm . long. Lab. Very rare. Also in northern Europe and Asia. June.
51. Salix purpùrea L. Purple Willow. (I. F. f. ir8o.) A slender shrub or small tree, with purplish flexible twigs, maximum height about 3.5 m .; branches often trailing; bark smooth and very bitter. Leaves oblanceolate or spatulate, acute, serrulate, narrowed at the base, short-petioled, glabrous, green above, paler and somewhat glaucous beneath, $4-7 \mathrm{~cm}$. long, $5-8 \mathrm{~mm}$. wide; stipules minute; petioles 2-4 mm. long, not glandular; aments appearing before the leaves, dense, leafy-bracted at the base, the staminate about 2 cm . long, the pistillate $3-5 \mathrm{~cm}$. long, sessile or nearly so; filaments and sometimes also the anthers united, pubescent; bracts purple, persistent; capsules ovoid-conic, obtuse, tomentose, 5 mm . long. Sparingly escaped from cultivation in the Atlantic States. Native of Europe. Also called Bitter, Rose and Whipcord Willow. April-May.

## Order 4. MYRICÀLES.

Shrubs or trees, with simple leaves and small monœcious or diœcious flowers in aments. Perianth none. Ovary I-celled; style short; stigmas 2. Ovule erect, orthotropous. Endosperm none. Only one family.

## Family i. MYRICÀCEAE Dumort.

## Bayberry Family.

Leaves alternate, mostly coriaceous and aromatic. Flowers solitary in the axils of the bracts. Staminate flower with 2-16 (usually 4-8) stamens inserted on the receptacle; filaments short; anthers ovate, 2 -celled, the sacs longitudinally dehiscent. Ovary subtended by $2-8$ bractlets; stigmas linear. Fruit a small drupe or nut, the exocarp often waxy. Seed erect. Cotyledons plano-convex. Radicle very short. Two genera and 35 species of wide geographic distribution.

## r. MYRİCA L

Leaves entire, dentate or lobed, mostly resinous-dotted. Staminate aments oblong or narrowly cylindric, expanding before or with the leaves. Stamens 4-8. Pistillate aments ovoid or subglobose; ovary subtended by $2-4$, mostly short, bractlets. Drupe globose or ovoid, its exocarp waxy. [Ancient Greek name of the Tamarisk.] Besides the following species, another occurs in the Southern States and 2 on the Pacific coast.
Bractlets of pistillate aments persistent, clasping the drupes; low bog shrub. 1. M. Gale.

Bractlets of pistillate aments deciduous, the ripe drupes separated.
Slender tree; leaves mostly acute, narrow; drupe less than 2 mm . in diameter.
2. M. cerifera.

Shrub; leaves mostly obtuse, broader ; drupe $2-3 \mathrm{~mm}$. in diameter. 3. M. Carolinensis.

1. Myrica Gàle L. Sweet Gale. (I. F. f. I159.) A shrub, the twigs dark brown. Leaves oblanceolate, obtuse and dentate at the apex, narrowed to a cuneate entire base, short-petioled, dark green and glabrous above, pale and puberulent or glabrous beneath, $2-6 \mathrm{~cm}$. long, unfolding after the aments; staminate aments linear-oblong, $\mathbf{I - 2} \mathrm{cm}$. long, crowded; pistillate aments ovoid-oblong, obtuse, about 8 mm . long, their bracts imbricated; drupe resinous-waxy, not longer than the 2 ovate persistent bractlets. In wet places, Newf. to Alaska, S. N. Y., Va., Mich. and Wash. Also in Europe and Asia. April-May.
2. Myrica cerífera L. Wax-myrtle. (I. F. f. i16o.) A slender diœcious tree, the bark gray, nearly smooth. Leaves narrow, oblong or oblanceolate, mostly acute, entire or sparingly dentate, narrowed at the base, fragrant, shortpetioled, dark green above, paler and sometimes pubescent beneath, golden-resinous, $2-8 \mathrm{~cm}$. long, unfolding with or before the aments; staminate aments cylindric; pistillate aments short, oblong; ripe drupes globose, bluish white, waxy, tipped with the base of the style, long-persistent. In sandy swamps or wet woods, Md. to Fla., Tex., north to Ark. March-April.
3. Myrica Carolinénsis Mill. Waxberry. Bayberry. (I. F.f.iri6i.) A shrub, $0.5-2.5 \mathrm{~m}$. high, with smooth gray bark, the twigs often pubescent. Leaves oblanceolate or obovate, glabrous above, often pubescent beneath, resinous, 5-10 cm . long, $\mathbf{I}-3 \mathrm{~cm}$. wide, serrate with a few low teeth above the middle, or entire, obtuse or sometimes acute at the apex, narrowed at the base, short-petioled ; staminate aments cylindric or oblong, 6-18 mm. long; pistillate aments short, oblong ; ripe drupes globose, bluish white, very waxy, long-persistent. In dry or moist sandy soil, N. S. to Fla. and Ala. and on the shores of Lake Erie. Occurs also in bogs in N. N. J. and Penn. April-May.

## 2. COMPTÒNIA Banks.

A low, branching shrub with terete brown branches and narrow, deeply pinnatifid leaves, the young foliage pubescent. Aments expanding with the leaves, the staminate ones and their flowers as in Myrica. Fertile aments globose-ovoid, on monœcious plants appearing below the staminate, several-flowered. Ovary subtended by 8 linear-subulate persistent bractlets, which form an involucre to the ovoid-oblong bony nut. Fruit bur-like. [Name in honor of Rev. Henry Compton, 1632-1713, bishop of Oxford.] A monotypic genus of eastern N. Am.
I. Comptonia peregrìna (L.) Coulter. Sweet Fern. (I. F. f. 1162.) Leaves linear-oblong or linear-lanceolate, o.7-1.5 dm. long, short-petioled, obtuse or subacute at the apex, deeply pinnatifid into numerous oblique lobes, fragrant ; stipules semi-cordate, mostly deciduous ; staminate aments clustered at the ends of the branches, 2.5 cm . long or less, their bracts reniform, acute ; pistillate aments bur-like in fruit, the subulate bractlets longer than the light brown, shining, striate, obtuse nut. In dry soil, especially on hillsides, N. S. to Man., N. Car., Ind. and Mich. April-May.

## Order 5. LEITNERIÀLES.

Shrubs or trees with diœcious small flowers in aments, and simple entire petioled alternate leaves. Staminate flowers with no perianth.

Pistillate flowers subtended by 3 or 4 bractlets (perianth?). Ovary r-celled ; style slender, stigmatic above; ovule laterally affixed, amphitropous. Endosperm thin. Only one family.

Family i. LEITNERIACEAE Drude. Cork-wood Family.

Aments expanding before the leaves. Staminate flowers with 3-12 stamens inserted on the receptacle; filaments distinct; anthers, oblong erect, 2 -celled, the sacs longitudinally dehiscent. Style terminal, grooved and flattened, recurved, caducous. Fruit an oblong drupe with thin exocarp and hard endocarp. Testa thin. Cotyledons flat, cordate at the base; radicle short, superior. Comprising only the following genus of the southern U.S.

## 1. LEITNÉRIA Chapm.

Characters of the family. One species, or perhaps two. [In honor of Dr. E. F. Leitner, a German naturalist, killed in Florida during the Seminole war.]
I. Leitneria Floridàna Chapm. Leitneria. Cork-wood. (I. F. f. il63.) Bark gray and rather smooth; young twigs, leaves and aments densely pubescent. Leaves oblong or elliptic-lanceolate, narrowed at the base, bright green, firm, $0.7-\mathrm{I} .5 \mathrm{dm}$. long, finely pubescent, at least on the veins, and rugose-reticulated beneath; staminate aments ascending, $2-5 \mathrm{~cm}$. long, their bracts triangular-ovate, acute, tomentose; pistillate aments shorter, borne toward the ends of the twigs; drupe slightly compressed, about 2 cm . long, $6-8 \mathrm{~mm}$. thick, rugose-reticulated. In swamps, S. Mo. to Tex., and in Fla. Wood lighter than cork and probably the lightest wood known, weighing only about $121 / 2 \mathrm{lbs}$. per cubic foot. March.

## Order 6. BALANOPSIDÀLES,

includes only the family Balanopsidaceae, comprising the genus Balanops of Australasia.

## Order 7. JUGLANDÀLES.

Trees with alternate pinnately compound leaves, and monœecious bracteolate flowers, the staminate in long drooping aments, the pistillate solitary or several together. Staminate flowers consisting of 3 -numerous stamens with or without an irregularly lobed perianth adnate to the bractlet, very rarely with a rudimentary ovary. Anthers erect, 2-celled, the sacs longitudinally dehiscent; filaments short. Pistillate flowers bracted and usually 2-bracteolate, with a 3-5-lobed (normally 4-lobed) calyx or with both calyx and petals, and an inferior I-celled or incompletely 2-4-celled ovary. Ovule solitary, erect, orthotropous; styles 2, stigmatic on the inner surface. Fruit in our genera a drupe with indehiscent or dehiscent, fibrous or woody exocarp (husk; ripened calyx ; also regarded as an involucre), enclosing the bony endocarp or nut which is incompletely $2-4$-celled. Seed large, 2-4-lobed. Endosperm none. Cotyledons corrugated, very oily. Radicle minute, superior. Only one family.

> Family I. JUGLANDÀCEAE Lindl. Walnut Family.

Characters of the order. Six genera and about 35 species, mostly of the warmer parts of the north temperate zone. The young leaves in the bud are stipulate in at least two species of Hicoria.

[^17]
## 1. JUGLANS L.

Trees, with spreading branches, superposed buds, fragrant bark, and oddpinnate leaves, with nearly or quite sessile leaflets, the terminal one sometimes early perishing. Staminate flowers in drooping cylindric aments, borne on the twigs of the previous year; perianth 3-6-lobed; stamens $8-40$ in 2 or more series. Pistillate flowers on a terminal peduncle at the end of shoots of the season, the calyx 4 -lobed, with 4 small petals a4nate to the ovary at the sinuses; styles fimbriate, very short. Drupe large, globose or ovoid, the exocarp somewhat fleshy, fibrous, indehiscent, the endocarp bony, rugose or sculptured, $2-4$-celled at the base, indehiscent, or in decay separating into 2 valves. [Name a contraction of the Latin $\mathcal{F}$ ovis glans, the nut of Jupiter.] About 8 species, natives of the north temperate zone, I in the W. I., I or 2 in the Andes of S. Am. Besides the following I or 2 others occur in the southwestern U.S.

| Fruit globose, obtuse, not viscid; petioles puberulent. | 1. J. nigra. |
| :--- | :--- |
| Fruit oblong, pointed, viscid; petioles pubescent. | 2. J. cinerea. |

1. Juglans nìgra L. Black Walnut. (I. F. f. 1149.) A large forest tree with rough brown bark, the twigs of the season and petioles puberulent, the older twigs glabrous or very nearly so. Leaflets 13-23, ovate-lanceolate, more or less inequilateral, acuminate at the apex, rounded or subcordate at the base, serrate, pubescent beneath, $7-13 \mathrm{~cm}$. long; staminate aments $7-14 \mathrm{~cm}$. long; drupes usually solitary or 2 together, globose or a little longer than thick, $3-8 \mathrm{~cm}$. in diameter, papillose; nut corrugated, slightly compressed, 4-celled at the base. In rich woods, Mass. to S. Ont., Minn., Fla., Kans. and Tex. April-May. Fruit ripe Oct.-Nov.
2. Juglans cinèrea L. Butrernut. White Walnut. Oil-nut. (I. F. f. 1150.) A forest tree, resembling the Black Walnut, the bark gray, smoother, the twigs, petioles and leaflets viscid-pubescent, at least when young. Leaflets $\mathbf{1 I - 1 9}$, oblong-lanceolate, acuminate, scarcely inequilateral, obtuse, rounded or truncate at the base, serrate; drupes racemed, 5-8 cm. long and about one-half as thick, pointed; nut 4-ribbed, deeply sculptured, and with sharp longitudinal ridges, firmly adherent to the husk, 2 -celled at the base. In rich or rocky woods, N. B. and Ont. to N. Dak., Neb., Del., Ga., Miss. and Ark. April-May. Fruit ripe Oct.-Nov.

## 2. HICORIA Raf.

Trees, with odd-pinnate leaves and serrate or serrulate leaflets. Staminate flowers in slender drooping aments, borne in 3's on a common peduncle at the base of the shoots of the season, or clustered and sessile or nearly so in the axils of leafscars at the summit of twigs of the preceding year; calyx adnate to the bract, 2-3-lobed or $2-3$-cleft; stamens $3-10$; filaments short. Pistillate flowers 2-6, together on a terminal peduncle; bract fugacious or none; calyx 4 -toothed; petals none; styles 2 or 4, papillose or fimbriate, short. Fruit subglobose, oblong or obovoid, the husk separating more or less completely into 4 valves; nut bony, incompletely $2-4$-celled. [From the aboriginal name Hicori.] About 15 species, natives of eastern North America, one in Mexico.
Bud-scales valvate; lateral leaflets lanceolate or oblong-lanceolate, falcate.
Nut not compressed or angled; seed sweet. 1. H. Fecan.
Nut somewhat compressed or angled; seed intensely bitter.

Leaflets 7-9; nut smooth.
2. H. minima.

Leaflets 9-13; nut angled.
3. H. aquatica.

Bud-scales imbricate; lateral leaflets not falcate.
Husk of the fruit freely splitting to the base; middle lobe of the staminate calyx narrow, often at least twice as long as the lateral ones.

Bark shaggy, separating in long plates.
Leaflets $3-5$ (rarely 7 ); nut rounded at the base, $x-2 \mathrm{~cm}$. long.
Leaflets oblong-lanceolate to obovate; twigs puberulent.
4. H. ovata.

Leaflets narrowly lanceolate; twigs glaucous.
5. H. Carolinae-septentrionalis.

Leaflets 7-9; nut usually pointed at both ends, $2.5-3 \mathrm{~cm}$. long.
6. H. laciniosa.

Bark close, rough ; leaflets 7-9.
Foliage persistently stellate-pubescent ; staminate aments stellate-woolly.
7. H. alba.

Mature leaves glabrous, or nearly so ; staminate aments slightly pubescent.
8. H. pallida.

Husk of fruit thin, not freely splitting to the base; lobes of the staminate calyx mostly nearly equal.
Fruit nearly globular; nut thin-shelled; bark, at least that of old trees, separating in strips.
Fruit little flattened ; middle lobe of staminate calyx short.
9. H. microcarpa.

Fruit much flattened; middle lobe of staminate calyx long.
10. $H$. borealis.

Fruit obovoid; nut thick-shelled; bark close.
Foliage nearly or quite glabrous.
11. H. glabra.

Foliage with silvery peltate glands.
12. H. villosa.
I. Hicoria Pecán (Marsh.) Britton. Pecan. (I. F. f. II5I.) A large tree, with rough bark. Young twigs and leaves pubescent; mature foliage nearly glabrous; bud-scales few, small; leaflets II-I5, oblong-lanceolate, short-stalked, inequilateral, acuminate, $\mathrm{I}-\mathrm{r} .8 \mathrm{dm}$. long; staminate aments sessile or nearly so, 1.2-1. 5 dm . long; middle lobe of the staminate calyx linear, much longer than the oblong lateral ones; fruit oblong-cylindric, $3-6 \mathrm{~cm}$. long; husk thin, 4 -valved; nut smooth, oblong, thin-shelled, pointed, 2 -celled at base, dissepiments thin, very astringent; seed delicious. In moist soil, especially along streams, Ind. to Iowa, Mo., Ky. and Tex. April-May. Fruit ripe Sept.-Oct.
2. Hicoria mínima (Marsh.) Britton. Bitter-nut. Swamp Hickory. (I. F. f. I152.) A slender tree, the bark close, rough. Bud-scales 6-8, small, caducous; young foliage puberulent; leaflets 7-9, sessile, long-acuminate, $0.7-1.5 \mathrm{dm}$. long, $1-\hat{3} \mathrm{~cm}$. wide, the lateral ones falcate; staminate aments slightly pubescent; lobes of the staminate calyx about equal, the middle one narrower; fruit subglobose, narrowly 6 -ridged, $2-3.5 \mathrm{~cm}$. in diameter; husk thin, tardily and irregularly 4 -valved; nut short-pointed, $1.5-2.5 \mathrm{~cm}$. long, thin-shelled. In moist woods and swamps, Quebec to Ont., Minn., Fla. and Tex. May-June. Fruit ripe Sept.-Oct.
3. Hicoria aquatica (Michx. f.) Britton. Water Hickory. (I. F. f. ir53.) A swamp tree, the bark close, the young foliage pubescent, becoming nearly glabrous when mature. Leaflets 9-13, lanceolate, or the terminal one oblong, longacuminate at the apex, narrowed at the base, $0.7-1.3 \mathrm{dm}$. long, $\mathrm{I}-2.5 \mathrm{~cm}$. wide, the lateral strongly falcate; staminate aments and calyx as in the preceding species; fruit oblong, ridged, $2-3.5 \mathrm{~cm}$. long, pointed; husk thin, tardily splitting; nut oblong, thin-shelled, angular. In river swamps, Va. to Fla., Ill., Ark. and Tex. MarchApril. Fruit ripe Sept.-Oct.
4. Hicoria ovàta (Mill.) Britton. Shag-bark. Shell-bark Hickory. (I. F. f. II54.) A large tree; bark shaggy in narrow plates; young twigs and leaves puberulent. Leaflets 5, or sometimes 7 . oblong, oblong-lanceolate or the upper obovate, acuminate at the apex, narrowed to the sessile base, I-I. 5 dm . long, those of young plants much larger; bud-scales 8-10, the inner becoming very large; fruit subglobose, $2.5-5.5 \mathrm{~cm}$. long; husk thick, soon splitting; nut white, somewhat compressed, 4 -celled at the base, 2 -celled (rarely 3 -celled) above, pointed, slightly angled, thin-shelled. In rich soil, Quebec to Ont., Minn., Fla., Kans. and Tex. May. Fruit ripe Sept.-Nov.
5. Hicoria Carolinae-septentrionàlis Ashe. Southern Shag-bark. (I. F. f. II54a.) A tree, with gray bark hanging in loose strips. Bud-scales 8-10, the inner greatly enlarging in leafing; terminal bud ovoid-lanceolate, truncate; twigs slender, glaucous, smooth, purplish brown; staminate aments glabrous; young foliage blackening in drying, glabrous, ciliate, with few resinous globules; leaflets $3-5$; fruit subglobose, $1.5-3 \mathrm{~cm}$. long; husk soon falling into 4 pieces; nut white or brownish, much compressed, angled, cordate or subcordate at top, thin-shelled. Sandy or rocky woods, Del. to Ga. and Tenn.
6. Hicoria laciniòsa (Michx. f.) Sarg. Big Shag-bark. King-nut. (I. F. f. II55.) A large tree, the bark separating in long narrow plates, the young foliage densely puberulent, the mature leaves somewhat so beneath. Leaflets 7-9 (rarely 5), acute or acuminate, sometimes 2 dm . long; middle lobe of the staminate calyx
linear, twice as long as the lateral ones; fruit oblong, $5-8 \mathrm{~cm}$. long; husk thick, soon splitting to the base; nut oblong, somewhat compressed, thick-shelled, pointed at both ends, yellowish white. In rich soil, N. Y. and Penn. to Ind., Iowa, Tenn., Kans. and the Ind. Terr. May. Fruit ripe Sept.-Oct.
7. Hicoria álba (L.) Britton. White-heart Hickory. Mocker-nut. (I. F. f. 1156.) A large tree, the foliage and twigs persistently tomentose-stellatepubescent, fragrant when crushed; bark close; bud-scales large; leaflets 7-9, oblonglanceolate or the upper oblanceolate or obovate, long-acuminate; middle lobe of the staminate calyx linear, much longer than the lateral ones; fruit globose or oblongglobose, $3-9 \mathrm{~cm}$. long; husk thick; nut grayish-white, angled, pointed at the summit, little compressed, thick-shelled, 4 -celled at the base. In rich soil, Mass. to Ont., Ill., Neb., Fla. and Tex. May-June. Fruit ripe Oct.-Nov.
8. Hicoria pállida Ashe. Pale-leaved Hickory. A forest tree with very rough gray bark and purple-brown twigs, the buds sharp-pointed, their scales 5-9. Leaflets $7-9$, lanceolate or ovate-lanceolate, long-acuminate, glabrous or nearly so when old, pale and with numerous silvery scales beneath, the rachis stellate-pubescent, at least when young; middle lobe of the staminate calyx linear, somewhat longer than the lateral ones; fruit usually subglobose, sometimes oval or pyriform, the husk rather thin, sometimes tardily splitting; nut laterally flattened, 4-celled at the base. In dry soil, S. Va. to Tenn., Ga. and Ala. April-May. (H. villosa pallida Ashe.)
9. Hicoria microcàrpa (Nutt.) Britton. Small-fruited Hickory. (I. F. f. 1157.) A forest tree, the older bark separating in narrow plates, the foliage glabrous. Bud-scales 6-8; leaflets 5-7, oblong, or ovate-lanceolate, acuminate at the apex, $9-13 \mathrm{~cm}$. long; staminate aments glabrous; middle lobe of the staminate calyx equalling or somewhat longer than the lateral ones; fruit globose or globoseoblong, less than 2.5 cm . long, the husk thin, tardily and incompletely splitting to the base; nut subglobose, slightly compressed, thin-shelled, pointed; seed sweet. In rich woods, Mass. to Mich., Va., Ill. and Mo. May-June. Fruit ripe Sept.-Oct.
10. Hicoria boreàlis Ashe. Northern Hickory. (I. F. f. ir56b.) A small tree, with rough furrowed bark when young, becoming shaggy in narrow strips with age. Bud-scales 8 -10, imbricated, the inner bright-colored and sericeous; terminal bud ovoid-lanceolate; twigs slender, glabrous, bright brownish red; middle lobe of staminate calyx much prolonged; young leaves blackening in drying, ciliate, with few resinous globules on lower surface; leaflets 5 , occasionally 3, lanceolate, the upper $9-15 \mathrm{~cm}$. long; fruit ovoid, much flattened, 1.5 cm . long or more; husk very thin, rugose, coriaceous, usually not splitting; shell thin and elastic; seed large, sweet and edible. A small tree of dry uplands, growing with oaks and H. microcarpa. Mich., Detroit river. Probably also in S. Ont.
ir. Hicoria glàbra (Mill.) Britton. Pig-nut Hickory. (I. F. f. 1158.) A tree, the bark close, rough; foliage glabrous, or slightly pubescent. Budscales $8-10$, imbricated, the inner ones enlarging; leaflets $3-7$, rarely 9 , oblong, oblong-lanceolate or the upper obovate, sessile, acuminate at the apex, mostly narrowed at the base, $7-15 \mathrm{~cm}$. long, in young plants much larger; staminate aments glabrous, peduncled in 3's; lobes of the staminate calyx about equal in length, the middle one narrower; fruit obovoid or obovoid-oblong, $3.5-5 \mathrm{~cm}$. long; husk thin, the valves very tardily dehiscent; nut brown, angled, pointed, very thick-shelled; seed astringent and bitter, not edible. In dry or moist woods, Me. to Ont., Minn., Fla., Kans. and Tex. Fruit ripe Oct.-Nov.

[^18]
## Order 8. FAGÀLES.

Trees or shrubs, with small monœecious or rarely diœcious flowers in aments, or the pistillate ones subtended by an involucre, which becomes a bur or cup in fruit. Calyx usually present. Corolla none. Endosperm none.

## Family 1. BETULÀCEAE Agardh. Birch Family.

Monœcious or rarely diœcious trees or shrubs, with alternate petioled simple leaves, and small flowers in aments. Stipules mostly fugacious. Staminate aments pendulous. Staminate flowers $1-3$ together in the axil of each bract, consisting of a membranous 2-4-parted calyx or none, and 2-10 stamens inserted on the receptacle, their filaments distinct, their anthers 2 -celled, the anther-sacs sometimes distinct and borne on the forks of the 2-cleft filaments. Pistillate aments spike-like or capitate. Pistillate flowers with or without a calyx adnate to the solitary 1-2-celled ovary ; style 2 -cleft or 2 -divided ; ovules I-2 in each cavity of the ovary, anatropous, pendulous. Fruit a small, mostly i-celled and i-seeded nut or samara. Testa membranous. Endosperm none. Cotyledons fleshy. Radicle short. Six genera and about 75 species, mostly natives of the northern hemisphere.
Staminate flowers solitary in the axil of each bract, destitute of a calyx ; pistillate flowers with a calyx.

Staminate flowers with no bractlets; pistillate aments spike-like; nut small, subtended by or enclosed in a large bractlet.

Fruiting bractlet flat, 3 -cleft and incised. 1. Carpinus. Fruiting bractlet bladder-like, closed, membranous. 2. Ostrya.
Staminate flowers with 2 bractlets; pistillate flowers 2-4, capitate; nut large, enclosed by a leafy involucre.
3. Corylus.

Staminate flowers $3-6$ together in the axil of each bract, with a calyx ; pistillate flowers without a calyx.
Stamens 2; filaments 2-cleft, each fork bearing an anther-sac ; fruiting bracts 3-lobed or entire, deciduous.
4. Betula.

Stamens 4 ; anther-sacs adnate; fruiting bracts woody, erose or 5 -toothed, persistent.
5. Alnus.

## x. CARPÌNUS L.

Trees or shrubs, with smooth gray bark, furrowed and ridged stems, and straight-veined leaves, the primary veins terminating in the larger teeth. Aments expanding before the leaves. Staminate aments linear-cylindric, sessile at the ends of short lateral branches of the preceding season, their flowers consisting of 3-12 stamens; filaments short, 2 -cleft, each fork bearing an anther-sac. Pistillate flowers in small terminal aments, 2 to each bract, consisting of a 2 -celled ovary adnate to a calyx and subtended by a flat persistent bractlet, which becomes much enlarged, foliaceous and lobed or incised in fruit, the bracts deciduous; stigmas 2, subulate. Nut small, ovoid, acute, borne at the base of the large bractlet. [The ancient name.] About 12 species, natives of the northern hemisphere, only the following American.

1. Carpinus Caroliniàna Walt. American Hornbeam. Blue Beech. Water Beech. (I. F. f. 1207.) A small tree, with slender terete gray twigs. Leaves ovate-oblong, acute or acuminate, sharply and doubly serrate, rounded or subcordate at the base, somewhat inequilateral, o.6-1 dm. long, slightly pubescent on the veins beneath; petioles very slender; staminate aments $2-3 \mathrm{~cm}$. long, their bracts triangular-ovate, puberulent; bractlet of the pistillate flowers 3-lobed
at the base, strongly veined and about 2.5 cm . long when mature, its middle lobe lanceolate, 2-4 times as long as the lateral ones, incised-dentate on one side, often nearly entire on the other ; nut 4 mm . long. In moist woods and along streams, N. S. to Ont., Minn., Fla. and Tex. April-May.

## 2. ÓSTRYA Scop.

Trees similar to the Hornbeams, the aments expanding with or before the leaves. Staminate aments sessile at the ends of branchlets of the preceding season; filaments 2-cleft. Pistillate aments small, terminal, erect, the flowers 2 to each bract, subtended by a tubular, persistent bractlet which enlarges into a nerved, bladderlike sac in fruit. Style slender; stigmas 2, subulate. Nut ovoid-oblong, compressed, smooth, sessile in the base of the inflated sac. Mature pistillate ament hop-like. [The ancient name.] Four species, the following, I in the Southwest, I in Europe and Asia, r Japanese.
r. Ostrya Virginiàna (Mill.) Willd. Hop-hornbeam. Iron-wood. (I. F. f. 1208.) Bark scaly. Twigs pubescent. Leaves ovate or oblong-ovate, acuminate, the base rounded or inequilateral, sharply and doubly serrate, sparingly pubescent above, pubescent or tomentose beneath, o.6-I dm. long; petioles rarely more than 4 mm . long; staminate aments $3-7.5 \mathrm{~cm}$. long, their bracts triangular-ovate, acuminate; bractlet of each fertile flower forming a sac $12-16 \mathrm{~mm}$. long in fruit, cuspidate, pubescent, villous near and at the base with bristly hairs, finely reticulated; nut 5 mm . long, shining; ripe fertile aments $4-7 \mathrm{~cm}$. long. In dry woods, Cape Breton I. to Minn., Fla., Neb. and Tex. April-May. Fruit ripe July.-Aug.

## 3. CÓRYLUS L.

Shrubs or small trees, with broad thin serrulate or incised leaves. Staminate aments sessile at the ends of twigs of the previous season, expanding much before the leaves, the flowers with about 4 stamens and 2 bractlets; filaments 2 -cleft or 2 divided, each fork bearing an anther-sac, which is villous at the summit. Calyx none. Pistillate flowers from scaly buds, clustered at the ends of short branches of the season, each in the axil of a bract, consisting of an incompletely 2 -celled ovary adnate to a calyx, a short style and 2 slender stigmas ; bractlets 2, enlarged in fruit, forming a leaf-like involucre to the nut. Nut ovoid or oblong, bony. [Name Greek, from the helmet-like involucre.] Species 7, in the northern hemisphere. Besides the following, another occurs in California.
$\begin{array}{lll}\text { Involucre of } 2 \text { broad laciniate bractlets. } & \text { 1. C. Americana. } \\ \text { Involucral bractlets united, prolonged into a tubular bristly beak. } & \text { 2. C. rostrata. }\end{array}$

1. Corylus Americàna Walt. Hazel-nut. (I. F. f. 1209.) A shrub, o.82.5 m . tall, the young shoots russet-brown, densely hispid-pubescent with pinkish hairs. Leaves ovate or broadly oval, acute or acuminate, serrulate all around, cordate or obtuse at the base, finely tomentose beneath, $0.7-1.5 \mathrm{dm}$. long; petioles $4^{-8}$ mm . long; staminate aments mostly solitary, $7-10 \mathrm{~cm}$. long; involucre of the nut compressed, the 2 finely pubescent leaf-like bractlets laciniate on their margins, commonly broader than high; nut compressed, light brown, striate, $1-1.5 \mathrm{~cm}$. high. In thickets, Me. and Ont. to Man., Fla. and Kans. March-April. Nuts ripe JulyAug.
2. Corylus rostràta Ait. Beaked Hazel-nut. (I. F. f. 1210.) A shrub. similar to the preceding. Leaves ovate or narrowly oval, incised-serrate and serrulate, glabrous, or with some scattered appressed hairs above, sparingly pubescent at least on the veins beneath; $2-6 \mathrm{~cm}$. wide; involucral bractlets bristly-hairy, united to the summit and prolonged into a tubular beak about twice the length of the nut. laciniate at the summit; not ovoid, scarcely compressed, striate. In thickets, N. S. to Br. Col., Ga., Tenn., Kans. and Ore. April-May. Fruit ripe Aug.-Sept.

## 4. bétula l.

Aromatic trees or shrubs, with dentate or serrate leaves, scaly buds and flowers of both kinds in aments expanding before or with the leaves. Staminate flowers consisting of a membranous, usually 4 -toothed perianth, 2 stamens, and subtended by 2 bractlets; filaments short, deeply 2 -cleft, each fork bearing an anther-sac. Pistillate flowers 2 or 3 (rarely 1) in the axil of each bract, the bracts deciduous
with the fruits; perianth none; ovary sessile, 2-celled; styles 2 , stigmatic at the apex, mostly persistent. Nut small, compressed, membranous-winged on each side (a samara), shorter than the bracts. [The ancient name.] About 35 species, natives of the north temperate and arctic zones.

> * Trees.

Fruiting aments peduncled; bark chalky-white.
Leaves deltoid, acuminate; lateral lobes of fruiting bracts-short, divergent.

1. B. populifolia.

Leaves ovate or suborbicular: lateral lobes of the fruiting bracts ascending.
2. B. papyrifera.

Fruiting aments peduncled ; bark greenish-brown or brown.
Western; leaves ovate, often obtuse at the base.
3. B. occidentalis.

Eastern; leaves rhombic, acute at both ends.
4. B. nigra.

Fruiting aments sessile, at the ends of short branches; bark brown or yellowish. Fruiting bracts 4 mm . long, lobed at the apex; leaves shining above.
5. B. lenta.

Fruiting bracts 8 mm . long, lobed to about the middle; leaves dull above.
6. B. lutea.

> ** Shrubs.

Twigs glandular-warty; leaves glabrous.
Twigs not glandular-warty, glabrous or pubescent.
Leaves glabrous; upper fruiting bracts mostly entire.
Young foliage densely pubescent ; bracts 3 -lobed.
7. B. glandulosa.
8. B. nana.
9. B. pumila.

1. Betula populifolia Marsh. American White Birch. (I. F. f. i2ir.) A slender tree, with white smooth bark, tardily separating in thin sheets; twigs russet, warty. Leaves deltoid, pubescent on the veins when young, nearly glabrous when old, minutely glandular, long-acuminate, sharply dentate and commonly somewhat lobed, obtuse or truncate at the base, $3-6 \mathrm{~cm}$. long, slender-petioled; staminate aments $5-8 \mathrm{~cm}$. long; pistillate aments cylindric, in fruit $\mathrm{I} .5-3.6 \mathrm{~cm}$. long, slenderpeduncled; fruiting bracts puberulent, $2-4 \mathrm{~mm}$. long, their lateral lobes larger than the middle one; nut narrower than its wings. In moist or dry soil, N. B. to S. Ont. and Del. Leaves tremulous like those of the Aspens. May.
2. Betula papyrifera Marsh. Paper or Canoe Birch. (I. F. f. I212.) A large forest tree. Bark chalky white, peeling in thin layers. Leaves ovate, acute or acuminate, dentate and denticulate, glabrous above, glandular and pubescent on the veins beneath, slender-petioled, $3-$ II cm . long: petioles $\mathrm{I}-3 \mathrm{dm}$. long; staminate aments $5-10 \mathrm{~cm}$. long; pistillate aments cylindric, slender-peduncled, 2-5 cm . long; fruiting bracts $4-6 \mathrm{~mm}$. long, puberulent or ciliate; nut narrower than its wings. Newf. to Alaska, Penn., Mich., Neb. and Wash. April-May.

Betula papyrífera minor Tuckerm. A low bushy form, occurring on the higher mountains of N. E. and N. N. Y.
3. Betula occidentàlis Hook. Western Red Birch. (I. F. f. 12I3.) A tree, the bark smooth, dark bronze, the twigs gray-brown, warty. Leaves broadly ovate or nearly orbicular, sharply serrate, short-petioled, glabrous on both sides or sparingly pubescent beneath, $2-5 \mathrm{~cm}$. long; pistillate aments peduncled, cylindric, $2-3 \mathrm{~cm}$. long, about Icm . in diameter in fruit; fruiting bracts ciliolate, about 6 mm . long, their lateral lobes ascending; nut much narrower than its wings. W. Neb. to Br. Col., Cal. and N. Mex. April-May.
4. Betula nigra L. River Birch. Red Birch. (I. F. f. 1214.) A slender tree; bark reddish or greenish-brown, peeling in very thin layers; twigs reddish. Young shoots, petioles and lower surfaces of the leaves tomentose; leaves rhombic-ovate, irregularly serrate or somewhat lobed, base cuneate, when mature dark green above, pale beneath, $3-8 \mathrm{~cm}$. long; petioles $6-16 \mathrm{~mm}$. long; staminate aments mostly clustered in 2 's or 3 's, 6-9 cm . long; pistillate aments oblongcylindric, spreading, peduncled, $2-5 \mathrm{~cm}$. long, $10-12 \mathrm{~mm}$. in diameter in fruit; fruiting bracts tomentose, about equally 3 -lobed; nut broadly obovate, wider than its wings. Along streams and lakes, Mass. and N. H. to Iowa, Kans., Fla. and Tex. April-May.
5. Betula lénta L. Cherry, Black or Sweet Birch. (I. F. f. 1215.) A large forest tree, with dark, brown close smooth bark, becoming furrowed, not
separating in layers; twigs smooth, warty; young leaves silky. Mature leaves ovate or ovate-oblong, acute or acuminate, the base cordate or rounded, sharply serrulate, bright green, and shining above, pubescent on the veins beneath, 6-10 cm . long; petioles $6-12 \mathrm{~mm}$. long; staminate aments clustered, $6-10 \mathrm{~cm}$. long; pistillate aments sessile, dense, oblong, about 2.5 cm . long in fruit, nearly erect; bracts appressed, about 4 mm . long, nearly equally 3 -lobed, the lateral lobes somewhat divergent; nut oblong, broader than its wings. Newf. to Ont., Fla. and Tenn. April-May.
6. Betula lùtea Michx. f. Yellow Birch. Gray Birch. (I. F. f. I216.) A large forest tree, similar to the preceding, the bark yellowish or gray, separating in thin layers or close, the twigs gray-brown. Leaves ovate or oblong-ovate, mostly acuminate at the apex, rounded, obtuse or rarely subcordate at the base, sharply serrulate, dark green and dull above, pubescent on the veins beneath; staminate aments usually 2-4 together; pistillate aments sessile, oblong or oblongcylindric, rather loose; bracts nearly equally 3 -lobed to the middle, ciliolate, the lateral lobes ascending. Newf. to Manitoba, N. Car., Ga. and Tenn. April-May.
7. Betula glandulòsa Michx. Glandular or Scrub Birch. (I. F. f. 1217.) A shrub, 3-12 dm. high, the twigs brown, glandular-warty, not pubescent. Leaves orbicular, oval or obovate, glabrous, rounded at the apex, crenate-dentate, bright green above, pale and glandular-dotted beneath, short-petioled, $0.6-2.5 \mathrm{~cm}$. long; petioles $2-6 \mathrm{~mm}$. long; staminate aments commonly solitary, I- 1.5 cm . long; pistillate aments cylindric, erect, peduncled, $\mathbf{I - 2 . 5} \mathrm{cm}$. long and about 4 mm . in diameter in fruit; fruiting bracts glabrous, the lateral lobes divergent, rather shorter than the middle one; nut oblong, usually narrower than its wings. Newf. to Alaska, the higher mountains of Me. and N. N. Y., Mich., Minn., and in the Rocky Mountains to Colo. Also in Asia. June-July.
8. Betula nàna L. Dwarf Birch. (I. F. f. 1218.) A low diffuse shrub, similar to the preceding, but the twigs glandless. Leaves orbicular, obovate, or reniform, bright green, firm, deeply and incisely crenulate, rounded at the apex, 6-20 mm. long; petioles rarely more than 2 mm . long; staminate aments $\mathrm{I}-2.5$ cm . long; pistillate aments oblong, $6-10 \mathrm{~mm}$. long; fruiting bracts glabrous, the lower usually 3 -lobed, the upper ovate or lanceolate, mostly entire; nut oblong, wingless or narrowly winged. Greenland and Lab. to Hudson Bay. Also in northern Europe and Asia. May-June.

Betula nana flabellifolia Hook. Leaves with a cuneate base and more deeply incised-crenulate. Lab. and Newf.
9. Betula pùmila L. Low Birch. (I. F. f. I219.) A bog shrub, $0.5-5 \mathrm{~m}$. tall, the twigs brown, becoming glabrous, the young foliage densely brownish tomentose. Leaves obovate, broadly oval or orbicular, rounded at both ends or some of them cuneate-narrowed at the base, rather coarsely dentate, when mature glabrous above, pale, persistently tomentose or becoming glabrous beneath and reticulate-veined, $1-3 \mathrm{~cm}$. long; petioles $3-6 \mathrm{~mm}$. long; fruiting aments oblongcylindric, erect, peduncled, 2.5 cm . long or less; bracts puberulent or ciliolate, the lateral lobes spreading at right angles, shorter than the middle one; nut oblong. mostly rather broader than its wings. Newf. to Ont., the N. W. Terr., N. J., Ohio and Minn. May-June.

## 5. ÁLNUS Gaertn.

Shrubs or trees, with dentate or serrulate leaves, few-scaled buds, and flowers of both kinds in aments, expanding before, with or after the leaves, making their first appearance during the preceding season, the staminate pendulous, the pistillate erect, clustered. Staminate flowers 3 or sometimes 6 in the axil of each bract. consisting of a mostly 4 -parted perianth, 4 stamens and subtended by I or 2 bractlets; filaments short, simple; anther-sacs adnate. Pistillate flowers $2-3$ in the axil of each bract, without a perianth, but subtended by 2-4 minute bractlets; ovary sessile, 2 -celled; styles 2 ; bracts woody, persistent, 5 -toothed or erose. Nut small, compressed. [Ancient Latin name derived from the Celtic, in allusion to the growth of these trees along streams.] About it species, natives of the northern hemisphere and the Andes of S. Am. Besides the following, some 6 others occur in the western parts of N. Am.

Leaves obovate, broadly oval or suborbicular, dull; aments expanding long before the leaves.

Leaves finely tomentose or glaucous beneath. 2. A. incana.
Leaves green, glabrous or sparingly pubescent beneath.

- Leaves finely serrulate; foliage not glutinous; native. 3. A. rugosa.

Leaves dentate-serrate; twigs glutinous; introduced tree. 4. A. glutinosa.
Leaves oblong, bright green and shining above; aments expanding in autumn.
5. A. maritima.
I. Alnus Alnobétula (Ehrh.) K. Koch. Green or Mountain Alder. (I. F. f. I220.) A shrub, $0.5-3.5 \mathrm{~m}$. high, the young foliage glutinous and more or less pubescent. Leaves oval or ovate, sharply and irregularly serrulate or incised-serrulate, when mature dark green and glabrous above, usually pubescent on the veins beneath, $5-13 \mathrm{~cm}$. long; petioles $8-25 \mathrm{~mm}$. long; aments expanding with the leaves, the staminate slender, naked, $3-6 \mathrm{~cm}$. long, the pistillate from scaly buds, oblong or ovoid-oblong, slender-peduncled, becoming $12-14 \mathrm{~mm}$. long in fruit, their bracts irregularly 5 -toothed; nut oblong, the thin wing about as broad as the body. Newf. to Alaska, Mass., N. Y., Mich. and Br. Col., and in the higher Alleghanies of Va. and N. Car. Also in Europe and Asia. June.
2. Alnus incàna (L.) Willd. Speckled or Hoary Alder. (I. F. f. i221.) A shrub, or rarely a small tree, the young shoots pubescent. Leaves oval or ovate, usually acute, finely serrulate or dentate, dark green above, pale or glaucous and pubescent, at least on the veins beneath, $5-13 \mathrm{~cm}$. long, the veins prominent on the lower surface; petioles $8-25 \mathrm{~mm}$. long; aments appearing from naked buds, the staminate $3-8 \mathrm{~cm}$. long, the pistillate ovoid, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. long in fruit, their bracts 5 -toothed; nut orbicular, coriaceous-margined. In wet soil, Newf., N. W. Terr., S. N. Y., Penn. and Neb. Also in Europe and Asia. April-May.
3. Alnus rugòsa (DuRoi) K. Koch. Smooth Alder. (I. F. f. 1222.) A shrub, or sometimes a small tree, the bark smooth, the younger shoots somewhat pubescent. Leaves green on both sides, obovate or oval, mostly obtuse and rounded, sharply and minutely serrulate, when mature glabrous above, usually pubescent on the veins beneath, $7-13 \mathrm{~cm}$. long; aments appearing from naked buds, the staminate $5-10 \mathrm{~cm}$. long, the pistillate ovoid, $\mathrm{I}-2 \mathrm{~cm}$. long in fruit; nut ovate, narrowly coriaceous-margined. In wet soil, or on hillsides, Me. to Ohio, Minn., Fla. and Tex. March-April.
4. Alnus glutinòsa (L.) Medic. European Alder. (I. F. f. 1223.) A tree, the bark smooth, the foliage glutinous. Leaves broadly oval, orbicular or obovate, thick, dark green, dull, often obtuse at both ends, dentate and the teeth denticulate, glabrous above, pubescent on the veins beneath, $5-13 \mathrm{~cm}$. long; aments, the staminate $7-10 \mathrm{~cm}$. long, the pistillate ovoid-oblong, $\mathbf{1 - 2} \mathrm{cm}$. long in fruit; nut wingless, coriaceous-margined. In wet places, S. N. Y. and N. J., escaped from cultivation. Native of Europe. April.
5. Alnus marítima (Marsh.) Muhl. Seaside Alder. (I. F. f. 1224.) A small tree, glabrous or nearly so throughout. Leaves oblong, ovate-oblong or obovate, firm, acute at both ends, bright green and shining above, pale green and dull beneath, sharply serrulate, $5-10 \mathrm{~cm}$. long; aments unfolding long after the leaves, the staminate $2.5-6 \mathrm{~cm}$. long, the pistillate oblong, $1.5-2.5 \mathrm{~cm}$. long; nut oblongobovate, wingless, coriaceous-margined. In wet soil, S. Del. and E. Md.; also in the Ind. Terr. Aug.-Sept.

## Family 2. FAGÀCEAE Drude.

Beech Family.
Trees or shrubs. Leaves alternate, petioled, pinnately veined, the stipules, if any, deciduous. Flowers small, monœecious, the staminate in aments, or capitate, the pistillate subtended by an involucre of partly or wholly united bracts, which becomes a bur or cup. Petals none. Staminate flowers with a 4-7-lobed perianth and 4-20 stamens; filaments slender, distinct, simple; anther-sacs adnate, longitudinally dehiscent.

Pistillate flowers with a $4-8$-lobed urn-shaped or oblong perianth, adnate to the 3-7-celled ovary; ovules I-2 in each cavity, only I in each ovary ripening, pendulous, anatropous; styles as many as the cavities of the ovary, linear. Fruit a I-seeded nut, with a coriaceous or somewhat bony exocarp. Testa thin. Endosperm none ; cotyledons large, fleshy, often rugose; radicle short. About 5 genera and 375 species, of very wide geographic distribution.
Staminate flowers capitate; nut sharply triangular.
Pistillate flowers 2-5 in each involucre; involucre becoming globose and very prickly in fruit, enclosing the nuts.
2. Castanea.

Pistillate flower 1 in each involucre; involucre of numerous scales forming a cup in fruit and subtending the acorn.
3. Quercus.

## r. FÀGUS L.

Trees, with smooth light gray bark, and serrate straight-veined leaves. Flowers appearing with the leaves, the staminate in slender-peduncled pendulous heads, the pistillate about 2 together in short-peduncled subulate-bracted involucres in the upper axils. Staminate flowers yellowish-green, subtended by deciduous bracts, consisting of a campanulate 4-8-lobed calyx, and 8-16 stamens with filiform filaments. Pistillate flowers with a 6 -lobed perianth adnate to a 3 -celled ovary; ovules 2 in each cavity, usually $\mathbf{I}$ only of each ovary maturing; styles 3, filiform. Nut coriaceous, sharply 3 -angled, enclosed in the 4 -valved bur. [Name from the Greek, to eat, referring to the esculent nuts.] About 4 species, natives of the northern hemisphere, only the following native in N. Am.
I. Fagus Americàna Sweet. American Beech. (I. F. f. 1225.) A large forest tree, the lower branches spreading. Leaves ovate or ovate-oblong, firm, acuminate, $5-12 \mathrm{~cm}$. long, densely silky when young, glabrous or nearly so when 'mature, green on both sides, not shining; petioles $4 \mathbf{- 1 2} \mathrm{~mm}$. long; heads of staminate flowers $12-18 \mathrm{~mm}$. in diameter, hanging on long peduncles; bur $1-2 \mathrm{~cm}$. high, densely tomentose, its soft pricklets recurved or spreading; nut brown; seed sweet. In rich soil, N. S. to Ont. and Wis., Fla. and Tex. April-May. Nut ripe Sept.Oct.

## 2. CASTÀNEA Adans.

Trees or shrubs, with serrate straight-veined leaves, their teeth sharply acuminate. Flowers appearing after the leaves, the staminate in narrowly cylindric interrupted axillary yellowish aments, several in the axil of each bract, the bracts fugacious, the pistillate in prickly involucres at the bases of the staminate aments or in separate axils. Staminate flowers 2 -bracteolate, consisting of a mostly 6-lobed campanulate perianth and numerous stamens, sometimes also with an abortive ovary; filaments filiform, long-exserted. Pistillate flowers $2-5$ (commonly 3 ) in each involucre, consisting of an urn-shaped 6 -lobed perianth adnate to the mostly 6 -celled ovary, and usually with 4-12 abortive stamens; ovules 2 in each cavity, I ovule only of each ovary usually maturing; styles as many as the cavities of the ovary, slender, exserted; stigmas minute. Pistillate involucre enlarging and becoming a globose mostly 4 -valved very prickly bur in fruit, enclosing I-several nuts. Nut rounded or plano-convex, r-seeded, the shell coriaceous. Seed large, sweet. Style mostly persistent. [Name Greek, from a city in Thessaly.] Four or five species, natives of the northern hemisphere. Besides the following, another occurs in the southeastern United States.

Leaves green on both sides; nuts usually $2-5$ in each involucre; large tree.
x. C. dentata.

Leaves densely white-tomentose beneath; nut usually solitary ; shrub or small tree.
2. C. pumila.

1. Castanea dentàta (Marsh.) Borkh. Amertidn Chestrit. (I. F. f. 1226.) A large tree, with gray bark rough in longitudinal plates. Leaves oblonglanceolate, glabrous, firm, acuminate, coarsely serrate, with very sharp-pointed ascending teeth, rather dark green above, lighter bencath, $1-3$ dm. long, petiokes stout, $\mathbf{I - 2 . 5} \mathrm{cm}$. long; staminate aments erect, numerous, $1.5-\mathbf{3} \mathrm{dm}$. long, $S-10 \mathrm{~mm}$.
in diameter; burs $3-10 \mathrm{~cm}$. in diameter, enclosing 1-5 nuts; nuts puberulent, dark brown, plano-convex or angled on the face, or when solitary ovoid. In rich soil, Me. and Ont. to Mich., Ga. and Ala. Involucre sometimes suppressed and the nuts naked. June-July. Nuts ripe Sept.-Oct.
2. Castanea pùmila (L.) Mill. Chinquapin. (I. F. f. 1227.) A shrub or small tree, the young shoots puberulent. Leaves oblong, acute at both ends, sharply serrate with ascending or divergent teeth, dark green and glabrous above, densely white-tomentulose beneath, $0.7-\mathrm{I} .5 \mathrm{dm}$. long, $2-6 \mathrm{~cm}$. wide; staminate aments erect or somewhat spreading, $7-12 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. in diameter; burs 3 cm . in diameter or less, commonly spicate, enclosing a solitary ovoid brown nut (rarely 2); seed very sweet. In dry soil, N. J. and Penn. to Ind., Fla. and Tex. June. Nuts ripe Sept.

## 3. QUÉRCUS L.

Trees or shrubs, with pinnatifid lobed, dentate, crenate or entire leaves, deciduous, or in some species persistent. Flowers very small, green or yellowish, appearing with or before the leaves, the staminate numerous in slender, mostly drooping aments, the pistillate solitary in many-bracted involucres. Staminate flowers subtended by caducous bracts, consisting of a mostly 6 -lobed campanulate perianth and 6-12 stamens with filiform filaments, sometimes also with an abortive pilose ovary. Pistillate flowers with an urn-shaped or oblong calyx, adnate to a mostly 3 -celled ovary; ovules 2 in each cavity of the ovary, rarely more than I in each ovary maturing; styles as many as the ovary-cavities, short. Fruit consisting of the imbricated and more or less united bracts of the involucre (cup), subtending or nearly enclosing the ovoid, oblong or subglobose, I-seeded coriaceous nut (acorn). [The ancient Latin name, probably of Celtic derivation, signifying "beautiful tree."] About 200 species, natives of the northern hemisphere. Besides the following, some 30 others occur in the western and southern section; of N. Am.

[^19]
## + Leaves pinnatifid or pinnately lobed.

Leaves green on both sides.
Cup of the acorn saucer-shaped, much broader than high.
Cup $16-25 \mathrm{~mm}$. broad; acorn ovoid; leaves dull.
Cup $8-16 \mathrm{~mm}$. broad; leaves shining.
Acorn subglobose or short-ovoid; northern. Acorn ovoid; southern.
Cup of the acorn turbinate or hemispheric.
Inner bark gray to reddish; leaves deeply lobed.
Leaves shining both sides. lobed to near the midrib.
Acorn ovoid; cup $15-25 \mathrm{~mm}$. wide.
Acorn narrow'y ellipsoid; cup $10-15 \mathrm{~mm}$. wide
Leaves dull and paler beneath; acorn ovoid. Inner bark orange.
Leaves white or gray-tomentulose beneath.
Large trees; leaf-lobes lanceolate or linear-lanceolate, long.
Leaves rounded or obtuse at base, $3-5$-lobed; lobes linear or lanceolate, often falcate.
8. Q. digitata.

Leaves cuneate and acute at base, 5-11-lobed; lobes triangular.
Shrub or low tree; leaf-lobes triangular-ovate, short.
9. Q. pagodaefolia.

+     + Leaves 3-5-1obed above the middle or entire, obovate or spatulate in outline.
Leaves obovate-cuneate, brown-floccose beneath.
Leaves spatulate, glabrous both sides.
ir. Q. Marylandica.

12. Q. nigra.

$\dagger+\dagger$ Leaves entire, oblong, lanceolate or linear-oblong (sometimes lobed in no. 14).

Leaves linear-oblong, green and glabrous on both sides.
Leaves oblong, glabrous, dark green and shining above.
Leaves oblong or lanceolate, brown-tomentulose beneath.
13. Q. Phellos.
14. Q. laurifolia.
15. Q. imbricaria.
** Leaves or their lobes not bristle-tipped, deciduous; acorns maturing in autumn of first year.

+ Leaves pinnatifid or pinnately lobed.
Mature leaves pale, or glaucous and glabrous beneath ; cup shallow.

16. Q. alba.

Mature leaves tomentulose beneath ; cup one-third to fully as long as the acorn.
Upper scales of the cup not awned.
Leaves yellowish-brown tomentulose beneath; acorn ovoid.

> 17. Q. minor.

Leaves white-tomentulose beneath; acorn depressed-globose.
18. Q. lyrata.

Upper scales awned, forming a fringe around the acorn. I9. Q. macrocarpa.
$\dagger+$ Leaves crenate or dentate, not lobed.
Fruit peduncled.
Yeduncle much longer than petioles; leaves white-tomentulose beneath.
20. Q. platanoides.

Peduncle equalling or shorter than the petioles; leaves gray-tomentulose beneath.
Bark white, flaky.
21. Q. Michauxii.

Bark close.
22. Q. Prinus.

Fruit sessile or nearly so.
Tall trees.
Leaves mostly oblong to lanceolate; cup deep; bark close. 23. Q. acuminata.
Leaves obovate; cup shallow; bark more or less flaky. 24. Q. Alexanderi.
Shrub or low tree; leaves oval or obovate. 25. Q. prinoides.

*     *         * Leaves entire (rarely with a few bristle-tipped lobes), evergreen.

26. Q. Virginiana.
27. Quercus rùbra L. Red OAK. (I. F. f. 1228.) A large forest tree, the bark dark gray, slightly roughened. Leaves oval or somewhat obovate, when mature glabrous, or pubescent in the axils of the veins beneath, $\mathbf{x}-2 \mathrm{dm}$. long, dull green above, paler beneath, sinuses rounded, lobes triangular-lanceolate, tapering from a broad base to an acuminate apex; styles spreading; cup saucer-shaped, its base flat or slightly convex, $16-25 \mathrm{~mm}$. broad; bracts ovate or ovate-lanceolate, appressed; acorn ovoid, $2-3 \mathrm{~cm}$. long, $2-4$ times as long as the cup. N. S. to Ont., Minn., Fla., Kans. and Tex. May-June. Acorns ripe Oct.-Nov.

Quercus rùbra runcinàta $\mathrm{A} . \mathrm{DC}$. Leaf-lobes nearly entire; acorn 1.2 cm . high. Near St. Louis. Perhaps a hybrid with Q. digitata.
2. Quercus palústris DuRoi. Swamp OAK. Pin Oak. (I. F. f. 1229.) A torest tree, the lower branches deflexed; bark brown, rough when old. Leaves broadly oblong or obovate, deeply pinnatifid, bright green, glabrous and shining above, duller, glabrous or with tufts of hairs in the axils of the veins beneath, 0.71.3 dm . long, the lobes oblong, lanceolate or triangular-lanceolate, divergent; styles slender; cup saucer-shaped, $8-12 \mathrm{~mm}$. broad, base flat, bracts triangular-ovate, appressed; acorn subglobose or ovoid, $8-\mathbf{1 4} \mathbf{m m}$. high, often striate, $2-3$ times as long as the cup. In moist ground, Mass. to Wis., Del. and Ark. May-June. Acorns ripe Sept.-Oct.
3. Quercus Schnéckii Britton. Schneck's Red Oak. (I. F. f. 1230.) A forest tree, similar to the preceding species. Bark reddish-brown, with broad ridges broken into plates; leaves mostly obovate, bright green and shining above. paler and with tufts of wool in the axils beneath, 0.5-1.5 dm. long, truncate or broadly wedge-shaped at the base, deeply pinnatifid into 5-9 oblong or triangular lobes; styles short; cup saucer-shaped, ro- $\mathbf{1} 6 \mathrm{~mm}$. broad, its scales appressed; acorn ovoid, $\mathbf{I}-2.5 \mathrm{~cm}$. long, $2-3$ times as high as the cup. Ohio and $s$ Ind. to Iowa, Mo., Fla. and Tex. April-May. Acorns ripe Sept.-()ct. (S). Titazmy Sargent, in part, not Buckley.)
4. Quercus coccínea Wang. Scarlet Oak. (I. F. f. 123 I; acorns.) A forest tree, inner bark pale reddish or gray; foliage turning scarlet in autumn. Leaves deeply pinnatifid, glabrous, bright green and shining above, paler beneath, $1-2$ dm . long, rather thin, the lobes oblong or lanceolate, divergent or asconding, fewtoothed; styles slender, recurved-spreading ; cup hemispheric or top-shaped. its bracts triangular-lanceolate, mostly glabrous ; acorn ovoid, $1-2 \mathrm{~cm}$. high, about twice as long as the cup. In dry soil, Me. and Ont. to Minn., Fia. and Mo. MayJune. Acorns ripe Sept.-Oct.
5. Quercus ellipsoidalis E. J. Hill. Hill's Oak. A tall tree. the lowest branches drooping, the bark close, fissured. gray, the innermost layer yellowish. Leaves oval to obovate-orbicular in outline, when mature $6-15 \mathrm{~cm}$. long, deeply 5-7-lobed, the sinuses rounded, shining above, glabrous or nearly so beneath, the base broadly cuneate to truncate ; petioles $2.5-5 \mathrm{~cm}$. long ; strles spreading or recurved. flattish ; cup turbinate, short-peduncled, its bracts pubescent, appressed ; acorn ellipsoid to subglobose, $\mathbf{I}-2 \mathrm{~cm}$. long, $\mathbf{I}-\mathbf{1} .5 \mathrm{~cm}$. thick, $\mathrm{I}-2$ times as long as the cup. Ill., Mich. and Minn.
6. Quercus borealis Michx. f. Gray OAk. A large tree, the leaves similar to those of Q. rubra, the acorns similar to those of Q. coccinea. Leaves 7-13-lobed to the middle or somewhat beyond. rather lustrous and deep green above. dull and paler and glabrous or nearly so beneath; cup turbinate, peduncled. its bracts appressed ; acorn ovoid, I-2 times as long as the cup, abnut 2.5 cm . long. Quebec to Ont.. N. Y. and Penn. (Q. ambigua Michx. f., not H. \& B.)
7. Quercus velutina Lam. Black Oak. Qtercitron. (I. F. f. 1232.) A large forest tree similar to $Q$. coccinea; outer bark very dark brown, rough in ridges, the inner bright orange. Leaves sometimes lobed to beyond the middle, firm, brown-pubescent or sumetimes stellate-pubescent when young, when mature glabrous and dark dull green ab ove. pale green and usually pubescent on the veins beneath, and with tufts of wool in the axils, the broad oblong or triangular-lanceolate lobes and their teeth bristle-tipped; cup hemispheric or top-shaped, commonly narrowed into a short stalk. its bracts mostly pubescent, the upper somewhat squarrose: acorn ovoid. $1-2.5 \mathrm{~cm}$. high. more or less longer than the cup. Me. to Ont., Minn., Fla., Neb. and Tex. May-June.
8. Quercus digitàta (Marsh.) Sudw. Spanish Oak. (I. F. f. 1233.) Leaves dark green and glabrous above. gray-tomentulose beneath, deeply pinnatifid into 3-7 linear or lanceolate lobes, often falcate, acuminate; terminal lobe commonly elongated; styles slender; cup saucer-shaped with a turbinate base. $10-14 \mathrm{~mm}$. broad. its bracts ovate. obtuse. appressed; acorn subglobose or depressed, a bout twice as high as the cup. In dry soil, L. I. (?). N. I. to Fla.. Mo., Neb. and Tex. May-June. Acorns ripe Sept.-Oct.
9. Quercus pagodaefòlia (Ell.) Ashe. A tree sometimes 32 m . high, the branches spreading, the bark dark gray. rough. Leaves oval to oblong in outline, cuneate to truncate at the base, $2-3 \mathrm{dm}$. long, deeply 5-II-lobed. persistently whitetomentulose beneath. dark green above, the lobes narrowly triangular, spreading or somewhat ascending, usually entire ; twigs tomentose ; petioles $3-6 \mathrm{~cm}$. long; cup sessile, shallow, its bracts appressed; acorn globose, about I cm . in diameter, about one-half enclosed in the cup. In wet or moist soil, E. Va. and N. Car. to Ga., Ind. and Mo. April-May.
10. Quercus nàna (Marsh.) Sarg. Bear or Shrtb Oak. (I. F. f. 1234.) A shrub or rarely a small tree, often forming dense thickets; bark gray, nearly smooth. Leaves mostly obovate. $5-13 \mathrm{~cm}$. long. short-petioled, dark green and glabrous above, grayish-whise tomentulose beneath. $3-7$-lobed; lobes triangularovate, acute; styles recurved; cup saucer-shaped. $\delta-12 \mathrm{~mm}$. broad. with a turbinate or rounded base. its bracts lanceolate, appressed; acorn globose-ovoid, longer than the cup. In sandy or rocky soil. Me. to Ohio. Del., and the mountains of N. C. and Ky. May. Acorns ripe Oct.-Nor. A hybrid of this, presumably with Q. coccinea, was found by Dr. Robbins of Uxbridge, Mass.
II. Quercus Marylándica Muench. Black-Jack or Barren-Oak. (I. F. f. 1235.) Bark nearly black. very rough in ridges. Leaves obovate, stellatepubescent above and brown-tomentose beneath when young. $3-5$-lobed toward the broad usually nearly truncate apex. cuneate below. the lobes short; mature leaves dark green. glabrous above. paler and more or less floccose beneath, 0.7-1.7 dm. long. styles recurved; cup deep. $10-16 \mathrm{~mm}$. broad, its bracts oblong-lanceolate, appressed. pubescent: acorn oroid, $2-3$ times as high as the cup. In dry soil, L. I. to Ohio, Neb., Fla. and Tex. Acorns ripe Oct.-Nov.

Quercus Rúdkini Britton, a hybrid of this with Q. Phellos, occurs from Staten I. to N. Car.

Quercus Brittoni W. T. Davis is a hybrid with Q. nana. Staten I.
12. Quercus nigra L. Water Oak. (I. F. f. 1236.) Bark gray, rough in ridges. Leaves spatulate or obovate, 1 -3-lobed at the apex, or some of them entire and rounded, coriaceous, short-petioled, rather bright green and shining, finely reticulate-veined, glabrous when mature except tufts of hairs in the axils of the veins beneath, $3-8 \mathrm{~cm}$. long, the lobes low, usually obtuse and bristle-tipped; styles recurved; cup saucer-shaped with a rounded base, $10-14 \mathrm{~mm}$. broad, its bracts appressed; acorn globose-ovoid, 2-3 times as high as the cup. Along streams and swamps or sometimes on the upland, Del. to Ky., Mo., Fla. and Tex. April-May. Acorns ripe Sept.-Oct.
13. Quercus Phéllos L. Willow Oak. (I. F. f. 1237.) A tree, with slightly roughened reddish brown bark. Leaves narrowly oblong or oblonglanceolate, entire, acute at both ends, very short-petioled, bristle-tipped, glabrous or very slightly pubescent in the axils of the veins beneath when mature, $5-10 \mathrm{~cm}$. long, $8-25 \mathrm{~mm}$. wide; styles slender, recurved-spreading; cup saucer-shaped, nearly flat on the base, $8-12 \mathrm{~mm}$. broad; acorn subglobose, $8-12 \mathrm{~mm}$. high. In moist woods, L. I. to Fla., Mo. and Tex. April-May. Acorns ripe Sept.-Oct.

Quercus heterophýlla Michx., the Bartram Oak, probably a hybrid of $Q$. Phellos with Q. rubra, but perhaps a distinct species, intermediate in leaf and fruit characters between the two, occurs from Staten Island to N. Car. and in Mo. Q. Phellos hybridizes also with Q. nana.
14. Quercus laurifolia Michx. Laurel Oak. (I. F. f. 1238.) Bark nearly black, with flat ridges. Leaves oblong or oblong-obovate, often somewhat falcate, green and shining above, paler beneath, glabrous when mature, o.3-1.5 cm . long, $\mathrm{I}-2.5 \mathrm{~cm}$. wide, entire, or those of young shoots undulate-lobed, the apex bristle-tipped; styles rather short, recurving; cup saucer-shaped, $8-12 \mathrm{~mm}$. wide, its base somewhat rounded, its scales ovate, rounded, appressed; acorn 3-4 times as long as the cup. Along streams and swamps, Va. to Fla. and La., mostly near the coast.
15. Quercus imbricària Michx. Shingle Oak. (I. F. f. 1239.) A forest tree. Leaves oblong or lanceolate, entire, coriaceous, acute at both ends, shortpetioled, bristle-tipped, dark green above, persistently gray-tomentulose beneath, $0.7-1.7 \mathrm{dm}$. long, $1.5-5 \mathrm{~cm}$. wide; styles recurved; cup hemispheric or turbinate, 10-14 mm . broad, its bracts appressed; acorn subglobose, $\mathbf{1 0}-\mathbf{1 4} \mathrm{mm}$. high. Central Penn. to Mich., Neb., Ga. and Ark. April-May.

Quercus Leàna Nutt. is a hybrid of this and Q. velutina, with intermediate characters. Ohio to Mo. and D. C.

Quercus tridentàta Engelm. is a hybrid with Q. Marylandica. Ill. and Penn.
Also hybridizes with Q. palustris and Q. rubra in Mo.
16. Quercus álba L. White Oak. (I. F. f. 1240.) A large forest tree, with light gray bark scaling off in thin plates. Leaves obovate, green above, pale and more or less glaucous beneath, pubescent when young, nearly glabrous when old, thin, pinnatifid into 3-9 oblong obtuse-toothed or entire lobes, 1-2 dm. long; styles short, erect; fruit peduncled; cup depressed-hemispheric, $1.4-2 \mathrm{~cm}$. broad, its bracts thick, warty, obtuse, woolly or at length glabrate, appressed; acorn ovoidoblong, 2.5 cm . high or less, 3-4 times as high as the cup. Mc. to Ont., Minn., Fla. and Tex. May-June. Acorns ripe Sept.-Oct.

Hybrids with Q. macrocarpa have been observed in Ill., with $\ell_{\mathbf{y}}$. minor, from Ill, to Va. and S. Car., with Q. Prinus, near Washington, D. C., and N. Y., and with (). acuminata in Mo.
17. Quercus mìnor (Marsh.) Sarg. Post or Iron (O.tk. (I. F. f. 1241.) A tree, with rough gray bark, or sometimes a shrub. Leaves broadly obowate. deeply lyrate-pinnatifid into $3-7$ broad rounded often deeply undulate or toothed lobes, when mature firm, glabrous, dark green and shining ahowe, bown-tomentulose beneath, $\mathbf{1 - 2 ~ d m}$. long, $\mathbf{I}-\mathbf{1} .5 \mathrm{dm}$. wide or smaller; petioles stont; fruit nearly or quite sessile: styles short; cup hemispheric, $12-16 \mathrm{~mm}$. imod, hase narrowed. its bracts lanceolate, subacute, slightly squarrose; acorn owod, $1-2 \mathrm{~cm}$. high, $2-3$ times as long as the cup. In dry soil, Mass. to S. N. V., Mich., Fla. and T'ex. MayJune. Acorns ripe Sept.-Oct.
18. Quercus lyràta Walt. Swamp, Overcup or Post Oak. (I. F. f. 1242.) A large tree; bark gray or reddish, in thin plates. Leaves obovate, I.5-2 dm. long, lyrate-pinnatifid or lobed to beyond the middle, thin, when mature bright green and shining above, densely white-tomentulose beneath, the lobes entire or toothed, the upper pair the larger and ussually divergent; fruit peduncled; styles short; cup depressed-globose, $2.5-3.5 \mathrm{~cm}$. in diameter, its bracts broad, thin, cuspidate; acorn depressed-globose, nearly or quite immersed in the cup. In swamps or along streams, N. J. to Ind., Mo., Fla. and Tex. April-May.
19. Quercus macrocàrpa Michx. Mossy-cup or Bur Oak. (I. F. f. 1243.) A large tree, with gray flaky bark. Leaves obovate or oblong-obovate, rather thin, irregularly lobed, pinnatifid, or some coarsely crenate; when mature bright green and shining above, grayish-white-tomentulose beneath, I-2 dm. long, the lobes toothed or entire, rounded; fruit short-peduncled or sessile; styles short; cup hemispheric or subglobose, $1.5-2.5 \mathrm{~cm}$. in diameter, its bracts floccose, thick, hard, ovate or lanceolate, the lower acute, the upper subulate-tipped, the tips forming a fringe around the acorn; acorn $1.5-3.5 \mathrm{~cm}$. long, ovoid, $\mathbf{I}-2$ times as high as the cup. In rich soil, N. S. to Manitoba, Mass., Penn., Kans. and Tex. May-June. Hybridizes with Q. acuminata in Kans. and Mo.
20. Quercus platanoìdes (Lam.) Sudw. Swamp White Oak. (I. F. f. 1244.) A large tree, with flaky gray bark. Leaves obovate, or oblong-obovate, coarsely toothed or sometimes lobed nearly to the middle, firm, when mature 1-2 dm. long, dark green, dull and glabrous above, densely white-tomentulose beneath; peduncles $2-5$ times as long as the petioles; cup hemispheric, its bracts pubescent, lanceolate, appressed, the lower obtuse, the upper acute or acuminate; acorn oblong-ovoid, about 2.5 cm . high; cup about 1.2 cm . high; seed rather sweet. In moist or swampy soil, Quebec to Mich., Ga. and Ark. May-June. Acorns ripe Sept.-Oct.
21. Quercus Michaùxii Nutt. Cow Oak. Basket Oak. (I. F. f. 1245.) A large tree, with white flaky bark. Leaves obovate or broadly oblong, when mature bright green, feebly shining above, pale and gray-tomentulose beneath, crenately toothed, 1-2 dm. long, the teeth often mucronulate; fruit short-peduncled or sessile; styles very short; cup depressed-hemispheric, $2.5-3.5 \mathrm{~cm}$. broad, its bracts thick, ovate or lanceolate, appressed; acorns ovoid, about 3 times as high as the cup. In moist soil, Del. to Ind., Mo., Ark., Fla. and Tex. April-May. Acorns ripe Sept.-Oct., sweet and edible.
22. Quercus Prinus L. Rock Chestnut Oak. (I. F. f. 1246.) A large tree; bark brown, ridged, close or slightly flaky. Leaves coarsely crenate, oblong, oblong-lanceolate or obovate, when mature dark green, glabrous and feebly shining above, finely gray-tomentulose beneath, 1.2-2 dm. long; petioles slender; peduncles equalling or shorter than the petioles; styles very short; cup hemispheric, $1-3 \mathrm{~cm}$. broad, its bracts tomentose, triangular-ovate, acute or cuspidate, appressed; acorn ovoid, 2-3 times as high as the cup; seed edible, but not very sweet. In dry soil, Me. to Ont., Ala. and Tenn. May-June. Acorns ripe Oct.-Nov.
23. Quercus acuminàta (Michx.) Houda. Chestnut or Yellow Oak. (I. F. f. I247.) A tree with gray close bark. Leaves oblong, lanceolate or sometimes obovate, acuminate or acute, coarsely toothed, with acute teeth, when mature dark green and shining above, pale, gray-tomentulose and prominently veined beneath, 1-I. 5 cm . long, $2.5-6 \mathrm{~cm}$. wide; fruit sessile or very short-peduncled; cup hemispheric, $\mathbf{I}-1.6 \mathrm{~cm}$. broad, its bracts floccose, ovate, thick, acute or cuspidate, appressed; acorn ovoid, $\mathbf{I}-\mathbf{2 c m}$. high, about twice as high as the cup. In dry soil, preferring limestone ridges, Ont. to Minn., Ga., Ala. and Tex. May-June. Acorns ripe Oct.-Nov., edible.
24. Quercus Alexánderi Britton, n. sp. Alexander's Oak. (I. F. f. 1245; leaves.) A tree similar to the preceding species, but the leaves broadest above the middle, obovate or oblong-obovate; cup cupulate, short-stalked or sessile, shallow; acorn ovoid, $1.5^{-2} \mathrm{~cm}$. long, 2-3 times as high as the cup; bark, especially that of old trees, flaky. Vt. to Mich., Ohio and Ind. Type specimens from Birmingham, Mich.
25. Quercus prinoides Willd. Scrub Chestnut Oak. (I. F. f. 1248.) A shrub, $0.6-5 \mathrm{~m}$. tall, sometimes tree-like, the bark gray. Leaves obovate, coarsely toothed, when mature bright green and somewhat shining above, gray-tomentulose
beneath, $6-13 \mathrm{~cm}$. long, $5-8 \mathrm{~cm}$. wide, mostly acute or short-acuminate at the apex, narrowed at the base, the teeth short, triangular ; petioles slender, $6-18 \mathrm{~mm}$. long; fruit sessile ; cup hemispheric, thin, about $\mathbf{I} .2 \mathrm{~cm}$. broad and one-half as high, its bracts floccose, triangular-ovate or oblong-lanceolate, appressed; acorn ovoid, obtuse, 2-3 times as long as the cup; seed sweet. In dry sandy or rocky soil, Me. to Minn., Ala. and Tex. April-May. Acorns ripe Sept.-Oct.
26. Quercus Virginiàna Mill. Live Oak. (I. F. f. 1249.) A tree, with rough brown bark; often shrubby, the young shoots puberulent. Leaves evergreen, coriaceous, oblong, elliptic or oblanceolate, obtuse, entire or with a few bristletipped teeth, bright green and glabrous above, pale green and puberulent or becoming glabrous beneath, $2-8 \mathrm{~cm}$. long; petioles stout, $2-6 \mathrm{~mm}$. long; fruit peduncled;
 lanceolate ; acorn ovoid-oblong, about twice as high as the cup; seed not edible. In dry soil, Va. to Fla., Tex. and Mex., mostly near the coast. Also in Cuba. March-April. Acorns ripe Sept.-Oct.

## Order 9. URTICÀLES.

Trees, shrubs or herbs, the flowers with a calyx but without corolla, small, not borne in aments, monœcious, diœcious or polygamous ; ovary i-celled, superior.
Fruit not an achene (except in Humulus and Cannabis of the Moraceae) : trees, shrubs
or herbs; ovule pendulous.

Trees with alternate leaves, the sap not milky.
Trees with alternate leaves and milky sap; or opposite-leaved herbs or herbaceous vines.
Fruit an achene; herbs with small clustered greenish flowers; ovule erect or ascending.
Fam. 3. Urticaceae.

## Family 1. ULMÀCEAE Mirbel. Elm Family.

Trees or shrubs, with alternate simple serrate petioled pinnately veined stipulate leaves, the stipules usually fugacious. Flowers small, monœcious, diœcious, perfect or polygamous, clustered, or the pistillate solitary. Perianth 3-9-parted or of 3-9 distinct sepals. Petals none. Stamens in our species as many as the perianth-lobes or sepals and opposite them; filaments straight ; anthers ovate or oval, longitudinally dehiscent. Ovary I-celled (rarely 2 -celled), mostly superior ; ovule solitary, pendulous, anatropous or amphitropous; styles or stigmas 2. Fruit a samara, drupe or nut. Endosperm of the seed little or none. Embryo straight or curved ; cotyledons mostly flat. About 13 genera and 140 species, widely distributed in temperate and tropical regions.

Flowers borne in clusters on twigs of the preceding season; fruit a samara or nut-like.
Flowers expanding before the leaves; calyx $4-9$-cleft; fruit a samara. I. C'lmus.
Flowers expanding with the leaves; calyx 4 - 5 -cleft; fruit nut-like.
2. Planera.

Flowers borne on twigs of the season, the pistillate mostly solitary; fruit a drupe.
3. Celtis.

## r. ÚLmus L.

Trees, with 2-ranked straight-veined inequilateral leaves. Flowers perfect or polygamous, fascicled or racemose, usually unfolding before the leaves, borne axillary on the twigs of the preceding season. Calyx campanulate, 4-0 lobed, persistent, its lobes imbricated. Filaments erect, slender, exserted. Ovary sessile or stalked, compressed. Styles 2, divergent, stigmatic along the inner margin. Fruit a I-seeded flat orbicular or oval samara, its membranous wings continuous all around except at the apex, commonly as broad as or broader than the hody. Embryo straight. [The ancient Latin name of the elm ; Celtic ilm.] About iS species,
natives of the northern hemisphere. Besides the following, 3 others occur in the southern U. S. and one in Mex.

Leaves smooth or slightly rough above; samara densely ciliate.
None of the branches corky-winged; samara-faces glabrous. 1. U. Americana.
Some or all of the branches corky-winged; samara-faces pubescent.
Leaves $5-13 \mathrm{~cm}$. long; flowers racemose; northern. 2. U. racemosa.
Leaves $2-8 \mathrm{~cm}$. long; flowers fascicled; southern. 3. U. alata.
Leaves very rough above; samara not ciliate; twigs not corky-winged. 4. U. fulva.
i. Ulmus Americàna L. American White or Water Elm. (I. F. f. 1250.) A large tree, with gray flaky bark, and glabrous or sparingly pubescent twigs and buds, the branches terete. Leaves oval or obovate, apex abruptly acuminate, base obtuse or obtusish, and very inequilateral, sharply and usually doubly serrate, slightly rough above, $5-\mathrm{I} 3 \mathrm{~cm}$. long; flowers fascicled ; pedicels filiform, drooping, jointed ; calyx 7-9-lobed, oblique, its lobes oblong, rounded; samara ovate-oval, reticulate-veined, $10-12 \mathrm{~mm}$. long, its faces glabrous; styles strongly incurved. In moist soil, especially along streams, Newf. to Manitoba, Fla. and Tex. March-April.
2. Ulmus racemòsa Thomas. Cork or Rock Elm. (I. F. f. 1251.) A large tree, the young twigs puberulent; bud-scales ciliate and somewhat pubescent; branches, or some of them, winged by narrow plates of cork. Leaves similar to those of the preceding, but less sharply serrate, smooth above ; flowers racemose ; pedicels filiform, drooping, jointed; calyx-lobes oblong, rounded; samara oval, 12-16 mm. long, its margins densely ciliate; persistent styles strongly incurved and overlapping. In rich soil, Quebec to Ont., Mich., N. J., Tenn. and Neb. April.

Ulmus campéstris L., from Europe, distinguished by its nearly or quite glabrous, not ciliate samaras, and wingless branches, rarely escapes from cultivation.
3. Ulmus alàta Michx. Winged Elm. Wahoo. (I. F. f. 1252.) A small tree, the branches, or most of them, with corky wing-like ridges. Twigs and buds glabrous or nearly so; leaves oblong, oblong-lanceolate or oblong-ovate, acute, doubly serrate, base obtuse, inequilateral and sometimes subcordate, roughish above, pubescent beneath, at least on the veins, $2-8 \mathrm{~cm}$. long; flowers fascicled; pedicels filiform; calyx-lobes obovate, rounded; samara oblong, $8-10 \mathrm{~mm}$. long, pubescent on the faces; styles very slender. In dry or moist soil, S. Va. to Fla., Ill., Ark. and Tex. March.
4. Ulmus fúlva Michx. Slippery, Red or Moose Elm. (I. F. f. 1253.) A tree, with rough gray fragrant bark, twigs rough-pubescent; bud-scales densely brown-tomentose. Leaves ovate, oval or obovate, very rough with short papillæ above, pubescent beneath, sharply doubly serrate, acuminate at the apex, obtuse, inequilateral and commonly cordate at the base, I-2 dm. long; flowers fascicled; pedicels $4^{-6} \mathrm{~mm}$. long, spreading, jointed near the base; calyx-lobes lanceolate, subacute, samara oval orbicular, $12-18 \mathrm{~mm}$. long, pubescent over the seed. In woods, on hills and along streams, Quebec to N. Dak., Fla. and Tex. MarchApril.

## 2. PLÁNERA J. F. Gmel.

Trees. similar to the elms, the flowers monœcious or polygamous, unfolding with the leaves. Staminate flowers fascicled on twigs of the preceding season, the pistillate or perfect ones in the axils of leaves of the year. Calyx 4-5-cleft, campanulate, persistent, the lobes imbricated. Filaments filiform, straight, exserted. Ovary stalked, ovoid, slightly compressed, I-celled. Styles 2, spreading, stigmatic along the inner side. Fruit coriaceous, obliquely ovoid, compressed, ridged on the back, covered with short fleshy processes. Embryo straight. [Name in honor of Johann Jakob Planer, 1743-1789, Professor of Botany in Erfurt.] A monotypic genus of southeastern N. Am.
I. Planera aquática (Walt.) J. F. Gmel. Planer-tree. Water Elm. (I. F. f. 1254.) A small tree, the foliage nearly glabrous. Leaves ovate or oblong-lanceolate, acute at the apex, obtuse or cordate and usually somewhat inequilateral at the base, serrate, $3-4 \mathrm{~mm}$. long; petioles $2-5 \mathrm{~cm}$. long; stipules lanceolate, about as long as the petioles, deciduous; staminate flowers fascicled and somewhat racemose from scaly buds; perfect or pistrliate flowers on short
branches; fruit 4-6 mm. long, about equalling its stalk, its soft processes $\mathbf{1} \mathrm{mm}$. long. In swamps, Mo. to Ind., Ky., N. Car., La. and Fla. April-May.
3. CÉLTIS L.

Trees or shrubs, with serrate or entire pinnately veined or in some species 3-5nerved leaves, and polygamous or monœcious (rarely diocious?) flowers, borne in the axils of leaves of the season, the staminate clustered, the fertile solitary or 2-3 together. Calyx 4-6-parted or of distinct sepals. Filaments erect, exserted. Ovary sessile. Stigmas 2, recurved or divergent, tomentose or plumose. Fruit an ovoid or globose drupe, with a row of bars at the base, the exocarp pulpy, the endocarp bony. Seed-coat membranous. Embryo curved. [Name ancient, used by Pliny for an African Lotus-tree.] About 60 species, natives of temperate and tropical regions. Besides the following, some 5 others occur in the southern and southwestern parts of N. Am.
Leaves sharply serrate, thin ; ripe drupe 8-10 mm. in diameter.

Leaves smooth above. Leaves scabrous above.
Leaves entire or nearly so, thick ; drupe $4^{-6} \mathrm{~mm}$. in diameter.

1. C. occidentalis.
2. C. crassifolia.
3. C. Mississippiensis.
4. Celtis occidentàlis L. American Nettle-tree. Sugar-berry. (I. F. f. 1255.) A tree or shrub, the bark dark and rough, the twigs glabrous. Leaves ovate or ovate-lanceolate, sharply serrate, mostly thin, usually abruptly acuminate, inequilateral, pinnately veined, o.3-1 dm. long, smooth above, pubescent or glabrate beneath; calyx-segments linear-oblong, deciduous; drupe globose and purple, or nearly black when mature, or orange, 8 -10 mm . in diameter, In dry soil, Quebec to Manitoba, La., N. Car., Mo. and Kans. April-May. Fruit ripe Sept. Variable.
5. Celtis crassifòlia Lam. Hackberry. A tree or shrub, the young shoots puberulent. Leaves ovate, firm, inequilateral, acute or short-acuminate at the apex, often cordate at base, scabrous above and often so beneath, more or less pubescent, usually serrate quite to the tip, rarely entire, $3-\mathbf{1 2} \mathrm{cm}$. long; fruiting pedicels mostly about twice as long as the petioles or more, sometimes short; drupe purple, red or nearly black when mature, globose to oval, 8-10 mm . in diameter. N. Y. to S. Car., Ohio, Ill., Mo. and Tenn.
6. Celtis Mississippiénsis Bosc. Southern Hackberry. (I. F. f. 1256.) A tree, similar to the two preceding, the bark light gray, rough and warty. Leaves lanceolate, firm, entire or with a few low sharp teeth, 3-nerved and prominently pinnately veined, glabrous, long-acuminate at the apex, inequilateral, $2-8 \mathrm{~cm}$. long, drupe purple-black, 5-6 mm. in diameter. In dry soil, N. Car. to Ill., Mo., Kans., Fla. and Tex. April. Fruit ripe July-Aug.

## Family 2. MORÀCEAE Lindl. <br> Mulberry Family.

Trees, shrubs or herbs, mostly with milky sap, petioled stipulate leaves, and small monœcious or diœcious axillary clustered flowers, or the pistillate flowers solitary in some exotic genera. Calyx mostly +-5parted. Petals none. Staminate flowers panicled, spicate or capitate, the stamens as many as the calyx-segments. Pistillate flowers capitate, spicate or cymose. Ovary superior, i-celled in our genera. Ovule solitary, pendulous, anatropous. Styles 1 or 2 . About 55 genera and 925 species, natives of temperate and tropical regions.

[^20]1. Morws.
2. Torylon.
3. Broussonetia.
4. Humulus.
5. Cannabis,

## 1. MÒRUS L.

Trees or shrubs, with milky sap, alternate dentate and often lobed, 3 -nerved leaves, fugacious stipules, the pistillate spikes ripening into a succulent aggregate fruit. Staminate flowers with a 4 -parted perianth, its segments somewhat imbricated, and 4 stamens, the filaments inflexed in the bud, straightening and exserted in anthesis. Pistillate flowers with a 4-parted persistent perianth, which becomes fleshy in fruit, a sessile ovary, and 2 linear spreading stigmas. Fruiting perianth enclosing the ripened ovary, the exocarp succulent, the endocarp crustaceous. Albumen scanty; embryo curved. [The ancient name of the mulberry; Celtic mor.] About io species, natives of the northern hemisphere. Besides the following trees, another occurs in the southwestern U. S.
I,eaves rough above, pubescent beneath; fruit purple; spikes 2-6 cm. long. I. M. rubra. Leaves smooth and glabrous, or very nearly so, on both sides; fruit nearly white; spikes $1-1.5 \mathrm{~cm}$. long.
2. M. alba.

1. Morus rùbra L. Red Mulberry. (I. F. f. 1257.) Bark brown and rough. Leaves ovate or nearly orbicular, scabrous above, pubescent beneath, or when young almost tomentose, acuminate at the apex, rounded, truncate or cordate at the base, serrate-dentate or $3-7$-lobed, $7-13 \mathrm{~cm}$. long; staminate spikes drooping; pistillate spikes spreading or pendulous in fruit, $8-10 \mathrm{~mm}$. in diameter, slender-peduncled, dark purple-red, delicious. In rich soil, Vt. and Ont. to Mich., S. Dak.; Fla. and Tex. April-May. Fruit ripe in June.
2. Morus álba L. White Mulberry. (I. F. f. 1258.) Bark light gray, rough, the branches spreading. Leaves ovate, thin, smooth, glabrous and somewhat shining on both sides, acute or abruptly acuminate at the apex, rounded, truncate or cordate at the base, varying from serrate to variously lobed, $5-15 \mathrm{~cm}$. long ; staminate spikes slender, drooping ; pistillate spikes oblong or subglobose, drooping, 6 mm . in diameter and white or pinkish when mature, not as succulent as those of the preceding. Sparingly escaped from cultivation. Me. and Ont. to Fla. Introduced from the Old World for feeding silkworms. May. Fruit ripe July-Aug.

## 2. TÓXYLON Raf.

A tree, with milky sap, thick alternate petioled pinnately veined leaves, stout axillary spines, caducous stipules and diocious axillary flowers, the staminate racemose, the pistillate capitate. Staminate flowers with a 4 -parted calyx, its segments valvate, and 4 stamens, the filaments inflexed in the bud, straightening and somewhat exserted in anthesis. Pistillate flowers with a 4 -cleft calyx enclosing the sessile ovary, and a filiform long-exserted style, the calices becoming fleshy and enlarged in fruit, densely aggregated into a large globular head. Endosperm none; embryo curved. [Greek, signifying bow-wood.] A monotypic genus of the south-central U. S.

1. Toxylon pomíferum Raf. Osage Orange. (I. F. f. 1259.) Foliage puberulent when young, glabrous when mature. Leaves ovate, ovate-lanceolate or ovate-oblong, glossy, entire, $7-15 \mathrm{~cm}$. long, apex acuminate, base obtuse, truncate or subcordate; axillary spines sometimes 8 cm . long; staminate racemes $\mathbf{I}-2.5 \mathrm{~cm}$. long; flowers about 2 mm . broad; head of pistillate flowers peduncled, pendulous, ripening into a hard yellowish tubercled syncarp $5^{-15} \mathrm{~cm}$. in diameter. In rich soil, Mo. and Kans. to Tex. Much planted for hedges and occasionally spontaneous in the East. May-June. Fruit ripe Oct.--Nov.

## 3. BROUSSONÉTIA L'Her.

Trees, with milky sap, the leaves alternate, petioled. entire, serrate, or 3-5lobed, 3 -nerved at the base. Flowers diœcious, the staminate in cylindric amentlike spikes, the pistillate capitate. Staminate flowers with a deeply 4 -cleft perianth, 4 stamens, and a minute rudimentary ovary. Pistillate flowers with an ovoid or tubular perianth, a stalked ovary and a 2 -cleft style. Head of fruit globular, the drupes red, exserted beyond the persistent perianth. [In honor of Broussonet, French naturalist.] About 4 species, natives of eastern Asia.
I. Broussonetia papyrìfera (L.) Vent. Paper Mulberry. (I. F. f. 1260.) Young shoots hirsute-tomentose, Leaves mostly ovate, thin, long-petioled, serrate,
often deeply 3-lobed, sometimes with a lobe on one side only, as in Sassafras, rarely 5 -lobed, rough above, tomentose beneath, $\mathbf{I}-2 \mathrm{dm}$. long; spikes of staminate flowers peduncled; heads of pistillate flowers $\mathbf{I - 2 . 5} \mathrm{cm}$. in diameter. Escaped from cultivation, N. Y. to Ga. and Mo. May-June.

## 4. HÛMULUS L.

Herbaceous perennial rough vines, with broad opposite thin petioled palmately veined leaves, lanceolate membranous stipules, and diœcious axillary flowers, the staminate panicled, the pistillate in ament-like drooping clustered spikes. Staminate flowers with a 5 -parted calyx, the segments distinct and imbricated, and 5 short erect stamens. Pistillate flowers in 2's in the axil of each bract of the ament. consisting of a membranous entire perianth, clasping the ovary, and 2 filiform caducous stigmas. Fruiting aments cone-like, the persistent bracts subtending the compressed ovate achenes. Endosperm fleshy. Embryo spirally coiled. [Name said to be the diminutive of the Latin humus, earth.] Two species, the following widely distributed through the north temperate zone, the other native of northeastern Asia.

1. Humulus Lùpulus L. Hop. (I. F. f. 1261.) A vine, often 8 m . long, very rough with stiff reflexed hairs. Leaves orbicular or ovate in outline, slenderpetioled, deeply 3-7-cleft or some of the upper ones ovate, acute and merely serrate; stipules reflexed, acuminate, $8-25 \mathrm{~mm}$. long; ripe pistillate clusters (hops) $2.5-6 \mathrm{~cm}$. long; fruiting bracts broadly ovate, concave, thin, glabrous or nearly so, obtuse, much longer than the achenes; fruiting calyx and achene strongly resinous-aromatic. In thickets and on river-banks, N. S. to Manitoba, N. Y., Penn., in the Alleghanies to Ga., to Kans., and in the Rocky Mts. to Ariz. and N. Mex. Extensively escaped from cultivation. Native also of Europe and Asia. July-Aug. Fruit ripe Sept.-Oct.

## 5. CÁNNABIS L.

A stout, rough and puberulent herb, with petioled digitately 5-II-divided thin leaves, subulate stipules, and greenish diœcious axillary flowers, the staminate panicled, the pistillate spicate. Staminate flowers with a 5 -parted calyx, the sepals distinct and imbricated, and 5 short stamens. Pistillate flowers solitary in the axils of foliaceous bracts, consisting of a thin entire calyx clasping the sessile ovary, and 2 filiform caducous stigmas. Fruit a compressed achene. Endosperm fleshy; embryo curved. [The classic name of hemp.] A monotypic genus of central Asia.
I. Cannabis sativa L. Hemp. (I. F. f. 1262.) Annual, branching, $\mathrm{I}-3 \mathrm{~m}$. tall, the inner fibrous bark very tough. Leaves divided to the base, the segments lanceolate or linear-lanceolate, acuminate at both ends, sharply and coarsely serrate, $0.7-1.5 \mathrm{dm}$. long; staminate panicles narrow, loose, peduncled; pedicels filiform, bracteolate, $2-6 \mathrm{~mm}$. long; pistillate spikes erect, leafy-bracted; achene crustaceous, ovoid-oblong, about 4 mm . high. In waste places, N. B. to Ont., Minn., N. Car., Tenn. and Kans. July-Sept.

## Family 3. URTICÀCEAE Reichenb.

## Nettle Family.

Herbs (some tropical species shrubs or trees), with watery sap, mostly stipulate simple leaves, and small greenish dioccious, moncecious or polygamous flowers, variously clustered. Calyx 2-5-cleft, or of distinct sepals. Petals none. Stamens in the staminate flowers as many as the lobes or segments of the calyx (sepals) and opposite them, the filaments inflexed and anthers reversed in the bud, straightening at anthesis. Ovary superior, I-celled; style simple; ovule solitary, erect or ascending, orthotropous, or in some genera partly amphitropous. Fruit an achene. Endosperm oily, usually not copious; embryo straight. About 40 genera and 475 species of wide geographic distribution.

Herbs with stinging hairs.
Leaves opposite ; both kinds of flowers 4-parted ; achene straight. 1. Urtica.
Leaves alternate; staminate flowers 5-parted ; achene oblique. 2. Urticastrum. Herbs without stinging hairs.

Flower-clusters panicled or spiked, not involucrate; leaves mostly opposite. Pistillate calyx 3-parted or of 3 sepals. 3. Adicea. Pistillate calyx 2-4-toothed or entire.
4. Boehmeria.

Flower-clusters involucrate by leafy bracts; leaves alternate.
5. Parietaria.

## 1. URTICA L.

Herbs, with stinging hairs, 3-7-nerved petioled dentate or incised leaves, and distinct or connate stipules. Flowers small and numerous, axillary, cymosepaniculate, or glomerate, diœcious, monœcious or androgynous. Staminate flowers with a deeply 4 -parted calyx and 4 stamens. Pistillate calyx 4 -parted, the segments unequal; ovary straight; stigma sessile or nearly so; ovule erect, orthotropous. Achene compressed, enclosed by the persistent calyx. Seed-coat thin; endosperm little; cotyledons broad. [The ancient Latin name.] About 30 species of wide distribution.

Perennials, $0.6-2.2 \mathrm{~m}$. tall ; flower-clusters large, compound.
Leaves ovate, cordate at base.

1. $U$. dioica.

Leaves laciniate, rarely cordate.
2. U. gracilis.

Annuals, $1.5-7 \mathrm{dm}$. tall ; flower-clusters small, mostly glomerate.
Leaves oval, laciniate-dentate; plant leafy at the top. 3. U. urens.
Leaves ovate or lanceolate, crenate; upper leaves very small.
4. U. chamaedryoides.
I. Urtica dioìca L. Stinging or Great Nettle. (I. F. f. 1263.) Densely beset with stinging hairs; stem $0.6-1.2 \mathrm{~m}$. tall, puberulent above. Leaves thin, ovate, long-petioled, acute or acuminate at the apex, cordate at the base, sharply serrate with acute teeth, pubescent beneath, $3-5$-nerved, $7-13 \mathrm{~cm}$. long; stipules lanceolate; flower-clusters large, cymose-paniculate; flowers diœecious or androgynous. In waste places, N. S. to Ont., Minn., S. Car. and Mo. Nat. from Europe. Native also of Asia. July-Sept.
2. Urtica grácilis Ait. Slender Nettle. (I. F. f. I264.) Sparingly armed with stinging hairs; stem usually slender, $0.6-2.2 \mathrm{~m}$. tall. Leaves lanceolate or ovate-lanceolate, slender-petioled, long-acuminate at the apex, narrowed or sometimes rounded at the base (rarely subcordate), sharply serrate, 3 - 5 -nerved, sparingly pubescent, $7-15 \mathrm{~cm}$. long; petioles usually bristly; stipules lanceolate; flower-clusters compound, smaller than those of the preceding, but commonly longer than the petioles; flowers diœcious or androgynous. In dry soil, N. S. to Br. Col., N. Car., La. and Kans. June-Oct.
3. Urtica ùrens L. Small Nettle. (I. F. f. 1265.) Stem 1.5-4.5 dm. high, stinging-bristly. Leaves thin, glabrous or very nearly so, elliptic, oval or ovate, deeply incised or sometimes doubly serrate. 3-5-nerved, $2-8 \mathrm{~cm}$. long, slender-petioled; stipules short ; flower-clusters oblong, rather dense. In waste places, Newf. to N. Y., N. J. and Fla. Also on the Pacific Coast. Nat. from Europe. May-Sept.
4. Urtica chamaedryoìdes Pursh. Weak Nettle. (I. F. f. I266.) Sparingly stinging-bristly; stem slender, weak, ascending, I.5-10 dm. long. Leaves slenderpetioled, thin, crenate-dentate, the lower broadly ovate or orbicular, obtuse at the apex and usually cordate at the base, $\mathbf{I}-3 \mathrm{~cm}$. wide, the upper ovate or lanceolate, acute or acuminate at the apex, the uppermost very small; stipules lanceolatesubulate; flower-clusters small, glomerate. In thickets, Ky. to Ark., Ga. and Tex. April-Aug.

## 2. URTICÁSTRUM Fabr.

Perennial herbs, armed with stinging hairs, the leaves broad, alternate, serrate, petioled, the flowers monœcious or diœcious, sessile in loose axillary compound cymes. Staminate flowers in our species with 5 imbricated sepals, 5 stamens and a rudimentary ovary. Pistillate flowers with 4 unequal sepals, the outer I or 2 minute, an oblique or nearly straight compressed ovary and a subulate slender persistent style ; ovule erect. Achene very oblique, flat. reflexed. Seed-coat mem-
branous. Endosperm scanty or wanting. [Latin, star nettle.] About 25 species, mostly of tropical distribution. only the following North-American.
I. Urticastrum divaricàtum (L.) Kuntze. Wood Nettle. (I. F. f. 1267.) Stem 3-12 dm. tall. Leaves thin, ovate, long-petioled, acuminate or acute at the apex, sharply serrate, 3 -nerved and pinnately veined, glabrous or with some stinging hairs, $5-13 \mathrm{~cm}$. wide; petioles $3-13 \mathrm{~cm}$. long; stipule solitary, small, lanceolate, 2 -cleft, commonly deciduous; flower-clusters often longer than the petioles, the lower staminate, the upper pistillate, divergent, $5-15 \mathrm{~cm}$. broad in fruit ; ultimate branches of the fruiting clusters flat, cuneate, emarginate ; achene twice as long as the calyx, glabrous. In rich woods, N. S. to Ont., Minn., Fla. and Kans. July-Aug.

## 3 ADícea Raf.

Herbs, with opposite petioled mostly 3 -nerved leaves, connate stipules, and small monœcious or diœcious flowers in axillary clusters. Staminate flowers mostly 4 -parted (sometimes 2 - or 3-parted) and with a rudimentary ovary. Pistillate flowers 3 -parted, the segments in most species unequal, each subtending a staminodium in the form of a concave scale; ovary straight; stigma sessile, penicillate. Achene compressed. Seed-coat thin. Endosperm scanty or none. [Name unexplained, About 150 species, chiefly in the tropics, most abundant in tropical America. Besides the following, another occurs in the southern U. S.
I. Adicea pùmila (L.) Raf. Clearweed. Richweed. (I. F. f. 1268.) Annual, stems pellucid, usually branched, glabrous, succulent, $1.5-6 \mathrm{dm}$. high. Leaves membranous, ovate, slender-petioled, acuminate or acute, 3-nerved, coarsely dentate, $2-13 \mathrm{~cm}$. long, sparingly pubescent with scattered hairs; petioles much longer than the pistillate flower-clusters; sepals of the pistillate flowers lanceolate, nearly equal; achene ovate, acute, I mm. long. In swampy, shaded situations, often on old logs, N. B. to Ont., Minn., Fla., La. and Kans. Also in Japan. July-Sept.

## 4. BOEHMERIA Jacq.

Perennial stingless herbs (some tropical species shrubs or even trees), with petioled 3 -nerved leaves, distinct or connate stipules, and small monœcious or diœcious flowers, glomerate in axillary spikes or heads. Staminate flowers mostly 4 -parted, or the calyx of 4 distinct sepals, usually with a rudimentary ovary. Pistillate calyx tubular or urn-shaped, enclosing the ovary; stigma subulate. Achene enclosed by the pistillate calyx. [In honor of Georg Rudolph Boehmer, 1723-1803, Professor in Wittenberg.] About 50 species, mostly natives of tropical regions, the following of eastern N. A.

1. Boehmeria cylíndrica (L.) Willd. False Nettle. (I. F. f. 1269.) A perennial rough erect branching herb, 3-10 dm. tall. Stem stiff; leaves ovate, ovate-oblong or ovate-lanceolate, thin, slender-petioled, opposite, or some alternate, coarsely dentate, $\mathbf{r}-3 \mathrm{~cm}$. wide; petioles shorter than the blades; stipules distinct; flowers diœcious or androgynous; staminate spikes usually interrupted, the pistillate mostly continuous, $0.6-3 \mathrm{~cm}$. long; achene ovate-oval, acute, rather less than 2 mm . long. In moist soil, Quebec and Ont. to Minn., Fla., Neb. and Kans. July-Sept.

Boehmeria cylíndrica scábra Porter. Leaves firm, rough above, tomentose beneath, short-petioled or nearly sessile, usually reflexed; fruiting spikes much longer than the petioles. Penn., N. J. and S. N. Y.

## 5. PARIETÀRIA L.

Herbs, with alternate entire 3 -nerved petioled leaves, no stipules, and axillary glomerate polygamous flowers, involucrate by leafy bracts. Calyx of the staminate flowers 4 -parted or of 4 (rarely 3) distinct sepals. Fertile flowers with a 4-lobed calyx investing the ovary, a short or slender style, and a penicillate stigma. Achene enclosed by the pistillate calyx. [Ancient Latin, referring to the growth of some species on walls.] Abont 7 species, widely distributed; besides the following, another occurs in the southern U. S.
r. Parietaria Pennsylvánica Muhl. Pennsvifanta Periftory. (I. F. f. 1270.) Annual, pubescent; stem weak, ascending or reclining; slender, 14 dm . long. Leaves lanceolate or oblong-lanceolate, membramous, dotted, acuminate at
the apex, narrowed at the base, 3-nerved and with 1-3 pairs of weaker veins above, slender-petioled, $6-12 \mathrm{~mm}$. wide; petioles almost filiform; flowers glomerate in all except the lowest axils, the clusters shorter than the petioles; bracts of the involucre linear, 2-3 times as long as the flowers; style almost none; achene about I mm. long. On dry rocks and banks, Ont. to Br. Col., Fla., Colo. and Mex. June-Aug.

## Order 10. PROTEÀLES,

includes only the Family Proteaceae, with nearly 1000 species, all natives of the southern hemisphere.

## Order II. SANTALÀLES.

Herbs or shrubs, mostly parasitic, the flowers with a calyx, but without a corolla, perfect or imperfect, clustered or solitary. Ovary i, inferior, at least in part I-celled.

Tree-parasites, with opposite leaves or scales; fruit a berry. Fam. I. Loranthaceae. Root-parasites, or shrubs; leaves alternate in our genera; fruit a drupe, or nut.

Fam. 2. Santalaceac.

## Family 1. LORANTHÀCEAE D. Don. Mistletoe Family.

Parasitic green shrubs or herbs, containing chlorophyll, growing on woody plants and absorbing food from their sap through specialized roots called haustoria (a few tropical species terrestrial). Leaves in the following genera opposite, in Razoumofskya reduced to opposite scales. Flowers regular, terminal or axillary, diœcious or monœcious, and perianth simple, or in some exotic genera perfect, and with perianth of both calyx and corolla. Calyx-tube adnate to the ovary. Stamens 2-6. Ovary solitary, erect ; style simple or none; stigma terminal, undivided, obtuse. Fruit a berry. Seed solitary, its testa indistinguishable from the endosperm, which is usually copious and fleshy; embryo terete or angled. About 21 genera and 500 species, widely distributed; most abundant in tropical regions.

Leaves scale-like, united at the base; anthers I-celled; berry peduncled.

1. Razoumofskya.

Leaves thick, flat; anthers 2-celled; berry sessile.
2. Phoradendron.

## r. RAZOUMÓFSKYA Hoffm.

Small or minute fleshy glabrous plants, parasitic on the branches of coniferous trees, their branches 4 -angled, and leaves reduced to connate scales. Flowers diœcious, not bracted, in the axils of the scales. Staminate flowers with a 2-5parted calyx and usually an equal number of stamens, the anthers sessile on the segments. Pistillate flowers with the ovary adnate to the tube of the calyx, the calyx-limb 2-parted. Disk present in both kinds of flowers. Berry fleshy, ovoid, more or less flattened, borne on a short somewhat recurved peduncle. Embryo enclosed in the copious endosperm. [In honor of Alexis Razoumofski, Russian botanist.] About io species. Besides the following, 7 or 8 others occur in western N. Am. and Mex., 2 in Europe and Asia.

I Razoumofskya pusílla (Peck) Kuntze. Small Mistletoe. (I. F. f. 1271.) Plant inconspicuous; stems $4-20 \mathrm{~mm}$. long, nearly terete when fresh, somewhat 4 -angled when dry. Scales suborbicular, appressed, obtuse, about I mm. wide; flowers diœcious, solitary in most of the axils, longer than the scales;
berry ovoid-oblong, acute, about 2 mm . long, nodding on a slightly exserted peduncle; seeds enclosed in a viscid mucus. On twigs of spruces, Me., N. H., N. Y. and Penn. June.

## 2. PHORADENDRON Nutt.

Shrubs, parasitic on trees, with opposite coriaceous flat faintly nerved leaves, terete twigs, and diœcious axillary spicate bracted small flowers, solitary or several in the axil of each bract. Staminate flowers with a 3-lobed (rarely 2-4-lobed) calyx, bearing a sessile transversely 2 -celled anther at the base of each lobe. Pistillate flowers with a similar calyx adnate to the ovoid inferior ovary. Style short, obtuse or capitate. Fruit a sessile fleshy berry. Endosperm copious. [Greek, tree-thief, from its parasitic habit.] About 80 species, all American. Besides the following, 5 or 6 others occur in the Western States.
r. Phoradendron flavéscens (Pursh) Nutt. American Mistletoe. (I. F.f. 1272.) A branching glabrous or slightly pubescent shrub, the twigs terete, brittle at the base. Leaves oblong or obovate, rounded at the apex, narrowed into short petioles, $3-5$-nerved, entire, $\mathbf{I - 2} \mathrm{cm}$. wide, dark green; spikes solitary, or 2 or 3 together in the axils, linear, shorter than the leaves; berry globose, white, about 4 mm . in diameter. Parasitic on deciduous leaved trees, notably on the Tupelo and Red Maple, N. J. to Ohio, Ind., Mo., Fla. and Tex. May-July.

## Family 2. SANTALÀCEAE R. Br.

## Sandalwood Family.

Herbs or shrubs (some exotic genera trees), with entire estipulate leaves. Flowers perfect, monœcious or diœcious, mostly greenish. Calyx adnate to the base of the ovary, or to the disk, 3-6-lobed, the lobes valvate. Petals none. Stamens as many as the calyx-lobes and inserted near their bases, or opposite them upon the disk. Ovary icelled; ovules $2-4$, pendulous from the summit of the central placenta; style cylindric, conic or sometimes none ; stigma capitate. Fruit a drupe or nut. Seed I. Testa none; endosperm copious, fleshy ; embryo small, apical. About 26 genera and 250 species, mostly of tropical distribution, a few in the temperate zones.

Perennial herbs; flowers perfect, cymose or solitary.

1. Comandra.

Shrubs ; flowers imperfect, mostly diœcious.
Flowers racemose.
Staminate flowers umbellate, the pistillate solitary.
2. Pyrularia.
3. Nestronia.

1. COMÁNDRA Nutt.

Glabrous herbs, some (or all ?) parasitic on roots of other plants. Leaves alternate, entire, pinnately veined, Flowers perfect, terminal or axillary, rarely solitary, cymose, bractless. Calyx campanulate, the base of its tube adnate to the ovary, its limb 5 -lobed (rarely 4-lobed). Stamens 5, or rarely 4, inserted at the bases of the calyx-lobes and between the lobes of the disk, attached to the middle of the lobes by tufts of hairs. Anthers ovate, 2 -celled. Fruit drupaceous, crowned by the persistent calyx. [Greek, referring to the hairy attachments of the anthers.] Four known species, the following N. Am., one European.
Cymes mostly corymbose-clustered at the summit of the stem; leaves acute, sessile; style slender.
Leaves oblong, pale green; fruit globose-urn-shaped. 1. C. umbillata.
Leaves lanceolate or linear, glaucous; fruit ovoid. 2. C. pallida.
Peduncles few, axillary; leaves oval, obtuse, short-petioled; style short. 3. C. lit $\bar{i} \neq z$.

1. Comandra umbellàta (L.) Nutt. Bastard Toad-flax. (I. F. f. 127.3.) Stem slender, leafy, 1.5-5 dm. tall. Leaves oblong or oblong-lanceolate, pale green, acute or subacute at both ends, sessile; ascending, $1-3 \mathrm{~cm}$. long, the lower smaller; cymes several-flowered, corymbose at the summit of the plant or also axillary; peduncles filiform; pedicels very short; calyx greenish white or purplish,
about 4 mm . high; drupe globose, 5-6 mm. in diameter. In dry fields and thickets, Cape Breton I. to Ont., Br. Col., Ga., Ariz. and Cal. April-July.
2. Comandra pállida A. DC. Pale Comandra. (I. F. f. 1274.) Similar to the preceding but paler and glaucous, the leaves narrower, linear or linearlanceolate, acute or the lowest and those of the stem oblong-elliptic; cymes few-several-flowered, corymbose-clustered at the summit; peduncles usually short; calyx purplish, about 4 mm . high; fruit ovoid-oblong, $6-8 \mathrm{~mm}$. high. In dry soil, Man. to Br. Col., Minn., Kans., Tex. and Cal. April-July.
3. Comandra lívida Richards. Northern Comandra. (I. F. f. 1275.) Stem slender, usually quite simple, 1 - 3 dm. high. Leaves oval, thin, obtuse or rounded at the apex, narrowed at the base, short-petioled, $1-2.5 \mathrm{~cm}$. long, 6-12 mm . wide; petioles $2-4 \mathrm{~mm}$. long; cymes axillary, few (often only 1 to each plant), $1-5$-flowered; peduncle shorter than its subtending leaf, filiform; flowers sessile ; drupe globose-oblong, about 6 mm . in diameter, red, edible. In moist soil, Newf. to Hudson Bay, the N. W. Terr., Vt., Ont., Mich., and Br. Col. June-July.

## 2. PYRULARIA Michx.

A branching shrub (the Asiatic species trees), with thin alternate pinnately veined entire short-petioled deciduous leaves, and diœcious or polygamous small greenish racemose flowers. Staminate flowers with a campanulate 3-5-cleft calyx, the lobes valvate, pubescent at the base within; disk of 3-5 distinct glands or scales; stamens 4 or 5 , inserted between the glands and opposite the calyx-lobes; filaments short; anthers ovate. Pistillate and perfect flowers with a top-shaped calyx adnate to the obovoid ovary; style short, stout; stigma capitate, depressed. Fruit a pear-shaped or oval drupe, the endocarp thin and endosperm of the seed very oily. [Name from Pyrus, the pear, from the similar shape of the fruit.] Three species, the following and two Asiatic.
i. Pyrularia púbera Michx. Oil-nut. Buffalo-nut. (I. F. f. 1276.) A much branched shrub, $1-5 \mathrm{~m}$. tall, with terete twigs, the young foliage pubescent. Leaves oblong, oblong-lanceolate or somewhat obovate, nearly glabrous when mature, acute or acuminate at both ends, $1.5-3 \mathrm{~cm}$. wide; racemes terminating short branches, the staminate many-flowered, $2-5 \mathrm{~cm}$. long, the pistillate few-flowered and shorter; pedicels $3-4 \mathrm{~mm}$. long; calyx $3-5$-cleft; drupe about 2.5 cm . long, crowned by the ovate acute calyx-lobes. In rich woods, Penn. to Ga. May. Fruit ripe Aug.-Sept.

## 3. NESTRÒNIA Raf.

A low glabrous diœcious shrub, with opposite short-petioled, oblong to ovate entire leaves. Staminate flowers small, in axillary peduncled umbels; calyx topshaped, $4-5$-cleft, the lobes spreading, each with a tuft of wool; stamens as many as the calyx-segments and opposite them; disk crenate. Pistillate flowers solitary in the axils, short-peduncled; calyx narrowly top-shaped, 4-lobed; stamens 4; style short, 4-lobed; ovary adnate to the calyx. Fruit an oval i-seeded drupe. [From the Greek name of Daphne.] A monotypic genus of the southeastern U. S.
I. Nestronia umbéllula Raf. NestroniA. (I. F. f. 1276a.) Shrub 3-Io dm. high, branching. Leaves thin, $2-5 \mathrm{~cm}$. long, pinnately veined, bright green above; petioles $2-6 \mathrm{~mm}$. long; peduncles of the staminate $3-9$-flowered umbels filiform, the pedicels about 4 mm . long, equalling the green calyx; stamens shorter than the oblong-ovate calyx-segments, pistillate calyx glaucescent, about 6 mm . long, the lobes much shorter than the tube; drupe about 1.2 cm . in diameter. In woods and along streams, Va. to Ga. and Ala. April-May.

## Order I2. ARISTOLOCHIÀLES.

Herbs or vines, mostly with cordate or reniform leaves and perfect flowers. Calyx inferior, its tube wholly or partly adnate to the ovary, Corolla none. Ovary several- (mostly 6-) celled. Only the following family.

## Family 1. ARISTOLOCHIÀCEAE Blume.*

## Birthwort Family.

Acaulescent plants, or with erect or twining stems. Leaves alternate, often basal, exstipulate. Flowers regular or irregular, sometimes clustered. Calyx-limb 3-6-lobed or irregular. Stamens 6-many, adnate to the pistil; anthers 2-celled, their sacs longitudinally dehiscent. Ovules numerous in each cavity, anatropous, horizontal or pendulous. Fruit a many-seeded 6-celled capsule. Seeds angled or compressed, with a crustaceous testa and usually with a fleshy or dilated raphe; endosperm fleshy, copious; embryo minute. Six genera and about 200 species of wide distribution in tropical and temperate regions.
Acaulescent herbs; perianth regular, persistent ; filaments distinct.
Calyx-tube mainly free from the ovary; filaments shorter than the anthers; styles distinct. 1. Hexastylis.
Calyx-tube wholly adnate to the ovary; filaments longer than the anthers: styles united.
2. Asarum.

Vines or erect leafy-stemmed herbs ; perianth irregular, deciduous; anthers sessile.
3. Aristolochia.

## ェ. HEXÁSTYLIS Raf.

Perennial evergreen acaulescent herbs with glabrous or nearly glabrous foliage. Rootstocks dichotomously branched ; roots fleshy. Leaves usually I every year, the blades leathery, often mottled, petioled. Flowers solitary, on a pedicel arising from a membranous bract. Calyx glabrous without, the tube terete, sometimes inflated, the 3 segments shorter than the tube, valvate. Corolla none. Stamens 12; filaments shorter than the anthers or wanting. Ovary mainly free from the calyx-tube. Styles distinct, prolonged beyond the extrorse stigmas into cleft appendages. Capsule free, sometimes distending the calyx-tube. Seeds flattened. [Greek, referring to the six styles.]
Leaf-blades mostly of an ovate or suborbicular type.
Calyx-tube turbinate during anthesis.

1. H. heterophylla.

Calyx-tube campanulate, cylindric-campanulate, sometimes constricted at the throat.
Calyx $2.5-5 \mathrm{~cm}$. long, much longer than thick.
2. H. Shuttleworthii.

Calyx $1-2 \mathrm{~cm}$. long, slightly longer than thick.
Calyx campanulate at maturity, its segments about one-half as long as the tube.
3. H. Virginica.

Calyx urn-shaped at maturity, its segments barely one-third as long as the tube.
4. H. Memmingeri.

Leaf-blades mostly of a hastate type.
Calyx not constricted at the throat ; segments erect.
5. H. Ruthii.

Calyx constricted at the throat ; segments spreading.
6. H. arifolia.

1. Hexastylis heterophylla (Ashe) Small. Ashes Hexastylis. Leafblades ovate to orbicular-reniform or triangular-ovate, $5-10 \mathrm{~cm}$. long, acute or sometimes rounded or retuse at the apex, with a slightly open sinus; petioles as long as the blades or twice as long; calyx $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. long, the tubes turbinate at least during anthesis, the segments $8-12 \mathrm{~mm}$. broad, often nearly as long as the tube. crisped, orange, purple or brown-purple without, brighter within; prolongations of the styles very stout, barely notched; capsules hardly distending the calyx at maturity ; seeds oval. In mountain woods, Va. to Ga. and Ala. March to May. (Asarum heterophyllum Ashe.)
2. Hexastylis Shúttleworthii (J. Britten) Small. Large-floweren Hexastylis. (I. F. f. 1279.) Leaf-blades ovate to suborbicular or rhombic-orbicular, $5-8 \mathrm{~cm}$. long, apiculate or obtuse ; petioles as long as the blades or longer : calyx $2.5-5 \mathrm{~cm}$. long ; the tube cylindric-campanulate, the segments 1.5 .2 cm . broad, often abruptly acute, mottled within; pedicels shorter than the diameter of the calyx-tube ; prolongations of the styles stout, barely notched: capsule hardly distending the calyx; seeds triangular in outline. In high-mountain woods, Va. to

[^21]N. C. and Tenn. May to July. [Asarum macranthum (Shuttlw.) Small; not Hook. A. Shuttleworthii J. Britten.]
3. Hexastylis Virgínica (L.) Small. Virginia Hexastylis. (I. F. f. 1278.) Leaf-blades ovate or rarely orbicular-ovate, 4-9 cm. long, mostly obtuse or retuse, usually with an open sinus; petioles as long as the blades or twice as long; calyx $1.5^{-2} \mathrm{~cm}$. long, the tube campanulate; the segments less than 1 cm . broad, rarely half as long as the tube, spreading, usually purplish and sometimes mottled within; pedicel about as long as the calyx; prolongations of the styles stout, barely notched; capsule only slightly distending the calyx; seeds oblong. In woods, Va. and W. Va., south to S. Car. and Tenn. May-June. (Asarum Virginicum L.)
4. Hexastylis Mémmingeri (Ashe) Small. Memminger's Hexastylis. Slender. Leaf-blades suborbicular or ovate, $4-7 \mathrm{~cm}$. long, mostly obtuse or retuse, sometimes mottled, with a slightly open sinus; petioles about as long as the blades or much longer; calyx $1-1.5 \mathrm{~cm}$. long, urn-shaped, the tube more or less constricted at the throat; the segments rarely over 3 mm . long, obtuse; pedicel as long as the calyx or shorter; prolongations of the styles slender, usually deeply cleft; capsule conspicuously distending the calyx; seed sharply triangular. In sandy woods, Va. and W. Va., south to Ga. May and June. (Asarum Memmingeri Ashe.)
5. Hexastylis Rúthii (Ashe) Small. Ruth's Hexastylis. Stout. Leafblades hastate to triangular, occasionally slightly rhombic, $8-15 \mathrm{~cm}$. long, obtuse, retuse or abruptly pointed, with a rather narrow sinus; petioles longer than the blades; calyx $2-3 \mathrm{~cm}$. long; the tube narrowed to the mouth but not constricted, usually over 10 mm . in diameter at the throat, the segments erect, mostly longer than broad, dull purplish green within; pedicel as long as the calyx or much longer; prolongations of the styles notched to the stigma; capsule barely distending the calyx-tube. In sandy woods, S. W. Va. to Tenn. and Ala. April to July. (Asarum Ruthii Ashe.)
6. Hexastylis arifòlia (Michx.) Small. Halberd-leaved Hexastylis. (I. F. f. I280.) Stout. Leaf-blades hastate, triangular or ovate-hastate, $6-\mathbf{1 2} \mathbf{~ c m}$. long, mostly obtuse or retuse, entire, sometimes with a wide-open sinus; petioles usually much longer than the blades; calyx $2-3 \mathrm{~cm}$. long, urn-shaped; the tube less than 8 mm . in diameter at the constricted throat; the segments triangular or rounded, broader than long, spreading, purple-brown within; prolongations of the styles cleft to the top of the stigmas; capsule only slightly distending the calyx-tube. In sandy soil, Va. to Ga. and Ala. May to July. (Asarum arifolium Michx.)

## 2. ÁSARUM L.

Perennial acaulescent herbs, with usually manifestly pubescent foliage. Rootstocks elongated; roots fibrous. Leaves in pairs, deciduous, the blades membranous, mostly broader than long, cordate at the base, petioled. Flowers on pedicels arising from between the petioles. Calyx pubescent without, the tube angled, the 3 segments as long as the tube or longer, inflexed in the bud. Corolla none. Stamens 12; filaments longer than the anthers. Ovary adnate to the calyx-tube. Styles united; stigmas terminal. Capsules inferior, angled. Seeds plump. [The ancient name, meaning obscure.]
Calyx-segments lanceolate-acuminate, longer than the tube, not reflexed.
Calyx-segments slightly longer than the tube, the tubular portion $4-8 \mathrm{~mm}$. long; species mainly Alleghenian. 1. A. Canadense.

Calyx-segments much longer than the tube, the tubular portion $10-20 \mathrm{~mm}$. long; species campestrian.
2. A. acuminatum.

Calyx-segments triangular, merely acute, about as long as the tube, reflexed.
3. A reflexum.
I. Asarum Canadénse L. Wild Ginger. (I. F. f. 1277.) Foliage finely pubescent. Petioles $1.5-3 \mathrm{dm}$. long: blades reniform, I-1. 8 dm . broad, often short-pointed, with a usually closed basal sinus: calyx slender, pedicelled, pubescent without, $2-3.8 \mathrm{~cm}$. broad, mainly brownish purple, its tube angled, its segments lanceolate, acuminate, longer than the tube, with tubular tips $4-8 \mathrm{~mm}$. long, curving upward; style-column 6-lobed; capsule $12-15 \mathrm{~mm}$. in diameter. In rich woods, N. B. to Quebec, Ont. and N. C. April-May.
2. Asarum acuminàtum (Ashe) Bicknell. Long-tipped Wild Ginger. (I. F. f. 1277a.) Quite similar to A. Canadense, but more pubescent, at least
when young. Leaf-blades very thin, reniform-cordate, and acutely short-pointed or broadly reniform and blunt, densely cinereous-tomentulose beneath, less closely so in age, the larger nerves often somewhat bristly, thus giving the lower surfaces a white-reticulated aspect; cakyx-segments much longer than those of $A$. Canadense and of a duller brownish purple color, caudate-acuminate or flagellate, the tubular terminations $10-20 \mathrm{~mm}$. long, recurved-spreading. In rich woods, Minn. and Wis. to Manitoba, Ind. and Ohio. May-June.
3. Asarum refléxum Bicknell. Short-lobed Wild Ginger. (I. F. f. 1277b.) Similar to the two preceding species in habit, but more loosely pubescent and with more elongated and slender rootstocks; leaf-blades reniform, much broader than long, blunt-tipped, the upper surface and the petioles nearly glabrous in age; calyx much smaller, the tube white within, the segments early reflexed, triangular, purplish brown, about as long as the tube, with a straight obtuse tip $2-4 \mathrm{~mm}$. long. In rich woods, along streams and in river valleys, Conn. to Iowa, N. C., Mo. and Kan. April-May.

Asarum reflexum ambiguum Bicknell. Leaf-blades short and conspicuously broad, with a wide and often rectangular sinus; calyx-segments narroweŕ and longer, 12-19 mm . long, the straight tip $4-8 \mathrm{~mm}$. long, sometimes extending back to the base of the ovary. Mich., Ill. and Mo.

## 3. ARISTOLÒCHIA L.,

Perennial herbs or twining vines. Leaves alternate, mostly petioled and entire (some exotic species $3-7$-lobed), cordate, palmately nerved. Flowers irregular. Calyx adnate to the ovary, at least to its base, the tube usually inflated around the style and contracted at the throat, the limb spreading or reflexed, entire, 3-6lobed or appendaged. Stamens mostly 6; anthers adnate to the short style or stigma, 2 -celled, the sacs longitudinally dehiscent. Ovary mostly 6 -celled with 6 parietal placentæ. Style 3-6-lobed. Capsule naked, septicidally 6 -valved. Seeds very numerous, horizontal, compressed. [Named for its supposed medicinal properties.] About 180 species, widely distributed in tropical and temperate regions. Besides the following, some 6 others occur in the southern and western United States.

Erect herbs.
Calyx-tube bent ; flowers solitary, on basal scaly branches.
Leaves hastate at the base; capsules $5-6 \mathrm{~mm}$. in diameter. I. A. Nashii.
Leaves merely cordate at the base ; capsules about ro mm . in diameter.
2. A. Serpentaria. Calyx-tube straight ; flowers axillary, clustered.
3. A. Clematitis.

Tall twining vines; flowers axillary ; calyx-tube bent.
Leaves minutely pubescent; calyx-limb flat, spreading.
4. A. macrophylla.

Leaves tomentose ; calyx-limb rugose, reflexed.
5. A. tomentosa.
r. Aristolochia Nàshii Kearney. Nash's Snakeroot. Stems erect or reclining, I-3 dm. long, zigzag, simple or branched below; leaves thin, linear or linear-lanceolate above the hastate base, $2-10 \mathrm{~cm}$. long, acuminate, ciliate, shortpetioled; peduncles slender; bracts $2-4 \mathrm{~mm}$. long; calyx S-shaped, brownish purple, IO-I2 mm . long, the limb slightly 3 -lobed, about $\mathbf{I ~ c m}$. broad; capsules subglobose, 5-6 mm. in diameter, sharply angled. In damp woods, Va. to Fla. and La. Summer.
2. Aristolochia Serpentària L. Virginia Snakeroot. Serpentary. (I. F. f. 128I.) Stems erect, $2-5 \mathrm{dm}$. tall, sometimes branched below, more or less zigzag; leaves rather thin, oblong-lanceolate to ovate or oval-lanceolate. $4-15 \mathrm{~cm}$. long, acuminate, undulate, cordate, short-petioled; peduncles scaly, solitary or clustered; bracts $2-3 \mathrm{~mm}$. long; calyx S-shaped, about $x \mathrm{~cm}$. long, the limb slightly 3 -lobed; capsules subglobose, about 10 mm . in diameter, somewhat ribbed; flowers sometimes cleistogamous. In dry woods, Conn. and N. V. to Mich., south to Fla. and La. Summer.
3. Aristolochia Clematitis L. Birthwort. (T. F. f. 12 S2.) Stem erect. glabrous, zigzag, 3-6 dm. tall; leaves dark green, reniform. glabrous, or their margins minutely spinulose-ciliate, strongly reticulate-reined, 5-13 cm . wide; petioles shorter than the blades; flowers fascicled in the axils, $2.5-3.5 \mathrm{~cm}$. long; tube
of the calyx yellowish green, straight, enlarged around the ovary, the lobes appendaged; anthers equidistant. Near Ithaca and Flushing, N. Y., and E. Penn. Escaped from cultivation. Native of southern Europe. Summer.
4. Aristolochia macrophýlla Lam. Dutichman's Pipe. (I. F. f. 1283.) A twining vine, the stem sometimes 2.5 cm . in diameter and 10 m . long; leaves thin, broadly reniform or suborbicular, densely pubescent beneath when young, glabrous or nearly so, and r.5-3.6 dm. broad when mature; petioles $2.5-10 \mathrm{~cm}$. long; peduncles solitary or 2 or 3 together, about as long as the petioles, each with a suborbicular clasping bract at about the middle $12-25 \mathrm{~mm}$. in diameter; calyx-tube strongly curved, 2.5 cm . long or more, contracted at the throat, yellowish green, veiny, the limb flat, spreading, purple-brown, somewhat 3 -lobed; anthers contiguous in pairs under the 3 lobes of the stigma; capsule oblong-cylindric, $5-7.5 \mathrm{~cm}$. long. In rich woods, S. Penn. to Minn., Ga., Tenn. and Kans. May-June. Fruit ripe Sept.
5. Aristolochia tomentòsa Sims. Woolly Pipe-vine. (I. F. f. 1284.) Similar to the preceding, but the twigs, petioles, leaves and peduncles persistently tomentose. Leaves suborbicular or broadly ovate, $0.7-1.5 \mathrm{dm}$. broad when mature; petioles rather stout; peduncles mostly solitary, bractless; calyx-tube sharply curved, yellowish green, about 3 cm . long, its throat nearly closed, the limb dark purple, 3 -lobed; capsule oblong-cylindric. In woods, Mo., Kans., and S. Ill. to N. Car., Ala. and Fla. May-June.

## Order I3. POLYGONÀLES.

## Characters of the only family, Polygonaceae, as given below.

## Family 1. POLYGONÀCEAE Lindl.*

## Buckwheat Family.

Herbs, twining vines, shrubs or trees, with alternate, or sometimes opposite or whorled, simple mostly entire leaves, jointed stems, and usually sheathing united stipules (ocreae). Flowers small, regular, perfect, diœcious, monœcious or polygamous. Petals none. Calyx inferior, $2-6$-cleft or $2-6$-parted, the segments or sepals more or less imbricated, sometimes petaloid, sometimes developing wings in fruit. Stamens 2-9, inserted near the base of the calyx; filaments filiform or subulate, often dilated at the base, distinct or united into a ring ; anthers 2 -celled, the sacs longitudinally dehiscent. Ovary superior, i-celled ; ovule solitary, orthotropous, erect or pendulous; style $2-3$-cleft or $2-3$-parted, sometimes very short; stigmas capitate or tufted, rarely 2 -cleft; fruit a lenticular 3-angled or rarely 4-angled achene, usually invested by the persistent calyx; endosperm mealy ; cotyledons accumbent or incumbent; embryo straight or nearly so. About 30 genera and 800 species, of wide geographic distribution.
3. Rumex.

Pedicels mostly several together; achene much surpassing the calyx.
5. Fagopyrum.

Pedicels usually fascicled; achene mostly enclosed by the enlarged calyx.
6. Polygonum.
7. Polygonella.

Pedicels solitary; leaves jointed at the base.
8. Brunnichia.

## 1. MACOUNASTRUM Small.

Low glabrous annual herbs, with fibrous roots, erect or spreading simple or forked stems, alternate or opposite leaves, funnelform membranous ocreae, and minute perfect terminal clustered flowers, subtended by a several-leaved involucre. Calyx 2-4-parted (usually 3-parted), greenish-white, the segments valvate, equal ; pedicels subtended by transparent bracts; stamens 2 or 4, alternate with and often protruding between the calyx-segments; filaments stout; style 2-3-parted; stigmas capitate; achene ovoid, exceeding the persistent calyx; embryo eccentric, accumbent. Two or three species, the following circumboreal, the others of the higher Himalayas.
I. Macounastrum Islándicum (L.) Small. Macounastrum. (I. F. f. 1285.) Stems very slender, $2.5-10 \mathrm{~cm}$. long, sometimes tufted. Leaves obovate, oblong or almost orbicular, $2-10 \mathrm{~mm}$. long, fleshy, obtuse, sessile or short-petioled; ocreae about I mm. long; involucre consisting of 3-6 obovate or orbicular bracts; flowers fascicled in the involucres, short-pedicelled; calyx I mm. long, the segments ovatelanceolate, rather obtuse; style-branches short; achene less than 2 mm . long, brown, striate, its faces convex. Greenland and Labrador to Hudson Bay and Alaska. Also in arctic Europe and Asia. Summer.

## 2. ERIÓGONUM Michx.

Annual or perennial acaulescent or leafy-stemmed herbs, some species very woody at the base, often with tufted stems, and entire alternate opposite or whorled leaves. Flowers small, fascicled, cymose, umbellate or capitate, subtended by 5 -8-toothed or cleft involucres. Calyx 6-cleft or 6-parted, usually colored, the segments equal or the outer ones larger. Stamens 9 ; filaments filiform, often villous. Style 3-parted; stigmas capitate. Achene pyramidal, 3-angled, more or less swollen near the base, invested by the calyx-segments, or winged. Embryo axial or somewhat eccentric. [Greek, referring to the woolly and jointed stems.] About 160 species, natives of America, mostly of the western U. S.

I. Eriogonum alàtum Torr. Winged Eriogonum. (I. F. f. 1286.) Perennial, strigose. Stems erect, 3-9 dm. tall, paniculately branched; leaves mostly basal, spatulate to oblanceolate, $2.5-7.5 \mathrm{~cm}$. long, or those on the stem nearly linear, obtuse or rather acute, ciliate, with prominent midrib beneath; panicle open; involucres in cymules, campanulate, $2-3 \mathrm{~mm}$. high, the 5 teeth obtuse, spreading or reflexed; calyx yellowish, 2 mm . long; filaments glabrous; achenes $5-7 \mathrm{~mm}$. long, glabrous, 3 -winged its whole length. On plains and prairies, Neb. to Colo., south to Tex. and N. Mex. June-Sept.
2. Eriogonum longifòlium Nutt. Long-leaved Eriogonum. (I. F. f. 1287.) Perennial from a stout root, caulescent. Foliage strigose or somewhat tomentose; stems erect, 6-I3 dm. tall, paniculately or corymbosely branched above; leaves alternate, the blades narrowly oblong or linear-oblong, $5-22 \mathrm{~cm}$. long, the lower ones with broad sheathing petioles, the upper sessile; bracts lanceolate to subulate; involucres turbinate-campanulate, $4-5 \mathrm{~mm}$. long, silky; calyx herbaceous, $4-5 \mathrm{~mm}$. long; achenes pubescent especially above, 4-5 mm . long including the beak. In dry soil, S. Mo. to Tex. June-Nov.
3. Eriogonum Állenii S. Wats. Allex’s Eriogoncm. (I. F. f. I288.) Perennial, floccose-tomentose; stems erect, $2-6 \mathrm{dm}$. tall, dichotomously branched above; leaves basal and in whorls of 3's to 5's at the nodes, the blades oblong or ovate-oblong, 6-8 cm. long, obtuse at both ends or cordate at the base, rather green above, the basal slender-petioled; involucres in clustered cymes, turbinate, 3-6 mm. high, with 5 obtuse teeth; calyx bright yellow, 6-7 mm. long, pubescent, the segments spatulate or obovate-spatulate, rounded, concave; stamens and style-branches exserted; achenes. On dry mountain slopes, White Sulphur Springs, W. Va. July-Aug.
4. Eriogonum Jàmesii Benth. James' Eriogoncm. (I. F. f. I289.) Perennial by woody rootstocks, tomentose with white or whitish hairs; stems short; leaves approximate, the blades oblong to oblong-spatulate, $3-8 \mathrm{~cm}$. long, narrowed into slender petioles which often exceed the blade in length, rarely glabrate above; peduncles erect, or assurgent, sometimes tufted, $1-3 \mathrm{dm}$. tall, dichotomous and corymbose above; bracts broadened upward or oblong; involucres campanulate, about 5 mm . high, sessile or short-stalked, with rounded teeth; calyx white or pink, 4 mm . becoming $6-7 \mathrm{~mm}$. long, the tube attenuate into a stipe-like base, the inner segments longer and slightly larger than the outer; filaments villous at the base; achene 4 mm . long, pubescent above the swollen base. On plains and prairies, Kans. and Colo. south to N. Mex. and Ariz. June-Nov.
5. Eriogonum flàvum Nutt. Yellow Eriogonim. (I. F. f. 1299.) Perennial from a stout scaly base, scapose, tomentose throughout with white hairs; leaves crowded, linear-oblong to oblong-spatulate, $2.5-8 \mathrm{~cm}$. long, flat or nearly so, narrowed into short petioles with dilated bases; scapes erect, $5-30 \mathrm{~cm}$. long, mostly solitary; involucres in terminal umbels, turbinate $4-5 \mathrm{~mm}$. high, shorter than their stalks, with blunt teeth; bracts subtending the umbel similar to the leaves but smaller ; calyx yellow. about 6 mm . long, copiously pubescent, narrowed into a stipe-like base; filaments villous at the base; achenes about 4 mm . long. villous near the top. On dry plains and prairies, N. W. Terr. south to Neb., Kans. and Ariz. Summer.
6. Eriogonum pauciflòrum Pursh. Few-flowered Eriogonum. (I. F. f. 1294.) Perennial. sparingly pubescent; stems very short, covered with the persistent leaf-bases; leaves linear or linear-spatulate, $2.5-7.5 \mathrm{~cm}$. long, glabrous or nearly so above, tomentose or cottony beneath, becoming strongly revolute, slenderpetioled; peduncles slender, erect. $5^{-15} \mathrm{~cm}$. high, simple, sparingly tomentose; involucres 4-10, capitate, about 3 mm . high, turbinate-campanulate, with 5 obtuse teeth'; calyx white, about 3 mm . long. glabrous; achenes 2.5 mm . long, the faces swollen about the middle, inconspicuously striate-reticulated. On dry plains, Neb. and Colo. Summer.
7. Eriogonum múlticeps Nees. Branched Eriogonum. (I. F. f. 1293.) Perennial from a more or less matted base, tomentose with white hairs. Leaves spatulate, $1.5-5 \mathrm{~cm}$. long, numerous. obtuse; peduncles simple, $2.5-15 \mathrm{~cm}$. long, rather slender; involucres $3-12$, in a head terminating the peduncles, about 3 mm . high, with 5-6 acute teeth ; bracts spatulate ; calyx white or rose, 3 mm . becoming 5 mm . high, somewhat villous, the segments cuneate, obtuse or notched at the
apex; filaments sparingly villous near the base; achenes 1 mm . long. On dry plains or hillsides, Neb. and Colo. Summer.
8. Eriogonum lachnogynum Torr. Long-rooted Eriogonum. (I. F. f. 1296.) Scapose perennial. Stems short, often tufted, clothed with the dilated petiole-bases; leaves numerous, crowded, lanceolate to narrowly oblong, $1.5-3 \mathrm{~cm}$. long, silky above, white tomentose beneath, somewhat revolute; scapes erect, $\mathbf{1}-3$ dm . tall, tomentose, branching into a dichotomous cyme above; involucres broadly campanulate or nearly hemispheric, 3-4 mm. high, commonly sessile, 5 -toothed; bracts scale-like ; calyx 3 mm . long, densely silky-villous; filament villous at the base; achenes about 2 mm . long, covered by a mass of cottony hairs. On dry plains and prairies, Kans. to Colo. and Ariz. Spring to fall.
9. Eriogonum ánnuum Nutt. Annual Eriogonum. (I. F. f. 1290.) Annual, caulescent white floccose-tomentose. Stems erect, 3-9 dm. tall; leaves narrowly oblong or oblanceolate, $2-7 \mathrm{~cm}$. long, sometimes revolute or crisped; peduncles shorter than the stems, topped by dichotomous cymes; involucres turbinate or turbinate-campanulate, $2-3 \mathrm{~mm}$. high, secund, short-stalked; calyx white or pink, I-2 mm. long, glabrous, the outer segments obovate, the inner narrower, all truncate or retuse; achenes 1.5 mm . long, with a globular base and smooth-angled beak about as long as the base. On dry plains and prairies, Neb. to Tex., N. Mex. and Mex. July to Sept.
10. Eriogonum campanulàtum Nutt. Narrow-leaved Eriogonum. (I. F. f. 1297.) Perennial from a woody base. Stems branched, more or less tomentose; leaves crowded on short branches, narrowly oblanceolate or linear, $2-8 \mathrm{~cm}$. long, obtuse, sometimes revolute, narrowed into petioles; peduncles erect or nearly so, 1-3 dm. tall, glabrous, topped by often trichotomous cymes; involucres oblongturbinate, $2-3 \mathrm{~mm}$. high, with five obtuse teeth ; bracts scale-like; calyx yellow, 1.5-2 mm . long, the segments often becoming fiddle-shaped, retuse or emarginate; filaments villous below the middle; achenes 3 mm . long, pitted, enlarged at the base. In dry soil, Neb. to Ore., south to Utah and N. Mex. Summer and fall.
ii. Eriogonum corymbòsum Benth. Crisp-leaved Eriogonum. (I. F. f. 1292.) Perennial, caulescent, densely floccose-tomentose. Stem erect, branched, 3-6 dm. tall; leaves oblong or oval, $\mathbf{1}-4 \mathrm{~cm}$. long, obtuse, more or less crisped, narrowed at the base; peduncles terminating leafy branches, $1-10 \mathrm{~cm}$. long, topped by a trichotomous cyme; involucres campanulate, sessile, $2-4 \mathrm{~mm}$. long, 5 -toothed; calyx $2-4 \mathrm{~mm}$. long, white or pinkish, glabrous, the outer segments broadened upward, rounded or notched at the apex, broader and longer than the inner; filaments woolly below; achenes about 2 mm . long, with a rounded base and rough angles especially on the beak. In dry soil, Neb. and Kans. to Utah, south to N. Mex. and Ariz. Aug.-Sept.
12. Eriogonum microthècum Nutt. Slender Eriogonum. (I. F. f. 1291.) Shrubby, more or less floccose-tomentose, $\mathbf{I}-3 \mathrm{dm}$. tall. Stems diffusely branched below, the branches spreading or ascending; leaves oblanceolate, spatulate or narrowly oblong, $\mathbf{I}-2 \mathrm{~cm}$. long, flat or revolute, with short petioles ; peduncles erect, 3-10 cm . long, topped by small twice or thrice compound corymbose cymes; bracts scale-like; involucres narrowly campanulate, 2 mm . high ; the teeth acutish; calyx glabrous, white or pink, sometimes tinged with red, $2.5-3 \mathrm{~mm}$. long, the outer segments obovate or oval-obovate, the inner smaller, inclined to be oblong; filaments villous; achenes $2-2.5 \mathrm{~mm}$. long, swollen at the base. On dry plains or prairies, S. Dak. to Wash., south to Tex. and Calif. Summer and fall.
13. Eriogonum effùsum Nutt. Effuse Eriogonum. Shrubby, 2-4 dm. tall, white floccose-tomentose. Stems stout, diffusely branched; leaves linear or narrowly oblong, $\mathbf{I}-4 \mathrm{~cm}$. long, revolute; peduncles $2-10 \mathrm{~cm}$. long, topped by $5-7$ times compound stiff corymbose cymes; bracts scale-like : involucres narrowly campanulate, $2-2.5 \mathrm{~mm}$. high, the tube slightly angled, the teeth rather obtuse; calyx 2 mm . high, white, glabrous, the outer segments cuneate obovate, rounded at the apex, the inner notched; filaments villous, especially below the middle ; achenes 3 -angled. On dry plains or prairies, S. Dak. and Neb, to Wyo., south to N. Mex. Summer.
14. Eriogonum cérnuum Nuit. Nomding Eriogoxim. (I. F. f. izos.) Annual, nearly acaulescent, often diffuse. Leaves basal, the blades suborbicular to oval, $\mathbf{1 - 2} \mathbf{~ c m}$. long, obtuse or slightly apiculate, floccose-tomentose; the petsoles
as long as the blades or shorter; scapes erect, $\mathbf{1}-4 \mathrm{dm}$. tall, sometimes branched at the base, topped by trichotomous compound cymes; involucres turbinate-campanulate, $1-2 \mathrm{~mm}$. high, solitary on deflexed peduncles, the teeth obtuse; calyx white or pinkish, I-I. 5 mm . long, the outer segments broadly obovate, often becoming fiddle-shaped, the inner smaller; filaments glabrous; achenes about 1 mm . long, with a globose base and rough angles. In dry soil, Neb. to Wyo. and Ore., south to N. Mex. and Ariz. Summer and fall.

## 3. RÙMEXL.

Perennial or annual, leafy-stemmed herbs, some species slightly woody, the reaves in some mainly basal. Stem grooved, mostly branched, erect, spreading or creeping. Leaves flat or crisped, the ocreae brittle and fugacious, the inflorescence of simple or compound, often panicled racemes. Flowers green, perfect, diœcious, or polygamo-monœcious, whorled, on jointed pedicels. Corolla none. Calyx 6 -parted, the 3 outer sepals unchanged in fruit, the 3 inner ones mostly developed into wings, one or all three of which usually bear a callosity (tubercle); wings entire, dentate, or fringed with bristle-like teeth. Stamens 6, filaments glabrous. Style 3-parted ; stigmas peltate, tufted; achene 3-angled, the angles usually margined. Embryo borne in one of the faces of the 3 -angled seed. [The ancient Latin name.] About 130 species, of wide geographic distribution. Besides the following some 6 others occur in the southern and western parts of North America.

## * Leaves hastate; flowers dicœious. foliage acid; low species.

Inner sepals not developing wings in fruit; achene granular.
Fruiting inner sepals developing wings; achene smooth.
Basal leaves numerous; wings orbicular-cordate.
Easal leaves few; wings broadly oblong-cordate.

1. R. Acetosella.
2. R. hastatulus.
3. R. Acetosa.

## ** Leaves not hastate; flowers perfect or polygamo-diœecious; foliage scarcely or not at all acid; tali species.

Leaves flat, bright or light green, or graucescent.
Wings, $12-35 \mathrm{~mm}$. broad, reddish; no tubercles. 4. $R$. venosus.
Wings small, not red, bearing tubercles.
Tubercles usually 3 .
Pedicels little longer than the wings.
Pedicels several times longer than the wings.
Tubercle usually I ; pedicels equalling the wings.
5. $R$. salicifolius.
6. $R$. verticillatus.
7. R. altissimus.

Leaves wavy-margined or crisped, dark green, not glaucescent.
Wings entire, more or less undulate.
Lower leáves narrowed or acuminate at the base.
Tubercle 1.
8. R. Patientia.

Tubercles 3 .
9. R. Britannzca.

Lower leaves cordate or rounded at the base.
Tubercles wanting.
1о. $R$. occidentalis.
Tubercles mostly 3 .
Inflorescence not leafy; pedicels long.
Inflorescence leafy; pedicels long.
ir. R. crispus.
12. $R$. conglomeratus.

Tubercle 1 ; inflorescence not leafy; pedicels short.
13. $R$. sanguineus.

Wings toothed or fringed.
Lower leaves cordate.
Wings ovate or oblong-ovate ; tubercles mostly 2.
14. R. puicher.

Wings hastate or ovate-hastate; tubercle 1. 15. R. obtusifolius.
Lower leaves mostly narrowed at base; wings with 4 spreading bristle-like teeth.
16. R. persicarioides.

1. Rumex Acetosélla L. Field or Sheep Sorrel. (I. F. f. 1299.) Annual or perennial, glabrous, diœcious; stem slender, erect or nearly so, the rootstock woody, horizontal or creeping. Leaves narrowly hastate, $5-16 \mathrm{~cm}$. long, obtuse or acute at the apex, usually widest above the middle, petioled, the basal auricles entire or 1-2-toothed, or the uppermost leaves nearly linear and not auricled, all papillose; ocreae silvery, 2-parted, soon lacerate; flowers in erect panicled racemes; racemes interrupted; calyx green, $\mathbf{1} \mathrm{mm}$. long, pedicelled;
stamens exserted; achene less than 2 mm . long, very granular, exceeding the persistent calyx, its angles not margined. In dry fields and on hillsides throughout N. Am. except the extreme north. In large part naturalized from Europe. Sometimes a troublesome weed. May-Sept.
2. Rumex hastátulus Muhl. Engelmann's Sorrel. (I. F. f. I300.) Perennial from a woody base, glabrous, diœcious; stem rather strict, erect, $10-40 \mathrm{~cm}$. tall. Leaves hastate, oblong or oblanceolate, $2-10 \mathrm{~cm}$. long, the basal numerous, auricled at the base, subacute, petioled, those of the stem linear, all papillose; ocreae silvery, 2 -parted, at length lacerate; racemes ascending, at length interrupted; calyx green, winged in fruit; pedicels equalling or longer than the wings; wings mostly broader than high, cordate, $2-4 \mathrm{~mm}$. long; stamens slightly exserted; achene reddish, smooth, shining, less than 2 mm . long, invested by the calyxwings, its angles margined. On the seacoast, S. N. Y. to Fla. and on the plains from Kans. to Tex. March-Aug.
3. Rumex Acetòsa L. Sorrel. Sour Dock. (I. F. f. 130I.) Perennial, glabrous, diœcious; stem erect, simple, grooved, $30-90 \mathrm{~cm}$. tall. Leaves oblonghastate or ovate-sagittate, $2-12 \mathrm{~cm}$. long, acute, crisped on the margins, the basal few, long-petioled, the upper subsessile, the acute auricles entire or I-toothed and more or less reflexed; ocreae lacerate; racemes nearly erect, crowded, at length interrupted; calyx green, 2 mm . long, winged in fruit; pedicels equalling or shorter than the wings, jointed; wings cordate, $4-5 \mathrm{~mm}$. long; achene rather more than 2 mm . long, pointed, smooth, shining, blackish, invested by the calyx-wings. Lab. to Alaska. Naturalized from Europe in Vt., N. Y. and Penn. Summer.
4. Rumex venòsus Pursh. Veined Dock. (I. F. f. I3O2.) Perennial by a woody rootstock, glabrous, stem rather stout, erect, somewhat flexuous, $15-40 \mathrm{~cm}$. tall, grooved, branched. Leaves ovate to oblong, 2-12 cm. long, acute at both ends, petioled, rather coriaceous; ocreae funnelform, thin, brittle; racemes mostly erect, soon interrupted; calyx red, pedicelled, conspicuously winged in fruit; pedicels at maturity rather stout, slightly shorter than the wings, jointed at about the middle; wings broad, suborbicular, with a deep sinus at the base, veiny, reddish; achene 6 mm . long, smooth, shining, its faces concave, its angles margined. N. W. Terr. to Ore. and Wash., South to Mo. and Nev. May-Aug.
5. Rumex salicifòlius Weinm. White, Pale or Willow-leaved Dock. (I. F. f. I3O3.) Perennial, glabrous, pale green; stem erect, ascending, or sometimes spreading, flexuous, 3-9 dm. high. Leaves lanceolate, linear-lanceolate or the lower oblong, acute or acuminate at both ends, or rarely obtuse at the apex, petioled; racemes erect, divergent or reflexed, dense, in fruit interrupted below, 2 mm . long, pedicelled; pedicel' slightly longer than the wings, jointed near the base; wings triangular-ovate, 3 mm . long, undulate or subdentate, each bearing a large ovoid tubercle; achene 2 mm . long, dark red, its faces concave, its angles slightly margined. In swamps, Lab. to S. N. Y., Fla., Neb., Tex. and L. Calif. Also in Europe. May-Sept.
6. Rumex verticillàtus L. Swamp Dock. (I. F. f. 1304.) Perennial, glabrous, rather bright green; stem erect, ascending or decumbent, 6-15 dm. long, more or less flexuous when old. Leaves narrowly oblong, oblong-lanceolate or lanceolate, 5.30 cm . long, narrowed at both ends or obtusish at the apex, slightly papillose, long-petioled; racemes interrupted below, spreading in fruit; calyx green, 2 mm . long; pedicels stout, thickened above, jointed near the base. 3-5 times as long as the wings, or rarely shorter; wings broadly deltoid, 4 mm . long, more or less decurrent on the pedicel, each bearing a narrowly ovoid tubercle; achene 2.5 mm . long, reddish, pointed, its faces concave. In swamps, Quebec to Ont. and Iowa, south to Fla. and Tex. May-July.
7. Rumex altíssimus Wood. Tall or Peach-leaten Dock. (I. F. f. 1305.) Perennial, glabrous, rather pale green; stem erect, simple or sparingly branched above, 3-12 dm. tall. Leaves lanceolate, oblong-lanceolate or ovatelanceolate (sometimes oblanceolate), $5-25 \mathrm{~cm}$. long, acute at both ends, papillose; panicle rather open; racemes slightly interrupted in fruit; flowers densely whorled, 2 mm . long; pedicels slender, jointed near the base, as long as the wings; wings triangular-cordate, $4-5 \mathrm{~mm}$. long, usually orie of them only bearing an owod tubercle; achene 3 mm . long, dark red, its faces concave. Along streams and in swamps, Mass. to Neb., Md. and Tex. April-June.
8. Rumex Patiéntia L. Patience Dock. (I. F. f. 1306.) Perennial, glabrous; stem erect, simple or sparingly branched, $6-\mathbf{I} 5 \mathrm{dm}$. tall. Lower leaves ovate-lanceolate, long-petioled, $10-40 \mathrm{~cm}$. long, the upper oblong-lanceolate or oblong-elliptic, acute or obtusish, the uppermost lanceolate; fruiting panicle dense; racemes erect, somewhat interrupted in fruit; flowers densely whorled; pedicels slender, 2-4 times as long as the calyx-wings, jointed below the middle; wings orbicular-cordate, $4-6 \mathrm{~mm}$. long, one of them bearing a prominent ovoid callosity; achene 3 mm . long, light brown, its faces concave, its angles obscurely margined. In waste places, Me. and Ont. to Wis., south to Conn., Penn. and Kans. Also in the Far West. Naturalized from Europe. May-June.
9. Rumex Británnica L. Great Water-Dock. (I. F. f. 1307.) Perennial, glabrous, dark green; stem stout, erect, more or less branched, 9-18 dm. tall. Leaves lanceolate or oblong lanceolate, the lower 3-6 dm. long, long-petioled, the upper $5-15 \mathrm{~cm}$. long, short-petioled; fruiting panicle dense; racemes nearly erect, more or less interrupted; flowers densely whorled; pedicels slender, conspicuously jointed above the base, $1 / 2-2$ times as long as the calyx wings; wings broadly cordate, 6 mm . long, irregularly denticulate, each bearing a large callosity; achene ovoid-oblong, or oblong, 4 mm . long, pointed at both ends, brown, its faces concave, its angles slightly margined. In swamps and wet soil, N. B. and Ont. to Minn., N. J., Penn., Ill. and Neb. July-Aug.

Io. Rumex occidentalis S. Wats. Western Dock. (I. F. f. I308.) Perennial. glabrous; stem strict, erect or nearly so, strongly grooved, 6-9 dm. high. Leaves lanceolate or ovate-lanceolate, bluish-green, somewhat crisped and wavymargined, papillose, the lower $20-30 \mathrm{~cm}$. long, obtuse or subacute at the apex, more or less cordate at the base, long-petioled, the upper smaller and usually lanceolate; panicle rather dense, leafless or nearly so, erect; racemes usually not interrupted; flowers loosely whorled; calyx 2 mm . long; pedicels obscurely jointed below the middle, $2-3$ times longer than the calyx-wings; wings triangular-ovate, 5-8 mm. long, somewhat dentate or undulate, bearing no tubercles; achene oblong, $4-5 \mathrm{~mm}$. long, short-pointed, chestnut-brown. In wet places, Lab. to Alaska, Ont., Rocky Mountains to Tex., and to Calif. May-Aug.
II. Rumex críspus L. Curled Dock. (I. F. f. 1309.) Perennial, glabrous, dark green; stem rather slender, erect, 3-10 dm. tall. Leaves crisped and wavy-margined, the lower oblong or oblong-lanceolate, $15-30 \mathrm{~cm}$. long, longpetioled, the upper narrowly oblong or lanceolate, $7-15 \mathrm{~cm}$. long, short-petioled, all cordate or obtuse at the base, more or less papillose; panicle rather open; racemes simple or compound, by the elongation of the pedicels apparently continuous in fruit; flowers rather loosely whorled; fruiting pedicels $11 / 2-2$ times as long as the calyx-wings, jointed near the base; wings cordate, $3-4 \mathrm{~mm}$. long, truncate or notched at base, erose-dentate, or nearly entire, each bearing a tubercle; achene 2 mm . long, dark brown. In fields and waste places nearly throughout the U. S. and southern British America. Often a troublesome weed. Naturalized from Europe. Native also of Asia. June-Aug. Hybridizes with R. obtusifolius.
12. Rumex conglomeràtus Murr. Clustered or Smaller Green Dock. (I. F.f. 1310.) Perennial, glabrous, pale green; stem slender, erect, 3-9 dm. tall. Leaves ovate, oblong or lanceolate, $2.5-14 \mathrm{~cm}$. long, some of them slightly fiddleshaped, acute at the apex, obtuse at the base, crenulate and slightly crisped, petioled; panicle loose and open in fruit; racemes leafy, slender, ascending, much interrupted; flowers loosely whorled; pedicels shorter than or equalling the calyxwings, jointed near the base; wings ovate, fiddle-shaped, 3 mm . long, toothed near the base, each bearing a large oblong callosity; achene less than 2 mm . long, pointed, red, its faces convex. In waste places, Va. to S. Car. Also in Calif. Naturalized from Europe. May-July.
13. Rumex sanguíneus L. Bloody or Red-veined Dock. (I. F. f. i3ir.) Perennial, glabrous; stem slender, erect, 3-9 dm. high. Leaves oblong, oblonglanceolate or lanceolate, $2.5-15 \mathrm{~cm}$. long, the lower long-petioled, cordate at the base, acute or obtuse at the apex, usually red-veined, the upper short-petioled; panicle loose: racemes slender, spreading, not leafy. interrupted; flowers loosely whorled; pedicels slender, $\mathbf{I}-11 / 2$ times as long as the calyx-wings, jointed at the base; wings oblong, 3 mm . long, one of them bearing a spherical-oblong callosity; achene less than 2 mm . long, sharp-pointed, dark red, its faces convex. In waste
places and ballast, S. N. Y. to Va. and La. Uncommon. Naturalized or advenive from Europe. May-Aug.
14. Rumex púlcher L. Fiddle Dock. (I. F. f. 1312.) Perennial, dark green; stem slender, erect or procumbent, diffusely branched, 3-9 dm. long, the branches spreading. Leaves oblong, or some of the lower fiddle-shaped, 2.515 cm . long, long-petioled, obtuse at the apex, cordate at the base; upper oblong or oblong-lanceolate, $2.5-7.5 \mathrm{~cm}$. long, usually narrowed at both ends; petioles more or less pubescent; panicle loose; racemes long, divergent, sometimes reflexed, much interrupted, rather leafy; flowers few in the whorls; pedicels equalling the calyx-wings, jointed at or below the middle; wings ovate or oblong-ovate, 4 mm . long, truncate at the base, one larger than the others or all three of different sizes, fringed with spine-like teeth, usually two, sometimes one or all three bearing tubercles; achene 2 mm . long, pointed, reddish, its faces concave. In waste places, Va. to Fla. and La. Also on the Pacific Coast and in ballast about the northern seaports. Naturalized from Europe. June-Sept.
15. Rumex obtusifòlius L. Broad- Leaved or Bitter Dock. (I. F. f. 1313.) Perennial, glabrous, dark green; stem stout, erect, more or less scurfy above, 6-12 dm. tall. Lower leaves oblong-lanceolate, $15-35 \mathrm{~cm}$. long, long-petioled, all cordate or rounded at the base, obtuse or acute at the apex, the upper lanceolate or oblong-lanceolate, $5-15 \mathrm{~cm}$. long, short-petioled, somewhat undulate or crisped; panicle rather open; racemes nearly erect, continuous or interrupted below; flowers loosely whorled; pedicels slender, somewhat longer than the calyxwings, jointed below the middle; wings hastate, $4-5 \mathrm{~mm}$. long, fringed with a few spreading spiny teeth, one of them bearing an oblong tubercle; achene 2 mm . long, pointed, dark red, its faces concave, its angles slightly margined. In waste places, N. S. and N. B. to Ore., south to Fla. and Tex. Naturalized from Europe. Native also of Asia. June-Aug.
16. Rumex persicarioìdes L. Golden Dock. (I. F. f. 1314.) Annual, pubescent, pale green; stem rather stout, erect and simple, or diffusely branched, 3-9 dm. high, sometimes spreading or creeping, very leafy. Leaves lanceolate, or oblong, $2.5-30 \mathrm{~cm}$. long, narrowed at the base, or sometimes cordate, or sagittate, acute at the apex, undulate; panicle simple or compound ; racemes erect, leafybracted, mostly interrupted; flowers densely whorled; pedicels slender, $\mathbf{I}-\mathbf{1} \frac{1}{2}$ times as long as the calyx-wings, jointed at the base; wings oblong, 2 mm . long, with $\mathrm{r}-3$ bristles on each margin, each bearing an ovoid or oblong callosity; achene less than 2 mm . long, pointed, reddish, its faces convex, its angles slightly margined. On sandy shores, N. B. to Va., extending across the continent through British America, south in the interior to Kan. and N. Mex. and on the Pacific Coast to Calif. Has been confounded with $R$. maritimus L. of the Old World. July-Oct.

## 4. OXÝRIA Hill.

Low fleshy glabrous perennial herbs, with erect stems. Leaves mostly basal, long-petioled, reniform or orbicular, cordate, palmately nerved, with cylindric ocreae. Flowers perfect, green, in terminal panicled racemes. Calyx 4-parted, the outer segments smaller than the inner; stamens 6, included; filaments short, subulate, glabrous. Ovary I-celled; ovule solitary; style 2 -parted; stigmas fimbriate, persistent on the large wings of the fruiting calyx. Achene lenticular. Embryo straight, borne in the centre of the endosperm. [Greek, sour, from the acid leaves.] Two known species, the following, and one in the Himalayas.
I. Oxyria dígyna (L.) Camptdera. Mountain Sorrel. (I. F. f. 1315.) Rootstock large, chaffy; stems scape-like, simple or sparingly branched, kafless or nearly so, 5-30.cm. tall. Leaves reniform or orbicular-reniform, $1-3.5 \mathrm{~cm}$. wide, undulate, sometimes emarginate at the apex, the basal long-petioled; ocreae oblique, loose, racemes many-flowered; flowers slender-pedicelled; segments oblong, the inner erect, the outer reflexed in fruit; achene ovoid, smooth. surrounded by a broad membranous wing. Greenland and Lab. to Alaska, south to the White Mits. of N. H. and in the Rocky Mts. to Colo. Also in northern Europe and Asia. July-Sept.

## 5. FAGOPỲRUM Gaertn.

Annual or perennial rather fleshy usually glabrous leafy herbs, with erect, striate or grooved stems. Leaves alternate, petioled, hastate or deltoid, with ob-
lique, cylindric or funnelform ocreae. Flowers small, white or green, in terminal or axillary usually paniculate racemes, perfect, borne solitary or several together from each ocreola, slender-pedicelled. Calyx about equally 5 -parted, persistent and unchanged in fruit, the segments petaloid, shorter than the achene. Stamens 8; filaments filiform, glabrous. Ovary I-celled, I-ovuled; style 3-parted; stigmas capitate. Achene 3 -angled. Embryo central, dividing the mealy endosperm into two parts; cotyledons broad. [Greek, beech-wheat, from the similarity of the grain.] About 6 species, native of Europe and Asia.

Racemes panicled or corymbose; angles of the achene not crested.
Racemes mostly simple; angles of the achene crested, undulate.

1. F. Fagopyrum.
2. F. Tataricum.
3. Fagopyrum Fagopỳrum (L.) Karst. Buckwheat. (I. F. f. I3I6.) Annual, glabrous except at the nodes, stem 3-9 dm. high. Leaves hastate, $2.5-7.5 \mathrm{~cm}$. long, abruptly narrowed above the middle, acuminate, the nerves on the lower surface slightly scurfy; ocreae brittle and fugacious; racemes mostly panicled, sometimes corymbose, many-flowered, erect or inclined to droop; pedicels as long as the calyx; calyx-segments white or whitish; stamens included; style-branches deflexed in fruit; achene acute, 5 mm . long, about twice as long as the calyx, its faces pinnately-striate when mature, the angles acute, not crested. In waste places, and persistent in fields after cultivation. Reported from almost all parts of the northern U. S. and southern British America. Native of eastern Europe or western Asia. June-Sept.
4. Fagopyrum Tatáricum (L.) Gaertn. Tartary Buckwheat. (I. F. f. 1317.) Annual, similar to the preceding species, but the leaves deltoid-hastate, or oblong-hastate, often broader than long, $2.5-10 \mathrm{~cm}$. wide, acute or short-acuminate at the apex; racemes terminal and axillary, mostly solitary, simple and fewflowered, long-peduricled; flowers whitish, short-pedicelled; achene subacute, 5 mm . long, its angles crested with three prominent lobes above the middle, its faces pinnately sulcate from a conspicuous groove. In waste places, eastern Canada and New England. Adventive from Asia. Summer.

## 6. POLÝGONUM L.

Annual or perennial, terrestrial or aquatic herbs, some species woody, with erect. prostrate, climbing or floating stems, alternate entire leaves, continuous with, or jointed to the cylindric funnelform or two-lobed, often lacerate or fringed ocreae, Flowers normally perfect, green, white, pink or purple, variously clustered, the clusters terminal or axillary. Pedicels jointed, subtended by ocreae or ocreolae; calyx 4-5-parted or 4-5-cleft, the outer sepals or segments somewhat larger than the inner: stamens 5-9, included or exserted; filaments filiform, or dilated at the base, glabrous; style 2-3-parted or 2-3-cleft, its branches included or exserted; stigmas capitate: achene lenticular or 3 -angled (rarely 4 angled), invested by or exceeding the calyx. Embryo near the end of the seed, in one of its angles. [Greek, manyknees from the swollen joints of some species.] About 200 species, of wide geographic distribution. Besides the following, some 33 others occur in the western and southern parts of North America.

1. Flowers in terminal spike-like racemes; calyx 5 -cleft or 5 -parted: stem not twining. Raceme solitary ; alpine species; perennial, not aquatic.
I. $P$. viviparum.

Racemes solitary or 2 ; aquatic or swamp species; perennials.
Leaves oblong, elliptic, or elliptic-lanceolate, not acuminate. 2. P. amphibium.
Leaves narrowly lanceolate, or oblong-lanceolate, not acuminate.
3. P. Hartwrightiz.

Leaves ovate-lanceolate, or oblong-lanceolate, usually acuminate.
4. P. emersum.

Racemes several or numerous; annuals or perennials, mostly terrestrial.
Ocreae naked or ciliolate, their limbs not spreading.
Racemes drooping.
Achene ovoid; style 2-parted to near the base. 6. P. incarnatum.
Achene broadly oblong-ovoid; style 2 -cleft to-below the middle. '
7. P. lapathifolium.

Racemes erect.
Style-branches scarcely or slightly exserted. Achene broadly oblong, biconvex. 5. P. Portoricense. Achene orbicular, flat. 8. P. Pennsylvanicum Style-branches long-exserted; achene ovoid, somewhat gibbous.
9. P. Iongistylum.

Ocreae fringed with bristles, their limbs not spreading.
Racemes not interrupted, erect ; achene lenticular or 3 -angled.
Ocreae conspicuously fringed; achene broadly ovoid.
ro. P. Persicaria.
Ocreae inconspicuously fringed; achene narrowly ovoid.
11. P. persicarioides.

Racemes not interrupted, erect; achene always 3 -angled.
Ocreolae conspicuously fringed.
14. P. Opelousanum.

Ocreolae inconspicuously fringed.
Leaves mostly glabrous above; achene pointed at the top.
15. P. hydropiperoides.

Leaves strigose above; achene pointed at both ends.
13. $P$. setaceum.

Racemes not interrupted, drooping.
Racemes interrupted, erect or drooping.
Achene granular and dull; racemes drooping. 16. P. Hydropiper.
Achene smooth, shining; racemes erect. 17. P. punctatum.
Ocreae fringed with bristles, their limbs normally spreading.
18. $P$. orientale.
2. Flowers in long naked much interrupted spike-like racemes; calyx 4 parted.
19. P. Virginzanum.
3. Flowers in axillary clusters; stems more or less wiry, not twining.

Plants prostrate; achene invested by the calyx.
Achene pointed at the apex, rounded at the base.
Leaves mostly acute; style 3-parted to below the middle.
Leaves mostly obtuse; style 3-parted to the base. 20. P. aviculare
Achene pointed at both ends.
21. P. littorale.
ats prostrate ; achene protruding beyond the calyx.
Leaves mostly longer than the internodes ; sea beach species.
23. P. maritimum.

Leaves shorter than the internodes; plant of waste places. 24. P. Rayi.
Plants erect or ascending, rather stout.
Achene invested by the calyx.
Leaves oval, oblong or obovate, persistent. 25. P. erectum.
Leaves narrowly lanceolate or linear-oblong, persistent. 27. P. ramosissimum.
Leaves oblong-lanceolate or narrowly oblong, fugacious.
Achene much exserted beyond the calyx.
28. P. camporum.
ants strictly erect and very slender.
26. P. exsertum.

Leaves with a lateral impression on either side of the midvein; fruiting pedicels stout, erect.
29. P. tenue.

Leaves without lateral impressions ; fruiting pedicels slender, deflexed.
30. P. Douglasiz.
4. Flowers in axillary and terminal clusters, racemes or panicled racemes: stems mostly twining.
Stems twining ; herbaceous vines.
Outer segments of the calyx unchanged, or keeled in fruit.

Achene granular and dull; ocreae not bristly.
Achene smooth and shining; ocreae bristly.
3r. $P$. Conzolviulus.
32. P. cilinode.

Outer segments of the calyx conspicuously winged in fruit.
Calyx-wings not incised.
Fruiting calyx ro-12 mm. long, the wings crisped. 33. P. scandens.
Fruiting calyx 6-8 mm. long, the wings rather flat. 34. P. dumetorum.
Calyx-wings incised.
Stems stout, erect, tall : outer calyx-segments winged in fruit.
5. Flowers in capitate clusters or racemes; stem climbing by recurved prickles.

Leaves sagittate: achene 3 -angled.
Leaves halberd-shaped; achene lenticular.
i. Polygonum vivíparum L. Atrine. Bistort. (l. F. f. isis.) Peremnial by a corm-like rootstock, mostly glabrous and somewhat ghacous: stems solitary
or clustered, erect, simple, 5-25 cm. tall. Basal leaves oblong or lanceolate, 2.5-20 cm . long, rather acute at the apex, cordate or subcordate at the base, long-petioled; stem leaves narrowly lanceolate or linear, $2.5-7.5 \mathrm{~cm}$. long, the lower petioled, the upper sessile, their margins often revolute; ocreae clasping below, open above; raceme solitary, terminal, narrow, rather dense, bearing a number of rather darkcolored bulblets about its base; calyx 5 -parted, pale rose-color or white; stamens 8 , exserted; style 3-parted, achene oblong, 3-angled. Greenland and Labrador to Alaska, south to the high summits of the mountains of New England, and in the Rocky Mountains to Colo. Also in Arctic and alpine Europe and Asia. JuneAug.
2. Polygonum amphíbium L. Water Persicaria. (I. F. f. 1319.) Aquatic, perennial, glabrous when mature; stem floating or submersed, $1-6 \mathrm{~m}$. long. Leaves oblong, elliptic or elliptic-lanceolate, $4-10 \mathrm{~cm}$. long, petioled, obtuse or subacute at the apex, slightly inequilateral, rounded or narrowed at the base, sometimes ciliate; ocreae cylindric, those of the branches often longer than the internodes, their limbs sometimes spreading, usually glabrous; raceme terminal, usually solitary, $12-25 \mathrm{~mm}$. long, dense, erect, oblong or ovoid; calyx rose-color, 5 -parted; stamens 5, exserted; style 2 -cleft, exserted; achene orbicular-oblong, lenticular, 3 mm . long, biconvex, black, smooth and shining, or granular. In ponds and lakes, Quebec to Alaska, south to northern N. J., Ky., Colo. and Cal. Also in Europe.• July-Aug.
3. Polygonum Hartwrightii A. Gray. Hart Wright's Persicaria. (I. F. f. 1320.) Perennial by rootstocks, more or less hispid; stem ascending, decumbent or erect, 1.5-6 dm. long, many-jointed, usually rather stout. Leaves lanceolate, oblong-lanceolate or oblong, $7-15 \mathrm{~cm}$. long, obtuse or subacute the apex, short-petioled or sessile; ocreae cylindric, varying from one-half as long to as long as the internodes, the limb abruptly spreading, fringed with short bristles; racemes usually solitary, dense, $\mathbf{I}-2.5 \mathrm{~cm}$. long, oblong; calyx rose-colored, 5 -parted; stamens 5, exserted; style exserted, 2 -cleft to beyond the middle; achene oblong, biconvex, lenticular, black, smooth, shining. In swamps or moist soil, Hudson Bay to Ore., south to Me., S. Penn., Kans., Nev. and L. Calif. JuneAug.
4. Polygonum emérsum (Michx.) Britton. Swamp Persicaria. (I. F. f. 1321.) Perennial by long creeping or horizontal rootstocks, glabrous or strigosepubescent; stem erect or assurgent, commonly simple, enlarged at the nudes, 3-9 dm. or sometimes 6 m . long: 'Leaves ovate-lanceolate or oblong-lanceolate, or the upper sometimes narrowly lanceolate, $6-20 \mathrm{~cm}$. long, acute or usually acuminate at the apex, rounded or cordate at the base, petioled, the lateral nerves prominent, sometimes forking; ocreae cylindric, not ciliate; racemes $\mathbf{1}$ or 2 , erect, $2.5-8 \mathrm{~cm}$. long, linear-oblong, dense; calyx dark rose-color, 5-parted; stamens 5, exserted; style 2 -cleft, exserted; achene broadly obovate or orbicular, 3 mm . long, very convex, lenticular, black and slightly granular, but shining. In swamps and moist soil, Me., Ont. to N. W. Terr. and Br. Col., south to Va., La. and Mex. July-Sept.
5. Polygonum Portoricénse Bertero. Dense-flowered Persicaria. (I. F.f. 1322.) Perennial, more or less scurfy; stem erect, decumbent or floating, I-I.5 m. long or longer, branched, enlarged at the nodes. Leaves lanceolate or linearlanceolate, 4-30 cm. long, acuminate at both ends, obscurely punctate, shortpetioled, the nerves prominent beneath; ocreae cylindric, sometimes bristly when young, naked when mature, sometimes hispid; racemes narrow, paniculate, often in pairs, $2.5-13 \mathrm{~cm}$. long, dense, erect; calyx white or whitish, 5 -parted to near the base; stamens 6-8, included; style $2-3$-cleft, somewhat exserted; achene lenticular and strongly biconvex or 3-angled, $2-3 \mathrm{~mm}$. long, broadly oblong, orbicular or even broader than high, black, smooth and shining, or minutely granular. In wet soil, Mo. to Fla., Tex., the W. I. and S. Am. May-Nov.
6. Polygonum incarnàtum Ell. Slender Pink Persicaria. (I. F. f. 1323.) Annual, glabrous or nearly so ; stem erect, more or less swollen at the nodes, 6-12 dm. tall. Leaves lanceolate, $7-22 \mathrm{~cm}$. long, acuminate at both ends, short-petioled, sparingly punctate and ciliate; ocreae cylindric, loose, brittle, sometimes ciliolate when young, glabrous when mature; racemes panicled, drooping, $3.5-10 \mathrm{~cm}$. long, linear, many-flowered; calyx white or pink, small, 5 -parted;
stamens 6; style 2-parted to near the base; achene ovoid-oblong, lenticular, about 2 mm . long, flat or biconcave, smooth, shining. In wet soil, Vt. to Ill. and Neb., south to Fla. and La. June-Sept.
7. Polygonum lapathifòlium L. Dock-leaved or Pale Persicaria. (I. F. f. I324.) Annual, stem erect or ascending, swollen at the nodes, 3-9 dm. high, the peduncles and pedicels glandular. Leaves lanceolate or oblonglanceolate, $5-25 \mathrm{~cm}$. long, usually broader than those of the preceding, attenuate to the apex, acuminate at the base, short-petioled, ciliate, inconspicuously punctate; ocreae cylindric, ribbed or striate; racemes panicled, $2.5-10 \mathrm{~cm}$. long, drooping, narrow, rather dense; calyx pink, greenish or white, 5 -parted; stamens 6; style 2-parted to below the middle; achene broadly oblong or ovoid, lenticular, 2 mm . long, brownish or black, slightly reticulated but shining, its faces concave. In waste places, throughout temperate N. Am. Nat. from Europe. Sometimes a troublesome weed. Native also of Asia. June-Sept.

Polygonum lapathifolium nodòsum (Pers.) Small. Generally robust and glabrous; stem stout, reddish, purple spotted and with a purple ring below each ocrea, much thickened at the nodes; leaves conspicuously punctate; racemes $2.5-7.5 \mathrm{~cm}$. long, less drooping, often erect ; achene slightly larger. Occasional in the range of the type.

Polygonum lapathifolium incànum (Schmidt) Koch. Low; stem slender, erect, $5-30 \mathrm{~cm}$. high, slightly scurfy; leaves lanceolate, ovate or oblong, usually narrowed at the base, white-tomentose beneath, glabrous above; racemes $1-4 \mathrm{~cm}$. long. In waste places, N. S. to Ont., N. Y., and Br. Col.
8. Polygonum Pennsylvánicum L. Pennsylvania Persicaria. (I. F. f. 1325.) Annual, glabrous below; stem erect, 3-9 dm. tall, the upper parts, the peduncles and pedicels glandular. Leawes lanceolate, acuminate at the apex, petioled, ciliate, $5-30 \mathrm{~cm}$. long, the upper sometimes glandular beneath; ocreae cylindric, naked, glabrous; racemes panicled, erect, thick, oblong or cylindric, dense, $2.5-5 \mathrm{~cm}$. long; calyx dark pink or rose-color, 5 -parted; stamens 8 or fewer; style 2 -cleft to about the middle; achene orbicular or mostly broader than high, 3 mm . long, short-pointed, lenticular, smooth, shining. In moist soil, N. S. to Ont., Minn., Fla. and Tex. July-Sept.
9. Polygonum longístylum Small. Long-styled Persicaria. (I. F. f. 1326.) Annual or perennial, glabrous except the glandular upper branches and peduncles; stem erect, rather slender, 3-9 dm. tall. Leaves lanceolate or ovatelanceolate, $2.5-\mathbf{1 5} \mathrm{cm}$. long, acuminate at both ends, petioled, their margins undulate, slightly crisped, more or less ciliolate; ocreae cylindric, entire, brittle; racemes panicled, sometimes geminate, $2.5-8 \mathrm{~cm}$. long, rather dense, erect; calyx lilac, 5 -parted to below the middle, the lobes petaloid; stamens $6-8$, included; style 2 -parted, slender, conspicuously exserted; stigmas black; achene broadly ovoid, lenticular, slightly gibbous on both sides, long-pointed, black, granular, but somewhat shining, 2.5 mm . long. In moist soil, S. Ill. and Mo. to La. and N. Mex. Aug.-Oct.
10. Polygonum Persicària L. Lady's Thumb. (I. F. f. 1327.) Annual, glabrous or puberulent; stem erect or ascending, $\mathbf{1} .5-6 \mathrm{dm}$. high. Leaves lanceolate or linear-lanceolate, $2-15 \mathrm{~cm}$. long, acuminate at both ends, conspicuously punctate, usually with a dark triangular or lunar blotch near the centre, their margins entire or slightly eroded, often ciliate; ocreae cylindric, nearly glabrous, fringed with short bristles; racemes solitary or panicled, $\mathbf{1}-5 \mathrm{~cm}$. long, ovoid or oblong, dense, erect ; calyx pink or dark purple; stamens mostly 6; style 2-3parted to below the middle; achene broadly ovate and lenticular, often gibhous or 3 -angled, $2-2.5 \mathrm{~mm}$. long, smooth and shining. In waste places, throushout N. Am. except the extreme north. Nat. from Europe. Often an abundant weed. JuneOct.
11. Polygonum persicarioides H. B. K. Southwestern Persicaria. (I. F. f. I328.) Perennial, glabrous or minutely pubescent; stem erect, decumbent or creeping, 3-9 dm. long. Leaves lanceolate or linear-lanccolate, acuminate at both ends, punctate, $4-25 \mathrm{~cm}$. long; ocreac cylindric, glabrous, or sparingly strigillose, fringed with short bristles; racemes more or less panicled, erect. $2.5-7.5 \mathrm{~cm}$. long, narrowly oblong or linear, loosely flowered; calyx rose-color tinged with green, 5 -parted to below the middle; stamens $S$ or fewer; style $2-3$ -
parted to near the base; achene lenticular and biconvex, or 3-angled, more or less gibbous, 2 mm . long, ovoid or broadly oblong, short-pointed, black, minutely granular, but shining. Neb. to Mex.; widely distributed in tropical Am. JuneSept.
12. Polygonum Càreyi Olney. Carey's Persicaria. (I. F. f. 1329.) Annual, rough-glandular throughout; stem erect, 3-9 dm. tall. Leaves oblonglanceolate or linear-lanceolate, the uppermost nearly linear, 5-27 cm. long, shortpetioled or nearly sessile, acuminate at both ends, hispid on the midrib, ciliate, sparingly punctate; ocreae cylindric, sparsely hispid, fringed with long bristles; racemes several, narrow, loosely flowered, drooping, $2-7 \mathrm{~cm}$. long; calyx purplish; stamens 5 or sometimes 8; style 2-parted to below the middle; achene lenticular, broadly ovoid or obovoid, $2.5-3 \mathrm{~cm}$. long, short-pointed, thick, smooth and shining. In marshes, Me. and Ont. to Mich., south to R. I., N. J. and Penn. July-Sept.
13. Polygonum setàceum Baldw. Bristly Persicaria. (I. F. f. I330.) Perennial, strigose; stem 6-12 dm. high, erect, simple or sparingly branched; leaves lanceolate or oblong-lanceolate, $5-23 \mathrm{~cm}$. long, acuminate at both ends, ciliate, inconspicuously punctate; ocreae cylindric, strigose, fringed with very long bristles; racemes few, terminal, $2.5-6.5 \mathrm{~cm}$. long, erect, narrow, sometimes geminate, rather loosely flowered; calyx white or pink; stamens 8 ; style 3-parted to below the middle; achene 3 -angled, oblong or obovoid, thick-pointed, $\mathrm{I}-2 \mathrm{~mm}$. long, minutely reticulated and rather dull, or smooth and shining. In swamps, southern Mo. to La., east to N. Car. and Fla. June-Sept.
14. Polygonum Opelousànum Riddell. Opelousas Persicaria. (I. F. f. 133I.) Perennial, glabrous or nearly so; stem slender, erect or ascending, sparingly or considerably branched, 3-9 dm. tall, becoming woody below. Leaves linear or linear-lanceolate, $4-13 \mathrm{~cm}$. long, ciliate; ocreae cylindric, strigose, fringed with long bristles; spike-like racemes panicled, erect, often geminate, $\mathbf{I} .2-5 \mathrm{~cm}$. long, not densely flowered; calyx white, 5 -parted to below the middle; stamens 8 or fewer; style deeply 3 -parted; achene 3 -angled or rarely 4 -angled, broadly ovoid or obovoid, 1.5 mm . long, black, smooth and shining. Mo. to La., Tex. and Mex. July-Sept.
15. Polygonum hydropiperoìdes Michx. Mild Water Pepper. (I. F. f. 1332.) Perennial, strigillose; stem erect, decumbent or prostrate, slender, 3-9 dm. long. Leaves narrowly lanceolate or oblong-lanceolate, varying to linear-lanceolate, $5-15 \mathrm{~cm}$. long, short-petioled, acute at apex, ciliate, pubescent with appressed hairs on the midrib beneath; ocreae cylindric, loose, strigose, fringed with long bristles; racemes panicled, terminal, erect, narrow, more or less interrupted, 3-7.5 cm . long; calyx pink or greenish; stamens 8; style 3-parted to below the middle; achene 3 -angled, ovoid or oblong, $2-2.5 \mathrm{~mm}$. long, smooth, shining. In swamps and wet soil, N. B. to Minn. and Calif., south to Fla. and Mex. June-Sept.

Polygonum hydropiperoides Macoùni Small. More robust than the type; stem 3-12 dm. long, clothed with stout appressed hairs : leaves lanceolate, obtuse ; ocreolae more or less ciliate ; calyx white or whitish, often conspicuous. Quebec to W. Va. and Ind. Also in Calif.
16. Polygonum Hydrópiper L. Smart-weed. Water Pepper. (I. F. f. 1333.) Annual, glabrous, stem erect, often red or reddish, 2-6 dm. tall. Leaves lanceolate or oblong-lanceolate; $2.5-8 \mathrm{~cm}$. long, short-petioled, acute or acuminate at the apex, undulate or slightly crisped, punctate, ciliate, very acrid; ocreae cylindric, fringed with short bristles, sometimes slightly pubescent, usually swollen at the base by the development of several flowers within; racemes panicled, 2.5-7.5 cm . long, narrow, drooping, interrupted; calyx green, 3 - 5 -parted (usually 4 -parted), conspicuously punctate; stamens 4 or sometimes 6: style short, 2-3-parted; achene lenticular or 3-angled, broadly oblong or ovoid, slightly gibbous, $2.5-3 \mathrm{~mm}$. long, granular, dull. In moist waste places, almost throughout N. Am. Naturalized from Europe in our area, perhaps indigenous in the far Northwest. July-Sept.
17. Polygouum punctàtum Ell. Dotted or Water Smart-weed. (I. F.f. 1334.) Annual or perennial, glabrous or very nearly so; stem erect or ascending, rarely prostrate, simple or branched, 3-12 dm. long. Leaves lanceolate or oblonglanceolate, $3-20 \mathrm{~cm}$. long, acuminate at both ends, petioled, ciliate. conspicuously punctate, acrid, the midrib often with a few scattered hairs; ocreae cylindric,
falling away at maturity, fringed with long bristles; racemes narrow, erect or slightly drooping, loosely-flowered, $2-8 \mathrm{~cm}$. long; calyx greenish; stamens 8 ; style $2-3$-parted to the base; achene oblong, thick, lenticular or 3 -angled, 2.5 mm . long, smooth, shining. In swamps and wet places, throughout N. Am. except the extreme north. June-Oct.

Polygonum punctàtum leptostàchyum (Meisn.) Small. Rather smaller; stem slender, 3-6 dm. long; leaves narrower ; racemes very slender and much interrupted, clustered at the summit; achene about 2 mm . long, oblong, shining. Vt. to Calif., south to Fla. and Mex.

Polygonum punctàtum robústior Small. Larger and stouter than the type, leafy ; stem 6-12 dm. tall, conspicuously enlarged at the nodes ; leaves $5-20 \mathrm{~cm}$. long; racemes thicker, $2.5-10 \mathrm{~cm}$. long, interrupted below; achene 3 mm . long, slightly granular, somewhat obovoid; calyx-segments white. Mass. to Fla., near the coast.
18. Polygonum orientàle L. Prince's Feather. (I. F.f. 1335.) Annual, more or less hispid; stem erect, 3-25 dm. tall, branched. Leaves ovate or broadly oblong, $7-30 \mathrm{~cm}$. long, petioled, acuminate at the apex, ciliate; petioles slightly winged; ocreae cylindric, loose, mostly with a spreading border, ciliate; racemes panicled, oblong-cylindric, $2.5-10 \mathrm{~cm}$. long, dense, drooping; flowers large for the genus; calyx dark rose-color or crimson; stamens 7, exserted; style 2 -cleft to above the middle; achene orbicular or broader than long, lenticular, flat, 3 mm . in diameter, finely reticulated and rather dull. In waste places, escaped from gardens throughout eastern N. Am. Native of India. Aug.-Sept.
19. Polygonum Virginiànum L. Virginia Knotweed. (I. F. f. 1336.) Annual, nearly glabrous, or strigose; stem erect or arching, simple, or branched above, 3-12 dm. tall. Leaves ovate, elliptic-ovate or ovate-lanceolate. shortpetioled, acuminate at the apex, $5-15 \mathrm{~cm}$. long, sparingly ciliate; ocreae cylindric, strigose, fringed with short bristles; racemes spike-like, naked, greatly elongated and interrupted, sometimes $4-5 \mathrm{dm}$. long; calyx curved, greenish or rose-color, 4-cleft; stamens 5; style long, exserted, 2-parted to the base, its branches at length curled; achene 4 mm . long, ovate-oblong, lenticular, strongly biconvex, dark brown or cream-colored, shining. In woods, N. S. to Minn., south to Fla. and Tex. July-Nov.
20. Polygonum aviculàre L. Knotgrass. Door-weed. (I. F. f. I337.) Annual or commonly perennial, slender, glabrous, dull green or bluish green; stem prostrate or ascending, $1-7 \mathrm{dm}$. long. Leaves oblong, linear or oblanceolate, $0.5-2$ cm . long, jointed to the ocreae, narrowed at the base, usually acute at the apex, not conspicuously veined; ocreae oblique, silvery, 2 -parted or at length lacerate: clusters axillary, 1-5-flowered; calyx green, 5 -parted, the lobes with a white or pink border; stamens 5 -8; style short, 3 -parted to near the base; achene 3 -angled, ovoid, 2 mm . long, acute, reticulated. A weed in cultivated and waste grounds, common almost throughout N. Am., Asia and Europe. June-Oct.
21. Polygonum littoràle Link. Shore Knotweed. (I. F. f. 1338.) Annual or perennial, stout, glabrous, bright green or slightly glaucous; stem 3-12 dm. long, prostrate or ascending, diffusely branched from a woody base, striate. Leaves oblong, oblong-lanceolate or oblanceolate, $0.5-2.5 \mathrm{~cm}$. long, obtuse or subacute at the apex, mostly acuminate at the base, prominently veined, often crisped, jointed to the ocreae; ocreae oblique, at length lacerate; flowers axillary, 2-6 in each cluster ; calyx green, its lobes whitish-margined or carmine: stamens 8 ; style short, 3 -parted to the base; achene broadly ovoid, 3 -angled, 3 mm . long, more or less pinched at the apex. On shores and in waste places, N. 13. to Minn. and Cal., south to Va., Ill. and Kans. Also in Europe. Aug.-Sept.
22. Polygonum Bellàrdi All. Bellari's Knotweel. (1. F. f. 1339.) Annual, dingy green; stem slender, prostrate or spreading, $3-\mathrm{c}$ dm. long, often diffusely branched, striate. Leaves oblong-lanceolate or linear-lanceolate, shortpetioled, $0.5-4 \mathrm{~cm}$. long, acute at the apex, acuminate at the base. distant, prominently veined beneath, jointed to the ocreae; ocreae oblique, silvery, slightly lacerate when young, becoming much incised when old: flowers 1 -3 torether in the axils; calyx green, its lobes white-margined; stamens $8:$ style 3 -parted to the base, very short; achene ovoid or oblong-ovoid. 3 -angled, rather prointed at both ends. $2-2.5 \mathrm{~mm}$. long, reticulated and rather dull. In waste grounds, Washington, D. C. Adventive from eastern Europe and western Asia.
23. Polygonum marítimum L. Seaside Knotweed. (I. F. f. 1340.) Perennial or sometimes annual, glaucous, glabrous; root usually deep, woody; stem prostrate or ascending, branched, 2-5 dm. long. Leaves ovate or oblong, mostly equalling or longer than the internodes, $0.5-2.5 \mathrm{~cm}$. long, fleshy, veined beneath, somewhat rugose above, conspicuously jointed to the ocreae, the margins often revolute; ocreae large, silvery, at length lacerate, becoming brown at the base; flowers $1-3$ together in the axils; calyx white or pinkish; stamens 8; style short, 3 -parted; achene 3 -angled, ovoid or narrowly ovoid, 3 mm . long, acute or acuminate, shining, longer than the calyx. In sands of the seashore, Me. to Fla. Also on the coast of Europe. July-Sept.
24. Polygonum Rayi Babingt. Ray's Knotweed. (I. F. f. 1341.) Perennial or annual, glabrous, slightly glaucous ; stem I-6 dm. long, prostrate, usually much branched. Leaves ovate-lanceolate or oblong, $0.5-3 \mathrm{~cm}$. long, acute or obtusish at the apex, veined beneath, inconspicuously so abuve, shorter than the internodes, inconspicuously jointed to the ocreae; ocreae becoming lacerate, silvery, brown and glaucous at the base when old; flowers 2-4 together in the axils; stamens 5 or 6 ; style short, 3 -parted to the base; achene ovoid, 3 -angled, $4-6 \mathrm{~mm}$. long, slightly granular but shining, much exceeding the calyx. In waste places, N. B. and Prince Edward's I. to Br. Col., south along the Atlantic coast to Va. Apparently naturalized from Europe. May-Sept.
25. Polygonum eréctum L. Erect Knotweed. (I. F. f. 1342.) Annual, glabrous; stem erect or ascending, 2-6 dm. high, terete, nearly simple or much branched. Leaves oval, oblong or obovate, subsessile or short-petioled, $0.5-4 \mathrm{~cm}$. long, obtuse or subacute at the apex, conspicuously jointed to the ocreae; ocreae oblique, funnelform, soon lacerate, silvery when young; flowers I or 2 together in the axils; calyx greenish, enlarged in fruit; stamens 6 (sometimes 5); style very short, 3 -parted to near the base; achene ovoid-pyramidal, 3 -angled, 3 mm . long, reticulated and dull, invested by the calyx, or the apex slightly protruding. In moist or dry soil, Me, to Ont., the N. W. Terr., Tenn. and Ark. July-Sept.
26. Polygonum exsértum Small. Long-Fruited KNotweed. (I. F. f. 1343.) Annual, glabrous, sometimes slightly glaucous; stem slender, brownish, erect or nearly so, conspicuously striate, branched, 5-10 dm. tall. Leaves lanceolate, rarely oblanceolate, $\mathbf{I}-4 \mathrm{~cm}$. long, acute or cuspidate at the apex, acuminate at the base, nearly sessile; ocreae soon lacerate, silvery, becoming brownish; calyx greenish or white, 6-parted to near the base; stamens 5 or 6 ; style 3 -cleft or 3parted, very short; achene 3-angled, narrowly pyramidal, 5-6 mm. long, more or less constricted above the middle, chestnut brown, smooth, shining, $2-3$ times as long as the calyx, at length twisted. N. IV. Terr., south to Ill., Mo. and Neb., and on the Atlantic coast, in brackish marshes, from Me. to N. Y. Aug.-Oct.
27. Polygonum ramoísssimum Michx. Bushy Knotweed. (I. F. f. I344.) Annual, bright green or yellowish green, glabrous; stem erect or ascending, usually very much branched, slender, usually rigid, I-I2 dm. tall. Leaves lanceolate or linear-oblong, $0.5-4 \mathrm{~cm}$. long, acuminate at both ends, persistent, conspicuously jointed to the ocreae; ocreae oblique, funnelform, few-nerved, becoming deeply lacerate ; flowers several together in the axillary clusters; calyx 5-6. parted, greenish-white; stamens 6 or fewer ; style very short, 3 -parted to the base; achene 3 -angled, acute, sometimes slightly protruding beyond the calyx, nearly 3 mm . long, black, reticulated, dull. In saline soil, Minn. to the N. W. Terr., N. Mex. and Cal., and on the Atlantic coast from Me. to N. J. July-Sept.

Polygonum ramosíssimum prolificum Small. Bushy, much branched; stem nearly erect, its internodes short, its nodes giving off 2 or more branches; leaves narrower; flowers and achenes more numerous. Neb. and Kan., also on the coast of Me.
28. Polygonum campòrum Meisn. Prairie Knotweed. (I. F. f. 1345.) Annual or perennial, glabrous ; stem mostly erect, slightly striate, much branched, sometimes slightly glaucous, 6-9 dm. tall. Leaves linear-lanceolate or oblong, soon falling away, subsessile, rather obtuse at the apex, veined beneath, 0.5-2.5 cm . long ; ocreae funnelform, early lacerate and fugacious, dark brown; flowers several together in the axillary clusters; pedicels short; stamens 8 ; style short, 3 -parted ; achene pyramidal-ovoid, 3 -angled, black, nearly 3 mm . long, shining. On prairies, Neb. to La., and N. Mex. Also in S. Am. July-Sept.
29. Polygonum ténue Michx. Slender Knotweed. (I. F. f. i346.) Annual, glabrous, somewhat rough about the nodes; stem very slender or filiform, erect, somewhat 4 -angled, I-4 dm. tall. Leaves linear or linear-lanceolate, sessile, acuminate at the apex, $0.5-2.5 \mathrm{~cm}$. long, articulated to the ocreae, 1 -ribbed with a lateral impression on each side of the rib, the margins minutely scabrous or serrulate; ocreae funnelform, soon lacerate; flowers several in the axillary clusters, green, subsessile ; calyx-lobes whitish; stamens 8 ; style 3-parted nearly to the base, its branches diverging ; fruit erect ; achene 3 -angled, black, $2-2.5 \mathrm{~mm}$. long, reticulated on the angles, the centre of its faces smooth. Dry soil, Me. and Ont. to Minn., Neb., Ga. and Ark. July-Sept.
30. Polygonum Douglásii Greene. Douglas' Knotweed. (I. F. f. 1347.) Annual, similar to the preceding species, glabrous, somewhat rough at the nodes, sometimes slightly glaucous; stem erect, $2-5 \mathrm{dm}$. tall, simple or usually much branched. Leaves oblong or narrowly lanceolate, $\mathrm{I}-5 \mathrm{~cm}$. long, subsessile, rather thin, flat or revolute, with no lateral impressions parallel to the midrib; ocreae oblique, short, soon lacerate ; clusters axillary, several-flowered; the flowers and fruit deflexed; calyx green with white or rose-colored margin ; stamens 8 ; style 3 -parted ; achene 3 -angled, 2.5-4 mm. long, oblong or ovoid-oblong, black, smooth and shining. N. W. Terr. and Br. Col. to N. Mex., Neb. and Ind. Terr., east through Ont. to northern N. Y. and Vt. June-Sept.

3I. Polygonum Convólvulus L. Black Bindweed. (I. F. f. 1348.) Annual, glabrous, scurfy; stem twining or trailing, I.5-10 dm. long, mostly branched. Leaves ovate-sagittate or the uppermost lanceolate-sagittate, long-petioled, acuminate at the apex, slightly ciliate, $\mathbf{I}-7.5 \mathrm{~cm}$. long; ocreae oblique, short, rough on the margin; axillary clusters or racemes loosely flowered; flowers greenish, pendulous on slender pedicels; calyx 5-parted or rarely 6-parted, closely investing the achene, the outer lobes slightly or not at all keeled ; stamens 8 ; style nearly entire; stigmas 3 ; achene 3 -angled, obovoid-pyramidal, 3 mm . long, thickpointed, black, granular, rather dull. In waste and cultivated grounds, nearly throughout N. Am., except the extreme north. Naturalized from Europe. Native of Asia. Sometimes a troublesome weed. July-Sept.
32. Polygonum cilinòde Michx. Fringed Black Bindweed. (I. F. f. 1349.) Perennial, sparingly pubescent; stem red or reddish, twining or prostrate, $0.3-3 \mathrm{~m}$. long. Leaves broadly ovate or somewhat hastate, acuminate at the apex, cordate at the base, rather long-petioled, undulate, finely ciliate, $2.5-10 \mathrm{~cm}$. long, or the upper smaller ; ocreae small, armed with reflexed bristles near the base; racemes mostly panicled, axillary and terminal, interrupted; calyx whitish; style short, 3 -parted to the base; achene 3 -angled, oblong-pyramidal or ovoid, nearly 3 mm . long, very smooth and shining. In rocky places, N. S. to Ont., Minn. and Penn., south in the Alleghanies to N. Car. June-Sept.

Polygonum cilinode brévis Peck. Stems erect, about 3 dm . tall: inflorescence mostly terminal. Adirondack Mountains, N. Y.
33. Polygonum scándens L. Climbing False Buckwheat. (I. F. f. I35 1.) Perennial, glabrous; stem climbing, $0.5-6 \mathrm{~m}$. long, rather stout, branched, rough on the ridges. Leaves ovate, acuminate, cordate at the base, $2.5-15 \mathrm{~cm}$. long or the upper smaller, the larger long-petioled, finely punctate, the margins scabrous; ocreae oblique, smooth and glabrous; racemes usually numerous and panicled, interrupted, leafy, $5-20 \mathrm{~cm}$. long; flowers yellowish-green, long-pediceled; calyx 5 -parted, the three outer segments very strongly winged and decurrent on the pedicels, especially in fruit; style almost none; stigmas 3 ; fruiting calyx $10-12$ mm . long, the wings crisped, not incised; achene $4-5 \mathrm{~mm}$. long, 3 -anyled, rather blunt at both ends, smooth, shining. In woods and thickets, N. S. to Ont. and the Rocky Mts., south to Fla., Neb. and Tex. Aug.-Sept.
34. Polygonum dumetorum L. Copse or Hfige Bickwheat. (I. F. f. 1350.) Perennial, glabrous, similar to the preceding species; stem extensively twining, $0.5-3 \mathrm{~m}$. long, much branched. Leaves ovate or somewhat hastate, and sometimes inequilateral, acuminate at the apex, cordate at the hase, $2.5-7 \mathrm{~cm}$. long, long-petioled, or the upper smaller or mearly sessile; ocreate oblique, smoth; racemes numerous, much interrupted, leafy bracted, $5-1,3 \mathrm{~cm}$. long; flowers yellowish green, pendulous; calyx 5 -parted, the three outer segments winged or keeled
and much enlarged in fruit; style short, 3-parted: fruiting calyx $6-8 \mathrm{~mm}$. long, the wings nearly flat, not incised; achene oblong, 3 -angled, 4 mm . long, inclined to be pointed at both ends, black, smooth, shining. Prairies of Ill. and about St. Louis, Mo. Also in the vicinity of Knoxville, Tenn. Naturalized from Europe(?) July-Sept.
35. Polygonum cristàtum Engelm. \& Gray. Crested False Buckwheat. (I. F. f. 1352.) Perennial, scurfy; stem slender, twining, o.7-2.5 m. long, more or less branched. Leaves triangular or ovate, $2.5-\mathbf{I} 3 \mathrm{~cm}$. long, acuminate at the apex, undulate, truncate or cordate at the base, rather long-petioled; ocreae cylin-dric-funnelform; flowers in simple or compound often naked racemes $2.5-\mathbf{I} 3 \mathrm{~cm}$. long; pedicels about 5 mm . long, jointed near the middle; calyx greenish-white, $4-5 \mathrm{~mm}$. long, 5 -parted, the three outer segments keeled and at maturity winged; stigmas 3 ; fruiting calyx $6-8 \mathrm{~mm}$. long, its wings incised; achene 3 -angled, oblong, black, smooth, shining, about 3 mm . long. Sandy woods and rocky banks, S. N. Y. to Ga., the Ind. Terr. and Tex. Aug.-Oct.
36. Polygonum Zuccarínii Small. Japanese Knotweed. (I. F. f. 1353.) Perennial, more or less scurfy; stem stout, erect, woody below, much branched, I-2.5 m. tall. Leaves oblong-ovate or ovate-lanceolate, petioled, 5-15 cm. long, acuminate cuspidate at the apex, truncate or subcordate at the base, reticulateveined on both surfaces, undulate; ocreae oblique, smooth, fugacious; racemes mostly terminal, panicled, $5-10 \mathrm{~cm}$. long, or axillary, many-flowered, more or less pubescent; flowers greenish-white, long-pedicelled; outer segments of the 5 -parted calyx very broadly winged in fruit; style 3 -parted; achene 3 -angled, narrowly oblong or oblong-pyramidal, $2.5-3 \mathrm{~mm}$. long, black, smooth, shining. Escaped from cultivation in Me., near Philadelphia, Pa., Schenectady, N. Y., N. J., and in Ohio. Native of Japan. July-Oct.
37. Polygonum sagittàtum L. Arrow-Leaved Tear-thumb (I. F. f. 1354.) Annual, light green; stem slender, weak, decumbent, or climbing over other plants by the abundant recurved prickles which arm its four prominent angles. Leaves lanceolate sagittate or oblong-sagittate, $1.2 \mathbf{2}^{\prime} \mathbf{- 7 . 5} \mathrm{cm}$. long, obtuse or acute at the apex, slightly rough on the margins, the lower petioled, the upper subsessile; petioles and lower surface of the midribs prickly; ocreae oblique, not ciliate, fringed at the base by a few bristle-like prickles; flowers in rather dense terminal heads or racemes; calyx greenish or rose-colored; style 3 -parted to below the middle; achene 3 -angled, oblong-pyramidal, thick-pointed, 3 mm . long, dark red, smooth, shining. In wet soil, Newf. and N. S. to the N. W. Terr., south to Fla. and Kans. July-Sept.
38. Polygonum arifòlium L. Halberd-leaved Tear-thumb. (I. F. f. 1355.) Perennial ; stem ridged, reclining, $3-18 \mathrm{dm}$. long, the ridges armed with recurved prickles. Peduncles and pedicels glandular or pubescent; leaves broadly hastate, long-petioled, $2.5-25 \mathrm{~cm}$. long, pubescent or glabrous beneath, the apex and basal lobes acuminate; petioles and stronger nerves prickly; ocreae oblique, fringed at the summit with short bristles and at the base with slender prickles; flowers in terminal and axillary heads or racemes; calyx rose-color or greenish. 4-parted; style 2 -parted; achene lenticular, broadly obovate, 4 mm . long, strongly biconvex, dark brown, smooth, shining. In moist or wet soil, N. B. and Ont. to Minn., south to S. Car. July-Sept.

## 7. POLYGONÉLLA Michx.

Annual or perennial glabrous herbs, sometimes slightly woody, with branched, usually conspicuously jointed stems, alternate narrow leaves jointed to the mostly naked ocreae, and small white, pink or greenish flowers in slender panicled racemes. Calyx unequally 5 -parted, persistent, its segments petalloid, loosely investing the achene or its base in fruit, the three inner calyx-segments often winged. Stamens 8, included; filaments filiform, or much dilated or auricled at the base. Style 3 -parted, short or almost wanting stigmas capitate. Achene 3 -angled, smooth. Embryo slender, nearly straight in one of the angles of the seed. [Diminutive of Polygonum.] Five or six species, natives of N. Am.

[^22]I. Polygonella articulàta (L.) Meisn. Coast Jointweed. (I. F. f. r356.) Annual, glaucous; stem wiry, erect or sometimes diffusely spreading, simple or branched, $\mathbf{I}-3 \mathrm{dm}$. long. Leaves linear or linear-subulate (apparently filiform from the revolute margins), $\mathbf{x}-4 \mathrm{~cm}$. long, cylindric, slightly expanded at the summit; racemes numerous, erect, many-flowered, $2.5-5 \mathrm{~cm}$. long; ocreolae crowded or imbricated; pedicels reflexed; calyx-segments white with a dark mid-rib, loosely investing the achene, not winged in fruit; achene narrowly ovoid-pyramidal, pointed, 2 mm . long, brown. In sands of the seashore and sandy soil along the coast, Me., N. H. to Fla., and on the shores of the Great Lakes. July-Oct.
2. Polygonella Americàna (F. \& M.) Small. Southern Jointweed. (I. F. f. 1357.) Perennial, slightly glaucous; stem erect or ascending, wiry, somewhat flexuous, $5-12 \mathrm{dm}$. high, simple or slightly branched, covered with a ridged more or less scaly bark. Leaves linear or linear-spatulate, $0.5-2.5 \mathrm{~cm}$. long, often fascicled on short branches, rather fleshy, obtuse and revolute at the apex; ocreae scarious-margined, split on one side; racemes $2.5-7.5 \mathrm{~cm}$. long, dense, divergent; calyx white or pink, its three inner segments developing orbicular cordate wings, the two outer reflexed in fruit; pedicels divergent; achene elliptic-oblong, $2-5 \mathrm{~mm}$. long, chestnut-brown, pointed at both ends. In dry soil, Mo. to Tex., east to Ga. and Ala. Aug.-Oct.

## 8. BRUNNÍCHIA Banks.

Perennial glabrous herbs with elongated grooved much branched stems climbing by tendrils at the ends of the branches, and alternate entire petioled leaves, the ocreae obscure or wanting, and small perfect flowers in panicled terminal and axillary racemes. Pedicels slender, fascicled in the axils of lanceolate-subulate bracts. Calyx 5 -parted, much enlarged, coriaceous and winged on one side in fruit, closely investing the achene, the segments spreading when fresh, converging when dry. Stamens 7-10, mostly 8; filaments filiform, much dilated at the base. Style 3-parted, the stigmas 2 -cleft at the summit; ovary imperfectly 2 -celled; ovule pendulous. Achene 3 -angled. Seed irregularly 6 -grooved, the embryo in one of its angles. [Name in honor of M. T. Brunnich, Norwegian naturalist.] Two known species, the following of southeastern N. Am., the other of tropical Africa.
I. Brunnichia cirrhòsa Banks. Brunnichia. (I. F. f. 1358.) Stem 2-6 m . long, somewhat woody, rather tough. Tendrils numerous, filiform; leaves ovate or ovate-lanceolate, acute or acuminate, $2.5-15 \mathrm{~cm}$. long, truncate or subcordate at the base, petioled; ocreae represented by a ring of short bristles, racemes $5-\mathrm{I} 5 \mathrm{~cm}$. long; calyx $6-8 \mathrm{~mm}$. long, greenish, 5 -parted, its base strongly winged along one side; achene oblong-ovoid, 6 mm . long, brown, smooth, closely invested by the calyx which becomes 2.5 cm . or more in length. On banks of streams, S. Ill. to Ark., S. Car. and Fla. May-June.

## Order 14. CHENOPODIÀLES.

Herbs, mostly with perfect flowers. Calyx present. Corolla, if present, polypetalous. Ovary superior. Embryo coiled, curved or annular. Fruit not an achene.

Fruit a utricle (see also last genera of Caryophyllaceae).
Flowers bractless, or, if bracted, the bracts not scarious; sepals green, or greenish.
Fam. 1. Chenopodiaceae.
Flowers bracted, the bracts, and also the sepals, mostly scarious.
Fam. 2. Amaranthaceae.
Fam. 3. Phytolaccaceae.
Fruit fleshy, enclosing several carpels ; a berry.
Fruit an anthocarp, the persistent base of the corolla-like calyx enclosing a utricle.
Fam. 4. Nyctagmaceae.
Fruit a capsule, dehiscent by valves, or teeth (utricular in Anvihia, Far whilhaz and Scleranthus of the Caryophyllaceae).

Capsule 2 -several-celled; petals none.
Capsule 1 -celled; petals mostly present.
Sepals 2.
Fam. 5. Arsoaceae.

Sepals 5 or 4, distinct or united.
Fam. 6. Portulacaceae.
Fam. 7. Caryophyllaceae.

## Family I. CHENOPODIÀCEAE Dumort.

## Goosefoot Family.

Annual or perennial herbs, rarely shrubs, with angled striate or terete stems. Leaves alternate or sometimes opposite, exstipulate, simple, entire, toothed or lobed, mostly petioled (in Salicornia reduced to mere ridges). Flowers small, green or greenish, regular or slightly irregular, variously clustered, occasionally solitary in the axils. Petals none. Calyx persistent, 2-5-lobed, 2-5-parted or rarely reduced to a single sepal, wanting in the pistillate flowers of some genera. Stamens as many as the lobes or divisions of the calyx, or fewer, and opposite them; filaments slender; anthers 2-celled, longitudinally dehiscent. Disk usually none. Ovary I-celled; ovule solitary, amphitropous; styles $1-3$; stigmas capitate, or $2-3$-lobed or divided. Fruit a utricle, with a thin or coriaceous pericarp. Seed vertical or horizontal ; endosperm mealy, fleshy or wanting. About 75 genera and 550 species, of wide geographical distribution.

* Embryo annular or conduplicate, not spirally coiled; endosperm copious (except in Salicornia).
Leafy herbs; endosperm copious.
Fruit enclosed by or not longer than the calyx or bractlets.
Flowers perfect or some of them pistillate ; calyx herbaceous or fleshy.
Calyx 2-5-lobed or $2-5$-parted ; stamens $1-5$.
Fruiting calyx wingless, its segments often keeled.
Calyx herbaceous or but slightly fleshy in fruit ; flowers in panicled spikes. 1. Chenopodium.
Fruiting calyx dry, strongly reticulated; leaves pinnatifid.

2. Roubieva.

Calyx very fleshy and bright red in fruit ; flowers densely capitate.
3. Blitum.

Fruiting calyx horizontally winged. Calyx of 1 sepal ; stamen I .
4. Cycloloma.
5. Monolepis.

Flowers monœecious or diœecious : calyx of pistillate flowers none; fruit enclosed by 2 bractlets.

Bractlets flat or convex, not silky. 6. Atriplex.
Bractlets silky-pubescent, conduplicate.
7. Eurotia.

Flowers perfect ; calyx membranous; leaves filiform-linear.
8. Kochia.

Fruit much exserted beyond the calyx.
9. Corispermum.

Leafless fleshy herbs with opposite branches; endosperm none.
10. Salicornia.
** Embryo spirally coiled; endosperm little or none.
Shrub ; flowers monœecious, not bracteolate. II. Sarcobatus.
Herbs ; flowers perfect, bracteolate.
Fruiting calyx wingless; leaves fleshy, not spiny. 12. Dondia.
Fruiting calyx bordered by a thin horizontal wing : leaves very spiny.
13. Salsola.

## 1. CHENOPÒDIUM L.

Annual or perennial herbs, with alternate petioled leaves. Flowers small, green, perfect, sessile, bractless, clustered. Calyx 2-5-parted or 2-5-lobed, embracing or enclosing the utricle, its segments or lobes often keeled or ridged. Stamens 1-5; filaments filiform or slender. Styles 2 or 3 ; seed horizontal or vertical, sometimes in both positions in different flowers of the same species; endosperm mealy; embryo completely or incompletely annular. [Greek, goose-foot, from the shape of the leaves.] About 60 species, mostly weeds, of wide geographic distribution. Besides the following, some 5 others occur in the western parts of N. Am.

> * Embryo a complete ring.

Leaves white-mealy on the lower surface.
Leaves or some of them sinuate-toothed or lobed,
Sepals strongly keeled in fruit.
Pericarp firmly attached to the seed ; stem erect, tall.

Pericarp readily detached from the seed; stem low.

Sepals not keeled in fruit; stem decumbent.
Leaves mostly entire, narrowly linear or oblong.
6. C. Fremontii incanum.
2. C. glaucum.
3. C. leptophyllum.
Leaves oblong or ovate-oblong, entire.

Leaves, at least the lower, sinuate, toothed or incised.
Stamens 5; calyx not fleshy.
Pericarp readily separable from the seed.
Leaves oblong or lanceolate ; calyx-lobes scarcely keeled.
5. C. Boscianum.

Leaves triangular-hastate ; calyx-lobes keeled.
6. C. Fremontii. Pericarp firmly attached to the seed.

Flower-clusters, at least the upper, longer than the leaves.
Leaves oblong, rhombic-ovate or lanceolate, narrowed at the base.
Leaves obtuse or merely acute. I. C. album viride.
Leaves or some of them cuspidate or brittle-tipped.
7. C. Berlandieri.

Leaves triangular-ovate, truncate or subcordate at base.
8. C. urbicum.

Spikes loosely panicled in the axils, the panicles shorter than the leaves.
9. C. murale.

Stamens only I or 2 ; calyx slightly fleshy, red. Leaves very coarsely toothed.
II. C. rubrum.

Leaves broadly triangular-hastate, entire or merely undulate. 12. C. Bonus-Henricus.
** Embryo an incomplete ring.
Leaves ovate or oblong, pinnately lobed; flowers in long loose panicles.
Leaves lanceolate; flowers in continuous or interrupted spikes. Spikes borne in the axils of the numerous small upper leaves.
Spikes in large commonly leafless terminal panicles.
13. C. Botrys.
I. Chenopodium álbum L. Lamb's Quarters. White Goosefoot. Pigweed. (I. F. f. I359.) Annual; stem usually slender, erect, commonly much branched, o.3-3 m. tall. Leaves rhombic-ovate or the upper lanceolate, narrowed at the base, 3 -nerved, dentate, sinuate or lobed, or the upper entire, $2-10 \mathrm{~cm}$. long; spikes terminal and axillary, simple or compound, often panicled; calyx about 1 mm . broad in fruit, its segments usually completely enclosing the utricle; seed horizontal, black, shining, firmly "attached to the pericarp. In waste places. A common weed throughout N. Am. except the extreme north. Nat. from Europe. Native also of Asia. June-Sept.

Chenopodium álbum viride (L.) Moq. Plant brighter green; leaves green on both sides or but slightly mealy beneath. Range of the type.
2. Chenopodium glaùcum L. Oak-Leaved Goosefoot. (I. F. f. 1360.) Annual, succulent; stem usually much branched, decumbent or prostrate. Leaves oblong, lanceolate or ovate-lanceolate, mostly narrowed at the base, dark green above, $2-5 \mathrm{~cm}$. long, the lower or all of them sinuate-dentate or lobed; flowers in axillary often branched spikes, or the upper panicled ; calyx about 1 mm . broad. its segments obtuse, neither fleshy nor keeled in fruit; utricle brown, depressed, its summit not completely covered by the calyx; seed of lateral flowers vertical, that of terminal flowers commonly horizontal. A weed in waste places throughout N. Am. except the extreme north. Nat. from Europe. June-Sept.
3. Chenopodium leptophyllum (Moq.) Nutt. Narrow-leayen Goosffont. (I. F. f. I36I.) Annual, scarcely succulent; stem slender, usually erect, striate or grooved, at least when dry, branched, I.5-8 dm. tall, mealy above. Leaves linear to oblong, acute or acuminate, or the lower obtuse, entire or the lower rarely toothed, short-petioled, 2-6 mm. wide, 1-3-nerved; flowers axillary and terminal simple or branched spikes; calyx about 1 mm . broad, its segments strongly keeled and nearly covering the fruit; seed horizontal, readily detached from the pericarp. In dry soil, Manitoba and the N. W. Terr. to Mo., N. Mex. and Ariz. Also on the shores of Lake Erie and on sands of the seashore, Conn. to N. I. July-Sept.

Chenopodium leptophyllum subglabrum S. Wats. Leaves scatcely mealy or quite green; flowers loosely clustered. W. Neb. and Colo.
4. Chenopodium polyspérmum L. Many-seeded Goosefoot. (I. F. f. 1362.) Annual, glabrous, not mealy ; stem commonly much branched, striate, 1.5-9 dm. high. Leaves oblong, elliptic or ovate, slender-petioled, entire, thin, obtuse, $2-8 \mathrm{~cm}$. long, flowers in loose axillary and terminal panicles; calyx less than 2 mm . wide, its segments oblong, not keeled, not completely covering the fruit; seed firmly attached to the pericarp, horizontal. In waste places and ballast, Mass. to N. J. Adv. from Europe. July-Sept.
5. Chenopodium Bosciànum Moq. Bosc's Goosefoot. (I. F. f. 1363.) Annual, light green; stem slender, 3-10 dm. tall, the branches very slender. Leaves thin, lanceolate or oblong-lanceolate, acute or acuminate at the apex, narrowed at the base, slender-petioled, $2-6 \mathrm{~cm}$. long, the lower sinuate-dentate or nearly all of them entire ; flowers in slender spikes; calyx-segments broadly oblong, obtuse ; herbaceous, nearly covering the utricle; seed horizontal, readily separating from the pericarp, black, shining. In woods and thickets, N. Y. and N. J. to Ind., Minn., N. Car. and Tex. July-Sept.
6. Chenopodium Fremóntii S. Wats. Fremont's Goosefoot. (I. F. f. 1364.) Annual, light green ; stem erect, grooved, branched, 3-10 dm. tall. Leaves thin, broadly triangular-hastate, sinuate-dentate or the upper entire, mostly obtuse at the apex, truncate or abruptly narrowed at the base, slender-petioled, $2-10 \mathrm{~cm}$. long and nearly as wide, the uppermost sometimes very small, oblong or lanceolate and acute; spikes slender; calyx $\mathbf{I} \mathrm{mm}$. wide, its segments nearly enclosing the utricle; pericarp easily separable from the seed; seed horizontal, shining. In woods and thickets, S. Dak. to Mont., Nev. and N. Mex. July-Sept.

Chenopodium Fremóntii incànum S . Wats. Low; stems stout and much branched, the branches and lower surfaces of the leaves densely white-mealy; leaves $6-25 \mathrm{~mm}$. long. Range of the type. Probably a distinct species.
7. Chenopodium Berlandièri Moq. Berlandier's Goosefoot. (I. F. f. 1365.) Annual; stem erect, commonly much branched, 4-10 dm. tall, the branches ascending. Leaves lanceolate, oblong or rhombic-lanceolate, slender-petioled, thin, some or all of them cuspidate-acuminate at the apex or bristle-tipped, narrowed at the base, $\mathbf{I}-4 \mathrm{~cm}$. long; flowers in rather loose panicled spikes; calyx nearly 2 mm . broad, its segments keeled, enclosing the utricle; pericarp firmly attached to the horizontal seed. In dry soil, southern Mo. to Tex. and in Fla. June-Sept.
8. Chenopodium úrbicum L. Upright or City Goosefoot. (I. F. f. 1366.) Annual; stem commonly stout, erect, channeled, 3-9 dm. tall. Leaves hastate or triangular-ovate, acute at the apex, truncate subcordate or abruptly narrowed at the base, stout-petioled, coarsely and irregularly dentate or the uppermost entire, the larger $7-13 \mathrm{~cm}$. long; spikes in erect panicles, the upper longer than the leaves; calyx 1 mm . broad, its segments oblong, obtuse, not entirely enclosing the fruit; seed horizontal, firmly attached to the pericarp, its margins rounded. In waste places, N. S. and Ont. to S. N. Y. Adventive from Europe. June-Sept.
9. Chenopodium muràle L. Nettle-leaved Goosefoot. Sowbane. (I. F. f. 1367.) Annual, somewhat scurfy above; stem $3-8 \mathrm{dm}$. high, leafy to the summit. Leaves rhombic-ovate, thin, bright green, acute or acuminate, sharply and coarsely sinuate-dentate, cuneate or subtruncate at the base, slender-petioled, $5-10 \mathrm{~cm}$. long; flowers in loose axillary panicles, often not longer than the petioles; calyx-segments not entirely enclosing the utricle ; seed sharp-edged, horizontal, firmly attached to the pericarp. In waste places, Me. to Mich., Br. Col., Fla. and Mex. June-Sept.
10. Chenopodium hýbridum L. Maple-Leaved Goosefoot. (I. F. f. 1368.) Annual, sometimes more or less scurfy; stem slender, erect, 6-13 dm. tall. Leaves ovate or rhombic-ovate, long-acuminate at the apex, truncate rounded or subcordate at the base, thin, slender-petioled, sharply dentate with I-4 large acute teeth on each side, or the upper lanceolate and entire, the lower $\mathrm{r}-2 \mathrm{dm}$. long; flowers in large panicles; calyx about 2 mm . broad, its segments oblong, slightly keeled, incompletely covering the fruit; seed horizontal, sharp-edged, firmly attached to the pericarp.' In woods and thickets, sometimes in waste places, Quebec to the Northwest Terr., Br. Col., N. Y., Ky. and N. Mex. Also in Europe. July-Sept.
II. Chenopodium rùbrum L. Red Goosefoot. (I. F. f. 1369.) Annual,
glabrous; stem leafy, 3-8 dm. tall, the branches strict or ascending. Leaves thick, $3-10 \mathrm{~cm}$. long, rhombic-ovate or rhombic-lanceolate, petioled, narrowed at the base, coarsely sinuate-dentate or the upper entire; flowers in erect compound leafy-bracted spikes; calyx 3-5-parted, its segments slightly fleshy, red, not keeled, obtuse, about as long as the utricle; stamens 1 or 2 ; stigmas short; seed horizontal, shining, separating from the pericarp. On the seacoast, Newf. to N. J., and in saline soil in the interior across the continent, south to central N. Y., Neb. and Br. Col. Also in Europe and Asia. July-Sept.
12. Chenopodium Bònus-Henrìcus L. Good King Henry. (I. F. f. 1370.) Perennial by a thick rootstock, glabrous; stem erect, 3-8 dm. tall. Leaves broadly trangular-hastate, palmately veined, entire or undulate, rarely with I or 2 small teeth, the lower long-petioled, the upper much smaller; flowers simple or panicled, commonly dense spikes sometimes $7-10 \mathrm{~cm}$. long; calyx 4-5-parted; stigmas elongated; seed vertical, or that of terminal flowers horizontal, black, shining, blunt-edged. .In waste places, N. S. to Ont., Mass. and southern N. Y. Naturalized from Europe. June-Sept.
13. Chenopodium Bòtrys L. Feather Geranium. Jerusalem Oak. (I. F. f. 1371.) Annual, glandular-pubescent and viscid, strong-scented; stem $2-6 \mathrm{dm}$. tall. Leaves ovate or oblong, deeply pinnately lobed, petioled, $1-5 \mathrm{~cm}$. long, or the uppermost much smaller, the lobes mostly obtuse and dentate; flowers very small, in numerous loose axillary cymose panicles; calyx 3-5-parted, the segments lanceolate, acute, thin, rather longer than the utricle; seed horizontal or vertical, firmly attached to the pericarp. In waste places, N. S. to Minn., Ore., N. Y., Ky. and Mex. Naturalized from Europe. Native also of Asia. July-Sept.
14. Chenopodium ambrosioìdes L. Mexican Tea. (I. F. f. 1372.) Annual, glabrous or slightly glandular-pubescent, strong-scented; stem leafy, $6-$ ro dm. high, angular and grooved. Leaves oblong or oblong-lanceolate, narrowed to a short petiole, repand-dentate, undulate or the upper entire, $2-9 \mathrm{~cm}$. long, the upper numerous and much smaller; flowers in small dense axillary spikes; calyx usually 3 -parted, completely enclosing the fruit; pericarp readily separable from the seed; seed horizontal or vertical, shining. In waste places, Me. and Ont. to Fla., west to Cal. Naturalized from tropical America. Aug.-Oct.

I5. Chenopodium anthelmínticum L. Wormseed. (I. F. f. 1373.) Annual or sometimes perennial, similar to the preceding species and perhaps intergrading with it; stem somewhat stouter. Leaves lanceolate or ovate-lanceolate, usually acuminate at the apex and narrowed at the base, slender-petioled, coarsely dentate or incised, $5-13 \mathrm{~cm}$. long, the lower 2 cm . or more wide, the upper gradually smaller; flowers in linear usually bractless panicled spikes, or the lower spikes leafy-bracted. In waste places, Mass. to Ont., Wis., Fla. and Mex. Naturalized from Europe. Aug.-Oct.

## 2. ROUBIEVVA Moq.

A perennial herb, glandular-pubescent, strong-scented, prostrate, and diffusely branched, with narrow small short-petioled deeply pinnatifid leaves. Flowers small, green, perfect, or pistillate, solitary, or in small axillary clusters. Calyx urn-shaped, $3-5$-toothed, narrowed at the throat, in fruit becoming obovoid, stronglyreticulated and closed. Stamens 5. Styles 3, exserted. Wall of the pericarp thin, glandular. Seed vertical. Embryo a complete ring in the mealy endosperm. [Name in honor of G. J. Roubieu, French botanist.] A monotypic genus of S. Am.
I. Roubieva multífida (L.) Moq. Cut-leaved Goosefoot. Roubieva. (I. F. f. 1374.) Very leafy, prostrate, or the branches ascending, r.5-3.5 dm. long. Leaves lanceolate or linear-lanceolate or linear-oblong in outline, $1-3 \mathrm{~cm}$. long ; flowers $1-5$ together in the axils, sessile, less than 1 mm . broad. some perfect, some pistillate; fruiting calyx, 3 -nerved and strongly veined. 1 mm. thick; utricle compressed. In waste places and ballast, S. N. Y. to Va. Naturalized or adventive from tropical America. June-Sept.

## 3. BLITUM L.

Annual succulent branching herbs, with alternate hastate petioled leaves. Flowers small, aggregated in globose axillary sessile heads, or the upper heads forming an interrupted spike. Calyx 2-5-lobed, becoming pulpy and bright red
in fruit. Stamens r-5. Pericarp separating from the seed. Seed vertical, shining. Embryo a complete ring in the mealy endosperm. [The classical name of orache.] One or perhaps two species, natives of N. Am. and Europe.

1. Blitum capitàtum L. Strawberry Blite. (I. F. f. 1375.) Stem 1.5-6dm. long, the branches ascending. Leaves usually longer than wide, $3-8 \mathrm{~cm}$. long, sinuate-dentate, or the upper or sometimes all of them entire, cordate or reniform, lower petioles often longer than the blades; heads becoming bright red and 10-16 mm . in diameter in fruit, and then somewhat resembling strawberries; seed compressed, ovate. In dry soil, N. S. to Alaska, N. J., Ill., Minn., in the Rocky Mountains to Colo. and Utah and to Nev. Also in Europe. June-Aug.

## 4. CYCLOLOMA Moq.

An annual diffusely branched glabrous or cobwebby -pubescent herb, with alternate petioled irregularly toothed leaves, and small sessile bractless flowers in panicled interrupted spikes. Calyx 5-lobed, the lobes keeled in flower, a thin horizontal irregularly dentate wing developing below them in fruit. Stamens 5. Styles 2-3. Fruit (except its summit) enclosed by the calyx, depressed. Seed horizontal; embryo a complete ring in the mealy endosperm. [Greek, circle border, alluding to the calyx-wing.] A monotypic genus of north central North America.

1. Cycloloma atriplicifòlium (Spreng.) Coult. Cycloloma. (I. F. f. I376.) Pale green or becoming dark purple, bushy-branched 1.5-5 dm. high. Leaves lanceolate, mostly acuminate, narrowed into slender petioles, sinuate-dentate with acute teeth, $2-8 \mathrm{~cm}$. long or the upper much smaller; spikes numerous, loosely flowered ; slender ; fruit, including the winged calyx, 4 mm . broad; calyx-lobes not completely covering the summit of the utricle, which appears as a 5 -rayed area. Along streams and on sand hills and banks, Manitoba to Ind., Ill., the N. W. Terr., Neb., and Ariz. Summer.

## 5. MONÓLEPIS Schrad.

Low annual branching herbs, with small narrow alternate entire toothed or lobed leaves, and polygamous or perfect flowers in small axillary clusters. Calyx of a single persistent herbaceous sepal. Stamen 1. Styles 2, slender. Utricle flat, the pericarp adherent to the smooth vertical seed. Embryo a very nearly complete ring in the mealy endosperm, its radicle turned downward. [Greek, single-scale, from the solitary sepal.] Three known species, natives of western N . Am., the following one reaching our limits.
I. Monolepis Nuttalliàna (R. \& S.) Greene. Monolepis. (I. F. f. I377.) Slightly mealy when young, glabrous or nearly so when old ; stem 7-30 cm. high ; branches many, ascending. Leaves lanceolate, short-petioled, or the upper sessile, I- 6 cm . long, narrowed at the base, 3-lobed, the middle lobe linear or linearoblong, acute or acuminate, 2-4 times as long as the lateral ones; flowers clustered in the axils; sepal oblanceolate or splatulate ; pericarp minutely pitted, about I mm. broad; margins of the seed acute. In alkaline or dry soil, Manitoba and the N. W. Terr. to Minn., Neb., N. Mex. and S. Cal. June-Sept.

## 6. ÁTRIPLEX L.

Herbs or low shrubs, often scrufy-canescent or silvery. Leaves alternate, or some of them opposite. Flowers diœcious or monœcious, small, green, in panicled spikes or capitate-clustered in the axils. Staminate flowers bractless, consisting of a 3-5-parted calyx and an equal number of stamens; filaments separate or united by their bases; a rudimentary ovary sometimes present. Pistillate flowers subtended by 2 bractlets which enlarge in fruit and are more or less united, sometimes quite to their summits ; perianth none; stigmas 2 . Utricle completely or partially enclosed by the fruiting bractlets. Seed vertical or rarely horizontal; embryo annular ; endosperm mealy. [From a Greek name of orache.] About I30 species, of very wide geographic distribution. Besides the following, some 45 others occur in the western parts of North America.
Annual herbs ; stems or branches erect, diffuse or ascending.
Leaves hastate, ovate, rhombic-lanceolate or linear-lanceolate.
Plants green, glabrous or sparingly scurfy, not silvery; leaves slender-petioled. Leaves lanceolate, several times longer than wide.
I. A. patula,

Leaves triangular-hastate, the lower only 1 -2 times as long as wide,
2. A. hastata.

Plant very scurfy; leaves rhombic-ovate, short-petioled.
3. A. rosea. Plants densely silvery; leaves hastate, entire or little toothed. Staminate spikes dense, short; leaves petioled. 4. A. argentea. Staminate spikes elongated, interrupted; upper leaves sessile.

Leaves oblong, densely silvery, entire ; plant of sea beaches.
5. A. expansa.
6. A. arenaria.

Perennial herbs or shrubs; leaves oblong or oblanceolate, entire ; plants of the western plains.

Fruiting bractlets suborbicular, wingless, their sides crested or tubercled.
Fruiting bractlets appendaged by 4 vertical reticulated wings.
7. A. Nuttallii.
8. A. canescens.

1. Atriplex pátula L. Spreading Orache. (I. F. f. 1378.) Annual, dark green; stem much branched, diffuse, ascending or sometimes erect, 3-10 dm. long. Leaves lanceolate or linear-lanceolate, the uppermost nearly sessile, entire, sparingly toothed, or 3 -lobed below the middle, acuminate at the apex, narrowed or cuneat at the base, $4-35 \mathrm{~mm}$. wide; flowers in panicled interrupted slender mostly leafless spikes, and usually also capitate in the upper axils; fruiting bractlets united only at the base, fleshy, triangular or rhombic, $6-8 \mathrm{~mm}$. wide, their sides often tubercled; radicle ascending. In waste places and ballast, N. S. and Ont. to S. N. Y. and N. J. Naturalized from Europe. Native also of Asia. July-Aug.
2. Atriplex hastàta L. Halberd-leaved Orache. (I. F. f. 1379.) Annual, pale green, or purple, somewhat scurfy, at least when young; stem branched, 3-7 dm. tall. Leaves slender-petioled, acuminate, the lower broadly triangularhastate, entire or sparingly toothed, $2-10 \mathrm{~cm}$. long, the basal lobes divergent, acute or acuminate; upper leaves sometimes triangular-lanceolate; inflorescence as in the preceding; the fruiting bractlets sometimes broader. In salt meadows and waste places mostly near the coast, N. B. to S. C., and in saline soil, Manitoba to Br. Col., Neb. and Utah. Also in Europe. Aug.-Oct.
3. Atriplex ròsea L. Red Orache. (I. F. f. 1380.) Annual, pale green, very scurfy; stem usually much branched, 3-7 dm. high. Leaves ovate or rhombicovate, short-petioled or the upper sessile, coarsely sinuate-dentate, $\mathbf{I}-9 \mathrm{~cm}$. long; flowers mostly in axillary capitate clusters, or some in terminal spikes; fruiting bractlets broadly ovate or triangular-hastate, strongly veined, mealy-white, dry, about 6 mm . broad, united only at their bases, their margins tonthed or lacerate and sides tubercled. In waste places and ballast, N. S. to N. N. Y. and N. J. Adventive from Europe. Aug.-Oct.
4. Atriplex argéntea Nutt. Silvery Orache. (I. F. f. 138r.) Annual, pale, densely silvery-scurfy or becoming smooth; stem bushy-branched, $1.5-5 \mathrm{dm}$. high, angular. Leaves firm, triangular-hastate or rhombic-ovate, mostly acute at the apex, petioled or the upper sessile, entire or sparingly dentate, $1-5 \mathrm{~cm}$. long, the basal lobes short; flowers in capitate axillary clusters, or the staminate in short dense spikes; fruiting bractlets suborbicular, rhombic or broader than high, 4-8 mm . wide, united nearly to their summits, the margins sharply toothed, the sides sometimes tubercled or crested. In dry or saline soil, Minn, to the N. W. Terr., Mont., Neb., Colo. and Utah. June-Sept.
5. Atriplex expánsa S. Wats. Sessile-Leaved Orache. (I. F. f. 13 §2.) Similar to the preceding but stouter, the stem erect, widely branched, sometimes 2 m . tall. Leaves thin, sessile or the lower very short-petioled, $1-4 \mathrm{~cm}$. long and nearly as wide at the base; fruiting bractlets broad. united nearly to their summits, tubercled, their margins strongly toothed. W. Kans. (according to A. S. Hitchcock) to Chihuahua and N. Mex., west to Cal. July-Oct.
6. Atriplex arenària Nutt. Sea-beach Atriplex. (I. F. f. 13S3.) Annual, pale, densely silvery-scurfy; stem bushy-branched, $1-4.5 \mathrm{dm}$. high, the branches ascending or decumbent, angular; leaves oblong, entire, short-petioled or sessile, $\mathbf{1}-4 \mathrm{~cm}$. long, the lateral veins few and obscure; flowers in axillary clusters much shorter than the leaves; fruiting bractlets triangular wedge-shaped, hroadest above, 4-6 mm . wide, united nearly to the several-toothed summits, their margins entire, their sides reticulated, or sometimes crested or tubercled. On sandy sea beaches, N. S.' (?), Mass. to Fla. July-Sept.
7. Atriplex Nuttàllii S. Wats. Nuttall's Atriplex. (I. F. f. I384.) A scurfy pale green shrub, 3-7 dm. tall, the branches rather stiff, leafy, the bark nearly white. Leaves oblong, linear-oblong or oblanceolate, narrowed at the base, sessile, entire, $4-10 \mathrm{~mm}$. wide; flowers in terminal spikes and clustered in the axils, often strictly diœcious; fruiting bractlets ovate or suborbicular, united to above the middle, $3-5 \mathrm{~mm}$. broad, the margins toothed, the sides crested, tubercled or spiny. In dry or saline soil, Manitoba to the N. W. Terr., Neb., Colo. and Nev. Aug.-Oct.
8. Atriplex canéscens (Pursh) James. Bushy Atriplex. (I. F. f. 1385.) A pale densely scurfy shrub, resembling the preceding species and with similar foliage. Flowers in short terminal spikes and in axillary clusters; bractlets ovate in flower, united nearly to their summits; in fruit appendaged by 4 broad thin distinct wings, which are $4-8 \mathrm{~mm}$. broad at the middle and usually about twice as high, strongly reticulate-veined, not tubercled nor crested. In dry or saline soil, S. Dak. and Neb. to N. Mex., Mex., Nev. and Cal. July-Sept.

## 7. EUROTIA Adans.

Pubescent perennial herbs or low shrubs, with alternate ent?re narrow leave and monœcious or diœcious flowers, capitate or spicate in the axils. Staminate flowers not bracteolate, consisting of a 4-parted calyx and as many exserted stamens. Pistillate flowers 2-bracteolate, the bractlets united nearly or quite to their summits, densely covered with long silky hairs, 2 -horned; calyx none; ovary ovoid, sessile, pubescent; styles 2, exserted. Seed vertical; embryo nearly annular in the mealy endosperm, its radicle pointing downward. [From the Greek for hoariness or mould.] Two known species, the following of western N. Am., the other of western Asia and eastern Europe.
I. Eurotia lanàta (Pursh) Moq. American Eurotia. White Sage. (I. F. f. 1386.) A stellate-pubescent erect much-branched shrub 3-9 dm. high, the hairs long, white when young, becoming reddish brown, the branches very leafy. Leaves linear or linear-lanceolate, short-petioled or the upper sessile, obtuse at the apex, narrowed at the base, $4-9 \mathrm{~mm}$. wide, their margins revolute, the mid-vein prominent; bractlets lanceolate, $4^{-8} \mathrm{~mm}$. long in fruit, appendaged by 4 tufts of spreading hairs; utricle loose, the pericarp readily separating from the large seed. In dry soil, N. W. Terr. to Neb., N. Mex., Nev. and Cal. June-Sept.

## 8. KOCHIA Roth.

Herbs or low shrubs, with alternate sessile narrow entire leaves, and perfect or pistillate flowers in the axils. Calyx 5 -lobed, wingless, or sometimes developing a horizontal wing, enclosing the fruit. Stamens 3-5, their filaments linear. Ovary ovoid; stigmas 2. Utricle pear-shaped or oblong, the pericarp membranous, not adherent to the seed. Seed inverted, the testa thin ; embryo annular; endosperm little or none. [Name in honor of W. D. J. Koch, 1771-1849, Director of the Botanical Garden at Erlangen.] About 35 species, mostly natives of the Old World, the following introduced from Europe. An indigenous species, K. Americana, occurs in the western U. S.

1. Kochia Scopària (L.) Roth. KochiA. (I. F. f. 1387.) Annual, pubescent or becoming glabrate; stem erect, slender, leafy, 3-8 dm. tall. Leaves linearlanceolate or linear, ciliate, acuminate, $2-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, the upper gradually smaller: flowers sessile in the axils of the upper leaves, forming short dense bracted spikes; fruiting calyx-segments each with a short triangular horizontal wing. In waste places, Ont., Vt. and N. N. Y. Adventive from Europe. Native also of Asia. July-Sept.

## 9. CORISPÉRMUM L.

Annual herbs. with alternate narrow entire i-nerved leaves, and perfect bractless small green flowers, solitary in the upper axils, forming terminal narrow leafy spikes, the upper leaves shorter and broader than the lower. Calyx of a solitary thin broad sepal, or rarely 2. Stamens I-3. rarely more, and one of them longer. Ovary ovoid; styles 2. Utricle ellipsoid. mostly plano-convex, the pericarp firmly adherent to the vertical seed, its margins acute or winged. Embryo annular in the somewhat fleshy endosperm, its radicle pointing downward. [Greek, bug-seed.]

About io species, natives of the north temperate and subarctic zones. Only the following is known to occur in N. Am.

```
Upper leaves imbricated; fruit 3.5-5 mm. long.
Upper leaves not imbricated; fruit 2 mm. long.
1. C. hyssopifolium.
Upper leaves not imbricated; fruit 2 mm . long.
2. C. nitidum.
```

I. Corispermum hyssopifòlium L. Bug-seed. (I. F. f. I388.) Rather pale green, somewhat pubescent when young, fleshy; stem erect, 1.5-4 dm. tall, the branches slender, ascending or divergent. Leaves narrowly linear, sessile, $\mathrm{I}-5 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, cuspidate, the upper ovate or lanceolate, imbricated, appressed-ascending, or at length spreading, acute or acuminate, $6-12 \mathrm{~mm}$. long, scarious-margined; utricle $3.5-5 \mathrm{~mm}$. long, winged. In sandy soil, shores of the Great Lakes to the N. W. Terr., Arctic America and Br. Col., south to Kans., Tex. and Ariz. Also in Europe and Asia. July-Sept.
2. Corispermum nítidum Kit. Small-fruited Bug-seed. Like the pre ceding, but taller, 3-6 dm. high, glabrous, with ascending branches, narrower leaves and lax spikes, the leaves of which are not imbricated, $3-4 \mathrm{~mm}$. long and generally narrower than the small-winged utricle, which is 2 mm . long. In poor soil, Neb. and Kans. to Tex. and Ariz. Also in Europe and Asia. July-Sept. [C. hyssopifolium var. microcarpum Wats.]

## io. SALICÒRNIA L.

Fleshy glabrous herbs, with opposite terete branches, the leaves reduced to mere opposite scales, the flowers sunken 3-7 together in the axils of the upper ones, forming narrow terminal spikes, perfect or the lateral ones staminate. Calyx obpyramidal or rhomboid, fleshy, 3-4-toothed or truncate, becoming spongy in fruit deciduous. Stamens 2, or sometimes solitary, exserted; filaments cylindric, short anthers oblong, large; ovary ovoid; styles or stigmas 2. Utricles enclosed by th spongy fruiting calyx, the pericarp membranous. Seed erect, compressed; embryo conduplicate; endosperm none. [Name Greek, salt-horn; from the saline habitat, and horn-like branches.] About 10 species, natives of saline soil, widely distributed in both the Old World and the New. Only the following are known to inhabit N. Am.
Annuals; stem erect.

Scales very short, acute or blunt ; spikes $2-3 \mathrm{~mm}$. in diameter.
Scales mucronate-tipped; spikes $4^{-6} \mathrm{~mm}$. in diameter.
Perennial by a woody rootstock; stems trailing or decumbent.

1. S. herbacea.
2. S. Bigelovii.
3. S: ambigua.
I. Salicornia herbàcea L. Slender Glasswort. (I. F. f. 1389.) Annual, 1. 5-6 dm. tall; stem much branched, the branches slender, ascending or nearly upright, their joints 2-4 times as long as thick. Scales 2 mm . long or less, broadly ovate or wider than long; fruiting spikes $2-8 \mathrm{~cm}$. long; middle flower of the 3 at each joint twice as high as the lateral ones, reaching nearly to the top of the joint; utricle pubescent. In salt marshes, Anticosti to Ga.; about salt springs in central N. Y.; in saline soil from Manitoba to Br. Col., Kans. and Utah. Also in Europe and Asia. The plant often turns bright red in autumn, forming vividly colored areas in the salt marshes, hence called Marsh Samphire. July-Sept.
4. Salicornia Bigelòvii Torr. Bigelow's Glasswort. (I. F. f. 1390.) Annual, stout, erect or nearly so, $5-30 \mathrm{~cm}$. tall. Scales ovate or triangular-ovate, sharply mucronate, $2-3 \mathrm{~mm}$. long, at lenyth spreading; fruiting spikes $1-6 \mathrm{~cm}$. long, their joints not longer than thick; middle flower slightly higher than the lateral ones, reaching very nearly to the end of the joint; utricle pubescent. In salt marshes, N. S. to Fla. and Tex. Plant bright red in autumn. July-Sept.
5. Salicornia ambígua Michx. Woody Glassiwort. (I. F. f. isqi.) Perennial by a woody rootstock; stem trailing or decumbent, 1.5-6 dm. long, the branches ascending or erect, slender, nearly or quite simple, rather long-jointed. Scales broadly ovate or wider than high, appressed or slightly divergent; fruiting spikes $\mathbf{r}-4 \mathrm{~cm}$. long, their joints not longer than thick ; flowers all ahout ciqually high and about equalling the joints. On sea beaches and salt meadows, Mass. to Fla. and Tex., and on the Pacific Coast. Aug.-Sept.

## ir. SARCOBATUS Nees.

An erect much branched shrub, with spiny hranches and alternate linear fleshy entire sessile leaves. Flowers monocious or diocious, the staminate in terminal
ament-like spikes, the pistillate solitary in the axils, or rarely several together. Staminate flowers without a calyx; stamens 2-5 together under peltate rhombicovate acute spirally arranged scales; filaments short. Pistillate flowers sessile or very nearly so; calyx compressed, ovoid or oblong, slightly 2 -lipped, adnate to the bases of the 2 subulate exserted papillose stigmas, appendaged by a narrow border which expands into a membranous horizontal wing in fruit. Seed vertical, the testa translucent, double; embryo coiled into a flat spiral, green; endosperm none. [Name Greek, flesh-thorn, from the fleshy leaves and thorny stems.] A monotypic genus of western N. Am.

1. Sarcobatus vermiculàtus (Hook.) Torr. Grease-wood. (I. F. f. 1392.) Glabrous or the young foliage somewhat pubescent, $0.6-3 \mathrm{~m}$. high, the branches nearly white. Stem $2-8 \mathrm{~cm}$. in diameter; wood yellow, very hard; leaves obtuse or subacute, $\mathbf{1}-4 \mathrm{~cm}$. long, $2-3 \mathrm{~mm}$. wide; spikes of staminate flowers $6-25 \mathrm{~mm}$. long, cylindric, short-peduncled or sessile; wing of the calyx $8-12 \mathrm{~mm}$. broad when mature, conspicuously veined. In dry alkaline and saline soil, western Neb. and Mont. to Nev. and N. Mex. June-July.

## 12. DÓNDIA Adans.

Fleshy herbs, or low shrubs, with alternate narrowly linear thick or nearly terete entire sessile leaves, and perfect or polygamous bracteolate flowers, solitary or clustered in the upper axils. Calyx 5 -parted or 5 -cleft, the segments in fruit enclosing the utricle. Stamens 5. Styles usually 2, short. Pericarp separating from the seed. Embryo coiled into a flat spiral. Endosperm wanting or very little. [In honor of Jacopodi Dondi, Italian naturalist of the fourteenth century.] About 50 species, of wide geographic distribution. Besides the following, some 6 others occur in the western and southern parts of N. Am.

Calyx-lobes not appendaged; Atlantic coast species.
Dark green, not glaucous: sepals acutely keeled; seed black.
Light green, glaucous: sepals scarcely keeled; seed dark red.
One or more of the calyx-lobes crested or winged; western species.

1. D. Americana.
2. D. maritima.
3. Dondia Americàna (Pers.) Britton. Tall Sea-Blite. (I. F. f. I393.) Stem erect, strict, 3-10 dm. tall, pale green or nearly white, the branches slender, very leafy, erect-ascending or sometimes recurved. Leaves of the stem linearsubulate, $1-4 \mathrm{~cm}$. long, those of the branches much shorter, somewhat 3 -angled, lanceolate-subulate, widest just above the base, the upper surface flat; sepals glaucous, acutely keeled or almost winged; seed orbicular, black, shining, I mm. broad. On salt marshes and along salt-water ditches, N. S. to N. J. Aug.-Sept.
4. Dondia marítima (L.) Druce. Low Sea-Blite. (I. F. f. 1394.) Pale green and somewhat glaucous; stem bushy-branched, 1-4 dm. high, becoming brownish, the branches ascending. Leaves $\mathbf{1 0}-\mathbf{2 5} \mathrm{mm}$. long, those of the branches not conspicuously shorter than the upper ones of the stem, 3 -angled, broadest at the base; sepals pale green, rounded or obtusely keeled, somewhat roughened; seed orbicular, dark brownish red, shining, about 2 mm . in diameter. On sea beaches, stony and muddy shores, and in salt marshes, Me. to S. N. Y. Also on the coasts of Europe. July-Sept.
5. Dondia depréssa (Pursh) Britton. Western Blite. (I. F. f. I395.) Branched, 1.5-6 dm. tall, the branches usually very leafy. Leaves narrowly linear, $\mathbf{1 - 2 . 5} \mathrm{cm}$. long, broadest at or just above the base, or the upper lanceolate or ovatelanceolate and commonly much shorter; sepals acute, one or more of them strongly keeled or crested in fruit; seed about I mm. in diameter, rather dull, minutely reticulated. In saline soil, Minn. to the N. W. Terr., south to Neb., Colo. and Nev. June-Aug.

## 13. SÁLSOLA L.

Bushy-branched herbs, with rigid subulate prickle-pointed leaves, and sessile perfect 2 -bracteolate flowers in the axils. Calyx 5 -parted, its segments appendaged by a broad membranous horizontal wing in fruit and enclosing the utricle. Stamens 5. Ovary depressed; styles 2. Utricle flattened. Seed horizontal; embryo coiled into a conic spiral; endosperm none. [Name Latin, a diminutive of salsus,
salty.] About 50 species, of wide geographic distribution on seashores and in saline districts, occasionally pernicious weeds in cultivated grounds.

Calyx coriaceous, not conspicuously veined ; plant maritime. r. S. Kali. Calyx membranous, very strongly veined; plant an inland weed. 2. S. Tragus.

1. Salsola Kàli L. Saltwort. (I. F. f. 1396.) Annual, loosely much branched, $3^{-6} \mathrm{dm}$. high, the branches ascending or spreading, mostly stout. Leaves dull green or grayish, $6-20 \mathrm{~mm}$. long, succulent, lanceolate-subulate, swollen at the base, the midvein excurrent into a stout yellowish green prickle; flowers solitary in the axils; wing of the persistent calyx nearly orbicular, lobed, becoming lacerate, not conspicuously veined, $4-8 \mathrm{~mm}$. in diameter; calyx coriaceous, not conspicuously veined, its wing not longer than the ascending lobe. On sea beaches, Cape Breton Island to Florida. Also in Europe and Asia. July-Sept.
2. Salsola Tràgus L. Russian Thistle. (I. F. f. 1397.) Similar to the preceding, but bushy branched, the branches usually slender. Leaves and outer branches usually bright red at maturity ; leaves not noticeably swollen at the base, linear, prickle-tipped, less fleshy; calyx membranous, conspicuously veiny, its wing longer than the ascending lobe. In cultivated fields and waste places, N. J. to Ont., the N. W. Terr. and Kans. A very troublesome weed in many parts of the Central and Western States. Naturalized from northern Europe or Asia. July-Sept.

## Family 2. AMARANTHÀCEAE J. St. Hil.

## Amaranth Family.

Herbs, some exotic genera low shrubs, with simple mostly entire thin leaves. Flowers small, green or white, bracteolate, variously clustered, usually in terminal spikes or axillary heads. Petals none. Calyx herbaceous or membranous, $2-5$-parted, the segments distinct, or united at the base, equal, or the inner ones smaller. Stamens I-5, mostly opposite the calyx-segments, hypogynous; filaments distinct, united at the base, or into a tube. Ovary i-celled ; ovule solitary in the following genera, amphitropous (several in some tropical genera) ; stigmas $1-3$. Fruit a utricle, circumscissile, bursting irregularly, or indehiscent, r-seeded in our genera. Seed mostly smooth; embryo annular; endosperm mealy, usually copious. About 40 genera and 425 species, widely distributed, most abundant in warm regions.
Anthers 2-celled; leaves alternate.

Calyx 5 -parted or of 5 sepals.
Calyx of the pistillate flowers wanting
Anthers i-celled; leaves opposite.
Flowers in small axilliary clusters.
Flowers variously spicate or paniculate. Calyx 5 -cleft ; filaments united into a tube.
Calyx 5 -parted; filaments united at the base.

1. Amaranthus.
2. Acnida.
3. Cladothrix.
4. Froelichia.
5. Iresine.

## 1. AMARÁNTHUS L.

Annual branched erect or diffusely spreading glabrous or pubescent herbs, with petioled pinnately veined leaves and small monocious polygamous or dicecious green or purplish mostly 3-bracteolate flowers in dense terminal spikes or axillary clusters. Calyx of $2-5$ distinct sepals. Stamens $2-5$; anthers longitudinally dehiscent. Styles or stigmas 2 or 3. Fruit an ovoid or oblong utricle, 2-3-beaked by the persistent styles. Embryo annular. [Greek, unfading flower, from the dry, unwithering bracts.] About 50 species of wide geographic distribution. Besides the following some 22 others occur in the southern and western U. S.
Utricle circumscissile, the top falling away as a lid.
Flowers, at least the upper, in dense terminal spikes.
Axils not spine-bearing.
Spikes stout, $8-14 \mathrm{~mm}$. thick. I. A. retrofexus.
Spikes slender, $4^{-6} \mathrm{~mm}$. thick.
2. A. hybridus.

A pair of stout spines in each axil.
3. A. spanosus.

Flowers all in small axilliary clusters, mostly shorter than the leaves.
Plant prostrate ; sepals 4 or 5 .
4. A. blitoides.
Plant erect, bushy-branched; sepals 3 .
5. A. graecizans.

Utricle indehiscent, membranous, coriaceous or fleshy.
Upper flowers in terminal, more or less elongated spikes.
Sepals 5, clawed; flowers dioccious; southwestern species.
Bracts cuspidate-tipped, short.
6. A. Torreyi.

Bracts subulate, long and sharp.
7. A. Palmeri.

Sepals 2 or 3, oblong or spatulate ; flowers monœcious or polygamous; in waste places.
Utricle smooth, dry, scarious. 8. A. lividus.
Utricle fleshy, 3-5-nerved.
Flowers all in small axillary clusters shorter than the leaves.
Plant not fleshy ; stem prostrate; leaves crisped. 9. A. deflexus.

Seacoast fleshy plant ; stem short, erect ; leaves not crisped.
11. A. pumilus.
I. Amaranthus retrofléxus L. Rough Pigweed. (I. F. f. 1398.) Roughishpuberulent, rather light green; stem stout, $0.3-3 \mathrm{~m}$. tall. Leaves ovate, rhombicovate or the upper lanceolate, acute or acuminate at the apex, narrowed or cuneate at the base, the larger $7-15 \mathrm{~cm}$. long, their margins undulate or entire; flowers green, densely aggregated in spikes, which are sessile, stout, ovoid-cylindric, $\mathbf{1}-6$ cm . long; bracts subulate, twice as long as the 5 scarious mucronate-tipped and often emarginate sepals; stamens 5 ; utricle slightly wrinkled, rather shorter than the sepals. A weed, throughout N. Am. except the extreme north. Also in Europe. Naturalized from tropical America. Aug.-Oct.
2. Amaranthus hýbridus L. Slender Pigweed. (I. F. f. I399.) Similar to the preceding but darker green, or purple; stem usually slender, erect, 0.3-2.5 m. tall. Leaves usually smaller; spikes linear-cylindric, axillary and forming dense terminal panicles, ascending, somewhat spreading or drooping; bracts subulate, twice as long as the 5 oblong acute or cuspidate sepals; stamens 5 ; utricle scarcely wrinkled. A weed, in waste grounds, range of the preceding species, but locally rare or absent. Naturalized from tropical America. Aug.-Oct.

Amaranthus hýbridus paniculàtus (L.) Uline \& Bray. Flowers and foliage more or less deeply tinged with red or purple; leaves sometimes lanceolate and bracts shorter. Range of the type, but less abundant.
3. Amaranthus spinòsus L. Spiny Amaranth. (I. F. f. 1400.) Stem stout, ridged, usually much branched, sometimes red, 3-12 dm. high. Leaves ovate, rhombic-ovate or the upper lanceolate, acute at both ends, $2-8 \mathrm{~cm}$. long, with a pair of rigid stipular spines at each node, the midvein excurrent; flowers in numerous capitate axillary clusters, and in dense terminal spreading or drooping spikes 2-15 cm . long; bracts lanceolate-subulate about as long as the 5 scarious oblong mucro-nate-tipped I-nerved sepals, and the thin imperfectly circumscissile utricle; stamens 5. In waste and cultivated soil, Mass. to Penn., Ohio, Kans., Fla. and Mex. Naturalized from tropical America. June-Sept.
4. Amaranthus blitoides S. Wats. Prostrate Amaranth. (I. F. f. i40I.) Stem diffusely branched, prostrate and spreading on the ground, I.5-6 dm. long, often forming mats. Leaves obovate or spatulate, $6-25 \mathrm{~mm}$. long, narrowed into slender petioles; flowers in small axillary clusters; bracts lanceolate-subulate, little longer than the 4 or 5 oblong-lanceolate acute or cuspidate sepals; stamens 3 ; utricle nearly smooth, equalling or slightly longer than the sepals. In waste places, especially along the principal routes of travel, Me. to S. Ont., Minn., N. J., Mo. and Kans. Naturalized from west of the Rocky Mts., where it appears to be indigenous from Utah and Colo. to Mex. June-Oct.
5. Amaranthus graecìzans L. Tumble-weed. (I. F. f. I402.) Glabrous, pale green; stem erect, bushy-branched, whitish, I.5-7 dm. tall, the branches slender, ascending. Leaves oblong, spatulate or obovate, $\mathbf{I}-4 \mathrm{~cm}$. long, papillose, the midvein excurrent; flowers polygamous, several together in small axillary clusters; bracts subulate, pungent-pointed, spreading, much longer than the 3 membranous sepals; stamens 3; utricle wrinkled, longer than the sepals. In waste and cultivated soil throughout N. Am. Naturalized from tropical America. The leaves fall away in autumn, and on the western plains the plant, thus denuded, is freely uprooted and blown before the wind, whence the popular name. June-Sept.
6. Amaranthus Törreyi (A. Gray) Benth. Torrey's Amaranth. (I. F.f. 1403.) Glabrous or nearly so; stem erect, grooved, 6-10 dm. tall. Leaves lanceolate or rhombic-lanceolate, thin, narrowed above to a rather blunt apex, mostly cuneate at the base, $4-10 \mathrm{~cm}$. long, slender-petioled; flowers diœcious, in terminal slender spikes and in axillary clusters; bracts shorter than or about equalling the 5 sepals, cuspidate; sepals of the pistillate flowers obovate or broadly spatulate, clawed, obtuse or emarginate, those of the staminate flowers narrower and subacute. In dry soil, W. Neb. to Nev., south to Mex. Plant with the aspect of Acnida. June-Aug.
7. Amaranthus Palmeri S. Wats. Palmer's Amaranth. (I. F. f. I404.) Somewhat similar to the preceding; stem slender, branched, 6-10 dm. tall, usually pubescent above. Leaves ovate, rhombic-ovate or the upper lanceolate, blunt, narrowed at the base, slender-petioled; flowers diœcious, in elongated spikes often 2 cm . long or more, and some of them commonly in clusters in the upper axils; bracts subulate, spiny-awned, spreading, twice as long as the sepals; sepals 5, spatulate, clawed. In dry soil, Kans. to Tex. and Mex., west to Cal. June-Sept.
8. Amaranthus lividus L. Purplish Amaranth. (I. F. f. 1405.) Glabrous, rather succulent, purplish-green; stem slender, 3-9 dm. tall. Leaves ovate, entire, $2-8 \mathrm{~cm}$. long, strongly emarginate, narrowed at the base, slender-petioled; flowers monœcious or polygamous, in dense terminal spikes and in capitate axillary clusters; bracts shorter than the 2 or 3 oblong or spatulate sepals; utricle smooth, longer than the sepals. In waste places, E. Mass. to S. N. Y. Adventive from tropical America. July-Sept.
9. Amaranthus defléxus L. Low Amaranth. (I. F. f. I406.) Glabrous, purplish-green; stem usually much branched, 3-10 dm. tall. Leaves ovate or oval, obtuse retuse or emarginate, mostly narrowed at the base, $\mathbf{I - 4} \mathrm{cm}$. wide, slender-petioled; flowers polygamous in dense, thick terminal spikes and capitate in the axils; bracts shorter than the 2 or 3 oblong or spatulate sepals; utricle fleshy, 3 - 5 -nerved, smooth, rather shorter than the sepals. In waste places and ballast along the coast, Mass. to S. N. Y. Also in Cal. Probably adventive from tropical America. July-Sept.
10. Amaranthus críspus (Lesp. \& Thev.) Braun. Crisp-Leaved Amaranth. (I. F. f. 1407.) Pubescent ; stem copiously branched, slender, spreading, forming mats $2-7 \mathrm{dm}$. in diameter. Leaves oblong or lanceolate, mostly acute at the apex and narrowed at the base, petioled, $8-25 \mathrm{~mm}$. long, their margins remarkably crisped; flowers in small axillary clusters; bracts lanceolate, cuspidate, shorter than the 5 spatulate spreading sepals; stamens (always?) 3 ; utricle wrinkled, about as long as the sepals. In waste places, N. Y. City, and Albany, N. Y. Also in France. Native region unknown. June-Sept.
11. Amaranthus pùmilus Raf. Coast Amaranth. (I. F. f. i408.) Glabrous, fleshy, branched, the branches $0.5-2 \mathrm{dm}$. long. Leaves ovate, rhombicovate or suborbicular, most of them clustered toward the ends of the branches, obtuse or emarginate, narrowed or rounded at the base, prominently veined; 6-20 mm . long, the veins often purple ; flowers few in small axillary clusters; bracts lanceolate, subacute, shorter than the 5 oblong obtuse sepals; stamens 5 ; anthers yellow; utricle fleshy, faintly 5 -ribbed, slightly wrinkled, nearly twice as long as the sepals when mature; seed very large for the genus. On sea beaches. R. I. to N. Car. June-Sept.

## 2. ACNİDA L.

Annual, glabrous herbs, similar to the diœecious Amaranths, with alternate petioled pinnately veined leaves. Flowers small, green, 1 -3-bracted, in terminal and axillary spikes, or clustered in the axils. Staminate flowers consisting of 5 scarious erect I -nerved mucronate sepals longer than the bracts, and as many stamens ; filaments subulate, distinct; anthers 2-celled. Pistillate fowers without a calyx; stigmas 2-5, papillose or plumose. Seed erect, smooth and shinins. [Greck. without nettle.] About 4 species, natives of eastem North America and the West Indies.

1. Acnida cannábina L. Salt-marsh Water-hemp. (I. F. f. 1409.) Succulent, stem usually much branched, $0.3-3 \mathrm{~m}$. tall. Leaves lanceolate, acuminate but generally blunt-pointed and apiculate, $5-15 \mathrm{~cm}$. long, narrowed at the base, entire or slightly undulate ; staminate spikes $2-13 \mathrm{~cm}$. long, usually dense; sepals oblonglanceolate or ovate-oblong, cuspidate or mucronate; stigmas slender, papillosehispid, I mm . long; utricle $3-5$-angled, $2-4 \mathrm{~mm}$. long when mature, becoming black, much longer than the bracts. In salt and brackish marshes, and up the rivers to fresh water, Mass. to Fla. July-Aug.

Acnida Floridàna S. Wats., a more slender plant, of the southern Atlantic coast, with narrower slender-petioled leaves, the flowers in elongated interrupted spikes, and a smaller utricle, may occur in southern Va.
2. Acnida tamaríscina (Nutt.) Wood. Western Water-hemp. (I. F. f. 1410.) Similar to the preceding, the branches usually slender. Leaves lanceolate or ovate-lanceolate, mostly long-acuminate, but sometimes obtuse, narrowed at the base ; spikes mostly loose or interrupted; sepals lanceolate, subulate-acuminate ; stigmas plumose, rather short ; utricle not angled, $\mathbf{I}-2 \mathrm{~mm}$. long, circumscissile; bractlets lanceolate, cuspidate. In swamps, Ill. to S. Dak., La. and N. Mex. July-Sept.

Acnida tamaríscina tuberculàta (Moq.) Uline \& Bray. Tall, erect, sometimes 3 m . high, with flexuous branches; inflorescence spicate; utricle ovoid, tubercled, indehiscent. Vt. to Manitoba, Tenn. and Neb. This and the following varieties perhaps constitute a distinct species.

Acnida tamaríscina concatenàta (Moq.) Uline and Bray. Stems often pecumbent; flowers larger, in separate glomerules. Range of preceding variety.

Acnida tamariscina prostràta Uline \& Bray. Stems diffuse and prostrate or sometimes ascending; leaves rarely over 2.5 cm . long, spatulate; flowers in axillary clusters or in separated glomerules. Mich. to S. Dak. and Mo.

## 3. CLÁDOTHRIX Nutt.

Diffusely branched stellate-pubescent herbs, with opposite entire or slightly undulate petioled leaves, and very small perfect 3-bracted flowers in the axils. Calyx of 5 equal pilose erect dry oblong i-nerved sepals. Stamens 5, hypogynous, their filaments united at the base, their anthers I-celled. Ovary subglobose; style short; stigma capitate or 2 -lobed. Utricle globose, indehiscent. [Greek, branchhair, from the stellate pubescence.] About 4 species, natives of southwestern N. Am. and Mex.
I. Cladothrix lanuginòsa Nutt. (I. F. f. I4II.) Perennial, somewhat woody at the base, or sometimes annual; stem much branched, the branches I-3 dm . long. Leaves orbicular, broadly ovate or rhombic-ovate, usually narrowed at the base, entire, inconspicuously veined, 4-25 mm. wide; flowers I mm. broad or less, mostly clustered in the axils of small upper leaves. In dry soil, Kans. to Tex., Ariz. and Mex. June-Sept.

## 4. FROELÍCHIA Moench.

Annual erect woolly or silky herbs, with opposite sessile entire or slightly undulate narrow leaves, or the lower and basal ones contracted into petioles. Flowers perfect, 3-bracted, often bracteolate, in panicled dense spikes. Calyx tubular, nearly terete, 5 -cleft or 5 -toothed, very woolly, its tube longitudinally crested and sometimes tubercled in fruit. Stamens 5, their filaments united into a tube, which is 5 -cleft at the summit and bears the I-celled anthers between its lobes. Ovary ovoid; stigma capitate or penicillate. Utricle indehiscent, enclosed by the tube of united filaments. [Name in honor of J. A. Froelich, a German botanist.] About 12 species, all American. Besides the following, 2 others occur in the Southwestern States.

Stout, 6-12 dm. tall ; crests of fruiting calyx continuous, dentate. Slender, $2-5 \mathrm{dm}$. tall ; crests of fruiting calyx interrupted.

1. F. Floridana.
2. F. graczlis.
3. Froelichia Floridàna (Nutt.) Moq. Florida Froelichia. (I. F. f. 1412.) Stem stout, the branches leafless above. Upper leaves linear or linearoblong, acute or acuminate at both ends, $2-8 \mathrm{~cm}$. long, the lower spatulate or oblanceolate, $8-15 \mathrm{~cm}$. long, narrowed into margined petioles; spikes mostly
opposite, narrowly ovoid or oblong, $\mathbf{1}-\mathbf{2 . 5} \mathrm{cm}$. long. In dry soil, Ill. and Minn. to Neb., Colo., Tenn., Fla. and Tex. June-Sept.
4. Froelichia grácilis Moq. Slender Froelichia. (I. F. f. I4I3.) Similar to the preceding, but the stem slender, sometimes simple, $2.5-5 \mathrm{dm}$. tall. Leaves all linear or linear-oblong, acute at both ends, $2-5 \mathrm{~cm}$. long: spikes alternate or opposite, oblong, mostly obtuse, $6-25 \mathrm{~mm}$. long. In dry soil, W. Neb. and Colo. to Tex. June-Sept.

## 5. IRESİNE P. Br.

Tall herbs, with opposite broad petioled leaves and small 3-bracted white flowers, in large terminal panicles or panicled spikes. Calyx 5 -parted, the pistillate usually woolly. Stamens 5, rarely fewer; filaments united by their bases, filiform; anthers I-celled. Utricle very small, subglobose, indehiscent. [Greek, in allusion to the woolly pubescence.] About 20 species, natives of warm and temperate regions. Besides the following another occurs in the southwestern U. S.
I. Iresine paniculàta (L.) Kuntze. Blood-leaf. Juba's Bush. (I. F. f. 1414.) Annual; stem erect, o.6-1.5 m. tall, glabrous or nearly so. Leaves ovate, ovate-lanceolate or the upper lanceolate, $0.5-\mathbf{1 . 5} \mathrm{dm}$. long; flowers very numerous, 2 mm . broad or less, calyx and bracts silvery; pistillate flowers white villous at the base, about twice as long as the bracts. In dry soil, Ohio to Kans., Fla. and Tex. Widely distributed in tropical Amerıca. Aug.-Sept.

## Family 3. PHYTOI.ACCÀCEAE Lindl.

## Pokeweed Family.

Herbs (some tropical species shrubs or trees) with alternate entire mostly exstipulate leaves, and perfect regular polygamous or monœcious flowers. Calyx $4-5$-parted or of 4 or 5 sepals, its segments or sepals imbricated in the bud. Petals wanting. Stamens as many as the calyx-segments or sepals and alternate with them, or more numerous, hypogynous; filaments distinct, or united at the base; anthers 2-celled, the sacs longitudinally dehiscent, often nearly separated. Ovary superior, several-celled in most of the genera; ovules solitary in the cavities, amphitropous. Styles as many as the carpels, short or none; stigmas linear or filiform. Fruit a berry in the following genus. Endosperm of the seed mealy or fleshy. About 22 genera and 85 species, mostly in the tropics.

## r. PHYTOLÁCCA L.

Tall perennial herbs, with petioled exstipulate leaves, and small flowers in terminal racemes, which by the further growth of the stem become opposite the leaves. Pedicels bracted at the base and often I-3-bracted above. Calyx of 4 or 5 persistent rounded sepals. Stamens 5-15, inserted at the base of the calyx. Ovary composed of $5-15$ distinct or somewhat united carpels. Fruit a depressedglobose 5-15-celled fleshy berry. Seeds I in each cavity, erect, compressed; embryo annular in the mealy endosperm. [Name Greek and French, referring to the crimson juice of the berries.] About 10 species, the following of eastern N. Am., the others tropical.
I. Phytolacca decándra L. Poke. Scoke. Pigeon-berry. Garget. (I. F. f. 1415.) A glabrous strong-smelling succulent erect herb, $\mathrm{I}-+\mathrm{m}$. tall, the root large, poisonous, the stem stout, its pith divided into disks. Leaves oblonglanceolate or ovate-lanceolate, acute or acuminate at both ends, 2-3 dm. long: racemes $0.5^{-2} \mathrm{dm}$. long; pedicels $4-12 \mathrm{~mm}$. long; flowers perfect; calyx white. 4-6 mm . broad; stamens 10 , slightly shorter than the sepals: wary green, 10 celled; styles recurved; berry dark purple, $10-12 \mathrm{~mm}$. in diameter, very junc, its Io carpels conspicuous when dry. In various situations, Me. and ()it. to Minn., Fla. and Tex. Naturalized in Europe. June-Sept. Berries ripe Aug.-Oct.

## Family 4. NYCTAGINÀCEAE Lindl.

## Four-o'clock Family.

Herbs (some tropical genera trees or shrubs) with simple entire leaves, and regular flowers in clusters, in the following genera subtended by involucres. Petals none. Calyx inferior, usually corolla-like, its limb 4-5-lobed or 4-5-toothed. Stamens hypogynous; filaments filiform ; anthers 2 -celled, dehiscent by lateral slits. Ovary enclosed by the tube of the perianth, i-celled, r-ovuled ; ovule campylotropous; stigma capitate. Fruit a ribbed, grooved or winged anthocarp. About i7 genera and 250 species, of wide geographic distribution, most abundant in America.
Involucre of united bracts; pairs of leaves equal.

1. Allionia.

Involucre of separate bracts; pairs of leaves mostly unequal.
2. Abronia.

## 1. ALLIONIA Loefl.

Forking herbs, with opposite equal leaves, and involucres in loose terminal panicles. Involucre 5 -lobed (of 5 partially united bracts), 3 - 5 -flowered, becoming enlarged and reticulate-veined after flowering. Perianth campanulate, its tube constricted above the ovary, its limb deciduous. Stamens 3-5, generally 3, unequal, hypogynous. Fruit obovoid or clavate, strongly ribbed, pubescent in our species. [Name in honor of Chas. Allioni, 1725-1804, a botanist of Turin.] About 20 species, natives of N. and S. Am., one Asiatic.

Leaves broadly ovate, cordate or oblong-ovate, all petioled.
Leaves oblong or lanceolate, only the lower petioled.
Plant glabrous or nearly so except the inflorescence.
Plant densely pubescent all over.
Leaves linear, sessile.
Plant tall, 5-9 dm. high ; branches erect-ascending.
Plants low, $1-2.5 \mathrm{dm}$. high, diffusely branched; branches divergent. Involucres axillary, their lobes ovate-oblong, acute. . 5. A. Bodini. Involucres clustered at the ends of branches, lobes simicircular, obtuse.
6. A. Bushi.
r. Allionia nyctagínea Michx. Heart-leaved Umbrella-wort. (I. F. f. 1416.) Stem often 4 -sided below, glabrous or slightly pubescent, 3-9 dm. tall. Leaves broadly ovate, $5-10 \mathrm{~cm}$. long, acute at the apex, cordate, rounded or truncate at the base, all petioled except the bract-like uppermost ones, glabrous or nearly so; peduncles and pedicles commonly somewhat pubescent; involucre shorter than the flowers; perianth red; stamens 3-5, exserted; style exserted; fruit oblong or narrowly obovoid, very pubescent. In dry soil, Minn. to the N. W. Terr., Ill., La. and N. Mex. May-Aug.

Allionia nyctaginea ováta (Pursh) Morong. Leaves oblong, lanceolate, oblanceolate or obovate, not cordate ; inflorescence very pubescent. Neb. to Tex. and N. Mex.
2. Allionia álbida Walt. Pale Umbrella-wort. (I. F. f. 1417.) Stem 4-sided below, 3-9 dm. tall, the peduncles and branches commonly glandular and viscous. Leaves lanceolate or oblong-lanceolate, 3 -veined, the upper sessile, the lower short-petioled; involucre much enlarged in fruit, pubescent, ciliate, becoming whitish and purple-veined; perianth pink or lilac; fruit with 5 or 6 obtuse hispid ribs, roughened in the furrows. S. Car. to Mont., Colo., Fla., Mo. and Tex. May-Aug.
3. Allionia hirsùta Pursh. Hairy Umbrella-wort. (I. F. f. 1418.) Stem 3-9 dm. tall, erect, angled, glandular-pubescent, especially at the nodes, occasionally glabrate toward the base. Leaves lanceolate or linear-lanceolate, obtuse, sessile or the lowest sometimes short-petioled, pubescent, $2-8 \mathrm{~cm}$. long; branches and petioles very pubescent; inflorescence usually contracted; stamens often 5 ; fruit narrowly obovoid, the ribs obtuse. In dry soil, Minn. to the N. W. Terr., Wis., Colo. and Tex. July-Aug.
4. Allionia lineàris Pursh. Narrow-leaved Umbrella-wort. (I. F. f. 1419.) Stem glabrous, glaucous, $3-13 \mathrm{dm}$. tall, the branches and peduncles some-
times puberulent. Leaves linear, thick, i-nerved, $2-6 \mathrm{~cm}$. long, sessile or the lower occasionally short-petioled; involucre about 3 -flowered; perianth purple, longer than the involucre; stamens and style exserted; fruit commonly roughened in the furrows between the 5 prominent ribs. In dry soil, Minn. to Mont., Utah, Tex. and Mex. June-Aug.
5. Allionia Bòdini (Holzinger) Morong. (Bodin’s Umbrella-wort. (I. F. f. 1420.) Low, glabrous or minutely pubescent, stem whitish, diffusely branched, o. 5-I. 3 dm . high. Leaves narrowly linear, sessile, $\mathbf{I}-3 \mathrm{~cm}$. long, 2 mm . wide or less, fleshy; involucres solitary and short-peduncled in the upper axils, finely pubescent, about 6 mm . broad when mature, 5 -lobed to about the middle, the lobes ovate-oblong, acute; fruit narrowly obovoid, obtusely 5 -ribbed, very pubescent, 5 mm. high. In dry soil, E. Colo. and W. Kans. June-July.
6. Allionia Búshi Britton. Bush's Umbrella-wort. (I. F. f. i421.) Low, glabrous, somewhat fleshy, stem nearly white, diffusely branched, about 2 dm . high, the branches widely divergent. Leaves narrowly linear, sessile, $2-8 \mathrm{~cm}$. long, $2-3$ mm . wide, blunt, their width almost uniform from base to apex; involucres clustered at the ends of the branches, at first campanulate and longer than the flowers, at length rotate and becoming 2 cm . broad, membranous, pubescent, finely retic-ulate-veined, their lobes semicircular, rounded, the midveins prominent. In dry ground; Jackson Co., Mo. Aug.

## 2. ABRÒNIA Juss.

Herbs, with opposite petioled thick entire leaves, one of each pair somewhat larger than the other. Stems branching, mostly glandular-pubescent, with clustered or solitary numerous-flowered involucres on long axillary peduncles. Flowers sessile, usually conspicuous. Perianth-tube elongated, tubular or funnelform, the limb spreading, 5 -lobed, the lobes obcordate or emarginate. Stamens 3-5, unequal, inserted on the tube of the perianth; anthers linear-oblong, included. Style filiform. Fruit dry, I-5-winged, the wings reticulate-veined. Seed cylindric, smooth, shining. [Name from the Greek, graceful.] About 15 species, all American. Besides the following, some 10 others occur in western N. Am.
Perennial ; flowers white ; wings of the fruit 2 mm . broad or less. 1. A. fragrans.
Annual ; flowers pink ; wings thin, $8-14 \mathrm{~mm}$. broad, very conspicuous.
2. A. micrantha.
r. Abronia fràgrans Nutt. White Abronia. (I. F. f. I422.). Viscid-pubescent; stem erect or ascending, usually much branched, 3-6 dm. high. Leaves oval, ovate, or oblong-elliptic, petioled, obtuse at the apex, $2-6 \mathrm{~cm}$. long; bracts of the involucre 5 or 6 , large, ovate or obovate, white; flowers white, very numerous in the involucres, $\mathbf{I}-2 \mathrm{~cm}$. long, fragrant, opening at night; fruit 8 -10 mm. high, coriaceous with 5 or sometimes fewer, undulate coarsely reticulated wings which do not close over its summit. In dry soil, Iowa to Neb., Mont., Tex. and Mex. June-Aug.
2. Abronia micrántha (Torr.) Chois. Pink Abronia. (I. F. f. 1423.) Glabrous below, more or less glandular-pubescent above; stem ascending, branched, 3-6 dm. high. Leaves similar to those of the preceding; involucral bracts orate or ovate-lanceolate, acute or acuminate; flowers several or numerous, about 18 mm . long, bright pink; calyx-limb $8-16 \mathrm{~mm}$. broad; fruit nearly 2.5 cm . high, its $2-+$ membranous wings entire-margined, shining, glabrous, united over the body of the fruit, beautifully reticulate-veined. In dry soil, W. Neb. to Mont., Nev.. Tex. and N. Mex. June-Aug.

Family 5. AIZOÀCEAE A. Br.
Carpet-weed Family.
Herbs, rarely somewhat woody, mostly prostrate and branching, with (in our species) opposite or verticillate leaves and perfect, small regular flowers. Stipules none or scarious, or the petiole-bases dilated. Calyx $4-5$-cleft or 4-5-parted. Petals small or none in our species. Stamens perigynous. Ovary usually free from the calyx. 3-5-celled, and orules numerous in each cell in our species. Fruit a capsule with loculicidal
or circumscissile dehiscence. Seeds amphitropous; endosperm scanty or copious; embryo slender, curved. About 22 genera and 500 species, mostly of warm regions, a few in the temperate zones.
$\begin{array}{ll}\text { Fleshy seacoast herbs ; leaves opposite ; capsule circumscissile. } & \text { 1. Sesuvium. } \\ \text { Not fleshy ; leaves in our species verticillate ; capsule 3-valved. } & \text { 2. Mollugo. }\end{array}$

## r. SESÙVIUM L.

Fleshy decumbent or prostrate herbs, with opposite leaves and axillary pink or purplish flowers. Stipules none, but the petioles often dilated and connate at the base. Calyx-tube top-shaped, 5 -lobed, the lobes oblong, obtuse. Petals none. Stamens 5-60, inserted on the calyx-tube. Filaments filiform, sometimes united at the base. Ovary 3-5-celled. Styles 3-5, papillose along the inner side. Capsule membranous, oblong, 3-5-celled, circumscissile. Seeds round-reniform, smooth; embryo annular. About 4 species, natives of seacoasts and saline regions. Besides the following, another occurs in the Southern States and in the alkaline areas of the Far West.
I. Sesuvium marítimum (Walt.) B. S. P. Sea Purslane. (I. F. f. 1424.) Annual, glabrous; branches $0.5-3 \mathrm{dm}$. long. Leaves obovate or spatulate, entire, rounded or slightly emarginate at the apex, narrowed into a petiole or the upper sessile, $8-25 \mathrm{~mm}$. long; flowers sessile or nearly so, about 2 mm . broad, mostly solitary ; stamens 5 , alternate with the calyx-lobes; capsule ovoid, about 4 mm . high, scarcely longer than the calyx. Sands of the seashore, Long Island, N. Y., to Fla. July-Sept.

## 2. MOLLÙGO L.

Herbs, mostly annual, much branched, with verticillate, or in some species basal or alternate leaves, and small cymose or axillary whitish flowers. Stipules scarious, deciduous. Calyx 5-parted. Sepals persistent, scarious-margined. Petals none. Stamens 3-5, when 3 alternate with the cavities of the ovary, when 5 alternate with the sepals. Ovary usually 3 -celled. Capsule usually 3 -celled, 3 -valved, loculicidally dehiscent. Seeds small, the testa smooth, granular or sculptured. About 12 species, most of them tropical. Besides the following, another occurs in the Southwest.
I. Mollugo verticillàta L. Carpet-weed. (I. F. f. I425.) Prostrate, glabrous, not fleshy, spreading and forming patches sometimes 5 dm . in diameter. Leaves verticillate, in 5's or 6's, spatulate, obovate or linear, entire, obtuse, 1-2.5 cm . long, narrowed into a petiole; flowers axillary, less than 2 mm . broad; pedicels filiform; sepals oblong, slightly shorter than the ovoid capsule, which appears roughened by the projecting seeds; seeds reniform, usually smooth and shining. In waste and cultivated grounds, N. B. and Ont. to Minn., Fla., Tex. and Mex. Native of the warmer parts of America. May-Sept.

## Family 6. PORTULACÀCEAE Reichenb.

## Purslane Family.

Herbs, rarely somewhat woody, with regular perfect but unsymmetrical flowers. Sepals commonly 2 (rarely 5). Petals 4 or 5, rarely more, hypogynous, imbricated. Stamens hypogynous, equal in number to the petals or fewer, rarely more ; filaments filiform ; anthers 2-celled, longitudinally dehiscent. Ovary I-celled; style $2-3$-cleft or $2-3$-divided, the divisions stigmatic on the inner side; ovules $2-\infty$, amphitropous. Capsule circumscissile, or dehiscent by 3 valves. Seeds $2-\infty$, reniform-globose or compressed : embryo curved. About I 50 species, mostly natives of America.
Calyx free from the ovary; capsule 3 -valved.
Seeds numerous; stamens $5-\infty$.
Seeds not more than 6; stamens 2-5.
Petals distinct or very nearly so, and stamens 5 in our species.
Petals united into a short tube at the base; stamens 2 or 3.
Calyx partly adnate to the ovary; capsule circumscissile,

1. Talinum.
2. Claytonia.
3. Mentia.
4. Portulaca.

## 1. TALINUM Adans.

Fleshy glabrous erect or ascending herbs, with alternate terete or flat exstipulate leaves (terete and clustered near the base in the following species). Sepals 2, ovate. Petals 5, hypogynous, fugacious. Stamens adherent to the bases of the petals. Ovary many-ovuled; style 3-lobed or 3-cleft. Capsule ovoid, oval or globose. Seeds numerous, borne on a central globose placenta. [Aboriginal name of a Senegal species.] A genus of about 12 species, all but 1 or 2 natives of America. In addition to the following, about 4 others occur in the western and southwestern U. S.
Flowers io-16 mm. broad; sepals deciduous.

Stamens io-30; capsule globose.
Stamens only 5 ; capsule oval.
Flowers $20-30 \mathrm{~mm}$. broad; sepals persistent.

1. T. teretifolium.
2. T. parviflorum.
3. T. calycinum.
I. Talinum teretifòlium Pursh. Fame-flower. (I. F. f. 1426.) Perennial, erect, $\mathrm{I}-3 \mathrm{dm}$. high, leafy at the base. Leaves linear, terete, $\mathbf{I}-5 \mathrm{~cm}$. long, about 2 mm . wide, the base broadened and prolonged posteriorly ; scape-like peduncles I-5, terminal, branched. leafless, o.7-1.5 dm. long; cymes terminal, loose; flowers pink, I2-16 mm . broad, opening for a day; sepals membranous, deciduous, ovate, obtuse, 4 mm . long, about half the length of the petals; style as long as the stamens; capsule globose, 4 mm . in diameter; bracts of the cyme ovate or ovate-lanceolate. On dry rocks, Penn. to Minn., Ga. and Tex. May-Aug.
4. Talinum parviflòrum Nutt. Small-Flowered Talinum. (I. F. f. 1427.) Perennial, similar to the preceding. Leaves terete or nearly so, rather more slender, broadened at the base; scape-like peduncles slender, o.7-2 dm. tall; cymes loose; flowers pink, 8 -10 mm. broad; sepals ovate, deciduous, acute or subacute; stamens 5 (or sometimes fewer ?); capsule 4 mm . high, about 2 mm . in diameter; bracts slightly prolonged posteriorly. In dry soil, Minn. to S. Dak., Ark., N. Mex. and Tex. May-Sept.
5. Talinum calycìnum Engelm. Large-flowered Talinum. (I. F. f. I428.) Perennial, erect from a thick root, I. 5-2.5 dm. high. Leaves nearly terete, $3-5 \mathrm{~cm}$. long, the base triangular-broadened, slightly prolonged posteriorly; cyme somewhat compound, scarious-bracted; flowers pink, $2-3 \mathrm{~cm}$. broad; sepals broadly ovate, persistent, cuspidate; petals twice as long as the calyx; stamens 12-30; style twice as long as the stamens; capsule globose-ovoid, about 6 mm . in diameter. In dry soil, Neb. and Kans. to Tex. June.

## 2. CLAYTÒNIA L.

Succulent glabrous herbs, with petioled basal leaves, and opposite or alternate cauline ones. Flowers terminal, racemose or cymose. Sepals 2, ovate, persistent. Petals 5, hypogynous, distinct, or slightly united by their bases. Stamens 5, inserted on the bases of the petals. Ovary few-ovuled; style 3-lobed or 3 -cleft. Capsule 3-valved, 3-6-seeded. Seeds compressed, orbicular or reniform. [In honor of John Clayton, 1686?-1773, American botanist.] About 25 species, mainly natives of northern N. Am.
Upper leaves not connate.
Perennials; leaves linear, lanceolate, oval or ovate.
Leaves linear-lanceolate, $8-17 \mathrm{~cm}$, long. $\quad$. C. Virginica.
Leaves ovate-lanceolate or ovate, $5-8 \mathrm{~cm}$. long. 2. C. Caroliniana.
Annual, diffuse ; leaves spatulate or oblanceolate.
Upper leaves connate, forming an orbicular disk.
3. C. Chamissoi.
4. C. perfoliata.

1. Claytonia Virgínica L. Spring Beatity. (I. F. f. I42n.) Ascending or decumbent, perennial from a deep tuberous root; stem I.5-3 dm. long. simple or rarely with a few branches. Leaves clongated, lincar, or lincar-lanceolate, the basal $2-12 \mathrm{~cm}$. wide, the cauline shorter and opposite; raceme loose. somewhat secund; flowers white or pink, with darker pink veins, $1-2 \mathrm{~cm}$. hroad; pedicles slender, at length recurved; petals emarginate; capsules shorter than the sepals. In moist woods, N. S. to the N. W. Terr., Ga, and Tex. March-May.
2. Claytonia Caroliniàna Michx. Caronina sikinc bealti. (I. F. f. 1430.) Similar to the preceding species but sometimes more nearly erect. Basal
leaves ovate-lanceolate or oblong, $\mathbf{I}-2 \mathrm{~cm}$. wide, obtuse; stem-leaves on petioles 6-12 mm. long; flowers fewer. In damp woods, N. S. to the N. W. Terr., Conn., N. Car., Ohio and Mo. March-May.
3. Claytonia Chamíssoi Ledeb. Chamisso's Claytonia. (I. F. f. i431.) Annual, glabrous, stoloniferous; stems weak, ascending or procumbent, $0.7-2.5 \mathrm{dm}$. long. Leaves spatulate or oblanceolate, obtuse, $6-10 \mathrm{~mm}$. wide; flowers few, pink, racemose, $6-8 \mathrm{~mm}$. broad; pedicels slender, recurved in fruit; capsule very small. In wet places, Minn. to Br. Col., Alaska, south in the Rocky Mts. to N. Mex. and to Cal. May-June.
4. Claytonia perfoliàta Donn. Spanish Lettuce. (I. F. f. I432.) Annual; stems several, simple, $0.7-3 \mathrm{dm}$. high, bearing a pair of connate-perfoliate leaves near the summit. Basal leaves rhomboid-ovate, long-petioled; petioles shorter than the stems; raceme usually peduncled, several-flowered; bracts broad, deciduous ; flowers white or pink, $6-10 \mathrm{~mm}$. broad ; petals and stamens 5 ; capsule globose, 2-4 mm . in diameter, 2-5-seeded. Established near Painesville, Ohio. Native from Br. Col. to Mex. April-May.

## 3. MÓNTIA L.

Small annual glabrous herbs, with opposite fleshy leaves and minute nodding white flowers. Sepals 2 (rarely 3), broadly ovate, persistent. Petals 5, hypogynous, more or less united. Stamens 3 (very rarely 5), inserted on the corolla. Ovary 3-ovuled ; style short, 3-parted. Capsule 3-valved, 3-seeded. Seeds nearly orbicular, compressed, minutely tuberculate ; embryo peripheral. [In honor of Guiseppe Monti, Italian botanist and author of the eighteenth century.] About 4 species, widely distributed in the colder parts of both hemispheres. In addition to the following, another occurs in Oregon.
I. Montia fontàna L. Water or Blinking Chickweed. (I. F. f. 1433.) Tufted, weak, diffuse or ascending, $2-15 \mathrm{~cm}$. long, oranching. Leaves opposite, spatulate or obovate, mainly obtuse, $6-12 \mathrm{~mm}$. long, 2 mm . broad or less; flowers nodding, solitary and terminal or in a small loose leafy-bracted raceme; sepals obtuse, slightly shorter than the ovate-oblong petals ; capsule globose, nearly 2 mm . in diameter. In springs and wet places, Quebec and Me. to Lab., Newf. and across arctic America, south in the mountains to Calif. Also in the Andes of S. Am., in Australasia and in northern Europe and Asia. Summer.

## 4. PORTULÀCA L.

Diffuse or ascending, glabrous or pubescent fleshy herbs, with terminal flowers. Sepals 2, united at the base and partly adnate to the ovary. Petals $4-6$ (mainly 5), inserted on the calyx, fugacious. Stamens $7-\infty$, also on the calyx. Ovary manyovuled ; style deeply 3-9-cleft or parted. Capsule membranous, dehiscent by a lid, many-seeded. [Latin, in allusion to the purging qualities of some species.] A genus of about 20 species, all but 2 or 3 natives of America. In addition to the following, some 7 others occur in the southern U.S.
Glabrous throughout; flowers small, yellow.

Leaves mainly rounded at the apex ; seeds minutely rugose.
Leaves mainly retuse; seeds prominently tuberculate.
Pilose pubescent, especially in the axils.
Flowers red or pink, $8-12 \mathrm{~mm}$. broad.
Flowers variously colored, $2-5 \mathrm{~cm}$, broad.

1. P. oleracea.
2. P. retusa.
3. P. pilosa.
4. P. grandiflora.
r. Portulaca oleràcea L. Purslane. Pussley. (I. F. f. I434.) Annụal, prostrate, branching from a deep central root; branches $\mathbf{I}-2.5 \mathrm{dm}$. long. Leaves alternate and clustered at the ends of the branches, obovate or cuneate, $6-20 \mathrm{~mm}$. long, rounded at the apex, very fleshy; flower-buds flat; flowers solitary, sessile, 4-6 mm . broad, yellow, opening in bright sunshine; sepals broad, keeled, acutish; style $4-6$-parted; capsule $6-10 \mathrm{~mm}$. long; seeds finely rugose. In fields and waste places, common throughout our area, and in warm and tropical America. Native in the southwest, but naturalized northward. Summer.
5. Portulaca retùsa Engelm. Notched Purslane. (I. F. f. 1435.) Closely resembles the preceding. Leaves cuneate, generally broader, mostly retuse or emarginate; sepals broad, obtusish, carinate-winged; style larger, 3-4-cleft; capsule 4-6 mm. long; seeds distinctly tuberculate; petals smaller and the flowers opening earlier in the morning than those of that species, where the two grow together. Minn. (?), Mo. and Ark. to Tex., west to Nev. Growing in large patches. Summer.
6. Portulaca pilòsa L. Hairy Portulaca. (I. F. f. 1436.) Annual, from a deep root, pilose-pubescent, with small tufts of light-colored hairs in the axils. Branches $5-15 \mathrm{~cm}$. long; leaves linear, terete, obtuse, $8-16 \mathrm{~mm}$. long, about 2 mm . wide, alternate, and clustered at the ends of the branches; sepals oblong, acute, membranous, not carinate, deciduous with the operculum of the capsule; stamens numerous; style 5-6-parted; seeds minutely tuberculate. In dry soil, N. Car. to Fla., Kans., Tex., Mex. and Cal. Also throughout tropical America. Summer.
7. Portulaca grandifiòra Hook. Garden Portulaca. Sun-plant. (I. F. f. I437.) Ascending or spreading. Branches 1.5-3 dm. long; leaves alternate, and clustered at the ends of the branches, terete, about 2 mm . wide; flowers pink, yellow, red, or white, open in sunshine; sepals broad, obtuse, scarious-margined; petals obovate; capsule ovoid; seeds gray, shining. In waste places, occasionally escaped from gardens. Introduced from S. Am. Summer.

## Family 7. CARYOPHYLLÀCEAE Reichenb.

## Pink Family.

Herbs often swollen at the nodes, with opposite entire leaves, and perfect or rarely diœcious regular flowers. Sepals 4 or 5, persistent, separate or united into a calyx-tube. Petals equal in number to the sepals or none. Stamens twice as many as the sepals or fewer, hypogynous or perigynous; anthers longitudinally dehiscent. Ovary mainly 1-celled (rarely 3-5-celled); styles 2-5; ovules and seeds attached to a central column. Fruit generally membranous, a capsule, dehiscent by valves or teeth, or an indehiscent achene or utricle. Seeds mainly amphitropous; embryo curved and peripheral to the endosperm, rarely straight; cotyledons mainly incumbent. About 70 genera and 1500 species, widely distributed, most abundant in the northern hemisphere.

* Calyx of united sepals, tubular or ovoid.

Calyx-ribs at least twice as many as the teeth, running both into the teeth and into the sinuses.

Styles 5, alternate with the foliaceous calyx-teeth. I. Agrostemma.
Styles 3-5, when 5 , opposite the short calyx-teeth.
Styles 5, capsule several-celled at the base. Styles 3, rarely 4.
Styles 5, capsule r-celled to the base.
2. Discaria.
3. Silene.
4. Lychnis.

Calyx 5 -ribbed, 5 -nerved, or nerveless, or striate-nerved.
Calyx conspicuously scarious between its green nerves.
Calyx not bracteolate at the base.
5. Gypsophila.

Calyx bracteolate at the base.
6. Tunica.

Calyx not at all scarious.
Petals appendaged at the base of the blade. 7. Saponaria.
Petals not appendaged at the base of the blade. Calyx strongly 5 -angled, not bracteolate. Calyx terete or nearly so, subtended by bractlets.
8. Laccaria.
9. Dianthus.
** Calyx of distinct sepals, or the sepals united only at the base.
Fruit a capsule, dehiscent by apical teeth or by valves.
Styles separate to the base; stipules wanting.
Plants not fleshy; disk of the flower inconspicuous or none.
Petals deeply 2 -cleft or 2 -parted (rarely none).
Capsule ovoid or oblong, dehiscent by valves. ro. Alsine.
Capsule cylindric, commonly curved, dehiscent by teeth.
II. Cerastium.

Petals entire or emarginate (rarely none). Capsule cylindric. Capsule ovoid or oblong.

Styles as many as the sepals. Styles opposite the sepals. Styles alternate with the sepals. Styles fewer than the sepals.

Seeds not appendaged by a strophiole. Seeds strophiolate.
Plants fleshy, maritime; disk conspicuous, 8-1o-lobed. Styles separate to the base; stipules present, scarious.

Styles and capsule-valves 5 .
Styles and capsule-valves 3 .
Styles united below; southwestern herbs with subulate leaves.
Fruit an indehiscent or irregularly bursting utricle or achene.
Leaves stipulate.
Sepals awn-tipped.
Sepals awnless.
Leaves not stipulate.
12. Holosteum.
13. Moenchia. 14. Sagina.
15. Arenaria.
16. Moehringia.
17. Ammodenia.
18. Spergula.
19. Tïssa.
20. Loeflingia.
21. Paronychia.
22. Anychia.
23. Scleranthus.

## I. AGROSTÉMMA L.

Annual pubescent herbs, with linear or linear-lanceolate acute or acuminate sessile leaves, and large red or white erect flowers, solitary at the ends of long axillary peduncles. Calyx oblong, not inflated, narrowed at the throat, io-ribbed, 5 -lobed, the lobes linear, elongated and foliaceous. Petals 5, shorter than the calyx lobes, their blades obovate or cuneate, emarginate, not appendaged; stamens 10. Styles 5, opposite the petals. Capsule I-celled. Seeds numerous, black. [Greek, a field-garland.] Two known species, natives of Europe and Asia.
I. Agrostemma Githàgo L. Corn Cockle. Corn Rose. Corn Campion, (I. F. f. 1438.) Erect, 3-10 dm. high, densely pubescent with whitish appressed hairs. Leaves linear-lanceolate, acute or long-acuminate, erect, $5-10 \mathrm{~cm}$. long, $4-6 \mathrm{~mm}$. wide; flowers red, $2-8 \mathrm{~cm}$. broad; calyx ovoid, its lobes 3 or 4 times the length of the tube and much exceeding the petals, deciduous in fruit; petals usually slightly emarginate, the blade obovate-cuneate. In grain fields and waste places, frequent or occasional throughout our area. Adventive from Europe, occurring also in northern Asia. July-Sept.

## 2. VISCÀRIA Roehl.

Perennial or biennial glabrous herbs, with erect stems and narrow leaves, the basal densely tufted, those of the stem sessile, and small red or rarely white flowers in clustered terminal cymes, the inflorescence in our species almost capitate. Calyx oblong-campanulate, not inflated, 4 - 5 -toothed, 8 -10-ribbed. Petals 4 or 5 , much exceeding the calyx, each with a 2 -cleft appendage at the base of the obovate emarginate blade. Stamens 10, exserted. Styles alternate with the petals. Capsule several-celled at the base, its teeth as many as the styles. [Latin, glutinous.] About 5 species, the following of arctic and subarctic regions; the others European and Asiatic.

1. Viscaria alpìna (L.) Roehl. Red Alpine Campion. (I. F. f. 1439.) Tufted, o. 7-3 dm. high, rather stout, somewhat glaucous. Basal leaves narrowly oblanceolate or linear, $2-4 \mathrm{~mm}$. wide; stem-leaves distant, linear-lanceolate, about 2 cm . long; inflorescence $1-2.5 \mathrm{~cm}$. broad; bracts small, membranous; flowers pink, 6-8 mm. wide; calyx campanulate, 4 mm . long, its teeth short, rounded; petals obovate, 2 -lobed; appendages minute. Quebec to Lab., Newf., Hudson Bay, Greenland, and in arctic and alpine Europe and Asia. Summer.

## 3. SILENE L.

Herbs, with mainly pink red or white flowers. Calyx more or less inflated, 5 -toothed or 5 -cleft, Io-many-nerved, not bracted at the base. Petals 5, narrow, clawed. Stamens 10. Styles 3 (rarely 4 or 5); ovary I-celled, or incompletely $2-4$-celled. Pod dehiscent by 6 or rarely 3 apical teeth. Seeds mainly spiny or tubercled. [Greek, saliva, in allusion to the viscid secretions of many species.] About 250 species of wide geographic distribution. In addition to the following, some 35 others occur in the southern and western U.S.

Erect or ascending herbs; flowers clustered (sometimes solitary in nos. 3-7).
Leaves or some of them verticillate in 4's.
2. S. stellata.

Leaves all opposite.
Calyx much inflated and bladdery.

| Flowers few, leafy-bracted. | 3. S. alba. |
| :--- | :--- |
| Flowers numerous, in leafless cymes, | 4. S. vulgaris. |

Calyx merely expanded by the ripening pod.
Flowers cymose or paniculate.
Day-blooming; flowers rarely white, mostly pink or red.
Perennials, more or less viscid-pubescent.
Petals 2 -cleft, 2 -lobed, or irregularly incised, scarlet or crimson.
Leaves lanceolate or spatulate ; flowers numerous.
Flowers in slender panicles, nodding.
5. S. nutans.

Flowers in terminal cymes, erect. 6. S. Virginica.
Leaves broadly oval ; flowers few or solitary.
7. S. rotundifolia.

Petals erose, entire, or emarginate.
Petals scarlet ; plant 9-12 dm. tall.
Petals pink; plant $1-2.5 \mathrm{dm}$. high.
8. S. regia.
9. S. Caroliniana. Annuals, glutinous at or below the nodes. Calyx ovoid.

Flowers small, panicled ; calyx-teeth ovate.
1o. S. antirrhina.
Flowers large, cymose ; calyx-teeth subulate.
II. S. conica.

Calyx club-shaped; flowers large, cymose.
12. S. Armeria.

Night-blooming ; flowers large, white.
13. S. noctiflora.

Flowers spicate or racemose, short-pedicelled.
Spike-like raceme simple; flowers small.
14. S. Anglica. Raceme forked; flowers $12-16 \mathrm{~mm}$. broad.
15. S. dichotoma. Flowers axillary and terminal, slender-pedicelled; western.
16. S. Menziesii.
I. Silene acàulis L. Moss Campion. (I. F. f. I440.) Perennial, branched, densely tufted, $2-8 \mathrm{~cm}$. high. Leaves sessile, crowded, linear, $8-12 \mathrm{~mm}$. long, about Imm . wide, the margins ciliate-serrulate; flowers sessile or slender-peduncled, $8-\mathrm{I} 2 \mathrm{~mm}$. broad, purple or purplish; calyx campanulate, glabrous, 8 mm . high; petals with a scale at the base of the blade; pod oblong. White Mountains, N. H., to Quebec; Lab. and throughout arctic America, south in the higher Rocky Mts. to Ariz. Also in arctic and alpine Europe and Asia. Summer.
2. Silene stellàta (L.) Ait. Starry Campion. (I. F. f. I44I.) Perennial, erect, 6-10 dm. high, densely and minutely rough-pubescent. Leaves ovatelanceolate, acuminate, $5-10 \mathrm{~cm}$. long, $\mathbf{I}-2.5 \mathrm{~cm}$. wide, verticillate in 4 's or the lowest opposite, their margins finely ciliate; flowers white, $1-2 \mathrm{~cm}$. broad, in panicled cymes; calyx campanulate, inflated, $14-16 \mathrm{~mm}$. high, its teeth triangular, acute; petals crownless, fimbriate, about equalling the stamens; pod globose-ovoid. In woods, R. I. to Niagara, Minn., Ga., Neb. and Ark. June-Aug.
3. Silene álba Muhl. Western White Campion. (I. F. f. 1442.) Perennial, rather weak, minutely puberulent or glabrate. Leaves lanceolate or oblonglanceolate, $8-13 \mathrm{~cm}$. long, $\mathbf{I}-\mathbf{1 . 6} \mathrm{cm}$. wide, acuminate, the upper gradually smaller; pedicels divaricate; flowers white, about 2 cm . broad; calyx inflated, elongatedcampanulate, pubescent, its teeth ovate, obtuse; petals cuneate, 2 -cleft, or 2 -lobed, minutely crowned. In shaded or moist places, Penn. to D. C., Minn. and Neb. June-July.
4. Silene vulgàris (Moench) Garcke. Bladder Campion. (I. F. f. 1443.) Perennial, branched from the base, glaucous and glabrous, or rarely pubescent, 1.5-4.5 dm. high. Leaves ovate-lanceolate or oblong, acute, or the lower often spatulate; flowers white, $\mathrm{r}-2 \mathrm{~cm}$. broad, in loose cymose panicles, often drooping; calyx at length inflated and globose, $8-12 \mathrm{~mm}$. long, strongly veined; petals 2-cleft. In meadows and waste places, N. B. to Ont., N. J. and Ill. Naturalized from Europe. Summer.
5. Silene nùtans L. Nodding Catchfly. (I. F. f. rt4t.) Peremnial; stem erect, 3-6 dm. tall. Lower and basal leaves spatulate, subacute, $6-16 \mathrm{~mm}$. wide,
tapering into slender petioles; stem-leaves few, distant, oblong or lanceolate, acute or acuminate, sessile; flowers $12-16 \mathrm{~mm}$. broad, white or pink, nodding or spreading in a loose panicle; pedicels slender; calyx oblong-cylindric in flower, $8-10 \mathrm{~mm}$. long, glandular, its teeth triangular, acute; petals 2 -cleft or sometimes 4 -cleft; capsule ovoid, $10-12 \mathrm{~mm}$. high, distending the calyx. Mt. Desert Island, Me., and Staten Island, N. Y. Fugitive from Europe. June-Sept.
6. Silene Virgínica L. Fire Pink. (I. F. f. 1445.) Perennial, viscidpubescent, 3-6 dm. high. Leaves thin, those of the lower part of the stem spatulate or oblanceolate, $8-13 \mathrm{~cm}$. long; upper leaves oblong-lanceolate, acute, sessile ; inflorescence loosely cymose-paniculate ; flowers crimson, $2-3 \mathrm{~cm}$. broad; pedicels slender, $\mathrm{I}-5 \mathrm{~cm}$. long ; calyx tubular-campanulate, $1.5-2.5 \mathrm{~cm}$. long, enlarged by the ripening pod, its teeth ovate, acute; petals 2 -cleft, 2 -lobed, or irregularly incised, crowned. In dry woods, S. N. J., W. N. Y. and Ont. to Minn., Ga. and Mo. May-Sept.
7. Silene rotundifòlia Nutt. Round-LEaved Catchfly. (I. F. f. 1446.) Perennial; stem ascending or reclining, viscid-pubescent, 4-6 dm. long. Leaves thin, the lower and basal ones obovate ; $5-10 \mathrm{~cm}$. long, narrowed into a winged petiole, the cauline obovate, broadly oblong or orbicular-ovate, acute, the uppermost sessile ; flowers few or solitary, scarlet, $2-5 \mathrm{~cm}$. broad; pedicels slender ; calyx tubular-campanulate, $2-3 \mathrm{~cm}$. long, somewhat enlarged by the ripening pod, its teeth ovate, acute: petals 2 -cleft, lobed, or laciniate, crowned. In shaded places, S. Ohio and Ky. to Ga. Summer.
8. Silene régia Sims. Royal Catchfly. (I. F. f. 1447.) Perennial; stem erect, stout, $\mathbf{I}-\mathbf{1} .2 \mathrm{~m}$. high, minutely rough-pubescent, slightly viscid. Leaves all but the lowest sessile, thick, ovate-lanceolate, acute or acuminate, $5-8 \mathrm{~cm}$. long ; inflorescence a narrow panicle of few-flowered cymose clusters; flowers numerous, deep scarlet, about 2.5 cm . broad; calyx oblong-tubular, 2 cm . long, slightly enlarged by the ripening pod, its teeth ovate, acute ; petals emarginate or laciniate, crowned. Prairies, Ohio to Ala., Tenn. and Mo. July.
9. Silene Caroliniàna Walt. Wild Pink. (I. F. f. I448.) Perennial, tufted, $\mathbf{I}-2.5 \mathrm{dm}$. high, viscid-pubescent, especially above. Basal leaves spatulate, or oblanceolate, $5-10 \mathrm{~cm}$. long, narrowed into a broad petiole; stem-leaves shorter, sessile, oblong or lanceolate; flowers pink, about 2.5 cm . broad, in terminal cymes; calyx narrow, much enlarged by the ripening pod, its teeth ovate, acute; petals cuneate, emarginate, eroded, crowned. In dry, sandy or rocky soil, Me. to Ga., west to central N. Y., Penn. and Ky. April-June.
10. Silene antirrhìna L. Sleepy Catchfly. (I. F. f. i449.) Annual, puberulent or glabrous, glutinous about the nodes, 2-7 dm. high. Basal and lower leaves spatulate or oblanceolate, $2-5 \mathrm{~cm}$. long, narrowed into a petiole; upper leaves linear to subulate; inflorescence a loose cymose panicle; pedicels slender, erect; flowers pink, $2-4 \mathrm{~mm}$. broad; calyx narrowly ovoid, 4-6 mm . long, much expanded by the ripening pod, its teeth ovate, acute; petals obcordate, minutely crowned. In waste places and woods, N. Eng. to S. Ont., Br. Col., Fla. and Mex. Summer.

Silene antirrhina divaricàta Robinson. More slender than the species and with narrower leaves; branches spreading, filiform; calyx $4-5 \mathrm{~mm}$. long; petals none. III. and N. Y.
ir. Silene cónica L. Striate, or Corn Catchfly. (I. F. f. i450a.) Canescent or puberulent; stems erect, commonly forked above, 1.5-6 dm. high. Leaves linear-lanceolate, acute, sessile, about 3 mm . wide ; inflorescence cymose ; flowers I-several; calyx ovoid, rounded or truncate at the base, densely about 3o-nerved, its teeth triangular-subulate; petals rose, obcordate; capsule oblongovoid, distending the calyx. Clyde, Ohio. Adventive or naturalized from Europe. June-July.
12. Silene Armèria L. Sweet William or Lobel's Catchfly. (I. F. f. 1450.) Annual, glabrous and glaucous, or minutely puberulent, about 3 dm . high, glutinous below each node. Basal leaves oblanceolate, 5-8 cm. long, obtuse; stem-leaves ovate or ovate-lanceolate; inflorescence a terminal compact compound cyme; flowers purple or pink, $12-16 \mathrm{~mm}$. broad; calyx club-shaped, $10-16 \mathrm{~mm}$.
long, slightly enlarged by the ripening pod; petals emarginate, crowned with narrow scales. In waste places and spontaneous in gardens, N. B. and Ont. to Mich., E. Mass., N. J. and Penn. Introduced from Europe. June-July.
13. Silene noctiflòra L. Night-flowering Catchfly. (I. F. f. 145 I.) Annual, viscid-pubescent, 3-10 dm. high. Lower and basal leaves obovate or oblanceolate, $5^{-13} \mathrm{~cm}$. long, obtuse, narrowed into a broad petiole; upper leaves sessile, ovate-lanceolate, acute or acuminate; flowers few, white or pinkish, I.52.5 cm . broad, in a loose panicle; calyx $2-3 \mathrm{~cm}$. long, tubular, Io-nerved and beautifully veined, much enlarged by the ripening pod, its teeth linear, acute; petals 2 -cleft. In waste places, N. S. and N. B. to Manitoba, Fla. and Mo. Adventive from Europe. Flowers opening at dusk and remaining so until the morning of the next day, fragrant. July-Sept.
14. Silene Ánglica L. English or Small-flowered Catchfly. (I. F. f. 1452.) Annual, hirsute-pubescent; stem 3-6 dm. high. Leaves spatulate or oblanceolate, $1-5 \mathrm{~cm}$. long, obtuse, sometimes mucronate, or the upper narrower and acute; flowers in a terminal simple I-sided raceme, nearly sessile or the lower ones distant and longer-pedicelled, sometimes all distinctly pedicelled; calyx ronerved, villous, $8-10 \mathrm{~mm}$. long, much enlarged by the ripening pod, its teeth lanceolate, spreading; petals white, somewhat longer than the calyx. In waste places, Me. to Ont., N. Y. and Penn. Adventive from Europe. Naturalized as a weed on the Pacific Coast. April-July.
15. Silene dichótoma Ehrh. Forked Catchfly. (I. F. f. 1453.) Annual, pubescent, 3-6 dm. high. Lower and basal leaves lanceolate or oblanceolate, 5-8 cm . long, acuminate or acute, tapering into a petiole; upper leaves sessile, lanceolate or linear; flowers white, distant in forking 1 -sided spikes; calyx cylindric, 12-16 mm . long, hirsute, much enlarged by the ripening pod, its teeth ovatelanceolate, acute; petals white, bifid, with a short obtuse crown. In fields and waste places, Me. to N. J. and Penn. Also in Cal. Adventive from southern Europe. Summer.
16. Silene Menzièsii Hook. Menzies’ Pink. (I. F. f. 1454.) Perennial, ascending or decumbent, leafy, widely branching, minutely glandular-pubescent, 1.5-4.5 dm. high. Leaves sessile, or the lowest petioled, oval, ovate-lanceolate or slightly oblanceolate, acute or acuminate at each end, minutely ciliate, $2-6 \mathrm{~cm}$. long; flowers axillary and terminal, numerous, slender-peduncled, white (or pink ?), 8 -10 mm. long; petals 2 -cleft, crownless, longer than the 5 -toothed calyx; capsule about the length of the calyx. In damp soil, Neb. to the N. W. Terr., Br. Col., Cal. and N. Mex. June-Aug.

## 4. LÝCHNIS L.

Herbs, mainly erect. Calyx ovoid, tubular, or inflated, 5 -toothed, io-nerved. Petals 5, narrowly clawed, the blade entire, 2-cleft, or laciniate, generally crowned. Stamens 10. Ovary I-celled or incompletely several-celled at the base, manyovuled; styles 5 , opposite the calyx-teeth (occasionally 4 or rarely 3). Capsule dehiscent by apical teeth or valves. [From the Greek for lamp, in allusion to the flame-colored flowers of some species.] A genus of about 35 species, natives of the north temperate and arctic zones. In addition to the following, about 9 others occur in northern and western N. Am.

[^23]1. Lychnis álba Mill. White Campion. Evening Lychnis. (I. F.'f. 1455.) Biennial, freely branching, 3-6 dm. high. Leaves ovate-oblong or ovate-lanceolate, acute, $2-8 \mathrm{~cm}$. long, the lower petioled, the upper sessile; flowers few, loosely paniculate, $1.5-2.5 \mathrm{~cm}$. broad, white or pinkish, opening at dusk and remaining open into the morning of the next day; calyx at first tubular, swelling with the ripening pod so as to become ovoid and $\mathbf{1 2 - 1 4} \mathrm{mm}$. in diameter, its teeth short, lanceolate; petals obovate, 2 -cleft, crowned; teeth of the capsule 2 -cleft, nearly erect. In waste places and on ballast, occasional in the maritime provinces of Canada, Ont. and in the Eastern and Middle States. Adventive or naturalized from Europe. Summer.
2. Lychnis diòica L. Red Campion. (I. F. f. 1456.) Biennial, 3-6 dm. high. Basal leaves long-petioled, oblong, the blade 5-8 cm . long; stem-leaves sessile or the lower short-petioled, ovate, acute, $2-5 \mathrm{~cm}$. long; flowers red or nearly white, opening in the morning; calyx at first tubular, swollen in fruit to nearly globular by the ripening pod, its teeth ovate-lanceolate, acute; petals obovate, 2 -cleft, crowned; teeth of the capsule 2 -cleft, recurved. In waste places and ballast, N. S., Ont., N. Eng. and the Middle States. Adventive from Europe. Summer.
3. Lychnis Chalcedónica L. Scarlet Lychnis. (I. F. f. 1457.) Perennial; stem pubescent or hirsute, $3-7 \mathrm{dm}$. tall. Leaves ovate, ovate-lanceolate or the upper lanceolate, acute or acuminate at the apex, rounded or subcordate at the base, sessile or somewhat clasping, $\mathbf{I}-2 \mathrm{~cm}$. wide ; flowers perfect, about 2.5 cm . broad, scarlet, in one or more dense terminal cymes ; calyx becoming obovoid, its teeth triangular, acute; petals 2 -cleft or laciniate; capsule borne on a stipe of nearly its own length, its teeth entire. Escaped from gardens to roadsides, Mass. to S. N. Y. Native of eastern Europe and western Asia. June-Sept.
4. Lychnis Flós-cùculi L. Cuckoo Flower. Ragged Robin. (I. F. f. 1458.) Perennial, 3-6 dm. high, freely branching, downy-pubescent below, slightly viscid above. Lower and basal leaves oblanceolate or spatulate, $5-8 \mathrm{~cm}$. long, tapering into a broad petiole ; upper leaves sessile, lanceolate or linear-lanceolate, distant; inflorescence paniculate ; flowers pink, blue or white, $1.5-2.5 \mathrm{~cm}$. broad; calyx ro-nerved, becoming campanulate in fruit, its teeth triangular, acute ; petals cleft into 4 linear lobes, the middle pair of lobes longer; capsule globose. In moist waste places, N. B. to N. J. and Penn. Fugitive from Europe. June-Sept.
5. Lychnis Drúmmondi (Hook.) S. Wats. Drummond's Pink. (I. F. f. 1459.) Erect from a perennial root, finely glandular-pubescent and viscid, 3-9 dm. high. Leaves oblanceolate or linear, acute, petioled or the upper sessile, $2-8 \mathrm{~cm}$. long; flowers few, slender-pedicelled, white or purplish, $\mathbf{1}-2 \mathrm{~cm}$. long; petals scarcely longer than the tubular calyx; capsule oblong-cylindric, $\mathbf{1 2 - 1 6 ~ m m}$. long; seeds tuberculate. In dry soil, Minn. to Manitoba, Neb., Ariz. and Ore. June-July.
6. Lychnis apétala L. Nodding Lychnis. (I. F. f. I460.) Tufted, perennial, o. $7^{-2} \mathrm{dm}$. high, glandular-pubescent at least above. Stems I-flowered; leaves linear or oblanceolate, $\mathbf{1 - 6} \mathrm{cm}$. long, sessile, or the lower petioled; flower nodding, $12-16 \mathrm{~mm}$. long; petals narrow, 2 -cleft, included in the calyx; calyx inflated, strongly purple-veined, its teeth triangular-ovate, acute; petals narrow, about 2 mm . wide, minutely appendaged, equalling or shorter than the calyx, deeply 2 -cleft; capsule erect, ovoid. Labrador and throughout arctic America. Also in arctic and alpine Europe and Asia. Summer.
7. Lychnis affinis Vahl. Arctic Lychnis. (I. F. f. 1461.) Tufted, perennial, 5-10 cm. high, glandular-pubescent. Basal leaves spatulate, obtuse, about $\mathbf{I} \mathrm{cm}$. long, ciliate; stem-leaves linear, $\mathbf{1}-5 \mathrm{~cm}$. long, obtuse; flower erect, $8-\mathbf{1 2}$ cm . long; calyx oblong or ovate-campanulate, slightly inflated, its teeth short, acute; petals somewhat exserted, the blade narrowed below, emarginate and eroded, the appendages minute. Lab. and arctic America and Europe. Summer.

8 Lychnis Coronària (L.) Desr. Mullein Pink. Rose Campion. (I. F. f. i462.) Perennial, densely white-woolly; stem $3-10 \mathrm{dm}$. tall. Lower leaves spatulate, $5-10 \mathrm{~cm}$. long, narrowed into margined petioles; upper leaves oblong or lanceolate, sessile, acute or acuminate; flowers few, 2 cm . broad or more, longpedicelled in open terminal panicles; calyx oblong-campanulate, its teeth filiformsubulate, twisted, shorter than tie tube; petals crimson. Escaped from gardens to roadsides and waste places, Mass. to S. N. Y. Native of Europe. June-Aug.

## 5. GYPSÓPHILA L.

Mostly glabrous and glaucous herbs, with narrow leaves, and small numerous axillary or paniculate flowers. Calyx 5 -toothed, 5-nerved, bractless. Petals 5, their claws narrow. Stamens IO; styles 2. Capsule dehiscent by 4 valves. Seeds reniform, laterally attached; embryo coiled. [Greek, in allusion to the supposed preference of some species for gypsum soils.] About 60 species, natives of Europe, Asia and northern Africa.
Annual, diffuse; leaves narrowly linear; flowers axillary on filiform peduncles.

1. G. muralis.

Erect perennial; leaves lanceolate; flowers paniculate.
2. G. paniculata.
I. Gypsophila muràlis L. Low Gypsophyll. (I. F. f. 1463.) Annual, diffuse, slender, much branched, smooth, or slightly rough at the base, $1-2 \mathrm{dm}$. high. Leaves narrowly linear or subulate, attenuate at each end, $6-20 \mathrm{~mm}$. long, 0.5-1 mm . wide; peduncles $6-20 \mathrm{~mm}$. long; flowers purplish, $3-4 \mathrm{~mm}$. broad; calyx turbinate, the teeth rounded; petals crenate or emarginate, much exceeding the calyx; pod about 4 mm . long, slightly longer than the calyx. In waste places, Me, and Ont. to Mich., Mass., N. Y. and N. J. Adventive or naturalized from Europe. June-Sept.
2. Gypsophila paniculàta L. Tall Gypsophyll. (I. F. f. 1464.) Perennial; glabrous, or sometimes pubescent below, 3-6 dm. tall. Leaves lanceolate, those of the $£ 2 \mathrm{~m} 2 \mathrm{~cm}$. long or more, $4-8 \mathrm{~mm}$. wide, acuminate at the apex, narrowed at the base, those of the branches much smaller; flowers $3-4 \mathrm{~mm}$. broad, in panicled cymes; calyx campanulate, 2 mm . high, deeply 5 -lobed, the segments with scarious margins; petals white or pink, slightly emarginate, longer than the calyx. Manitoba and Neb. Fugitive from northern Europe or Asia. Summer.

## 6. TUNICA Adans.

Rigid and slender mainly perennial herbs, with small glomerate panicled or solitary flowers, bracted at the base. Calyx top-shaped or campanulate, 5 -toothed, 5-15-nerved. Petals 5, long-clawed, the limb emarginate or bifid. Stamens io. Styles 2. Capsule dehiscent by 4 apical teeth or valves. Seeds compressed, laterally attached; embryo excentric. [Latin, a cloak, in allusion to the bracts at the base of the calyx.] About 20 species, natives of southern Europe and western Asia.
I. Tunica Saxífraga (L.) Scop. Saxifrage Pink. (I. F. f. I465.) Perennial, tufted, sparsely pubescent or glabrous; stems $\mathbf{I}-2 \mathrm{~cm}$. long, terete. Leaves linear-subulate, erect, acute, $6-8 \mathrm{~mm}$. long, less than I mm. wide, connate at the base, the lower imbricated, the upper distant; flowers panicled, about 6 mm . broad, pink or purple; calyx 5 -ribbed, twice the length of the scarious-margined acute bracts. Roadsides, Flushing, Long Island, N. Y., and London, Ont. Adventive from Europe. Summer.

## 7. SAPONARIA L.

Herbs. mostly with broad leaves and large flowers. Calyx 5 -toothed, obscurely nerved. Petals 5, long-clawed. Stamens io. Ovary i-celled or incompletely 2-4-celled; styles 2. Capsule dehiscent by 4 short apical teeth or valves. [Latin, soap; the juices abound in saponin.] About 35 species, natives of Europe, Asia and northern Africa.
r. Saponaria officinàlis L. Soapwort. Bouncing Bet. (I. F. f. i $\ddagger 66$.) Perennial, glabrous, erect, leafy, 3-6 dm. high. Leaves ovate or oval. $5-8 \mathrm{~cm}$. long, 3-5-ribbed, acute, narrowed into a broad short petiole; flowers pink or whitish, about 2.5 cm . broad, in dense terminal corymbs, with numerous small lanceolate floral leaves: calyx tubular, $\mathbf{I} .5-\mathbf{2 c m}$. long; petals obcordate with a scale at the base of the blade; pod narrowly oblong, shorter than the calyx. Roadsides and waste places, common in most districts, spreading by underground stokns. Naturalized from Europe. Flowers sometimes double. Summer.

## 8. VACCÀRIA Medic.

Annual glabrous and glaucous erect branching herbs, with clasping ovate or ovate-lanceolate acute leaves, and rather small red or pink slender-pedicelled
flowers in terminal cymes. Calyx cylindric in flower, becoming sharply 5-angled and inflated in fruit, 5 -toothed, not bracted at the base. Petals much longer than the calyx, not appendaged. Stamens 10. Styles 2. Capsule 4 -toothed. Seeds laterally attached; embryo curved. [Latin, cow, in allusion to its value for fodder.] About 3 species, natives of Europe and Asia.
I. Vaccaria Vaccària (L.) Britton. Cow-Herb. (I. F. f. 1467.) Plant 3-6 dm . high. Leaves $2-8 \mathrm{~cm}$. long, connate at the base; flowers pale red, $6-8 \mathrm{~mm}$. broad; calyx io- 15 mm . long, 5 -ribbed; petals crenulate. In waste places, Ont. to Br. Col., Fla. and La. Also in the Rocky Mt. region. Naturalized or adventive from Europe. June-Aug.

## 9. DIÁNTHUS L.

Stiff herbs, mainly with narrow leaves. Flowers terminal, solitary or cymosepaniculate, generally purple. Calyx 5 -toothed, finely and equally many-striate, tubular, several-bracted at the base. Petals 5, long-clawed, dentate or crenate. Stamens 10. Styles 2. Ovary I-celled, stipitate. Capsule cylindric or oblong, stalked, dehiscent by 4 or 5 short teeth at the summit. Seeds compressed, laterally attached. Embryo straight, excentric. [Greek, the flower of Jove.] Species about 200, natives of the Old World; one of Siberia extending into arctic America.
Annuals; flowers clustered.
Bracts broad, scarious. I. D. prolifer.
Bracts narrow, herbaceous, long-pointed.
2. D. Armeria.

Perennials.
Flowers solitary ; leaves linear, short. 3. D. deltoides.
Flowers clustered ; leaves lanceolate.
4. D. barbatus.
I. Dianthus prólifer L. Proliferous Pink. (I. F. f. 1468.) Glabrous, 1.5-4 dm. high, simple, or with few erect branches. Leaves distant, linear, acute, I-2 mm. wide; flowers small, pink, in terminal oblong or obovoid heads, and appearing successively from behind the bracts. which are broad, ovate, imbricated, shining, obtuse or mucronate, concealing the calyx. In waste places and ballast, Mass. to Del. and Ohio. Fugitive from Europe. Summer.
2. Dianthus Armèria L. Deptford Pink. (I. F. f. 1469.) Finely pubescent, I.5-4.5 dm. high; branches few, nearly erect. Leaves linear, erect, $2-3 \mathrm{~mm}$. wide; flowers small, pink with whitish dots, in terminal often dense clusters; bracts lanceolate-subulate, erect, mostly longer than the sharply-toothed calyx. In fields and along roadsides, Me. to S. Ont. Mich.- and Va. Naturalized from Europe. Summer.
3. Dianthus deltoìdes L. Maiden Pink. (I. F. f. I470.) Tufted, glabrous or somewhat hoary; stems ascending, I.5-4 dm. long. Leaves linear-lanceolate, 2 mm . wide, those of the flowering stems erect, acutish, the lower obtuse; flowers pink or whitish, solitary; petals dentate; bracts ovate, pointed, about half as long as the calyx or less. In waste places, Conn. and eastern Mass. to northern N. Y. and Mich. Adventive from Europe. Summer.
4. Dianthus barbàtus L. Sweet William. (I. F. f. I471.) Tufted, glabrous, erect, 3-6 dm. high. Leaves lanceolate or ovate-lanceolate, $8-18 \mathrm{~mm}$. wide, acute; bracts linear-filiform, about equalling the long-toothed calyx; flowers pink or whitish, in large terminal clusters. In waste places, occasional in the Eastern and Middle States. Introduced from Europe. Summer.

## 10. ALSİNE L.

Tufted herbs, with cymose white flowers. Sepals 5, rarely 4. Petals of the same number, 2 -cleft, 2 -parted, or emarginate, white in our species, rarely none. Stamens 10 or fewer, hypogynous. Ovary i-celled; styles commonly 3, rarely 4 or 5 , usually opposite the sepals. Capsule dehiscent by twice as many valves as there are styles. [Greek, grove, the habitat of some species.] Species about 75, widely distributed, most abundant in temperate or cold climates.
Styles 5 ; leaves ovate, $2-5 \mathrm{~cm}$. long.

1. A. aquatica.

Styles 3, rarely 4.
Leaves broad, ovate, ovate-oblong or oblong.
Plants glabrous, or with a few scattered hairs.
Flowers few, terminal ; leaves ovate, $4^{-6} \mathrm{~mm}$. long.
2. A. humifusa.

Cymes lateral ; leaves oblong; $\mathbf{x}-2 \mathrm{~cm}$. long. Stems with I or 2 pubescent lines; petioles often ciliate.

Petals shorter than the calyx; lower leaves petioled.

Leaves narrow, linear, oblong, oblanceolate or spatulate.
Flowers $1.4^{-2} \mathrm{~cm}$. broad.
Flowers only $4-12 \mathrm{~mm}$. broad.
Bracts of the cyme small, scarious.
Pedicels widely spreading; cyme diffuse.
Leaves linear, acute at each end; seeds smooth. 7. A. longifolia.
Leaves lanceolate, broadest below; seeds rough. 8. A. graminea. Pedicels erect ; flowers few or solitary.
9. A. longipes.
3. A. uliginosa.
4. A. media.
6. A. Holostea.
Pts of the cyme foliaceous, resembling the upper leaves.
Capsule $11 / 2^{-2}$ times as long as the calyx; leaves lanceolate or oblonglanceolate.
Seeds rough ; petals equalling or longer than the calyx.
10. A. crassifolia.
Seeds smooth ; petals much shorter than the calyx or none.
II. A. borealis.
Capsule not longer than the calyx; leaves linear or linear-spatulate ; petals none.
12. A. fontinalis.

1. Alsine aquática (L.) Britton. Water Mouse-ear Chickweed. (I. F. f. 1472.) Perennial; stem angled, mostly glandular-pubescent above, ascending or decumbent, 3-7 dm. long. Leaves ovate or ovate-lanceolate, acute, the upper sessile and subcordate, the lower petioled, rounded at the base, $2-5 \mathrm{~cm}$. long; flowers about 1.2 cm . broad, solitary in the forks of the stem and in terminal cymes; pedicels slender, glandular, deflexed and much longer than the calyx in fruit; calyx campanulate; sepals ovate, acute, about one-half as long as the 2 -cleft petals; stamens Io; capsule ovoid-oblong, slightly longer than the calyx; seeds rough. In wet and waste places, Ont. to Penn. Also in Br. Col. Adventive from Europe. May-Aug.
2. Alsine humifùsa (Rottb.) Britton. Low Chickweed. (I. F. f. 1473.) Glabrous; stems spreading and ascending, $2-8 \mathrm{~cm}$. long, purplish. Leaves ovate or oblong, fleshy, 4-6 mm. long, sessile; bracts foliaceous; flowers few or solitary, 6-io mm . broad; sepals ovate-lanceolate, acute or acutish, 4 mm . long; petals 2 -parted; capsule ovoid, as long as the sepals; seeds smooth, brown. In moist or wet places, Lab. to N. B. and Me., west to Ore and Alaska. Also in northern Europe and Asia. Summer.
3. Alsine uliginòsa (Murr.) Britton. Bog Starwort. Marsh Chickweed. (I. F. f. I474.), Weak, slender, generally growing in masses; stems nearly simple, $\mathbf{I}-4 \mathrm{dm}$. long. Leaves oblong, $\mathbf{I}^{6}-25 \mathrm{~mm}$. long, $4-\mathbf{1 0} \mathrm{mm}$. wide, narrowed at the base, the lower slightly petioled and sometimes ciliate, the upper sessile; flowers 6 mm . broad, in lateral sessile cymes, rarely terminal; sepals lanceolate. acute; petals 2-parted, about the length of the calyx and the ovoid pod; seeds rough. In cold brooks and springs, Md. and Penn. to Newf. Also in Br. Col. and the N. W. Terr., Europe and Asia. Summer.
4. Alsine mèdia L. Common Chickweed. (I. F. f. 1475.) Annual, tufted, much branched, decumbent or ascending, I-4 dm. long, glabrous except a line of hairs along the stem and branches, the pubescent sepals and the sometimes ciliate petioles. Leaves ovate or oval, 4-35 mm. long, acute or rarely obtuse, the lower often cordate; flowers $4-8 \mathrm{~mm}$. broad, in terminal leafy cymes or also solitary in the axils; sepals oblong, longer than the 2-parted petals; stamens 2-10; capsule ovoid, longer than the calyx; seeds rough. A weed in waste places, meadows and woods, common throughout N. Am. Naturalized from Europe, though possibly native northward. Jan.-Dec.
5. Alsine pùbera (Michx.) Britton. Great Chickweed. (I. F. f. $1+76$.) Perennial, $\mathbf{I}-3 \mathrm{dm}$. high, branching, the stems and branches with two hairy lines. Leaves oblong or ovate-oblong, $\mathbf{I}-6 \mathrm{~cm}$. long, their margins ciliate, the upper generally sessile, the lower sometimes narrowed at the base or on bond petioles. those of sterile shoots sometimes all petioled; flowers $8-12 \mathrm{~mm}$. bonad, in terminal leafy cymes; sepals lanceolate, shorter than the 2-cleft or 2 -parted petals : capsuke subglobose, or ovoid, its teeth revolute after splitting; seeds rough. In moist rocky places, N. J. and Penn. to Ind., Ky., Ga. and Ala. May-June.
6. Alsine Holóstea (L.) Britton. Greater Stitchwort or Starwort. Adder's Meat. (I. F. f. 1477.) Erect from a creeping rootstock, glabrous or slightly downy, $4-6 \mathrm{dm}$. high. Leaves sessile, lanceolate, $2-8 \mathrm{~cm}$. long, tapering to a long slender tip; flowers showy, $1.4-3 \mathrm{~cm}$. broad, in terminal leafy cymose panicles ; pedicels downy ; sepals lanceolate, acute, one-half to two-thirds the length of the 2 -cleft petals; capsule globose-ovoid. Along Train's Meadow Road, Long Island, N. Y.; Poland, Me. Fugitive or adventive from Europe. Native also of northern Asia. Also called Allbone, from its brittle nodes. AprilJune.
7. Alsine longifòlia (Muhl.) Britton. Long-Leaved Stitchwort. (I. F. f. 1478.) Weak, glabrous, or the stem rough-angled, freely branching, $2-5 \mathrm{dm}$. high. Leaves linear, spreading, acute or acutish at each end, $2-6 \mathrm{~cm}$. long, 2-6 mm. wide, the lower smaller; bracts lanceolate ; pedicels slender, divaricate ; cymes terminal or lateral ; flowers numerous, $6-10 \mathrm{~mm}$. broad ; sepals lanceolate, acute, 3 -nerved, equalling or somewhat shorter than the 2 -parted petals; capsule ovoid-oblong, nearly twice as long as the calyx; seeds smooth, shining. In low meadows and swamps, Newf. to Alaska, Ky. and La., and in the Rocky Mountain region, Br. Col., northern Europe and Asia. May-July.
8. Alsine gramínea (L.) Britton. Lesser Stitchwort. Lesser Starwort. (I. F. f. I479.) Weak, glabrous, ascending from creeping rootstocks, $3-5 \mathrm{dm}$. high or long; stem 4 -angled. Leaves sessile, lanceolate or oblong-lanceolate, $2-3 \mathrm{~cm}$. long, $4^{-6 ~ \mathrm{~mm}}$. wide, broadest just above the base, acute, the lower smaller; cymes diffuse; pedicels spreading; bracts scarious, often ciliate, lanceolate, $4-6 \mathrm{~mm}$. long; flowers $6-10 \mathrm{~mm}$. broad; sepals lanceolate, acute; petals 2 -cleft, about the length of the sepals; capsule oblong, exceeding the sepals; seeds finely roughened. In fields and along roadsides, Newf. to Ont. and Md. Adventive from Europe. May-July.
9. Alsine lóngipes (Goldie) Coville. Long-stalked Stitchwort. (I. F.f. 1480.) Tufted, simple, or sparingly branched, o.7-3 dm. high, glabrous, shining, rarely glaucous or pubescent. Leaves lanceolate or linear-lanceolate, $1-3.5 \mathrm{~cm}$. long, $2-6 \mathrm{~mm}$. wide at the base, rigid, ascending or erect; flowers few, $6-\mathrm{IO} \mathrm{mm}$. broad, terminal, on long erect pedicels; bracts lanceolate; sepals ovate or lanceolate, acute or acutish; petals 2-cleft, exceeding the calyx; capsule ovoid, longer than the sepals; seeds smooth. In moist places, Lab. and N. S. to northern New England, Alaska and Minn., south in the Rocky Mts. to Colo., and in Cal. Also in northern Asia. Summer.

Alsine lóngipes Edwárdsii (R. Br.) Britton. Leaves lanceolate or ovate-lanceolate, sparingly ciliate at the base; stems $2-3$-flowered, $5-8 \mathrm{~cm}$. tall. Lab. and Quebec, through arctic America to Siberia.

Alsine lóngipes pedunculàris (Bunge) Britton. Stem $5^{-15} \mathrm{~cm}$. high, bearing $\mathrm{r}-3$ larger flowers on longer pedicels; stem more or less pubescent, especially at the nodes. Lab. to Alaska and Siberia.
10. Alsine crassifòlia Ehrh. Fleshy Stitchwort. (I. F. f. 1481.) Diffuse or ascending, weak, slender, simple or branched, glabrous, $5-25 \mathrm{~cm}$. long. Leaves somewhat fleshy, oblong-lanceolate to linear-oblong, acute or obtuse, narrowed at the base, $6-16 \mathrm{~mm}$. long, $2-5 \mathrm{~mm}$. wide; cymes terminal, few-flowered, or flowers axillary and solitary; bracts foliaceous, small; peduncles slender, ascending; flowers 4-6 mm. broad; sepals lanceolate-oblong, acute; petals longer than the calyx; capsule ovoid, longer than the sepals; seeds rough. In springs and moist places, Lab. to N. H., Minn., Ill. and Manitoba, and in arctic America, south in the Rocky Mts. to Colo. Also in northern Europe and Asia. Summer.
ir. Alsine boreàlis (Bigel.) Britton. Northern Stitchwort. (I. F. f. 1482.) Erect or ascending, weak, much branched, glabrous, or pubescent above, I.5-4.5 dm. long. Leaves membranous, lanceolate or oblong-lanceolate, $\mathrm{I}-4 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide, acute, sessile, their margins ciliate or naked; inflorescence a leafly terminal compound cyme; pedicels slender, ascending or spreading; flowers $4-8 \mathrm{~mm}$. broad; sepals ovate-lanceolate, acute; petals $2-5$, shorter than the sepals, or none; capsule oblong, much exceeding the sepals; seeds smooth. In wet places, Lab. to R. I., northern N. J., Minn. and Br. Col., south in the Rocky Mts. to Colo. Also in northern Europe and Asia. Summer.

Alsine borealis alpéstris (Fries) Britton. Larger, leaves broader, cyme more diffuse; upper bracts scarious or scarious-margined; seeds obscurely roughened. Lake Superior, the Saskatchewan region, Br. Col. and the Rocky Mts. Also in northern Asia.
12. Alsine fontinàlis (Short \& Peter) Britton. Water Stitchwort. (I. F. f. 1483.) Annual, glabrous; stems weak, very slender, branched, ascending or diffuse, I-3 dm. long. Leaves linear-spatulate, $8-25 \mathrm{~mm}$. long, about 2 mm . wide, the upper sessile, acute or subacute at the apex, the lower obtuse and narrowed into short petioles; pedicels filiform, $6-30 \mathrm{~mm}$. long, erect or ascending, solitary or 2-3 together in the forks of the stem and branches and axils; calyx oblong-campanulate, 2 mm . long; sepals 4 or 5 , oblong or linear, obtuse, about equalling the ovoid-oblong obtuse capsule; stamens 4-8; petals wanting; styles very short; seeds densely tuber-culate-roughened. In wet places, Ky. and Tenn. April-May.

## ir. CERÁSTIUM L.

Generally pubescent or hirsute herbs, with terminal cymes of white flowers. Sepals 5, rarely 4. Petals of the same number, emarginate or bifid (rarely wanting). Stamens ro, rarely fewer. Styles equal in number to the sepals and opposite them, or in some species fewer. Capsule cylindric, r-celled, many-ovuled, often curved, dehiscent by io, rarely 8, apical teeth. Seeds rough, more or less flattened, attached by their edges. [Greek, horny, referring to the horn-like capsule of many species.] About 50 species, of wide distribution, most abundant in the temperate zones.

$$
\begin{array}{ll}
\text { Petals equalling the sepals, or shorter. } \\
\text { Pedicels not longer than the sepals; flowers glomerate. } & \text { I. C. viscosum. } \\
\text { Pedicels at length longer than the sepals; flowers cymose. } \\
\text { Leaves 4-8 mm. long; capsule nearly straight. } & \text { 2. C. semidecandrum. } \\
\text { Leaves } 8-25 \mathrm{~mm} \text {. long; capsule curved upward. } & \text { 3. C. vulgatum. }
\end{array}
$$ Petals manifestly longer than the sepals (rarely wanting). Annuals, viscid-pubescent ; flowers $4-6 \mathrm{~mm}$. broad.

Pedicels much longer than the calyx. 4. C. longipedunculatum.
Pedicels shorter than or but little exceeding the calyx.
5. C. brachypodum.

Perennials, glabrous or pubescent ; flowers $\mathbf{1 2 - 2 0 ~ m m}$. broad.
Styles always 5.
Leaves linear or lanceolate-oblong, mainly acute. 6. C. arvense. Leaves oblong-ovate, obtuse.
7. C. alpinum.

Styles 3 (very rarely 4 or 5 ) ; leaves linear-oblong. 8. C. cerastioides.
I. Cerastium viscòsum L. Mouse-ear Chickweed. (I. F. f. 1484.) Annual, tufted, densely viscid-pubescent, I-3 dm. high. Leaves ovate, obovate, or the lower spatulate, $8-25 \mathrm{~mm}$. long, obtuse; bracts small, herbaceous; flowers 4-6 mm. broad, in glomerate cymes; pedicels shorter than or equalling the acute sepals; petals shorter than the calyx, 2 -cleft. In waste places and meadows, N. B. and Ont. to Fla. and Mex. Naturalized from Europe. Naturalized also in the W. I., Cent. Am. and on the Pacific Coast. April-July.
2. Cerastium semidecándrum L. Small Mouse-ear Chickweed. (I. F.f. 1485.) Low, tufted, annual, $5-15 \mathrm{~cm}$. high, finely viscid-pubescent. Leaves ovate, or the lower spatulate, obtuse; bracts scarious; pedicels at length longer than the calyx; flowers $2-3 \mathrm{~mm}$. broad; sepals lanceolate, acute, slightly exceeding the emarginate petals; capsule narrow, nearly straight; stamens often 5. In dry, sterile soil, N. J. to Va. Naturalized from Europe. April-May.
3. Cerastium vulgàtum L. Larger Mouse-ear Chickiveed. (I. F. f. 1486.) Biennial or perennial, viscid-pubescent, tufted, x.5-4.5 dm. long. Lower and basal leaves spatulate-oblong, obtuse; upper leaves oblong, $1-2.5 \mathrm{~cm}$. long ; inflorescence loose, the pedicels at length much longer than the calyx: sepals about equalling the 2 -cleft petals, 4-6 mm . long; capsule curved upward. In fields and woods, common throughout our area. May-Sept.
4. Cerastium longipedunculàtum Muhl. Nompinti Chickivern. Powner horn. (I. F. f. 1487.) Annual; stem weak, reclining or ascending, r.5-6 dm. long, striate, finely clammy-pubescent to glabrate. Lower and basal leaves spatulate, obtuse, petioled, $1-2.5 \mathrm{dm}$. long, the upper lanceolate or oblong, acute, sessile; inflorescence loose; pedicels in fruit several times the length of the calyx ; flowers 4-6 mm. broad; sepals lanceolate, about one-half the length of the 2 -cleft
petals (petals sometimes wanting) ; pods nodding, I-2 cm. long, curved upward, much exceeding the calyx. In moist, shaded places, N. S. and Hudson Bay to N. Car., Br. Col., Nev. and northern Mexico. April-June.
5. Cerastium brachypodum (Engelm.) Robinson. Short-stalked Chickweed. (I. F. f. I488.) Annual, light green, viscid-pubescent or puberulent ; stems tufted, erect, $0.7-2.5 \mathrm{dm}$. tall. Lower and basal leaves oblanceolate or spatulate, $6-25 \mathrm{~mm}$. long, narrowed into short petioles, the upper linear or linearoblong, acute, sessile, sometimes erect-appressed; flowers about 4 mm . broad; fruiting pedicels, or some of them, deflexed, not more than twice as long as the calyx; capsule straight or slightly curved upward, $2-3$ times as long as the calyx. In dry soil, Ill. and Mo. to Neb., S. Dak., Mont., Nev., Ariz. and Mex. March-July.

Cerastium brachýpodum compáctum Robinson. Cyme capitate; capsules very slender. Neb. to Tex.
6. Cerastium arvénse L. Field Chickweed. (I. F. f. i489.) Perennial, densely tufted, erect or ascending, flowering stems $\mathbf{1}-2.5 \mathrm{dm}$. high. Basal leaves and those of the sterile shoots linear-oblong, close; stem-leaves distant, linear or narrowly lanceolate, $\mathrm{I}-3 \mathrm{~cm}$. long, $2-4 \mathrm{~mm}$. wide, acute; flowers $12-16 \mathrm{~mm}$. broad; petals obcordate, much exceeding the lanceolate acute sepals which equal or are a little shorter than the slightly oblique capsule. In dry, rocky places, Lab. to Alaska, Ga., Mo.,. Nev. and Cal. Also in Europe and Asia, April-July,

Cerastium arvénse oblongifòlium (Torr.) Holl. \& Britt. Larger, pubescent ; leaves oblong or lanceolate, broader, mainly obtuse; capsules about twice the length of the calyx. Mainly on magnesian rocks, N. S. to Va., S. Ont., Minn. and in the Rocky Mts. and Sierra Nevada.

Cerastium arvénse velutinum (Raf.) Britton. Depressed, villous-pubescent; stemleaves lanceolate or ovate-lanceolate; capsule 2 or 2.5 times the length of the calyx. On serpentine rocks, Lancaster and Chester counties, Pa.
7. Cerastium alpìnum L. Alpine Chickweed. (I. F. f. I490.) Perennial, generally silky-hairy; sterile stems prostrate; flowering stems erect, $5-\mathbf{1 5} \mathrm{cm}$. high. Lower leaves oblanceolate or spatulate, $4-8 \mathrm{~mm}$. long, obtuse; upper leaves distant, ovate-oblong, obtusish, $8-16 \mathrm{~mm}$. long; flowers solitary or 2-3, 12-18 mm. broad; petals 2 -lobed, twice the length of the lanceolate acute scarious-tipped sepals; pod longer than the calyx, nearly straight. In moist, rocky places, Quebec, Lab. and in arctic America. Also in arctic and alpine Europe and Asia. Summer.

Cerastium alpìnum Fischeriàncm (Ser.) T. \& G. Taller ; pubescence more rigid. Lab. and through arctic America to Siberia.
8. Cerastium cerastioìdes (L.) Britton. Starwort Chickweed. (I. F. f. 149I.) Perennial, glabrous except a line of minute hairs along one side of the stem and branches, rarely pubescent throughout. Flowering branches ascending, $0.7-\mathrm{I} .5 \mathrm{dm}$. long; leaves linear-oblong, $8-16 \mathrm{~mm}$. long, about 2 mm . wide, obtuse; flowers solitary or few, $10-12 \mathrm{~mm}$. broad, long-pedicelled; petals 2 -lobed, twice the length of the sepals; capsule nearly straight, twice the length of the calyx; styles 3, rarely 4 or 5; sepals and petals 5 or 4 . Quebec and arctic America. Also in arctic and alpine Europe and Asia. Summer.

## 12. HOLÓSTEUM L.

Annual erect herbs, often viscid-pubescent above, with cymose-umbellate, white flowers on long terminal peduncles. Sepals 5. Petals 5, emarginate or eroded. Stamens 3-5, hypogynous. Styles 3. Ovary 1-celled, many-ovuled. Capsule ovoid-cylindric, dehiscent by 6 short valves or teeth. Seeds compressed, attached by the inner face, rough. [Greek, signifying all bone, an antiphrase, the herbs being tender.] About 3 species, natives of Europe and temperate Asia.
I. Holosteum umbellàtum L. Jagged Chickweed. (I. F. f. 1492.) Glabrous or slightly downy below, tufted, 1-3 dm. high. Basal leaves spreading, oblanceolate or oblong; stem-leaves oblong, sessile, $1-5 \mathrm{~cm}$. long; umbel 3-8flowered; pedicels slender, about 2.5 cm . long, erect or ascending in flower, subsequentiy reflexed and again erect when the fruit is mature; flowers white, 4-6
mm . broad; sepals obtuse, somewhat shorter than the petals; capsule nearly twice the length of the sepals, its teeth recurved. Penn. and Del. Naturalized from Europe. April-May.

## 13. MOENCHIA Ehrh.

Low annual glabrous herbs, with small narrow sessile leaves. Flowers terminal, solitary or cymose, 4 -parted or sometimes 5 -parted, white. Sepals lanceolate. Petals entire. Stamens 4-10. Styles as many as the sepals and opposite them. Capsule cylindric, 8 -toothed or rarely 10 -toothed, the teeth somewhat revolute at maturity. [In honor of Konrad Moench, Professor in Marburg.] Two or three species, natives of the Mediterranean region.
I. Moenchia erécta (L.) Gaertn. Upright Pearlwort. (I. F. f. I493.) Glaucous, tufted, $5-15 \mathrm{~cm}$. high. Basal leaves spatulate, narrowed into a short petiole; stem-leaves sessile, linear or linear-lanceolate; $8-16 \mathrm{~mm}$. long, about 2 mm . wide; flowers few or solitary, $4^{-8} \mathrm{~mm}$. broad, on slender erect pedicels; sepals 4 . lanceolate, acute, 4-6 mm. long, scarious-margined; petals 4, slightly shorter than the sepals, entire; stamens 4, rarely 8; styles 4 . In waste grounds, near Philadelphia and Baltimore. Fugitive or adventive from Europe. Not recently collected. May-July.

## 14. SAGINA L.

Tufted matted low herbs, with subulate leaves, and small pedicelled whitish flowers. Sepals 4 or 5. Petals of the same number, entire, emarginate or none. Stamens of the same number, or fewer, or twice as many. Ovary I-celled, manyovuled. Styles as many as the sepals and alternate with them. Capsule 4-5valved, at length dehiscent to the base, the valves opposite the sepals. [Ancient name of the spurry.] About Io species, natives of the northern hemisphere.
Parts of the flower in 4's (or some flowers in 5's).

Plant depressed-spreading; petals present.
Plant erect; petals very minute or none.
Parts of the flower in 5 's.
Leaves opposite, not fascicled.
Petals equalling or shorter than the sepals.
Petals and pods longer than the sepals.
Leaves fascicled in the axils; petals exceeding the sepals.
I. S. procumbens.
2. S. apetala.
3. S. decumbens.
4. S. saginoides.
5. S. nodosa.

1. Sagina procúmbens L. Procumbent Pearlwort. (I. F. f. 1494.) Annual or perennial, branching, decumbent, or spreading, glabrous or minutely downy, matted, $2-8 \mathrm{~cm}$. high. Leaves linear, subulate, $2-6 \mathrm{~cm}$. long, connate at the base; flowers about 2 mm . broad, numerous; peduncles capillary, longer than the leaves, often recurved at the end after flowering; sepals 4 , sometimes 5 , ovateoblong, generally longer than the petals, which are occasionally wanting; capsule about equalling the calyx; stamens 4, rarely 5. In moist places, Newf. and Greenland to N. J., Penn., Kans. and Mich. Native of Europe and Asia. Probably in part naturalized from Europe. May-Sept.
2. Sagina apétala Ard. Small-flowered Pearlwort. (I. F. f. 1405.) Erect or ascending, annual, glabrous, filiform, $2-10 \mathrm{~cm}$. high. Leaves linear-subulate, glabrous or sparingly ciliate, $2-8 \mathrm{~mm}$. long; flowers 2 mm . broad or less: peduncles elongated, capillary, erect; sepals 4 , ovate or oval, obtuse; petals none. or 4 and very minute; pod ovoid, nearly twice the length of the calyx. In dry soil in woods and fields, Mass. to N. J. and Penn. Apparently introduced. Native of Europe. June.
3. Sagina decúmbens (Ell.) T. \& G. Decumbent Pearliont. (I. F. f. 1496.) Annual, tufted; stems $5-10 \mathrm{~cm}$. long, glabrous or minutely glandularpubescent. Leaves narrowly linear, sometimes bristle-tipped, $6-10 \mathrm{~mm}$. long; peduncles filiform; flowers $2-3 \mathrm{~mm}$. broad; sepals, petals and styles 5 ; stamens 5 or 10; pod ovoid-oblong, nearly twice as long as the calyx. In dry soil, eastern Mass. to Ill., Fla., Mo. and La. March-May.

Sagina decumbens Smithii (A. Gray) S. Wats. Slender: stems erect or nearly so ; flowers apetalous. Plant with the aspect of S. apetala, but the parts of the flower in 5 's. Southeastern Penn. and southern N. J.
4. Sagina saginoides (L.) Britton. Arctic Pearlwort. (I. F. f. 1497.) Perennial, glabrous, tufted, $2-10 \mathrm{~cm}$. high, few-flowered or the flowers solitary at the ends of the stems. Leaves linear-subulate, or filiform, $4-10 \mathrm{~mm}$. long, acuminate or mucronate; flowers $3-5 \mathrm{~mm}$. broad; sepals, petals and styles 5 ; stamens 10 ; sepals oval, obtuse, half the length of the ovoid-oblong capsule. On rocks, Lab., Anticosti and in arctic America. Also in the higher Rocky Mts., south to Colo. and Utah, in Cal., and in alpine and arctic Europe and Asia. Summer.
5. Sagina nodòsa (L.) Fenzl. Knotted Pearlwort. (I. F. f. 1498.) Perennial, tufted, $5-15 \mathrm{~cm}$. high; stems glabrous, or slightly glandular-pubescent above. Lower leaves linear, teretish, $8-16 \mathrm{~mm}$. long, mucronulate, the upper shorter and with clusters of minute ones in their axils; flowers few, about 6 mm . broad; sepals, petals and styles 5; stamens 10; sepals ovate-oblong, obtuse; petals obovate, longer than the calyx, as is also the ovoid pod. In wet, sandy places, coast of Mass. to Greenland; shores of Lake Superior, Lake Winnipeg and of the Arctic Sea. Also in northern Europe and Asia. Summer.

## 15. ARENÀRIA L.

Mainly tufted herbs, with sessile leaves, and terminal cymose or capitate, rarely solitary, white flowers. Sepals 5. Petals 5, entire or scarcely emarginate, rarely none. Stamens io. Styles generally 3 (rarely 2-5). Ovary i-celled, manyovuled. Capsule dehiscent at the apex by as many valves or teeth as there are styles, or twice as many. Seeds reniform-globose or compressed. [Latin, sand, in allusion to the habitat of many species.] About 150 species, of wide distribution.
Valves of the capsule 2-cleft or 2-toothed, sometimes appearing as if double the number of the styles.

Leaves ovate or oblong.
Sepals acute or acuminate; annual herb of waste places.
I. A. serpyllifolia.

Sepals obtuse or scarcely acute ; perennial ; arctic.
2. A. ciliata.

Leaves subulate or setaceous.
Cymes very dense ; stems $2-10 \mathrm{~cm}$. tall.
Cymes loose ; stems I-4 dm. tall.
3. A. Hookeri.
4. A. Fendleri.

Valves of the capsule entire (Genus Alsine Wahl).
Leaves rigid, subulate or setaceous.
Arctic or alpine, densely tufted, $2-8 \mathrm{~cm}$. high.
Flowers $10-16 \mathrm{~mm}$. broad.
Flowers $4^{-6} \mathrm{~mm}$. broad.
5. A. biflora.
6. A. verna.

Neither arctic nor alpine, tufted but diffuse, I-4 dm. high. Leaves densely imbricated ; pine barren species.
Leaves fascicled in the axils.
Sepals ovate or ovate-lanceolate, 4 mm . long ; plant bright green.
8. A. Michauxiz.

Sepals narrowly lanceolate, long-acuminate, 5 mm . long; plant pale green.
9. A. Texana.

Leaves soft, herbaceous, narrowly linear or filiform.
Sepals prominently ribbed; southern.
10. A. patula.

Sepals not ribbed; alpine and northern.
i1. A. Groenlandica.
I. Arenaria serpyllifolia L. Thyme-Leaved Sandwort. (I. F. f. I499.) Annual, slender, slightly downy-pubescent, widely branched, $0.5-2 \mathrm{dm}$. high. Leaves ovate, $4-8 \mathrm{~mm}$. long, acute; pedicels $4-12 \mathrm{~mm}$. long ; bracts ovate, resembling the leaves; flowers 4 mm . broad or less, very numerous in cymose panicles; sepals ovate, acute or mucronate, $3-5$-nerved; petals obovate or oblong, usually shorter; capsule ovoid, dehiscent by 6 short apical valves; seeds rough. In dry or rocky places, throughout eastern N. Am. Naturalized from Europe. May-Aug.
2. Arenaria ciliàta L. Fringed Sandwort. (I. F. f. 1500.) Perennial, tufted, glandular-puberulent; stems very slender, creeping or ascending, pubescent in lines, $2-13 \mathrm{~cm}$. long, or the flowering branches erect. Leaves ovate or oblong, sessile or very nearly so, $2-6 \mathrm{~mm}$. long, ciliate or glabrous; peduncles filiform, erect, mostly I-flowered; flowers about 6 mm . broad; sepals ovate or oblong, obtuse, nerveless or faintly I-nerved, about as long as the petals; capsule oblong, twice as long as the calyx, its 3 valves deeply 2 -cleft; seeds slightly roughened. Quebec to Greenland. Also in arctic and alpine Europe. Summer.
3. Arenaria Hoókeri Nutt. Hooker's Sandwort. (I. F. f. 1501.) Tufted from a deep woody root, $2-10 \mathrm{~cm}$. high. Leaves linear-subulate, rigid, very
sharp-pointed, densely imbricated, glabrous, $\mathbf{I} \mathbf{- 2 . 5} \mathrm{cm}$. long ; flowering stems finely pubescent; bracts lanceolate-subulate, the margins ciliolate; cyme $1.5-3.5 \mathrm{~cm}$. broad, its rays short and pubescent ; sepals lanceolate-subulate, pubescent, shorter than the similar bracts and about one-half the length of the petals. In dry or rocky soil, Neb. and Colo. to Mont. and Idaho. June-Aug.
4. Arenaria Féndleri A. Gray. Fendler's Sandwort. (I. F. f. 1502.) Perennial by a woody root, pale green, glandular-pubescent above ; stems tufted, erect, very slender, I-4 dm. tall, the internodes $2-5 \mathrm{~cm}$. long. Lower leaves subulate or setaceous, glabrous or minutely ciliate, $2-10 \mathrm{~cm}$. long, about 0.5 mm . wide, the upper somewhat connate at the base; cyme loose, its rays filiform, several-flowered; pedicels very glandular; flowers $8-12 \mathrm{~mm}$. broad; sepals linearlanceolate, acuminate, nearly as long as the obovate petals ; capsule rather shorter than the sepals. In dry, usually rocky soil, Neb., and Wyo. to Utah, N. Mex. and Cal. June-Aug.
5. Arenaria biflòra (L.) S. Wats. Arctic Sandwort. (I. F. f. 1503.) Perennial, tufted, glandular-pubescent, $2-5 \mathrm{~cm}$. high. Leaves linear or linear-lanceolate, sessile and sheathing, densely imbricated, $6-8 \mathrm{~mm}$. long, semiterete, obtuse, glabrous, ciliate or glandular-pubescent; peduncles I-2-flowered; flowers $10-16 \mathrm{~mm}$. broad; sepals linear-oblong, 3-nerved, obtusish; petals obovate, twice as long as the calyx ; capsule slightly longer than the sepals ; seeds smooth. Greenland and Lab. to Quebec and Alaska, south in the Rocky Mts. to Ariz. Also in Asia. Summer.
6. Arenaria vérna L. Vernal Sandwort. (I. F. f. 1504.) Perennial, tufted; flowering stems $2-13 \mathrm{~cm}$. high. Leaves subulate-linear, rather rigid, imbricated below, more distant above, $4-8 \mathrm{~mm}$. long ; the upper a little shorter and broader than the lower ; flowers $4-6 \mathrm{~mm}$. broad, numerous in loose cymes ; sepals lanceolate, acuminate, 3 -ribbed; capsule 3 -valved, exceeding the sepals; seeds rugose. In rocky places, Smuggler's Notch, Vt.; Mt. Albert, Quebec; Lab. and arctic America. Also in northern and alpine Europe and Asia. Summer.
7. Arenaria Caroliniàna Walt. Pine-barren Sandwort. (I. F. f. 1505.) Perennial from a deep root, tufted, glandular-pubescent; flowering stems $1-2.5 \mathrm{dm}$. high. Lower leaves subulate, rigid, 4-6 mm . long, keeled by the prominent midrib, densely imbricated; upper leaves similar, distant; cymes few-flowered; flowers 1o-16 mm. broad; sepals ovate-oblong, obtuse, nerveless; petals oblanceolate, 3-4 times as long as the calyx ; pod short-ovoid, twice as long as the calyx, 3 -valved; seeds nearly smooth. In dry sand, southeastern N. Y., pine barrens of N. J., south near the coast to Fla. and Ga. May-July.
8. Arenaria Michaùxii (Fenzl.) Hook. f. Rock Sandwort. (I. F. f. I 506.) Perennial, tufted, slender, glabrous, dark green, 1.5-4 dm. high. Leaves slender, rigid, subulate or filiform, broadest at the sessile base, $8-20 \mathrm{~mm}$. long, distinctly I-ribbed, spreading, with numerous others fascicled in the axils; flowers $8-10 \mathrm{~mm}$. broad; calyx ovoid-oblong in fruit ; sepals lanceolate or ovate-lanceolate, acute, 3 -ribbed, about half the length of the petals and slightly shorter than the ovoid pod ; seeds minutely rugose. In dry, rocky places, Ont. and Vt. to Va., Minn., S. Dak. and Mo. [A. stricta Michx. ; not A. stricta (Sw.) S. Wats.] June-July.
9. Arenaria Texàna (Robinson) Britton. Texas Sandwort. (I. F. f. I507.) Similar to the preceding, but lower, stiffer, pale green ; stems erect, I-2 dm. tall, thickened at the nodes, the internodes mostly short. Leaves subulate, stiff, 6-12 mm. long, connate, with numerous minute or similar ones fascicled in their axils; cymes small, rather few-flowered ; calyx narrowly conic in fruit ; sepals narrowly lanceolate, strongly 3 -ribbed, long-acuminate, 4 mm . long, longer than the capsute. In dry rocky soil, Kans. and Mo. to Tex. June-July.
10. Arenaria pátula Michx. Pitcher's Sandwort. (I. F. f. 150S.) Annual, branched from the base, slender or even filiform. $\mathbf{I}-2.5 \mathrm{dm}$. high. Leaves soft, linear-filiform, $8-25 \mathrm{~mm}$. long, i mm . wide or less; cyme several-flowered, diffuse; sepals lanceolate, acuminate, 3-5-nerved, about half the length of the emarginate petals and equalling the pod; seeds rough. In open dry places. Ky. to Ill., Minn., Kans., Ala., Tenn. and Tex. April-May.
11. Arenaria Groenlándica (Retz) Spreng. Mountuin Sandwort or Starwort. (I. F. f. 1500.) Perennial from a slender rontstock, tufted, glabrous: flowering stems slender, $5-\mathbf{1 3} \mathbf{~ c m}$. high; leaves linear-filiform, the upper distant,
the lower matted, $6-12 \mathrm{~mm}$. long; cyme terminal, several-flowered; pedicels filiform; flowers $8-12 \mathrm{~mm}$. broad; sepals oblong, obtuse, nerveless, half the length of the petals and shorter than the oblong pod; petals rarely wanting; seeds compressed, smooth. On dry rocks, Lab. and Greenland to N. N. Y., Conn., the mountains of S. N. Y. and Penn., and on the higher Alleghanies of Va. and N. Car. June-Sept.

## 16. MOEHRÍNGIA L.

Low herbs, our species perennials, with oblong ovate-lanceolate or linear soft leaves, sessile or very short-petioled, and small white flowers solitary or in cymes. Sepals and petals 4 or 5. Stamens 8 or 10. Capsule oblong or ellipsoid, fewseeded. Seeds mostly smooth and shining, appendaged at the hilum by a membranous broad strophiole. [In honor of P. H. G. Moehring, naturalist of Danzig.] About 20 species, natives of the northern hemisphere. Only the following are known to occur in N. Am.
Leaves oblong or oval, usually obtuse; sepals obtuse or acute, much shorter than the petals.

1. M. laterifora.

Leaves lanceolate, usually acute ; sepals acuminate, longer than the petals.
2. M. macrophylla.
I. Moehringia lateriflòra (L.) Fenzl. Blunt-leaved Moehringia or Sandwort. (I. F. f. 1510.) Stems finely pubescent, I-3 dm. high. Leaves thin, oval or oblong, $\mathbf{I}-5 \mathrm{~cm}$. long, obtuse, the margins and nerves ciliate ; cymes few-flowered or flowers sometimes solitary ; flowers $6-8 \mathrm{~mm}$. broad; sepals half as long as the petals ; ovary at first 3 -celled ; capsule ovoid, nearly twice as long as the calyx, dehiscent by three 2 -cleft valves. In moist places and on shores, S. N. Y. and N. J. to Mo., N. S. and Alaska, extending in the Rocky Mts. to Utah. Also in Ore., Br. Col., northern Europe and Asia. May-July.
2. Moehringia macrophýlla (Hook.) Torr. Large-Leaved Moehringia or Sandwort. (I. F. f. I5II.) Stems decumbent, puberulent, I.5-4 dm. long. Leaves lanceolate, acute or acuminate (rarely obtusish) at the apex, narrowed at the base, $2-8 \mathrm{~cm}$. long, $4-10 \mathrm{~mm}$. wide ; cymes $\mathrm{I}-5$-flowered; flowers about 6 mm . broad; sepals lanceolate or ovate-lanceolate, long-acuminate, longer than the small petals; capsule rather shorter than the calyx, 3 -valved, the valves 2 -cleft. Isle St. Ignace, Lake Superior, to Br. Col., south to Cal. May-Aug.

## 17. AMMODÈNIA J. G. Gmel.

Perennial fleshy maritime herbs, with ovate, obovate, oblong, or oblanceolate leaves, and rather small flowers, solitary in the axils and in the forks of the stem or branches. Sepals 5 (rarely 4). Petals the same number, entire. Stamens 8 or 10. Disk prominent, 8-10-lobed, glandular. Styles 3-5. Capsule subglobose, fleshy, $3-5$-valved when mature, the valves entire. Seeds numerous, obovate, not strophiolate. [Greek, referring to the growth of these plants in sand.] Two species, of sea beaches in the north temperate zone.
I. Ammodenia peploìdes (L.) Rupr. Sea-beach Sandwort. (I. F. f. I512.) Perennial by long rootstocks, glabrous; stems stout, tufted; 0.7-2.5 dm. long. Leaves sessile, clasping, ovate or oval, acute or mucronate, $\mathrm{I}-2 \mathrm{~cm}$. long ; flowers 6-8 mm . broad ; peduncles stout ; ovary 3 -celled (rarely $4-5$-celled) ; sepals ovate, obtusish, about equalling the petals, shorter than the pod; seeds smooth, shortbeaked at the hilum. On sands of the seashore, Va. to arctic America. Alsos on the shores of Europe and Asia. June-July.

## 18. SPÉRGULA L.

Annual branched herbs, with subulate stipulate leaves, much fascicled in the axils, and terminal cymes of white flowers. Sepals and petals 5. Stamens io or 5. Styles 5 , alternate with the sepals. Capsule 5 -valved, the valves opposite the sepals. Seeds compressed, acute-margined or winged. [Latin, from spergo, to scatter.] Two or three species, natives of the Old World.
i. Spergula arvénsis L. Spurry. Corn Spurry. (I. F. f. 1513.) Slender, glabrous or sparingly pubescent, $\mathbf{I} .5-4.5 \mathrm{dm}$. high. Leaves narrowly linear or subulate, $2-5 \mathrm{~cm}$. long, clustered at the nodes in two opposite sets of 6-8 together, appearing verticillate; stipules small, connate ; flowers $4-6 \mathrm{~mm}$. broad, numerous
in loose terminal cymes ; pedicels slender, divaricate; sepals ovate, slightly longer than the petals; stamens io or 5 ; capsule ovoid, longer than the calyx. In fields and waste places, frequent as a weed throughout eastern Canada and the Eastern and Middle States, and locally westward. Adventive or naturalized from Europe. Summer.

## 19. TISSA Adans.

Low herbs, mostly with fleshy linear or setaceous leaves, often with others clustered in the axils, and small pink or whitish flowers in terminal cymes. Stipules scarious. Sepals 5. Petals the same number, rarely fewer, or none, entire. Stamens 2-10. Ovary I-celled, many-ovuled; styles 3. Pod 3-valved to the base. Seeds reniform-globose or compressed, smooth, winged or tuberculate. [Name unexplained.] About 20 species, of wide distribution, most of them on saline shores or salt marshes.
Species of salt marshes or sea beaches; leaves very fleshy.
Pedicels $11 / 2-2$ times the length cf the sepals; flowers pink. . 1. T. marina.
Pedicels 2-4 times the length of the sepals; flowers pale or white.
2. T. Canadensis. Species mostly of dry sandy soil ; leaves scarcely fleshy. 3. T. rubra.

1. Tissa marìna (L.) Britton. Salt-marsh Sand Spurry. (I. F. f. 1514.) Annual to perennial, erect, ascending or nearly prostrate, I-2 dm. high, branching. Stipules ovate; leaves linear, terete, fleshy, $\mathbf{I}-4 \mathrm{~cm}$. long, $\mathbf{I - 2} \mathrm{mm}$. wide, often much fascicled in the axils; pedicels $4-10 \mathrm{~mm}$. long; sepals ovate, $2-6 \mathrm{~mm}$. long; capsule equalling or longer than the calyx; seeds smooth, or roughened with projecting processes, wingless, or winged. In salt marshes, N. B. to Fla. Also in those of Salina, N. Y., the Pacific Coast, and of Europe and northern Asia. Summer.

Tissa marina mínor (Wats. \& Coult.) Britton. Rarely over 6 cm . high; flowers smaller; pedicels 1-4 mm. long. Coast of New England. [Buda marina minor Wats. \& Coult.].
2. Tissa Canadénsis (Pers.) Britton. Northern Sand Spurry. (I. F. f. 1515.) Annual, diffuse and spreading, glabrous, $5-\mathbf{1 3} \mathrm{cm}$. high. Leaves linear, fleshy, teretish, io-16 mm. long, mainly obtuse, generally not fascicled; stipules broadly ovate; pedicels slender, at length much exceeding the calyx; sepals 2 mm . long; flowers pale or white; capsule twice the length of the calyx; seeds smooth or papillose, usually wingless. On muddy shores, R. I. and Mass. to Lab. Summer.
3. Tissa rùbra (L.) Britton. Sand Spurry. Purple Sandwort. (I. F.f. 1516.) Annual to perennial, depressed or ascending, very leafy, glabrous, or glandular-pubescent above, $5-15 \mathrm{~cm}$. high. Leaves linear, flat, scarcely fleshy, 4-8 mm. long; flowers bright pink, $2-3 \mathrm{~mm}$. broad; stipules ovate-lanceolate, acuminate; sepals ovate-lanceolate, acutish; pedicels slender, spreading, $4-8 \mathrm{~mm}$. long; pods about equalling the calyx; seeds wingless, rough with projecting points. In waste places and along roadsides, or sometimes maritime, Newf. to Penn., western N. Y., Ohio and Va. Apparently adventive from Europe. Also in Cal. and Ore., Europe and Asia. Summer.

## 20. LOEFLÍNGIA L.

Low annual glandular-puberulent diffusely branched herbs, with small subulate or setaceous stipulate leaves, and very small sessile flowers in the axils. Sepals 5 , rigid, keeled, acuminate or awn-tipped, the outer ones commonly with a tooth on each side. Petals $3-5$, minute, or wanting. Stamens $3-5$, perigynous. Ovary triangular-pyramidal, I-celled, many-ovuled. Capsule 3-valved. Seeds attached near their bases; cotyledons accumbent. [In honor of Peter Loefling, 1729-1756, Swedish traveler.] About 5 species, natives of N. Am., Europe, and central Asia. Besides the following, 2 others occur in the southwestern U. S.

1. Loeflingia Texàna Hook. Texan Loeflingia. (I. F. f. 1517.) Bushy, 7-15 cm. high, the branches slender, terete, ascending or those bearing flowers secund and recurved. Leaves $4-6 \mathrm{~mm}$. long; flowers less than 2 mm . broad; sepals nearly or quite straight: stamens usually 3 ; capsule shorter than the calyx; seeds obovate, In dry soil, Neb, to Tex, April-June,

## 21. PARONÝCHIA Adans.

Perennial tufted herbs, often woody at the base, with opposite leaves, scarious stipules, and small clustered scarious-bracted apetalous flowers. Calyx 5 -parted, the segments bristle-pointed. Stamens 5, inserted at the base of the calyx, sometimes alternate with as many staminodia. Ovary narrowed upward into the style; style 2 -cleft at the apex; ovule solitary, amphitropous. Utricle membranous, included in the calyx, I-seeded. [Greek, for a disease of the fingers and a plant supposed to cure it.] About 40 species, natives of warm and temperate regions. Besides the following about 5 others occur in the Southern States, one in the Rocky Mts., and one in Cal.

Awns of the calyx-segments erect.
Awns of the calyx-segments divergent.
Stipules 2-cleft.
Stipules entire.
Lowest leaves obtuse, uppermost mucronate or bristle-pointed.
Leaves all acute, mucronate or bristle-pointed.

1. P. argyrocoma.
2. $P$. sessiliflora.
3. P. Jamesii.
4. P. dichotoma.
5. Paronychia argyrócoma (Michx.) Nutt. Silver Whitlow-wort. (I. F. f. 1518 .) Stem much branched, $0.7-2 \mathrm{dm}$. high, clothed with silvery appressed scale-like hairs. Leaves linear, I-nerved, acute or mucronate; stipules silvery-white, entire; flowers in forking cymes, subtended by the large silvery bracts; calyx-segments $4-5 \mathrm{~mm}$. long, their awns erect, nearly as long; style filiform; staminodia minute and much shorter than the filaments or wanting. In rocky places, Me. and N. H. to Tenn. and Ga. July-Sept.
6. Paronychia sessilifiora Nutt. Low Whitlow-wor'r. (I. F. f. I519.) Densely tufted from thick roots, low, the internodes very short and hidden by the imbricated leaves and stipules. Leaves linear-subulate, the lowest erect and obtuse, the uppermost recurved-spreading, mucronate or bristle-pointed; stipules 2 -cleft; bracts entire; flowers sessile, solitary or several together; calyx $2-3 \mathrm{~mm}$. long, its segments hooded at the apex, tipped with divergent awns of nearly their own length; staminodia about as long as the filaments. In dry soil, N. W. Terr. to Neb. and Wyo. Aug-Sept.
7. Paronychia Jàmesii T. \& G. James' Whitlow-wort. (I. F. f. 1520.) Scabrous-pubescent; stems 0.7-2 dm. high, much branched. Leaves linear-subulate, the lowest obtuse, the uppermost mucronate or bristle-pointed; stipules entire; flowers in small cymes; bracts shorter than the calyx; calyx $2-3 \mathrm{~mm}$. long, the segments hooded at the apex, tipped with divergent awns of about one-fourth their length; staminodia about as long as the filaments. In dry soil, Neb. and Colo. to Tex. July-Oct.

Paronychia Jàmesii depréssa Nutt. Lower, rarely over 0.7 dm . high, densely tufted; internodes very short; leaves imbricated. Neb. to Tex.
4. Paronychia dichótoma (L.) Nutt. Forking Whitlow-wort. Nailwort. (I. F. f. 152I.) Much branched from the thick woody base, I-4 dm. tall. Leaves subulate, acute, mucronate or bristle-tipped; stipules entire, often $\mathbf{1 0 - 1 2 ~ m m . ~ l o n g ; ~}$ calyx $2-4 \mathrm{~mm}$. long, the awns of its segments divergent, short; staminodia hardly one-fourth as long as the filaments; styles nearly as long as the perianth-segments. In dry soil, Md. to N. Car., Ark. and Tex. July-Oct.

## 22. ANÝCHIA Michx.

Annual herbs, with forking stems, elliptic oval or oblanceolate opposite, mostly punctate, short-petioled leaves, small scarious stipules, and minute green apetalous flowers. Calyx 5-parted, its segments oblong. concave, not awned. Stamens 2-5, inserted on the base of the calyx; filaments filiform. Staminodia wanting. Ovary subglobose, compressed; styles 2, distinct, or united at the base; ovule solitary, amphitropous. Utricle subglobose, as long as the calyx or longer. [Derivation same as the preceding genus.] Only the following species, natives of eastern N . Am.

Pubescent; flowers sessile; stems mostly prostrate or ascending. Glabrous or nearly so; flowers pedicelled; stems usually erect.

1. A. dichotoma.
2. A. Canadensis.
3. Anychia dichótoma Michx. Forked Chickweed. (I. F. f. 1522.) Pubescent; stems mostly prostrate or ascending, much forked, o.7-2 dm. high, the internodes often shorter than the leaves. Leaves narrowly elliptic, $4-8 \mathrm{~mm}$. long, $\mathbf{1 - 2}$ mm . wide, mucronate or acute, sessile, or the base tapering into a very short petiole, usually numerous and crowded; flowers sessile in the forks, more or less clustered, scarcely 1 mm . high. In dry woods, thickets and in open places, Me. to Minn., Fla., Ala. and Ark. June-Sept.
4. Anychia Canadénsis (L.) B. S. P. Slender Forked Chickweed. (I. F. f. 1523.) Glabrous or nearly so; stem very slender or filiform, usually erect, 1.5-3 dm . tall, the internodes sometimes 2.5 cm . long, much longer than those of the preceding. Leaves elliptic, oval or sometimes oblanceolate, 6-16 mm. long, 2-8 mm . wide, narrowed into petioles about 2 mm . long, not crowded; flowers more or less pedicelled. In dry woods, Ont. to Mass., Ga., Minn. and Ark. June-Sept.

## 23. SCLERÁNTHUS L.

Low annual herbs, with forking stems, opposite subulate leaves connate at the base, no stipules and minute green clustered apetalous flowers. Calyx not bracted, deeply 5 -lobed (rarely 4 -lobed), the lobes awnless, the cup-like tube hardened. Stamens 1-10, inserted on the calyx-tube. Ovary ovoid; styles 2, distinct; ovule solitary, pendulous, amphitropous. Utricle I-seeded, enclosed by the calyx. [Greek, referring to the hard calyx-tube.] About io species, of wide distribution in the Old World, the following nat. from Europe as a weed.
I. Scleranthus ánnuus L. Knawel. German Knotgrass. (I. F. f. 1524.) Much branched, the branches prostrate or spreading, $7-13 \mathrm{~cm}$. long. Leaves subulate, 4-25 mm. long, ciliate, light green, often recurved; tube of the calyx 10 angled, rather longer than the lobes, the lobes somewhat angled on the back and their margins incurved. In fields and waste places or on dry rocks, Quebec and Ont. to Penn. and Fla. Nat. from Europe. March-Oct.

## Order 15. RANÀLES.

Herbs, shrubs or trees. Calyx present, usually of separate sepals. Corolla usually present and of separate petals. Ovary or ovaries superior, free from the calyx; carpels i to many, usually separate. Stamens mostly hypogynous and more numerous than the sepals.

* Aquatic herbs; floating leaves peltate, or with a basal sinus.

Carpels 3 or more; petals large; floating leaves not dissected. Fam. r. Nymphaeaceae.
Pistil I; petals none; leaves whorled, all submersed and dissected.
Fam. 2. Ceratophyllaceae.

*     * Land or marsh plants (some Ranunculaceae aquatic.)

Stamens numerous; sepals distinct ; petals present (except in some Ranunculaceae and in Calycocarpum of the Menispermaceae).

Receptacle not hollow; leaves alternate (except in Clematis).
Flowers perfect (except in some species of Clematis and Thalictrum).
Fruit aggregate, cone-like; trees; sepals and petals in 3 series, or more, of 3 . Fam. 3. Magnoliaceae.
Fruit not aggregate; the carpels separate, at least when mature. Anthers not opening by valves; pistils usually more than I. Sepals 3; petals 6; shrubs or trees. Fam. 4. Anonaceae. Sepals 3-15; petals (when present) about as many; our species herbs or vines (Xanthorrhiza shrubby). Fam. 5. Ranunculaceae. Anthers opening by valves (except in Podophyllum); pistil i.

Fam. 6. Berberidaceae.
Diœcious climbing vines with simple leaves; fruit drupaceous.
Fam. 7. Menispermaceae. Receptacle hollow, enclosing the'numerous pistils and achenes; opposite-leaved shrubs.

Fam. 8. Calycanthaceae. Stamens 9 or 12 , in 3 or 4 series of 3 ; anthers opening by valves; aromatic trees or shrubs with no petals, more or less united sepals, and x pistil. Fam. 9. Lauraciae.

## Family 1. NYMPHAEÀCEAE DC.

## Water Lily Family.

Aquatic perennial herbs, with horizontal rootstocks, floating, immersed or rarely emersed leaves, and solitary axillary flowers. Sepals 3-5. Petals $5-\infty$. Stamens $5-\infty$; anthers erect, the connective continuous with the filament. Carpels $3-\infty$, distinct, united, or immersed in the receptacle. Stigmas distinct, or united into a radiate or annular disk; ovules $\mathrm{I}-\infty$, orthotropous. Fruit indehiscent. Seeds enclosed in pulpy arils, or rarely naked; cotyledons fleshy; hypocotyl very short.

Eight genera and about 33 species, of wide distribution in fresh-water lakes and streams.

Sepals and petals 3 ; stamens 6, hypogynous ; carpels distinct ; ovules few.

Leaves dissected, excepting the small floating ones.
Leaves peltate, entire, floating.

1. Cabomba.
2. Brasenia.

Sepals $4^{-6}$; petals numerous or several; carpels united; ovules numerous.
Petals small or minute; stamens hypogynous.
Petals large, numerous; stamens epigynous.
3. Nymphaea.
4. Castalia.

Sepals 4-5; petals numerous ; carpels distinct, immersed in the receptacle; ovule $\mathbf{r}$.
5. Nelumbo.

## 1. CABÓMBA Aubl.

Stems slender, coated with gelatinous matter, branching. Leaves petioled, peltate, the floating ones small, entire; submerged ones opposite, palmately dissected into capillary segments. Flowers small, white or yellow. Sepals and petals 3. Stamens 6; filaments slender; anthers extrorse. Carpels 2-4. Stigmas small, terminal; ovules commonly 3, pendulous. Fruit coriaceous, indehiscent, about 3seeded. [Guiana name.] A genus of 2 or 3 species, natives of the warmer parts of America.

1. Cabomba Caroliniàna A. Gray. Cabomba. Carolina Water-shield. (I. F. f. 1525.) Stem several feet long. Submerged leaves opposite or sometimes verticillate, $2-5 \mathrm{~cm}$. broad, repeatedly divided; floating ones linear-oblong, $1-2 \mathrm{~cm}$. long; flowers long-peduncled from the upper axils, $\mathbf{I}-\mathbf{1} .6 \mathrm{~cm}$. wide, white, or yellow at base within; petals obovate; ripened carpels 3, separate, flask-shaped. In ponds and slow streams, Mo. and S. Ill. to N. Car., Fla. and Tex. May-Aug.

## 2. BRASENIA Schreb.

Plant covered with gelatinous matter. Leaves alternate, oval, entire, $5-10 \mathrm{~cm}$. long, long-petioled, floating. Flowers axillary, purple. Sepals and linear petals 3 . Stamens $\mathbf{1 2 - 1 8}$; filaments filiform. Carpels 4-18, separate. Ovules 2 or 3, pendulous from the dorsal suture. Ripe carpels indehiscent, coriaceous, I-2-seeded. [Name unexplained.] A monotypic genus of N. Am., Cuba, eastern and tropical Asia, west tropical Africa, and Australia.

1. Brasenia purpùrea (Michx.) Casp. Water-Shield or -TARGet. (I. F. f. 1526.) Rootstock slender. Leaves thick, rounded at each end; flowers $\mathbf{I}-\mathbf{1} .6 \mathrm{~cm}$. in diameter, on long stout peduncles; fruit oblong, 6-8 mm. long. In ponds and slow streams, N. S. to Fla., Man., Tex., Mex., and at a few stations on the Pacific Coast from Cal. to Wash. Summer.

## 3. NYMPHAEA L.

Herbs, with cylindric thick horizontal rootstocks, and large cordate leaves with a deep sinus. Flowers showy, yellow, or sometimes purplish. Sepals 5 or 6, concave, thick. Petals $\infty$, small, stamen-like, hypogynous. Stamens $\infty$, hypogynous. Carpels $\infty$, many-ovuled, united into a compound pistil. Stigmas disciform, 7-24radiate. Fruit ovoid, naked. Seeds with endosperm. [Greek, water-nymph.] About 8 species, natives of the north temperate zone.
Leaves broadly ovate or oval.
Leaves $1-3 \mathrm{dm}$. long ; stigma 12-24-rayed; petals truncate, fleshy. I. N. advena.
Leaves o.7-2.5 dm. long; stigma 9-12-rayed; petals spatulate, fleshy.
2. N. hybrida.

Leaves o.5-1 dm. long; stigma 7 -1o-rayed; petals spatulate, thin. 3. N. Kalmiana,
Leaves narrowly ovate or ovate-lanceolate.
4. N. sagittaefolia.
I. Nymphaea ádvena Soland. Large Yellow Pond Lily. (I. F. f. 1527.) Floating and emersed leaves $\mathbf{I - 2 . 5} \mathrm{dm}$. broad, ovate or orbicular-oval, thick, the sinus generally open; submerged leaves, when present, thin-membranous, nearly orbicular; petioles, peduncles and lower surfaces of the leaves often pubescent; flowers $3-9 \mathrm{~cm}$. in diameter, depressed-globose, yellow or tinged with purple; sepals 6 , oblong, about 3 mm . long; petals oblong, $8-10 \mathrm{~mm}$. long; stamens in 5-7 rows; anthers about the length of the filaments; stigmatic disk undulate, yellow, or pale red; fruit ovoid, not deeply constricted into a neck, $3-5 \mathrm{~cm}$. long. In ponds and slow streams, Labrador to the Rocky Mts., Fla., Tex. and Utah. April-Sept. Rev. Thos. Morong (Bot. Gaz. II: 167) describes a var. (?) minor having smaller flowers, the margins of the stigmatic disk more crenate, rays 10, and fruit only 2.5 cm . long. Called also Cow-lily and Spatter-dock.
2. Nymphaea hýbrida Peck. Red-disked Pond Lily. (I. F. f. I528.) Floating leaves $0.5-1.5 \mathrm{dm}$. long, sometimes pubescent beneath; submerged leaves generally present, membranous, orbicular; flowers $2.5-4 \mathrm{~cm}$. broad, yellow; sepals 5 or 6 ; petals $6-8 \mathrm{~mm}$. long, less fleshy than those of the last; anthers nearly the length of the filaments; stigmatic disk crenate, bright red or crimson; stamens in about 5 rows; fruit about 2.5 cm . long, contracted below into a neck. In ponds and slow streams, Vt. to Ont., N. Y., Penn. and Mich. May-Sept.
3. Nymphaea Kalmiàna (Michx.) Sims. Small Yellow Pond Lily. (I. F. f. I529.) Leaves 0.5-I dm. long, commonly pubescent beneath; submerged ones always present, membranous, orbicular, larger; flowers 2.5 cm . in diameter or less, yellow; sepals 5 ; petals 4 mm . long; stamens in 3 or 4 rows, narrowly linear, the anther one-fourth the length of the filament; stigmatic disk crenate or stellate, $4^{-6} \mathrm{~mm}$. broad, dark red; fruit ovoid, with a short neck. In ponds and slow streams, Newf. to N. Y., Penn., Minn. and Saskatch. Summer, flowering later than the two preceding.
4. Nymphaea sagittaefòlia Walt. Arrow-Leaved Pond Lily. (I. F. f. I530.) Floating leaves glabrous, obtuse, 2-4 dm. long; submerged ones numerous, similar, but membranous and commonly larger; flowers yellow, about 2.5 cm . broad; sepals 5 ; petals broadened above, 6 mm . long; stamens in 4 or 5 rows, the filaments about equalling the anthers; stigmatic disk crenate, II-15-rayed; fruit ovoid, not constricted into a neck. In ponds, S. Ind. and Ill., and in the Atlantic States from N. Car. to Fla. Summer.

## 4. CASTÀLIA Salisb.

Herbs with horizontal perennial rootstocks, floating leaves and showy flowers. Sepals 4. Petals imbricated in several rows, inserted on the ovary, gradually passing into stamens; stamens $\infty$, the exterior with large petaloid filaments and short anthers, the interior with linear filaments and elongated anthers. Carpels $\infty$. united into a compound pistil with radiating linear projecting stigmas. Fruit globose, covered with the bases of the petals, ripening under water. [A spring of Parnassus.] About 25 species, of wide geographic distribution.

Flowers o.7-1.5 dm. broad, fragrant : leaves orbicular, purplish beneath. 1. C. odorata. Flowers I-2.5 dm. broad, not fragrant ; leaves orbicular, green both sides.
2. C. tuberosa.

Flowers $2.5-4 \mathrm{~cm}$. broad, not fragrant ; leaves oval or oblong. 3. C. tetragona.
I. Castalia odoràta (Dryand.) Woodv. \& Wood. Sweet-scentel) White Water Lily. Pond Lily. (I. F. f. I53I.) Rootstock thick. Leaves I-3 dm. in diameter, glabrous above, more or less pubescent beneath, cordate-cleft or reniform; petioles and peduncles with 4 main air-channels: flowers white, or tinged with pink; petals narrowly oblong, obtuse; fruit glohose or slightly depressed; seeds stipitate, oblong, shorter than the aril. In ponds and slow streams, Newf. to Manitoba, Fla. and Tex. June-Sept.

Castalia odoràta risea (Pursh) Britton. Flowers large, deep pink or red. E. Mass. to N. J., near the coast.
2. Castalia tuberòsa (Paine) Greene. Tuberous White. Water Lily. (I. F. f. 1532.) Rootstock with numerous lateral tuberous-thickened branches.

Leaves green both sides; the veins very prominent on the lower surface; flowers pure white, inodorous or very slightly scented; petals oblong, broader than those of C. odorata, obtuse; fruit depressed-globose; seeds globose-ovoid, sessile, longer than or about equalling the aril. Lake Champlain, west through the Great Lakes to Mich., south to Del., Penn. and Ark. Summer.
3. Castalia tetragòna (Georgi) Lawson. Small White Water Lily. (I. F. f 1533.) Leaves oval or oblong, o. 5-1 dm. long, green above, green or purplish beneath, the sinus narrow; petioles and peduncles nearly or quite glabrous; flowers white, inodorous; petals in about 2 rows, faintly striped with purple, oblong or obovate, thin, about the length of the sepals. In the Misinaibi River, Ont.; in ponds along the Severn River, Keewatin; near Granite Station, northern Idaho. Also in Siberia, Japan and the Himalayas. Summer.

## 5. NELÚMBO Adans.

Large herbs, with thick rootstocks, long-petioled concave leaves, and small and scale-like submerged ones borne sessile on the rootstock. Flowers large, yellow, pink or white. Sepals imbricate. Petals and stamens $\infty$, inserted on the calyx, caducous. Filaments more or less petaloid; anthers introrse. Carpels distinct, contained in pits in the large convex receptacle. Style short; ovules I or 2; endosperm none; cotyledons thick, fleshy. Nuts globose, ovoid or oblong. [Ceylon name for $N$. Nelumbo.] A genus of 2 species, one North American, the other Asiatic and Australasian.
Flowers pale yellow;-plant native.
Flowers pink or white; plant introduced.

\author{

1. $N$. lutea. <br> 2. N. Nelumȯo.
}
I. Nelumbo lùtea (Willd.) Pers. American Nelumbo or Lotus. (I, F. f. 1534.) Rootstock tuberiferous. Emersed leaves $3-6 \mathrm{dm}$. broad, nearly orbicular but often somewhat constricted in the middle, centrally peltate, prominently ribbed, glabrous above, more or less pubescent and lepidote beneath, the lower surface marked with an oblong, transverse area; petioles and peduncles thick, 0.9-2.2 m. long, with several large air-canals; flowers $1-2.5 \mathrm{dm}$. broad; petals concave, obovate, obtuse; anthers appendaged; fruit obconic or somewhat hemispheric, 7-10 cm . long; seeds nearly globular. Ont. to Mass., Fla., Minn. and Tex. July-Aug.
2. Nelumbo Nelúmbo (L.) Karst. Indian Lotus. (I. F. f. 1535.) Leaves 6-9 dm. in diameter, concave, glaucous; petioles and peduncles $9-18 \mathrm{dm}$. long, glabrous or with scattered minute prickles: flowers $\mathbf{I}-2.5 \mathrm{dm}$. broad, pink or sometimes white; petals oblong or elliptic, obtuse; fruit obconic, $10-13 \mathrm{~cm}$. long; seeds oblong or ovoid. Nat. in ponds about Bordentown, N. J. July-Aug.

## Family 2. CERATOPHYLLÀCEAE A. Gray. Hornwort Family.

Submerged aquatics, with slender branching stems, and verticillate leaves, the monocious or diœcious flowers solitary and sessile in the axils. Perianth many-parted, the segments entire or toothed. Stamens numerous, crowded on a flat or convex receptacle; anthers sessile or nearly so, linear-oblong, extrorse, the connective prolonged into a thick appendage beyond the sacs. Pistillate flowers with a superior i-celled ovary; ovule I, orthotropous, pendulous ; style filiform, stigmatic at the summit. Fruit an indehiscent nut or achene. Endosperm none ; embryo composed of 4 verticillate cotyledons, with a short hypocotyl and a plumule of several nodes and leaves. The family contains only the following genus:

## I. CERATOPHÝLLUM L.

Leaves crowded, linear or filiform, spinulose-serrulate, forked. Sterile flowers with Io-20 stamens, the anthers about as long as the perianth. Fertile and sterile flowers generally at different nodes. Ovary and fruit somewhat longer than the perianth, the fruit beaked with the long persistent style. One species or possibly two, widely distributed in fresh water.
I. Ceratophyllum demérsum L. Hornwort. (I. F. f. 1536.) Stems 0.5-2.5 m . long. Leaves $8-25 \mathrm{~mm}$. long; ripe fruit oval, 4-6 mm. long with a spine-like beak 4-8 mm. long, smooth and spurless or with a long basal spur on each side, or tuberculate and with narrowly winged spiny margins or broadly winged without spines. In ponds and slow streams, throughout N. Am., except the extreme north. June-July.

## Family 3. MAGNOLIACEAE J. St. Hil.

## Magnolia Family.

Trees or shrubs, with alternate leaves, large solitary flowers, and bitter aromatic bark. Sepals and petals hypogynous, deciduous. Stamens $\infty$; anthers adnate. Carpels $\infty$, separate or coherent, borne on the surface of the elongated receptacle, ripening into an aggregate fruit composed of I-2-seeded follicles or achenes. About io genera and 70 species, of wide distribution.

Anthers introrse; leaves entire, or with 2 basal lobes.

1. Magnolia. Anthers extrorse; leaves lobed or truncate.
2. Liriodendron.

## I. MAGNOLLIA L.

Leaves large and generally thick, entire. Buds covered with conduplicate sheathing stipules. Flowers fragrant. Sepals petaloid. Petals 6-12, imbricated in 2-4 series. Anthers linear, introrse. Carpels spiked or capitate on the elevated or elongated receptacle, 2 -ovuled, forming follicles at maturity. Seeds fleshy, suspended from the ripe pink or rose cones by slender filamentous threads. [In honor of Pierre Magnol, 1638-1715, Professor of Botany in Montpellier.] A genus of about 15 species, natives of eastern N. Am., eastern Asia and the Himalayas.

Leaves auriculate, glabrous.

1. M. Fraseri.

Leaves cordate, white-pubescent beneath.
Leaves acute at the base.
Leaves $2-\mathcal{d} \mathrm{dm}$. long, light green beneath; corolla higher than broad. 3. M. tripetala.

Leaves $0.7-\mathrm{I} .5 \mathrm{dm}$. long, glaucous beneath; corolla broader than high.
4. M. Virginiana.
5. M. acuminata.

Leaves rounded or truncate at the base, thin.

1. Magnolia Fràseri Walt. Fraser's Magnolia. Long- or Ear-leaved Umbrella-tree. (I. F. f. 1537.) A tree $8-\mathrm{I} 6 \mathrm{~m}$. high, the branches spreading. Leaf-buds glabrous; leaves clustered at the ends of the branches, auriculate, I.5-4 dm . long, elongated-obovate or oblong, contracted below, the lower surface light green, the upper darker; petioles $2-8 \mathrm{~cm}$. long; flowers white, $\mathbf{I}-2 \mathrm{dm}$. broad; petals spatulate or obovate, obtuse, much longer than the sepals; cone of fruit $0.7-1 \mathrm{dm}$. long. In mountain woods, Va. and Ky. to Fla. and Miss. Mây-June.
2. Magnolia macrophýlla Michx. Great-leaved Magnolia. Largeleaved Umbrella-tree, or Cucumber-tree. (I. F. f. 1538.) A tree $6-20 \mathrm{~m}$. high; bark gray. Leaf-buds silky-pubescent; leaves oblong or obovate, blunt, cordate, 3-II dm. long, I-3.5 dm. broad, glaucous-white and pubescent beneath; petioles stout, $5-10 \mathrm{~cm}$. long; flowers $2-4 \mathrm{dm}$. in diameter, white with a large purple centre; petals ovate-oblong, obtuse, thrice the length of the rounded sepals; cone of fruit ovoid-cylindric, $\mathbf{I}-\mathbf{I} .5 \mathrm{dm}$. long. In woods, Ky. to N. Car., Fla., Ark. and La. May-June.
3. Magnolia tripétala L. Umbrella-tree. Eik-woon. (I. F. f. 1530.) A tree $6-13 \mathrm{~m}$. high. Leaf-buds glabrous; leaves clustered at the summits of the branches, 3-5 dm. long, I-2 dm. wide, obovate, acute, cuneate at the hase, more or less pubescent beneath; petioles stout; flowers $2-2.5 \mathrm{dm}$. in diameter, white. slightly odorous; sepals broad, reflexed, early deciduous; petals oblong-lanceolate or obovate-lanceolate, acutish; cone of fruit $\mathbf{I}-\mathbf{I} .5 \mathrm{dm}$. long. In woods, l'enn. to Cia.. Ark. and Miss. May.
4. Magnolia Virginiàna L. Laterei Manolit. Siffer bay: (1. F. f. 1540.) A tree 5-23 m. high. Leaf-buds pubescent; leaves scattered, 0.7-1.5 dm .
long, $2-5 \mathrm{~cm}$. broad, oval or oblong, obtuse or blunt-acuminate, acute at the base, coriaceous, dark green above, glaucous and more or less pubescent beneath; flowers white, depressed-globose, deliciously fragrant, $5-8 \mathrm{~cm}$. in diameter; sepals spreading, obtuse, nearly as large as the obovate rounded petals; cone of fruit oblong, 4-5 cm . high. In swamps and swampy woods, eastern Mass. to Penn., Fla. and Tex. May-June.
5. Magnolia acuminàta L. Cucumber-tree. Mountain Magnolia. (I. F. f. 154I.) A tree 20-30 m. high. Leaf-buds silky-pubescent; leaves scattered, I.52.5 dm . long, thin, oval, acute or somewhat acuminate, rounded or truncate at the base, light green and more or less pubescent on the lower surface; flowers oblongcampanulate, greenish-yellow, 5 cm . high; petals obovate or oblong, mucli longer than the spreading deciduous sepals; cone of fruit cylindric, usually curved, o.7-I dm. long. In woods, N. Y. to Ill., Ga., Ala. and Ark. May-June.

## 2. LIRIODÉNDRON L.

Leaves alternate, truncate or broadly emarginate, 4-6-lobed or rarely entire, recurved on the petiole in the laterally compressed obtuse buds. Stipules united at the base. Flowers large, slightly fragrant. Sepals 3, petaloid, reflexed. Petals 6, connivent. Anthers linear, extrorse. Carpels spiked on the elongated receptacle, 2-ovuled, samaroid, $\mathbf{x}$-2-seeded; seeds pendulous by a short slender funiculus at maturity. [Greek, a tree bearing lilies.] One or possibly two species, natives of eastern N. Am. and China.
I. Liriodendron Tulipífera L. Tulip-tree. White-wood. Yellow Poplar. (I. F. f. 1542.) A magnificent tree $20-65 \mathrm{~m}$. high, with diverging curved branches. Leaves glabrous, very broadly ovate or nearly orbicular in outline, truncate, rounded or cordate at the base, $0.7-\mathbf{I} .5 \mathrm{dm}$. long with 2 apical and 2-4 basal lobes with rounded sinuses; flowers about 5 cm . high, erect, greenishyellow, orange-colored within; petals obovate, obtuse, about equalling the sepals; cone of fruit dry, oblong, acute, $7-8 \mathrm{~cm}$. long. In woods, Vt. and R. I. to Fla., Mich. and Ark. May-June.

## Family 4. ANONÀCEAE DC.

## Custard-apple Family.

Trees or shrubs, generally aromatic, with alternate entire leaves. Stipules none. Sepals 3 (rarely 2), valvate or rarely imbricate. Petals about 6, arranged in 2 series. Stamens $\infty$; anthers adnate, extrorse. Carpels $\infty$, separate or coherent, mainly fleshy in fruit. Seeds large, anatropous; embryo minute ; endosperm copious, wrinkled. About 46 genera and 550 species, mostly in the tropics, a few in the temperate zones.

## x. ASÍMINA Adans.

Small trees, or shrubs, with lateral or axillary nodding flowers. Buds naked. Sepals ovate, valvate. Petals 6, imbricated in the bud, those of the outer series the larger when mature. Receptacle subglobose. Stamens and carpels 3-15. Style oblong, stigmatic along the inner side: ovules numerous, in 2 rows. Fruit, large fleshy oblong berries. Seeds large, flat, horizontally placed, enclosed in fleshy arils. [From the aboriginal name Assimin.] A genus of about 7 species, natives of eastern N. Am.
I. Asimina tríloba (L.) Dunal. North American Papaw. (I. F. f. I543.) A shrub or small tree $\mathbf{1}-\mathbf{1} 5 \mathrm{~m}$. high. Shoots and young leaves dark-pubescent, becoming glabrous; leaves obovate or cuneate, acute, $1.5-3 \mathrm{dm}$. long; petioles $8-12 \mathrm{~mm}$. long; flowers axillary, on shoots of the preceding year, appearing with the leaves, $2-4 \mathrm{~cm}$. in diameter, dark purple; sepals obovate, densely darkpubescent; outer petals spreading, nearly orbicular, slightly exceeding the ovate inner ones; fruit $0.7-2 \mathrm{dm}$. long, $2-7 \mathrm{~cm}$. thick, sweet and edible when ripe, pendulous, several together on a thick peduncle. Along streams, Ont. and N. Y. to Mich., Neb., Fla. and Tex. March-April.

## Family 5. RANUNCULÀCEAE Juss.*

## Crowfoot Family.

Herbs, or rarely climbing shrubs, with acrid sap. Leaves alternate (except in Clematis and Atragene). Stipules usually none, but the base of the petiole often sheathing. Pubescence, when present, composed of simple hairs. Sepals 3-15, generally caducous, often petal-like, iṃbricate, except in Clematis and Atragene. Petals about the same number (occasionally more), or wanting. Stamens $\infty$, hypogynous, their anthers innate. Carpels $\infty$ or rarely solitary, I-celled, I-many-ovuled. Ovules anatropous. Fruit achenes, follicles or berries. Seeds with endosperm. About 35 genera and 1050 species, distributed throughout the world, not abundant in the tropics.

* Carpels several-ovuled (I-2.0vuled in nos. I and 8); fruit a follicle or berry.

Flowers regular; leaves palmately nerved or palmately compound.
Petals wanting.
Carpels ripening into a head of red berries. 1. Hydrastis.
Carpels ripening into a head of dry follicles.
Petals present, narrow or small, linear, flat.
Fetals present, narrow or small, tubular, at least at the base.
Sepals persistent ; stem tall, leafy.
2. Caltha.

Sepals deciduous ; stem scape-like, bearing one leaf.
3. Trollius.
4. Helleborus.
5. Cammarum.

Flowers regular; leaves ternately or pinnately compound or decompound.
Petals not spurred.
Low herbs with solitary or panicled flowers.

Carpels and follicles stalked. Carpels and follicles sessile.
Low shrub with racemose flowers.
Tall erect herbs with racemose flowers.
Fruit berries.
Fruit follicles.
Petals prolonged backward into hollow spurs.
Flowers irregular.
Posterior sepal spurred.
Posterior sepal hooded, helmet-like.
6. Coptis.
7. Isopyrum.
8. Xanthorrhiza.
9. Actaea.
10. Cimicifuga.
11. Aquilegia.
12. Delphinium.
13. Aconitum.

## * * Carpels I-ovuled ; fruit an achene.

Flowers subtended by involucres remote from the calyx or close under it; sepals petallike.

Styles short, glabrous or pubescent, or none.
Involucre remote from the calyx; styles short, subulate. 14. Anemone.
Involucre of 3 simple sessile leaves close under the flower. 15. Hepatica.
Involucre of 3 compound sessile leaves; leaflets stalked; stigma sessile.
16. Syndesmon.

Styles elongated, densely plumose.
17. Pulsatilla.

Flowers not subtended by involucres.
Leaves opposite; sepals petal-like.
Petals wanting. 18. Clematis.
Petals present, small, spatulate. 19. Atragene.
Leaves alternate or basal.
Small annual herbs; leaves basal, linear; sepals spurred. 20. Myosurus.
Low or tall herbs, mostly with both basal and stem leaves; sepals spurless.
Petals none; leaves palmately lobed. 21 . Trautvetteria.
Petals present, bearing a nectariferous pit at the base of the blade.
Achenes compressed, smooth, papillose or spiny ; flowers yellow.
22. Ranunculus.

Achenes transversely wrinkled; flowers white. $\quad$ 23. Batrachium.
Achenes swollen, smooth; sepals 3 ; petals mostly 8 .
24. Ficaria.

Achenes compressed or terete; longitudinally nerved.
Achenes terete; leaves pinnately compound. 25. Cyrtor/ivncha.
Achenes compressed; leaves crenate or lobed. 26. Oxygraphis.
Petals none; leaves ternately decompound.
27. Thalictrum.

Petals present, with no nectar-bearing pit; leaves dissected.
28. Adonis.

* Revised by Dr. P. A. Rvinberg.

## 1. HYDRÁSTIS Emlis.

Erect perennial pubescent herbs, with palmately lobed reniform leaves, and small solitary greenish-white flowers. Sepals 3, petaloid, falling away at anthesis. Petals none. Stamens numerous. Carpels $\infty$, each bearing two ovules near the middle, and in fruit forming a head of 1-2-seeded crimson berries. [Greek; wateracting, from its supposed drastic properties.] Two known species, one of eastern N. Am., the other Japanese.
i. Hydrastis Canadénsis L. Orange-root Golden-seal. (1. F. f. I544.) Rootstock thick, yellow; stem erect, about 3 dm . high. Basal leaf long-petioled, $12-20 \mathrm{~cm}$. broad, 5-9-lobed, the lobes broad, acute, sharply serrate; cauline leaves 2 , borne at the summit of the stem, the upper one subtending the greenish white flower, which is $8-10 \mathrm{~mm}$. broad when expanded; filaments widened, about 4 mm . long; anthers oblong, obtuse; head of fruit ovoid, blunt, about 16 mm . long, the fleshy carpels tipped with a short curved beak. In woods, Conn. and southern N. Y. to Ont., Minn., Ga. and Ark. April.

## 2. CÀLTHA L.

Succulent herbs, with simple mostly basal cordate or auriculate leaves. Flowers yellow, white or pink. Sepals large, deciduous, petal-like. Petals none. Stamens numerous, obovoid. Carpels numerous or few, sessile, bearing orules in 2 rows along the ventral suture, in fruit forming follicles. [Latin name of the Marigold.] A genus of marsh plants, comprising about 10 species, of temperate and arctic regions. In addition to those here described, three others are found on the western side of the continent.

Stems erect or ascending, not rooting at the nodes; flowers yellow.
Leaves cordate, generally with a narrow sinus; flowers $2.5-4 \mathrm{~cm}$. wide.
Leaves flabelliform with $a$ broad sinus; flowers $\mathbf{I}-2.5 \mathrm{~cm}$. wide. 2. C. palustris. Stems floating or creeping, often rooting at the nodes.

Flowers yellow, $1-2.5 \mathrm{~cm}$. broad; upper leaves more or less triangular-cordate, dentate.
3. C. radicans.

Flowers white or pinkish, $8-16 \mathrm{~mm}$. broad; all the leaves reniform, wavy or entire. 4. C. natans.
I. Caltha palústris L. Marsh-marigold. Meadow-gowan. (I. F. f. 1545.) Stout, glabrous; stem hollow, 3-6 dm. high. Basal leaves on long and broad petioles, cordate or reniform, $5-18 \mathrm{~cm}$. wide, the upper shorter-petioled or sessile, with nearly truncate bases; sepals oval, obtuse; follicles $3-12$ or even more, compressed, $10-12 \mathrm{~mm}$. long, many-seeded. In swamps and meadows, Newf. to S. Car. and Neb. April-June.
2. Caltha flabellifòlia Pursh. Mountain Marsh-marigold. (I. F. f. 1546.) Weak, slender, 3-4 dm. long, glabrous. Basal leaves $5-10 \mathrm{~cm}$. broad, longpetioled; the upper sessile or short-petioled, similar or with truncate bases, all crenate or dentate; flowers solitary or $2-3$ together; sepals oval; achenes $4-10$, about 8 mm . long, compressed. In cold shaded mountain springs, Penn. and northern N. J. to Md. June-July.
3. Caltha radícans Forst. Rooting Marsh-marigold. Slender, prostrate or reclining, I-4 dm. long. Basal leaves $4-8 \mathrm{~cm}$. broad, reniform with a broad sinus, long-petioled; upper short-petioled, all dentate, thin and lighter-colored than in the preceding; sepals rounded, oval; follicles about 8 mm . long. In swamps, Woodlawn, N. Y., and West Hampton, Long Island. (Circumboreal).
4. Caltha nàtans Pall. Floating Marsh-marigold. (I. F. f. 1547.) Stems slender, I.5-3 dm. long, branching. Lower and basal leaves slender-petioled, $3-5 \mathrm{~cm}$. wide, wavy or entire, thin, with a narrow sinus; upper leaves shortpetioled, smaller; sepals oval, obtusish; follicles several or numerous, rather densely capitate, about 4 mm . long, the beak short and straight. In pools and streams, Tower, Mifch.; Athabasca; arctic Am. and northern Asia. Summer.

## 3. TRÓLLIUS L.

Perennial herbs, with palmately divided or lobed leaves, thickened fibrous roots, and large usually solitary yellowish or purplish flowers. Sepals $5-\infty$, petaloid, deciduous. Petals $5-\infty$, small, unguiculate, linear, with a nectariferous pit at the base of the blade. Carpels $5-\infty$, sessile, many-ovuled, forming a head
of follicles in fruit. Stamens numerous. [Old German, trol, something round.] About 10 species, natives of the north temperate zone. Only the following and one from the Rocky Mts. are N. American.
I. Trollius láxus Salisb. American Globe-flower. (I. F. f. 1548.) Stems slender, ascending, 3-6 dm. long. Leaves all but the upper petioled, palmately 5-7-parted, $5-10 \mathrm{~cm}$. wide, the segments obovate, cuneate, lobed, cleft or toothed; flowers $2.5-3.5 \mathrm{~cm}$. broad; sepals 5-7, ovate or obovate, obtuse, spreading; petals 15-25, minute, much shorter than the stamens; head of fruit about 2 cm . hroad, the follicles 10 mm . long, each tipped with a straight subulate beak of one-fourth its length. In swamps, N. H. to Del., west to Mich. May-July.

## 4. HELLÉBORUS L.

Erect perennial herbs, with large palmately divided leaves, the basal longpetioled, the upper sessile and sometimes reduced to bracts. Flowers large, white, greenish or yellowish. Sepals 5, broad, petaloid, mainly persistent. Petals small, unguiculate, tubular. Stamens $\infty$. Carpels generally few, sessile, in fruit forming several-seeded capsules, which are dehiscent at the apex at maturity. [The classical name for $H$. orientalis; derivation unknown.] About Io species, natives of Europe and western Asia.
i. Helleborus víridis L. Green Hellebore. (I. F. f. 1549.) Stout, 3-6 dm. high, glabrous. Basal leaves $2-3 \mathrm{dm}$. broad, on petioles $15-25 \mathrm{~cm}$. long, divided into $7-11$ oblong acute sharply serrate segments; stem hardly exceeding the basal leaves, and bearing several sessile similar leaves near the top subtending the large flowers; sepals broadly oblong, obtuse, spreading, about 2.5 cm . long; petals 2 -lipped, 4 mm . long; pods 16 mm . long, tipped with a slender beak one-third their length or longer. In waste places, locally adventive from Europe in N. Y., N. J., Penn., N. Car. and W. Va. May.

## 5. CÁMMARUM Hill. (Eránthis Salisb.)

Low herbs, with perennial tuberiferous rootstocks. Basal leaves palmately dissected. Cauline leaf one, borne near the summit of the stem, sessile or amplexicaul, immediately subtending the large yellow flower. Sepals narrow, petaloid, deciduous. Petals, small two-lipped nectaries. Stamens numerous. Carpels commonly few, stipitate, many-ovuled, in fruit forming a head of follicles. [Greek, for aconite.] About 5 species, natives of Europe and the mountains of Asia.
i. Cammarum hyemàle (L.) Greene. Winter Aconite or Hellebore. (I. F. f. 1550.) Erect, simple, 12-20 cm. high. Basal leaves long-petioled, 3 dm . broad, divided and cleft into numerous linear or oblong lobes; cauline leaf similar, involucrate, sessile, clasping; flower solitary, 3-4 dm. wide, sessile; sepals 5-9, membranous, obovate, obtuse; stamens numerous; anthers obtuse; follicles compressed, $\mathbf{r} \mathrm{cm}$. long, tipped with a sharp beak. Nat. from Europe at Bartram's Garden, Philadelphia, and at Media, Penn. February. [Eranthis hyemalis Salisb.]

## 6. CÓPTIS Salisb.

Low herbs, with slender perennial rootstocks, basal compound or divided leaves, and scapose white flowers. Sepals 5-7, petaloid, deciduous; petals 5-6, small, linear, cucullate. Stamens numerous. Carpels stipitate, few, in fruit forming an umbel of follicles. [Name from the Greek, referring to the cut or divided leaves.] About 9 species, of the north temperate zone. In addition to the following, three others are found on the Pacific Coast.

1. Coptis trifòlia (L.) Salisb. Gold-thread. (I. F. f. 155 I.) Tufted, glabrous, $7-15 \mathrm{~cm}$. high from a slender yellow roctstock. Leaves evergreen, longpetioled, the blade reniform, $3-5 \mathrm{~cm}$. broad, 3 -divided ; segments broadly obovate, cuneate, obtuse, prominently veined, crenate or slightly lobed. dark green and shining above, the teeth mucronate; scape i-flowered; sepals oblong, obtuse; follicles 3-7, about 6 mm . long, borne on stipes of about their own length, spreading, tipped with a beak $2-3 \mathrm{~mm}$. long. In damp mossy woods and bogrs. Newf. to Md., E. Tenn., Minn., Br. Col. and Alaska. May-Aug.
2. ISOPỲRUM L.

Slender glabrous herbs, with ternately decompound leaves, and white flowers. Sepals 5-9, petaloid, deciduous. Petals 5, nectariform, or none. Stamens numer-
ous. Carpels $2-20$, sessile (stalked in a western species), several-ovuled, forming a head of follicles in fruit. [Old Greek name for some Fumaria.] About 15 species, natives of the north temperate zone. Besides the following, 3 others occur in western N. Am.
a. Isopyrum biternàtum (Raf.) T. \& G. False Rue Anemone. (I. F. f. 1552.) Erect, paniculately branching above; roots fibrous and sometimes tuberiferous. Basal leaves long-petioled, thin, the ultimate segments broadly obovate, obtuse, lobed or divided; upper ones similar but sessile or short-petioled; flowers several, terminal and axillary, $10-18 \mathrm{~mm}$. broad; sepals 5 , oblong or somewhat obovate, obtuse; petals none; follicles widely spreading, ovate, 4 mm . long, severalseeded, tipped with a beak nearly one-half their length. In moist woods and thickets, Ont. to Minn., south to Fla. and Tex. May.

## 8. XANTHORRHIZA L'Her.

Low shrubby plants, with pinnate or bipinnate leaves, and small compoundly racemose flowers. Sepals 5, petaloid, deciduous. Petals 5, smaller than the sepals, unguiculate, concave, 2-lobed. Stamens 5 or 10. Carpels 4-10, sessile, 2-ovuled, forming I-seeded follicles at maturity by the suppression of one of the ovules. [Greek, yellow root.] A monotypic genus of eastern N. Am.
I. Xanthorrhiza apiifòlia L'Her. Shrub Yellow-root. (I. F. f. I553.) Glabrate, $3^{-6 ~ d m}$. high, the bark and rootstocks yellow and bitter. Leaves clustered at the summit of the short stem, the blade $12-15 \mathrm{~cm}$. long, slender petioled; leaflets 5, thin, $3-7 \mathrm{~cm}$. long, incisely toothed, cleft or divided, sessile, ovate or oblong, acute, shining; branches of the raceme slender, drooping, $5-7 \mathrm{~cm}$. long; flowers about 4 mm . broad, pedicelled, solitary or 2-3 together, brownish purple; sepals ovate, acute; follicles 4-8, inflated, light yellow, I-seeded, diverging, curved at the apex, minutely beaked. In woods, southwestern N. Y. to Ky. and Fla. April-May.

## 9. ACTAEA L.

Erect perennial herbs, with large ternately compound leaves, and small white flowers in terminal racemes. Sepals 3-5, petaloid. Petals 4-10, small, spatulate or narrow, clawed. Stamens numerous. Ovary I, many-ovuled, forming in fruit a large somewhat poisonous berry; stigma broad, sessile. [An ancient name of the elder.] About 6 known species, natives of the north temperate zone. Besides the following, another occurs in the western United States.
Pedicels slender.

Berries red, spherical.
Berries red, ellipsoid
Berries white, ellipsoid. Pedicels stout ; berries white, ellipsoid.

1. A. arguta.
2. A. rubra.
3. A. eburnea. 4. A. alba.
I. Actaea argùta Nutt. Western Red Baneberry. Erect, 6-8 dm. high, glabrous except the inflorescence. Basal leaf long-petioled, ternate, the divisions long petioled, pinnate; leaflets ovate, $4-14 \mathrm{~cm}$. long, generally more incised and thinner than those of the next; teeth mostly sharp; raceme ovoid, in fruit often elongated; petals spatulate; berry $5-7 \mathrm{~mm}$. long. In rich woods, from Br . Col. to Mont., Black Hills of S. Dak., W. Neb., N. Mex. and Cal. [A. rubra arguta (Nutt.) Greene.]
4. Actaea rùbra (Ait.) Willd. Red Baneberry. (I. F. f. 1554.) Erect, bushy, 3-6 dm. high, pubescent or glabrate. Leaves petioled, or the upper sessile; leaflets ovate, or the terminal one obovate, toothed or somewhat cleft, the teeth mainly rounded or mucronate, or acutish; raceme ovoid; petals spatulate, shorter than the stamens; berries red, oval, $10-12 \mathrm{~mm}$. long and 6 mm . in diameter. In woods, N. S. to N. J. and Penn., west to S. Dak. and Neb. Most abundant northward. April-June.

Actaea rùbra dissécta Britton. Leaflets all deeply incised, the lower compound or decompound. Lincoln Co., Ont. Perhaps not properly referable to this species.
3. Actaea ebúrnea Rydb. Ivory Baneberry. Stout, 6-10 dm. high from a very thick knotted rootstock, with the habit and leaves of $A$. arguta; sepals rhom-bic-spatulate; fruit 9-12 mm . long and about 6 mm . in diameter, about 12 -seeded,

In rich woods from Idaho and Utah to the Black Hills of S. Dak. Also collected on Mt. Mackay, Ont., and Willoughby Mountains, Vt.
4. Actaea álba (L.) Mill. White Baneberry. (I. F. f. I555.) Closely resembles $A$. rubra. Leaflets generally more cut and the teeth and lobes acute or acuminate; raceme oblong, petals truncate; fruiting pedicels as thick as the peduncle and often red; berries white, often purplish at the end. In woods, N. S. and Anticosti to Ga., west to Minn. and La. April-June.

## 10. CIMICÍFUGA L.

Tall erect perennial herbs, with large decompound leaves, and white racemose flowers. Sepals 2-5, petaloid, deciduous. Petals 1-8, small, clawed, 2-lobed or none. Stamens numerous. Carpels I-8, many-ovuled, sessile or stipitate, forming follicles at maturity. Stigma broad or minute. [Latin, to drive away bugs.] A genus of about io species, natives of N. Am., Asia and eastern Europe. Besides the following, there are 3 on the western side of the continent.
Carpels i or 2, sessile; seeds in 2 rows, smooth.
Leaflets ovate, oblong or obovate, narrowed, truncate or subcordate at the base.
$\begin{array}{ll}\text { Leaflets broadly ovate or suborbicular, deeply cordate. } & \text { 1. C. cordifolia. } \\ \text { Carpels } 2-8 \text {, stalked ; seeds in I row, chaffy. } & \text { 3. C. Americana. }\end{array}$

## I. Cimicifuga racemòsa (L.) Nutt. Black Snakeroot. Black Cohosh.

 (I. F. f. I556.) Stem slender, I-2.5 m. high, leafy above. Leaves ternate, the divisions pinnate and the ultimate leaflets often again compound; leaflets ovate or oblong, or the terminal one obovate, incisely-toothed, cleft or divided, thickish, nearly glabrous; racemes compound, terminal, $1.5-6 \mathrm{dm}$. long; flowers $\mathbf{1 2 - 1 4} \mathrm{mm}$. broad, foetid; petals 4-8, z-cleft; follicles oval, 6-8 mm. long, minutely beaked. In woods, Me. and Ont. to Wis., south to Ga. and Mo. June-Aug.Cimicifuga racemòsa dissécta A. Gray. Leaves pinnately compound, the leaflets all incised. Conn., S, Penn. and Del.
2. Cimicifuga cordifòlia Pursh. Heart-leaved Snakeroot. (I. F. f. 1557.) Tall, similar to the preceding species. Leaflets very broadly ovate or orbicular, acute, obtuse or acuminate at the apex, deeply cordate at the base, sometimes 15 cm . wide; pistil I, sessile; follicles apparently very similar to those of C. racemosa. In woods, S. W. Va. to N. Car. and Tenn. June-July.
3. Cimicifuga Americàna Michx. American Bugbane. (I. F. f. 1558.) Stem slender, $\mathbf{I}-\mathbf{1} .5 \mathrm{~m}$. high, leafy. Leaves ternate, the divisions pinnate, with many of the ultimate leaflets again compound; leaflets ovate or oblong, the terminal one generally cuneate, acute, thin, glabrate, all incisely toothed, cleft or divided, 3-7 cm . long; racemes slender, compound, densely and finely pubescent, $3-6 \mathrm{dm}$. long; flowers pedicelled, $8-12 \mathrm{~mm}$. broad; pedicels minutely bracted; pistils $3-8$, stipitate; stigma minute; follicles inflated, membranous, io mm . long, narrowed below; beak short, oblique, subulate. Watkins, N. Y., to Blair Co., Penn., and Ga. Aug.-Sept.

## iI. AQUILÈGIA L.

Erect branching perennial herbs, with ternately decompound leaves, and large showy flowers. Sepals 5, regular, petaloid, deciduous. Petals concave, produced backward between the sepals into a hollow spur; stamens numerous, the inner ones reduced to staminodia. Carpels 5, sessile, many-ovuled, forming heads of follicles in fruit. [Latin eagle, from the fancied resemblance of the spurs to the eagle's claws.].About 15 species, distributed throughout the north temperate zone and extending into the mountains of Mexico. Besides the following, some 12 others occur in the western part of N. Am.
Spur of petals nearly straight; flowers scarlet, white or in a variety yellow.
Spur stout, abruptly narrowed near the apex; sepals ovate-lanceolate.

1. A. coccined.

Spur slender, gradually narrowed from near the base, sepals broadly orate. ${ }^{\bullet}$
2. A. Canadensis.

Spur incurved; flowers blue, white or purple.
Flowers 15-18 mm. ; style in fruit $2-4 \mathrm{~mm}$.
Flowers $2-4 \mathrm{~cm}$.; style in fruit $6-8 \mathrm{~mm}$,
3. A. brezistyla.
4. A. vulgaris,
I. Aquilegia coccínea Small. Large Red Columbine. Tall, 3-8 dm. high, sparingly pubsecent at the nodes. Leaves larger than in the next; leaflets with 3 main lobes, glaucous beneath, nearly orbicular in outline; sepals acute or acuminate, $17-21 \mathrm{~mm}$. long; spur, $30-33 \mathrm{~mm}$. long; follicles straight, 20 mm . long, tipped by a style shorter than the body. On clifts and in rocky woods, Va. to Mo., Neb. and Ala. May-July.
2. Aquilegia Canadénsis L. Wild Columbine. (I. F. f. 1559.) Glabrous or somewhat pubescent, $2-6 \mathrm{dm}$. high. Lower leaves slender-petioled, biternate, the ultimate leaflets cuneate, obtusely lobed and toothed, pale beneath; leaves of the upper part of the stem lobed or divided; flowers nodding, $3-4 \mathrm{~cm}$. long, the spurs 12 mm . long, thickened at the end; stamens and styles long exserted; follicles with spreading tips, about 16 mm . long, tipped with a filiform beak of about the same length. In rocky woods, N. S. to the N. W. Terr., south to N. Car. and Kans. April-July.

Aquilegia Canadénsis flavifì̀ra (Tenney) Britton. Flowers yellow; foliage lighter green than in the type. Mass., N. Y. and N. J. Rare.
3. Aquilegia brevístyla Hook. Small-flowered Columbine. (I. F. f. 1560.) Slender, erect, sparingly pubescent, branching, 3-5 dm. high. Basal leaves long-petioled, biternate, the ultimate leaflets nearly sessile, broadly obovate, lobed and crenate; leaves of the stem few, nearly sessile, lobed or divided; flowers small, nodding; spurs about 4 mm . long; stamens and short styles barely exserted; follicles slightly spreading, 16 mm . long, pubescent. N. W. Terr. to S. Dak. and Alb. June-July.
4. Aquilegia vulgàris L. European Columbine. (I. F. f. 156i.) Stout, erect, $3^{-6} \mathrm{dm}$. high. Basal and lower leaves petioled, 2-3-ternate, the lateral divisions broadly obovate, obtuse, lobed and crenate, glaucous beneath; the upper few, lobed or divided; spurs $6-8 \mathrm{~mm}$. long, stout, strongly hooked; sepals spreading; stamens and styles hardly exserted. Escaped from gardens in the Eastern and Middle States, in N. S. and N. B. Adventive or nat. from Europe. May-July.

## 12. DELPHÍNIUM L.

Erect branching herbs, with racemose or paniculate showy flowers. Leaves palmately lobed or divided. Sepals 5 , the posterior one prolonged into a spur. Petals 2 or 4 , small, the two posterior ones spurred, the lateral, when present, small. Carpels few, sessile, many-ovuled, forming follicles at maturity. [Latin, from the supposed resemblance of the flowers to a dolphin.] A genus comprising some 60 species, natives of the north temperate zone. Besides the following, some 20 others in western N. Am.
Annuals; pistil r.
Follicle glabrous. I. D. Consolida.
Follicle pubescent.
2. D. Ajacis.

Perennials; pistils 3.
Follicles erect.
Leaf-segments narrow, ultimate divisions linear or oblong linear. Raceme elongated, pedicels almost erect.

Bractlets close under the usually bright blue flower.
3. D. Carolinianum. Bractlets $2-4 \mathrm{~mm}$. (in fruit even 1o mm .) below the almost white flower.
4. D. albescens.

Raceme short; pedicels spreading.
Leaf-segments broad, ultimate divisions lanceolate. Follicles in fruit widely spreading.
5. D. Nelsoniz.
6. D. urceolatum.
7. D. tricorne.
r. Delphínium Consólida L. Field Larkspur. Knight's-spur. Larkheel. (I. F. f. 1562.) Erect, 3-5 dm. high, divaricately branched. Leaves short-petioled or sessile, all divided into narrowly linear cleft or toothed segments; racemes terminating the branches, rather loose and few-flowered; flowers blue or white, $3-4 \mathrm{~cm}$. long; spur slender, bent near the middle; petals 2 , united; follicles 8-ro, tipped with a short slender beak. In waste places, nat. from Europe in southern N. J. and Penn. to Va. and Kans., locally adventive or fugitive northward. Summer.
2. Delphinium Ajàcis L. Garden Larkspur. Like the preceding, generally taller, 3-7 dm. high. Leaves with shorter and more diverging divisions;
racemes longer, $\mathrm{I}-3 \mathrm{dm}$. long, more densely flowered; follicle $12-15 \mathrm{~mm}$., tipped with a short stout beak. Often escaped from gardens, from N. Y. to Va., Tenn. and Mo.
3. Delphinium Caroliniànum Walt. Carolina Larkspur. (I. F. f. 1564.) Stem slender, more or less glandular pubescent, 3-6 dm. high, from a cluster of thickened roots. Leaves deeply cleft into narrowly linear toothed or cleft segments; flowers blue or the petals light brown, $2-3 \mathrm{~cm}$. long, the spur curved upward, 16 mm . long; follicles downy, $14-18 \mathrm{~mm}$. long, tipped with a subulate beak; seedcoat rugose. Sandy soil, from N. Car. to Ark., La. and Fla.; probably also in southern Va. May-June.
4. Delphinium albéscens Rydb. Prairie Larkspur. Stem stout and tall, 5-Io dm. high, strigose below, more or less glandular above, from a thick, woody root. Leaves as those of the preceding, but generally larger and with broader segments, more or less puberulent; flowers white, slightly tinged with blue and bluish spots on the sepals; spur generally horizontal, $12-15 \mathrm{~mm}$. long, straight or slightly curved upward; follicle $\mathbf{1 2 - 1 8} \mathrm{mm}$. long, puberulent. It has hitherto been confused with the preceding. Open prairies, from Ill. to Manitoba, Kans. and Ark. May-July.
5. Delphinium Nélsoni Greene. Nelson's Larkspur. (I. F. f. 1564a.) Finely puberulent, at least above; stem slender, simple, 2-4 dm. high from a cluster of tuberous roots near the surface of the ground. Leaves firm, divided into linear segments; flowers blue, slightly villous, slender-pedicelled; sepals oblong, shorter than the slender spur; lower petal 2-cleft, with a tuft of hairs about the middle; appressed-pubescent; seeds wing-angled above. Wyo., western Neb. and Colo. May-June.
6. Delphinium urceolàtum Jacq. Tall Larkspur. (I. F. f. 1563.) Slender, $6-18 \mathrm{dm}$. high, glabrous below, densely and finely pubescent above. Leaves large, all but the upper petioled, deeply $3-5$-cleft, the divisions acuminate, upper ones reduced to small linear bracts; racemes dense, elongated; flowers purple or blue, $16-20 \mathrm{~mm}$. long, downy-pubescent, the lower pedicels about 2 cm . long; spur nearly straight, 4 mm . long; follicles $8-10 \mathrm{~mm}$. long, pubescent, tipped with a subulate beak. In woods, Penn. to Minn., south to N. Car., Ala. and Neb. July-Aug.
7. Delphinium tricórne Michx. Dwarf Larkspur. (I. F. f. 1565.) Stout, simple, 3-10 dm. high. Leaves slender-petioled, deeply 5-7-cleft or divided, the divisions linear or obovate, obtuse, entire, or again cleft and toothed; raceme loose, 10-12 $\mathbf{c m}$. long, mostly several-flowered; flowers $2.5-3 \mathrm{~cm}$. long, blue or white; spur generally slightly bent, ascending, $2-2.5 \mathrm{~cm}$. long; follicles $10-12 \mathrm{~mm}$. long, tipped with a short beak; seed-coat smooth, dark. Western Penn. to Ga., west to Minn. and Ark. Roots tuberous. April-June.

## 13. ACONITTUM L.

Erect ascending or trailing perennial herbs, with palmately lobed or divided leaves, and large irregular showy flowers. Sepals 5, the posterior (upper) one larger, hooded or helmet-shaped. Petals 2-5, small, the two superior ones hooded, clawed, concealed in the helmet, the three posterior ones, when present, minute. Stamens numerous. Carpels 3-5, sessile, many-ovuled, forming follicles at maturity. [Ancient Greek name for these plants.] A genus of some 18 species, mostly natives of the north temperate zone. Besides the following, 4 others are found in the Rocky Mts. and on the Pacific Coast.
Flowers blue.

Helmet arched, tipped with a descending beak. Helmet conic, slightly beaked.
Flowers white; stem trailing; helmet elongated-conic.

1. A. Noveboracense.
2. A. uncinatum.
3. A. reclinatum.
4. Aconitum Noveboracénse A. Gray. New York Monkshood. (I. F. f. 1566.) Slender, erect, about 6 dm . high, leafy. Lower leaves all petioled. 7-10 cm . broad, nearly orbicular, deeply $5-7$-cleft, the divisions obovate, cuncate. toothed and cut, acute or acuminate, glabrous, rather thin: upper leaves nearly sessile, 3 - 5 -cleft, otherwise similar; flowers 15 mm . broad; follicles erect. o mm . long, subulate-beaked. Orange, Ulster and Chenango Counties, N. V. Reported from Ohio. June-Aug.
5. Aconitum uncinàtum L. Wild Monkshood. (I. F. f. 1567.) Slender, weak, 6-12 dm. long, ascending or climbing, leafy. Leaves thick, broader than long, $7-10 \mathrm{~cm}$. wide, deeply $3-5$-lobed or cleft; lobes oblong or ovate-lanceolate, cleft or toothed, acute, glabrous or nearly so; panicle few-flowered, pubescent; flowers 20 mm . broad or more; follicles $3,12-14 \mathrm{~mm}$. long, subulate-beaked. In woods, southern Penn. and Wis., to Ga. and Ky. June-Sept.
6. Aconitum reclinàtum A. Gray. Trailing Wolfsbane. (I. F. f. 1568.) Trailing, $6-25 \mathrm{dm}$. long. Leaves $3-7$-clett, all but the upper petioled, thin, the lower 15-20 cm. broad, mainly obovate, acute, toothed and cleft toward the apex; simple panicle or raceme loose, pubescent; Howers $16-20 \mathrm{~mm}$. long; follicles 3 , 10 mm . long, with slender divergent beaks. In woods, Cheat Mountain, Va., south along the Alleghanies to Ga. July-Aug.

## 14. ANEMÒNE L.

Erect perennial herbs. Basal leaves lobed, divided or dissected, those of the stem forming an involucre near to or remote from the flower. Sepals $4-20$, petaloid. Petals none. Stamens $\infty$, shorter than the sepals. Carpels $\infty$. Achenes compressed, $\mathbf{r}$-seeded. [From the Greek, a flower shaken by the wind.] About 75 species, widely distributed through the temperate and subarctic regions of both hemispheres. About 18 species are natives of N. Am.

## * Achenes densely woolly.

Stem simple, slender, r -flowered.
Root tuberous; sepals 6-20, narrow.
Radical leaves or some of them simply ternate. I. A. decapetala.
Radical leaves repeatedly ternately divided. 2. A. Caroliniana.
Rootstock slender; sepals 56 , oval.
3. A. parviftora.

Stem commonly branching above, tall, generally 2 -several-flowered.
Leaves of the involucre sessile or short-petioled; sepals red or green; head of fruit globose or oval.
4. A. Hudsoniana.

Leaves of the involucre slender-petioled; sepals white or green; head cylindric, oval, or oblong.

Beak of fruit I mm. long; divisions of the leaves wedge-shaped, narrow.
5. A. cylindrica.

Beak of fruit 2 mm . long; divisions of the leaves ovate, broad.
Flower greenish white, $1.5-3 \mathrm{~cm}$. wide; head of fruit oblong.
6. A. Virginiana.

Flower pure white, $3-5 \mathrm{~cm}$. wide; head of fruit short-cylindric.
7. A. riparia.

## ** Achenes pubescent, or nearly glabrous.

Leaves of the involucre sessile.
Stout, $3^{-6} \mathrm{dm}$. high, branching and bearing several flowers; carpels nearly orbicular,
8. A. Canadensis.

Slender, $.5-3 \mathrm{dm}$. high, r-flowered; carpels narrow.
9. A. Richardsonii

Leaves of the involucre petioled.
Involucral leaf-divisions lobed and incised ; plant 1-2 dm. high.
10. A. quinquefolia.

Involucral leaf-divisions dentate; plant 1.5-4 dm. high. II. A. trifolia.
r. Anemone decapétala Ard. Ten-petaled Anemone. Appressed-pubescent or glabrate, $\mathbf{1}-3 \mathrm{dm}$. high from a globose or cylindric tuber. Basal leaves slender-petioled, ternate, divisions broad, ovate to obovate, thick, crenate; those of the involucre on short, broad petioles, cleft into linear lobes; sepals 10-20, blue, oblong, linear; head of fruit cylindric, 5-20 mm. long. Ala. to Kans. and Tex. Also in Mex. and southern S. Am.
2. Anemone Caroliniàna Walt. Carolina Anemone. (I. F. f. i569.) Sparsely hairy, $10-25 \mathrm{~cm}$. high, arising from a tuber $8-12 \mathrm{~mm}$. in diameter. Basal leaves slender-petioled, 3-divided, the divisions variously lobed and parted, those of the involucre sessile and 3 -cleft; flower erect. $10-35 \mathrm{~mm}$. broad; sepals 6-20, linear-oblong, purple, varying to white; head of fruit oblong. Open places, Ill. to Wis., S. Dak., Ga. and Tex. April-May.
3. Anemone parviflòra Michx. Northern Anemone. (I. F. f. 1570.) Sparingly hairy, I-2 dm. high from slender rootstocks. Basal leaves longpetioled, 3 -parted, the broadly wedge-shaped divisions obtusely lobed or crenate, those of the involucre nearly sessile, similarly lobed; flower $\mathbf{1}-4 \mathrm{~cm}$. in diameter or
less; sepals oval, very obtuse, white; head of fruit short-oval or globose. Lab. and Newf. to Minn., and in arctic America, south in the Rocky Mts. to Colo. Also in northern Asia. May-June.
4. Anemone Hudsoniàna Richards. Cut-leaved Anemone. Red WindFLOWER. (I. F. f. 1571.) Silky-hairy, 1.5-4.5 dm. high, sparingly branched, the lateral peduncles involucrate. Basal leaves long-petioled, reniform, 3-5-parted, the divisions cleft into narrowly linear acute lobes, those of the involucres shortpetioled and more or less cuneate, otherwise similar; sepals 5-9, greenish or red, oblong, forming a flower $\mathbf{1 0}-\mathbf{1} 5 \mathrm{~mm}$. broad; head of fruit $\mathbf{I}-2 \mathrm{~cm}$. long. Anticosti, Hudson Bay and N. B. to northern N. Eng. and Minn. Has been confused with A. multifida Poir., a South American species. Summer.
5. Anemone cylindrica A. Gray. Long-fruited Anemone. (I. F. f. 1572.) Silky-hairy throughout, 3-6 dm. high, branched at the involucre. Basal leaves long-petioled, $3-5$-parted; those of the involucre similar, their petioles about 2 cm . long; sepals 5-6, greenish-white, oblong, generally obtuse; flowers $15-18 \mathrm{~mm}$. broad, on elongated generally naked peduncles; head of fruit cylindric, $2-4 \mathrm{~cm}$. long. Open places, N. B. and Ont. to Conn., N. J., N. Mex. and in Br. Col. June-Aug.
6. Anemone Virginiàna L. Tall Anemone. (I. F. f. 1573.) Hairy, 6-10 dm . high, stout, branching at the involucre, the lateral peduncles bearing secondary involucres. Basal leaves long-petioled, 3 -parted, cleft into acute serrate lobes, those of the involucres similar, on petioles $2-5 \mathrm{~cm}$. long; sepals generally 5 , acute or obtuse; head of fruit $\mathbf{1 - 2 . 5} \mathrm{cm}$. long and $\mathbf{1 2 - 1 5} \mathrm{mm}$. thick. In woods, N. S. to S. Car., Kans., Manitoba and the Canadian Rocky Mts. June-Aug.
7. Anemone ripária Fernald. River-bank Anemone. Like the last but generally more slender; petals large and pure white, obtuse; head of fruit more cylindric, $2-3 \mathrm{~cm}$. long and $\mathbf{I} \mathrm{cm}$. wide. On river banks, Me. and Ont. to Va. June-July.
8. Anemone Canadénsis L. Canada Anemone. (I. F. f. 1574.) Somewhat hairy, especially on the lower surfaces of the leaves, branching at the involucre. Basal leaves long-petioled, 3-5-parted, the divisions broad, acute, variously cleft and toothed, those of both primary and secondary involucres similar, sessile; sepals white, oblong, obtuse; flower $2.5-4 \mathrm{~cm}$. broad; head of fruit globose; achenes flat, tipped with the stout style of their own length. Low grounds, Lab. to the N. W. Terr., E. Mass., Md., Ill. and Colo. May-Aug.
9. Anemone Richardsònii Hook. Richardson's Anemone. (I. F. f. 1575.) Low, slender, pubescent, from slender rootstocks. Basai leaves reniform, slenderpetioled, 3-5-parted, the lobes acute, broadly oblong, dentate or crenate; those of the involucre similar, sessile: flower solitary, 18 mm . broad, white (?); sepals about 6, oblong; head of fruit depressed-spherical; achenes nearly glabrous, compressed, ovate-oblong, reflexed, tipped with a long hooked persistent style. Lab., Hudson Bay and in Arctic America. Also in Siberia. Summer.
10. Anemone quinquefòlia L. Wind-flower. (I. F. f. 1576.) Low, simple, nearly glabrous, from thick rootstocks. Basal leaves long-petioled, appearing later than the flowering stem, 5 -parted, the divisions oblong, cuneate, dentate: those of the involucre $3-5$-parted; flower solitary, 2.5 cm . broad; sepals $4-0$. obovate or oval, white, or purplish without; head of fruit globose, inclined; achenes pubescent, oblong, tipped with the hooked styles. In low woods, N. S. to Ga., west to the Rocky Mits. April-June.
11. Anemone trifòlia L. Mountain Anemone. (I. F. f. 1577.) Stout, nearly glabrous. Basal leaves mostly 3-divided (sometimes 4-5-divided), longpetioled, dentate, often somewhat lobed: involucral leaves stout-petioled, 3 -parted, the divisions oblong-lanceolate, $3-7 \mathrm{~cm}$. long; flower solitary, white, $2.5-4 \mathrm{~cm}$. broad when expanded; sepals oblong; head of fruit globose, $10-12 \mathrm{~mm}$. in diameter; achenes 10-20, oblong, fincly pubescent, tipped with the hooked style. Southern Penn., Va., N. Car. and Ga. Also in Europe. May.

## 15. HEPÁTICA Scop.

Perennial scapose herbs, with long-petioled thick 3 -lohed evergreen basal leaves. and large white or purple flowers, solitary on slender scapes. Involucre of 3 small sessile leaves close under the flowers, simulating a calyx. Sepals membranous,
petal-like. Stamens all anther-bearing. Achenes short-beaked, pubescent. [Name ancient, from the supposed resemblance of the leaves to the liver.] About 4 species, natives of the north temperate zone. Only the following are known from N. Am.
Lobes of the leaves rounded or obtuse.
Lobes of the leaves acute.

> 1. H. Hepatica.
> 2. H. acuta.

1. Hepatica Hepática (L.) Karst. Round-Lobed or Kidney Liver-leaf. Noble Liverwort. (I. F. f. I578.) Scapes io-I 5 cm . high, villous; roots fibrous. Leaves long-petioled, reniform, $5^{-6} \mathrm{~cm}$. broad when mature, spreading on the ground, 3 -lobed, and the lobes sometimes toothed or again lobed. obtuse; involucral leaves obtuse; flowers blue, purple or white, $12-20 \mathrm{~mm}$. broad; sepals oval or ublong, obtuse, longer than the stamens; achenes several. 4 mm . long. oblong, acute, hairy. In woods, N. S. to northern Fla., west to Manitoba, Iowa and Mo. Also in Europe and Asia. Dec.-May.
2. Hepatica acùta (Pursh) Britton. Sharp-lobed or Heart Liver-leaf. (I. F. f. I579.) Scapes I-2 dm. high, villous. Plant closely resembling the preceding, differing in that the leaf-lobes and those of the involucre are acute or acutish. In woods, Quebec and throughout Ont., south to Ga.. west to Iowa and Minn. Puzzling forms occur which are referable with about equal certainty to the preceding species. March-April.

## 16. SYNDÉSMON Hoffmg.

A glabrous perennial herb from a cluster of tuberous-thickened roots, with basal 2-3-ternately compound leaves. those of the involucre similar but sessile, and large terminal umbellate slender-pedicelled white flowers. Sepals thin, petaloid. Petals none. Stamens all anther-bearing. Achenes terete, deeply grooved; stigma sessile, truncate. [Greek, bound together, the plant uniting many of the characters of Anemone and Thalictrum.] A monotypic genus of eastern N. Am.
I. Syndesmon thalictroides (L.) Hoffmg. Rue-Anemone. (I. F. f. i58o.) Low, glabrous, $10-35 \mathrm{~cm}$. high, the flowering stem arising in early spring, the ternately-compound basal leaves appearing later and resembling those of Thalictrum; sepals $5-10$, white or pinkish, longer than the stamens; flower $\mathbf{1 - 2} \mathbf{c m}$. broad; achenes sessile, pointed, $8-12 \mathrm{~mm}$. long. In woods throughout the eastern U. S., west to Kans. and Minn., sparingly in Ont. March-June.

## 17. PULSATÍLLA Adans.

Peremnial scapose herbs, with thick rootstocks, basal long-petioled digitately divided leaves, and large purple or white solitary flowers. Involucre remote from the flower, 3 -leaved. Sepals petaloid. Petals none. Inner stamens anther-bearing. the outer ones often sterile. Achenes with long persistent plumose styles. [Latin name, unexplained.] About 18 species, of the north temperate and subarctic zones. Besides the following, 2 others occur in northwestern N. Am.
I. Pulsatilla hirsutíssima (Pursh) Britton. American or Nuttall's Pasque Flower. (I. F. f. 1581.) Villous, 1.5-4 dm. high. Leaves much divided into narrow linear acute lobes, the basal on slender petioles, those of the involucre sessile and erect or ascending; sepals ovate-oblong, light bluish-purple; fruit a head of silky achenes like those of some Clematis. In dry soil, prairies of Ill. to the N. W. Terr., Br. Col., Neb. and Tex. March-April.

## 18. CLÉMATIS L.

Climbing vines. or perennial herbs, more or less woody. Leaves opposite, slender-petioled, pinnately compound, lobed. or in some species entire. Sepals 4 or 5 , valvate in the bud, petaloid. Petals none. Stamens $\infty$. Pistils $\infty$ Achenes I-seeded. Style long, persistent, plumose, silky or naked. [Greek name for some climbing plant.] About 100 species of very wide geographic distribution. most abundant in temperate regions. Besides the following, some 12 others occur in the southern and western parts of North America.

Flowers panicled, numerous: filaments glabrous.
Leaves glabrate or nearly so; achenes with a thick obtuse margin.

## Leaves 3 -foliolate; eastern.

Leaves pinnately $5-7$-foliolate; western.

1. C. Tirginiana.
2. C. ligusticifolia.
3. C. Missouriensis.

Flowers solitary; filaments pubescent.
Fruiting styles silky, not plumose; sepals thin.
Sepals conspicuously dilated; leaflets thin, pinnately veined. 4. C. crispa.
Sepals with recurved tips; venation strongly reticulated. 5. C. Simsiz
Fruiting styles plumose.
Leaflets thick, strongly reticulated, glaucous beneath.
Leaflets thin, not strongly reticulated.
Leaflets all simple, pubescent beneath.
6. C. versicolor.

Lower leaflets ternate or 3 -lobed, glabrate, or nearly so,
Leaflets or their lobes rounded, ovate or subcordate.
8. C. glaucophylla.

Leaflets or their lobes ovate or ovate-lanceolate. 9. C. Viorna.

*     * Erect or ascending perennial herbs; leaves simple or pinnate.

Glabrous, glaucous; leaves simple, or pinnate and tendril-bearing. 10. C. Addisoniz.
Pubescent; leaves simple or pinnate, not tendril-bearing.
Leaves simple, entire or rarely lobed.
Fruiting styles long, plumose; eastern species.
Flowers yellowish-green; style-plumes brown, achenes straight.
ir. C. ochroleuca.
Flowers purple ; style-plumes white; achenes distinctly oblique.
12. C. ovata.

Fruiting styles short, I cm., silky below, naked above; western species.
13. C. Fremontii.

Leaves pinnate, or the lowest entire.
14. C. Scottiz.
I. Clematis Virginiána L. Virginia Virgin's Bower. (I. F. f. 1582.) Leaflets mostly broadly ovate, acute at the apex, toothed or lobed, sometimes slightly cordate; flowers white, in leafy panicles, polygamo-diœcious, $16-30 \mathrm{~mm}$. broad when expanded; persistent styles plumose, $2-4 \mathrm{~cm}$. long or more. . In low woodlands and along fences and watercourses. Ga. to Kans., northward to N. S. and Manitoba. Leaves rarely 5 -foliolate. July-Sept.
2. Clematis ligusticifòlia Nutt. Western Virgin's Bower. (I. F. f. 1583.) Leaves pinnately 5 -folioliate; leaflets oblong or ovate-lanceolate, acute and sometimes acuminate at the apex, rounded or cuneate at the base, toothed, lobed or divided; flowers white, in leafy panicles; persistent styles plumose throughout, nearly white, $3-5 \mathrm{~cm}$. long. Neb., Mo. and throughout the Rocky Mts., west to the Pacific Coast. June-Aug.
3. Clematis Missouriénsis Rydb. n. sp. Missouri Virgin's Bower. Stem obtusely angled, silky-puberulent. Leaves pinnately 3 - 5 -foliolate; leaflets ovate or cordate, often 3 -lobed and incised; flowers dull white, polygamo-diœcious in rather small panicles, the branches often subumbellate; achenes lanceolate-ovate, pubescent, 4 mm . long, with a plumose style 3 cm . long. Rich woods in the Missouri Valley from Mo. to Kans. and Neb. Type from Lincoln, Neb. July-Sept. Has been confused with C. Virginiana and C. Catesbyana.
4. Clematis crıspa L. Marsh Clematis. (I F. f. I584.) Leaves pinnate; leaflets mostly trifoliolate, the ultimate divisions entire or occasionally lobed, glabrous and thin; flowers nodding, bluish-purple, $20-35 \mathrm{~mm}$. long; calyx cylindric below, but the sepals thin and widely spreading above, their margins undulate; persistent styles silky, not plumose. In marshes, S. E. Va. to Fla. and Tex. May-June.
5. Clematis Símsii Sweet. Sims' Clematis. (I. F. f. 1585.) Itigh climb) ing, the branches more or less pubescent. Leaves pinnate; leaflets entire. lobedor trifoliolate, thick reticulated, generally mucronate; calyx campanulate. less than 2.5 cm . long, purplish, pubescent; persistent styles more or less pubescent. Southern Ind. to Mo., Neb. and Tex. May-Aug.
6. Clematis versícolor Small, n. sp. Pale Clematis. A branching vine. glabrous or slightly pubescent below the nodes. Leaves pinnate; leaflets firm. oblong to ovate-lanceolate, $2-7 \mathrm{~cm}$. long, conspicuously reticulate, very glatucous beneath; sepals thin, lanceolate, about 2 cm . long, glabrous. slighty recurved at the tip. Rocky ledges, Mo. and Ark. July: Type from Mclonald (©). Mo.
7. Clematis fláccida Small, n. sp. Tun-healen Cimatis. Stem climbing over bushes, angled, pubescent or qlandular. Leaves pimate; leatlets oblong or ovate-lanceolate, $2-10 \mathrm{~cm}$. long, slender-stalked, apiculate or rarch acmminate: calyx greenish to light lavender, 1.5 cm . long, noddng; sepals acutish, pubescent
without; achenes rhomboid, 6-7 mm. long; style of fruit $2.5-3 \mathrm{~mm}$. long. In thickets, Ky. and Tenn. May. Type from Warren Co., Ky.
8. Clematis glaucophýlla Small. Glaucous Clematis. Stem $2-5 \mathrm{~mm}$., climbing over bushes, glabrous. Leaves pinnate; leaflets simple, 3-lobed or 3foliolate, ovate, $3-10 \mathrm{~cm}$., prominently veined and glaucous beneath; sepals glossy purple, lanceolate-acuminate, not very thick; styles in fruit $5-6 \mathrm{~cm}$. long, tawny. River valleys, N. Car. and Ky., south to Fla. June-July.
9. Clematis Viórna L. Leather-flower. (I. F. f. 1586.) A vine, climbing to the height of 3 m . or more over bushes. Leaves mostly pinnate; leaflets glabrous, entire, lobed or trifoliolate; uppermost and lowest leaves often entire; calyx ovoid-campanulate, purple; persistent styles plumose throughout, 2 cm . long or more, brownish. In rich soil, S. Penn. to Ind. Mo., Ga. and Tenn. MayJuly.
10. Clematis Addisònii Britton. Addison Brown's Clematis. (I. F. f. 1587.) Ascending or erect, 3-10 dm. long, tufted. Lower leaves simple, entire or I-4-lobed, obtuse, deep bluish-green above, glaucous beneath, sessile, clasping, $5-10 \mathrm{~cm}$. long; upper leaves pinnate, or sometimes simple; leaflets 2-4, ovate, sessile; flowers solitary, purplish, nodding; calyx ovoid, 18-30 mm. long, contracted near the summit; sepals thick, lanceolate, acute, their tips recurved; achenes flat, nearly orbicular, silky pubescent ; persistent styles, brown-plumose throughout. Banks near Roanoke, Va., and N. Car. May-June.

Clematis viornioìdes Britton is a hybrid between this and C. Viorna. Roanoke, Va.
ir. Clematis ochroleùca Ait. Erect Silky Clematis. (I. F. f. 1588.) An erect silky-hairy plant, 3-6 dm. high, somewhat woody at the base. Leaves sessile, ovate, obtuse, glabrous and reticulated above, silky beneath, entire or occasionally lobed, mucronate; flower terminal, nodding, 2 cm . long; calyx cylindraceous, green; sepals thick, very silky without, their tips recurved; head of fruit erect; achenes scarcely oblique; styles yellowish-brown, $3-4 \mathrm{~cm}$. long. S. N. Y. and Penn. to Ga. May-June.
12. Clematis ovàta Pursh. Erect Mountain Clematis. (I. F. f. 1589.) Similar to the preceding species; stems stiff, $3-6 \mathrm{dm}$. tall, pubescent when young, becoming nearly glabrous when old. Leaves ovate, entire, 4-5 dm. long, strongly reticulate-veined and nearly glabrous when mature; flowers solitary at the ends of the stem or branches, nodding, about 2 cm . long; styles $3-4 \mathrm{~cm}$. long. Kate's Mountain, White Sulphur Springs, W. Va., and Negro's Head in S. Car., or Ga. May-June.
13. Clematis Fremóntii S. Wats. Fremont's Clematis. (I. F. f. I590.) Stout, erect, I.5-4 dm. high, the stem villous-pubescent, especially at the nodes, simple or branched. Leaves sessile, coriaceous, conspicuously reticulated, glabrous except on the veins beneath, broadly ovate, entire or sparingly toothed; flowers terminal, nodding; calyx purple, 2.5 cm . long; sepals thick, tomentose on the margins, their tips recurved. Prairies, Kans., S. Neb. and Mo. Rare and local. AprilMay.
14. Clematis Scóttii Porter. Scott's Clematis. (I. F. f. I591.) Somewhat villous when young, nearly glabrous when old; stems erect, $2-6 \mathrm{dm}$. tall. Leaves petioled, the upper pinnate or bipinnate, their segments entire or fewtoothed, stalked, acuminate or acute at the apex, narrowed at the base, $12-36 \mathrm{~mm}$. long; lower leaves sometimes entire; flowers solitary. long-peduncled, nodding, about 2 cm . long, purple; sepals ovate-lanceolate, thick; persistent styles plumose throughout, 2.5 cm . long or more, the plumes brown. In dry soil, S. Dak. to Neb., Colo. and Idaho. May-July.

## 19. ATRÁGENE L.

Perennial climbing vines, with opposite petioled compound leaves, and large showy peduncled flowers, solitary in the axils, or at the ends of the branches. Scpals very large, petaloid, mostly membranous and prominently veined. Petals small, spatulate. Stamens very numerous, the outer ones usually with broadened filaments. Styles long, persistent, plumose. [Ancient Greek name for some vine.] About 5 species, natives of the north temperate zone. In addition to the following, two occur in the Rocky Mts. and one in northwestern N. Am.

1. Atragene Americàna Sims. Purple Virgin's Bower. (I. F. f. 1592.) Leaves trifoliolate; leaflets thin, ovate, acute, toothed or entire; petioles slender; flowers purplish blue, $5-10 \mathrm{~cm}$. broad; sepals 4 , thin and translucent, strongly veined, silky along the margins and the veins; petals spatulate, $12-18 \mathrm{~mm}$. long; persistent styles, plumose throughout. Hudson Bay to Manitoba, Coun., Va. and Minn. May-June.

## 20. MYOSŨRUS L

Diminutive annual herbs, with fibrous roots, basal linear entire leaves and $\mathbf{I}$ flowered scapes; sepals 5 (rarely 6-7), long-spurred at the base. Petals the same number or none, when present greenish-yellow, narrow, the claw bearing a nectariferous pit at the summit, the limb spreading. Stamens 5-25, about equalling the sepals. Pistils numerous, borne on a central axis, which becomes greatly elongated in fruit. Ovule I, suspended. Achenes apiculate or aristate. [Greek, mouse-tail.] A genus of insignificant plants of local but wide geographic distribution, consisting of the species here described and 4 others found in western America and Australia.
I. Myosurus mínimus L. Mouse-tail. (I. F. f. 1593.) Low, glabrous, $2-15 \mathrm{~cm}$. high, the scape at length surpassing the leaves and the elongated receptacle attaining the length of 3 cm . or more. Leaves $5-10 \mathrm{~cm}$. long, blunt; petals small: achenes glabrous, apiculate. In moist places, southern Ont. to Neb., Kans. and Fla. Reported from the Pacific Coast. Also in central Europe. April-July.

## 21. TRAUTVETTEERIA F. \& M.

Tall erect perennial herbs, with large palmately-lobed leaves, those of the stem distant. Sepals 3-5, concave, caducous. Petals none. Carpels $\infty$, I-ovuled. Achenes capitate, sharply angular, inflated, tipped with the minute styles. Embryo large. Flowers small, white, corymbosely paniculate. [In honor of Prof. Trautvetter, a Russian botanist.] A genus of two species in N. Am. and one in eastern Asia.
I. Trautvetteria Carolinénsis (Walt.) Vail. False Bugbane. (I. F. f. 1594.) Stout, $6-10 \mathrm{dm}$. high, branching, nearly glabrous, except the lower surfaces of the leaves. Basal leaves long-petioled, $15-20 \mathrm{~cm}$. broad, $\mathbf{1 0 - 1 2 \mathrm { cm } \text { . long, }}$ deeply lobed, the lobes acute and sharply dentate; panicle ample, the flowers 6-12 mm. broad, borne in cymose clusters at the ends of its branches; filaments slender, slightly widened; anthers oblong. Southwestern Penn., south to Fla., west to Ind. and Mo. June-July.

## 22. RANÚNCULUS L.

Herbs, with alternate simple entire-lobed or divided or dissected leaves, and yellow white or red flowers. Sepals mostly 5, deciduous. Petals equal in number or more, conspicuous or minute, provided with a nectariferous pit and a scale at the base of the blade. Carpels $\infty$, $\mathbf{I}$-ovuled. Achenes capitate or spicate, generally flattened, tipped with a minute or an elongated style. [Latin for a small frog, in allusion to the marsh habitat of many species.] Some 200 species, widely distributed in the temperate and cool regions of both hemispheres and on mountain tops in the tropics. In addition to those here described, about 50 others inhabit the western and northwestern parts of the continent.

+ Aquatic or creeping mud plants with palmately lobed, divided or dissected leaves.
Leaves orbicular, palmately divided.
Achenes marginless, flowers $7-14 \mathrm{~mm}$. broad. $\quad$ 1. R. Purshiii.
Achenes callous-margined.
Flowers $15-30 \mathrm{~mm}$. broad; leaves mostly finely dissected. 2. $R$. delfhinitolius. Flowers $6-10 \mathrm{~mm}$. broad ; leaves mostly thrice 3 -cleft. 3. R. Missouriensis.
Leaves 3 -lobed or 3 -cleft, cuneate at the base.

4. R. hyperboreus.
$\dagger \dagger$ Scapose plant from a filiform rootstock; leaves reniform, 3-parted.
5. R. Lapponicus.
$\dagger \dagger \dagger$ Plants of swamps or muddy shores; leaves entire or denticulate.
Annuals ; achenes beakless; tipped with the persistent style-base.

Petals $2-4 \mathrm{~mm}$. long; stamens few, $x-10$.
Petals $4-6 \mathrm{~mm}$. long; stamens numerous.
Perennials, rooting from the nodes; achenes beaked.
Stems trailing; achenes minutely beaked.
Stems ascending or erect ; achenes subulate-beaked.
6. R. pusillus.
7. R. oblongifolius.
8. R. reptans.
9. R. obtusiusculus.
$\dagger \dagger \dagger \dagger$ Terrestrial species with some or all the leaves lobed or divided. Calyx conspicuously black-pubescent ; arctic ; flowers white or light yellow.

Calyx glabrous or pubescent ; flowers yellow.

1. Achenes smooth, neither papillose, muricate nor spiny.

Plants low, arctic-alpine ; leaves small, palmately lobed.
Flowers $4^{-6 ~ m m}$. in diameter ; sepals glabrous or slightly hairy.

> II. R. pygmaeus.

Flowers about 1 cm . in diameter; sepals densely hairy.
12, R. Sabini.
Plants neither arctic nor alpine.
Basal leaves, some or all of them, merely crenate.
Head of fruit oblong, $2-3$ times as long as thick.
Flowers 4-12 mm. in diameter ; sepals glabrate or slightly hairy. 13. R. pedatifidus.

Flowers $1.5^{-2} \mathrm{~cm}$. in diameter; sepals densely villous.
14. R. cardiophyllus.

Head of fruit globose or subglobose.
Petals large, oblong, longer than the sepals.
Basal leaves oval or ovate, not cordate. 15. R. ovalis.
Basal leaves reniform or orbicular, cordate. 16. R. Harveyi.

Petals small, oblong, shorter than or equalling the sepals.
Styles very short, curved.
Basal leaves cordate; plant glabrous or nearly so.
17. $R$. abortivus.

Basal leaves not cordate; plant villous.
18. R. micranthus.

Styles subulate, hooked, nearly one-half as long as the achene.
19. R. Alleghaniensis.

Leaves all lobed or divided.
Plant glabrous; stem hollow ; flowers very small. 20. R. sceleratus. Plants more or less pubescent.

Beak of the achene strongly hooked; flowers $8-10 \mathrm{~mm}$. wide. 21. $R$. recurvatus.

Beak of the achene short.
Erect plants, naturalized in fields; flowers 25 mm . broad.
Calyx spreading; roots fibrous. 22. R. acris.
Calyx reflexed; stem bulbous-thickened at base.
23. R. bulbosus.

Erect or ascending plants of moist soil ; flowers 6-12 mm. broad.

Petals not longer than the reflexed sepals; head of fruit oblong to cylindric. 24. R. Pennsylvanicus.

Petals longer than the sepels; head of fruit sphericalovoid.
25. R. Macounii.

Ascending and creeping by stolons; flowers 2.5 cm . broad. 26. R. repens.

Beak of the achene long, stout or slender; flowers $12-36 \mathrm{~mm}$. broad.

Beak stout, sword-shaped; roots slender; leaflets cuneate at base. 27. R. septentrionalis.
Beak of achene slender, subulate; roots thickened.
Leaf-segments broad, oblong or obovate. 28. R. hispidus.

Leaf-segments narrow, linear-oblong.
29. R. fascicularis.
2. Achenes with a few scattered papillae near the margins.
30. $R$. parvulus.
3. Achenes rough-papillosed all over.
4. Achenes muricate or spiny.

Leaf-lobes broad, obtuse.
31. R. parviflorus.

Leaf-lobes narrow, subacute.
32. R.muricatus.
33. R. arvensis.

1. Ranunculus Púrshii Richards. Pursh's Buttercup. (I. F. f. 1596.) Aquatic or creeping, pubescent at least on the younger parts. Leaves slenderpetioled, 6-24 mm. wide. palmately divided nearly to the base into obtuse lobes or segments; petals about 5 ; head of fruit subglobose or ovoid-oblong, $4-6 \mathrm{~mm}$. long, In moist soil, N. S. to Mich., Minn., western Ont. and Arctic Am., west to Br. Col., Colo. and Utah. July-Aug.
2. Ranunculus delphinifòlius Torr. Yellow Water-Crowfoot. (I. F. f. 1595.) Aquatic or partly emersed. Immersed leaves repeatedly divided into capillary segments, short-petioled, $3-7 \mathrm{~cm}$. long; emersed leaves $1-5 \mathrm{~cm}$. broad, petioled or the upper nearly sessile, 3-5-divided, the divisions cleft into linear or cuneate segments; petals $5-8$, much longer than the sepals; head of fruit globose or oblong, $6-10 \mathrm{~mm}$. long. In ponds, Me. and Ont. to Mich., south to N. Car., Mo. and Kans. The so-called var. terrestris, appears to be an emersed form. June-Aug.
3. Ranunculus Missouriénsis Greene. Missouri Buttercup. (I. F. f. 1597.) Perennial, sparingly pubescent; stems slender, decumbent, leafy, 3 dm . long or more, rooting at the lower nodes. Leaves usually wider than long, thin, $3-7 \mathrm{~cm}$. wide, palmately divided into 3 obovate-cuneate incised and lobed segments, the lobes obtuse; petals about 5 ; head of fruit oblong, about 8 mm . long; achenes compressed, somewhat wrinkled. In ditches and on borders of lakes, Mo. to N. Mex. July-Aug.
4. Ranunculus hyperbòreus Rottb. Arctic Buttercup. (I. F. f. 1598.) Stem slender, glabrous, filiform, creeping, $5-15 \mathrm{~cm}$. long. Leaves petioled, 3 -lobed or cleft, 4-8 mm. long, obtuse, the base cuneate or rounded, the lobes oblong, obtuse, the lateral ones sometimes toothed; flowers few, $4-6 \mathrm{~mm}$. broad; petals slightly shorter than the reflexed sepals; head of fruit globose, 4 mm . broad; achenes slightly compressed, with a minute blunt tip. Lab., Arctic Am., Iceland, northern Europe and Siberia. Summer.
5. Ranunculus Lappónicus L. Lapland Buttercup. (I. F. f. 1599.) Scapose from running rootstocks, $7-15 \mathrm{~cm}$. high. Basal leaves long-petioled, the blade $3-4 \mathrm{~cm}$. broad, reniform, 3 -parted, the divisions broadly obovate, cuneate, obtuse, crenate or lobed; scape I-flowered, slender, longer than the leaves; flower $6-10 \mathrm{~mm}$. broad; petals $5-6$; sepals generally fewer and reflexed; head of fruit globose, 12 mm . broad; achenes flattened, ovate, with a slender hooked beak. Lab., Lake Nipigon and Thunder Bay, Lake Superior, northern Minn., Arctic Am. and in northern Europe and Siberia. Summer.
6. Ranunculus pusíllus Poir. Low Spearwort. (I. F. f. 1600.) Slender, weak, glabrous, branching, $15-30 \mathrm{~cm}$. high. Lower leaves oblong or ovate, on long petioles, the upper narrower, lanceolate or linear, short-petioled or sessile ; flowers 4-6 mm. broad, the petals few, often barely exceeding the sepals; head of fruit globose, 4 mm . broad. Marshes, southern N. Y. and N. J., Penn., south to Fla., and west through the Gulf States to Tex. and Mo. April-July.
7. Ranunculus oblongifòlius Ell. Oblong-leaved Spearwort. (I. F. f. 1601.) Branched above, erect or ascending, 3-5 dm. high, glabrous or pubescent. Leaves oblong, or oblong-lanceolate, the lower on long petioles, the blade sometimes 7 cm . long, the upper narrower, lanceolate or linear; flowers $10-12 \mathrm{~mm}$. broad, the 5 petals much exceeding the sepals; head of fruit 4 mm . broad. In swamps, southern Va., southern Ill. and Mo., south to Fla. and Tex. April-Sept.
8. Ranunculus réptans L. Creeping Spearwort. (I. F. f. i602.) The flowering stems and peduncles ascending. Leaves linear, lanceolate or spatulate. $2-5 \mathrm{~cm}$. long, mainly entire, gradually narrowed into the petiole; flowers $8-10 \mathrm{~mm}$. broad, solitary on peduncles $2-7 \mathrm{~cm}$. long; petals $4-7$, much exceeding the calyx; achenes flattish; stamens numerous. On shores, Newf. and Arctic Am., south to N. J., Penn. and Mich., and in the Rocky Mts. to Colo. Also in Europe and Asia. Summer.

Ranunculus réptans intermèdius (Hook.) T. \& G. Larger; leaves longer and wider, $7^{-13} \mathrm{~cm}$. long, $4^{-6} \mathrm{~mm}$. wide. Newf. to the shores of the Great Lakes, and Ore.
9. Ranunculus obtusiúsculus Raf. Water Plantain Spearwort. (I. F. f. 1603.) Stout, 3-10 dm. high, ascending, glabrous; stem hollow, sometimes ne:arly 2 cm . thick at the base. Leaves lanceolate or oblong-lanceolate, $7-12 \mathrm{~cm}$. hong. $10-12 \mathrm{~mm}$. wide, denticulate or entire, all but the uppermost on broad petioles; flowers $\mathbf{1 2 - 1 6 ~ m m}$. broad; petals 5-7, much exceeding the sepals; head of fruit globose or slightly elongated, $10-12 \mathrm{~mm}$. in diameter; achenes 1 mm . long. Marshes. Me. and Ont: to Ga., west to Minn. and Mo. June-Aug.
10. Ranunculus nivàlis L. Snow Buttercup. (I. F. f. 1604.) Stem simple, $\mathbf{I}-2 \mathrm{dm}$. high. Basal leaves long-petioled, 7 -hobed, or crenate, thich. glabrous, the blade about 2 cm . broad, those of the stem short-petioled or sessile.
deeply loved; flowers solitary, 12-18 mm. broad; head of fruit oblong, 12 m . long; achenes tipped with the subulate style. Lab. and Arctic America; also in northern Europe and Asia. Summer.
II. Ranunculus pygmaèus Wahl. Pigmy Buttercup. (I. F. f. 1605.) Small, $2-5 \mathrm{~cm}$. high, glabrous or sparsely pubescent. Basal leaves slenderpetioled, deeply $3-5$-lobed or divided, the blade $6-\mathbf{1 2} \mathrm{mm}$. wide; those of the stem similar and nearly sessile; the petals slightly exceeding the sepals; head of fruit short-oblong, 4 mm . long; achenes I mm . long, lenticular, tipped with a slender beak. Lab., Arctic Am., and in the Rocky Mts. Also in Europe and Asia.
12. Ranunculus Sábini R. Br. Sabine's Buttercup. Small, 6-10 cm. high, glabrous, and upper portion hairy. Basal leaves petioled, orbicular-reniform, deeply 5 -cleft, about 15 mm . wide, lobes obovate-cuneate 3 -lobed; stem leaves ses. sile, deeply 3 -divided into oblong segments; petals $5-8$, about half longer than the orbicular sepals. Melville Island and Lab. Also in the northern Rccky Mts.
13. Ranunculus pedatífidus J. E. Smith. Northern Buttercup. (I. F. f. 1606.) Erect, I-3 dm. high, branching. Basal leaves petioled, broadly ovate or nearly orbicular, about 2 cm . broad, obtuse, crenate or often lobed, those of the stem deeply lobed, nearly sessile, the lobes narrow, obtuse; the petals slightly exceeding the spreading sepals; head of fruit oblong, $5-10 \mathrm{~m}$. long, $4-5 \mathrm{~mm}$. in diameter; achenes oval, tipped with a short beak, often hairy. Lab. and Quebec to Alaska, south in the Rocky Mts. to Ariz. Also in northern Asia. Summer.
14. Ranunculus cardiophyllus Hook. Heart-leaved Buttercup. Stout, 1-3 dm. high, more or less villous. Basal leaves broadly ovate or orbicular, often subcordate at the base, and upper portion crenate or lobed; stem leaves sessile, pedately 3-7 divided into oblong divisions; petals one-half or more longer than the sepals; head of fruit $10-15 \mathrm{~mm}$. long, $6-8 \mathrm{~mm}$. in diameter; achenes oval, tipped with a short curved beak. Lab. to Br. Col., south to Quebec, S. Dak. and Colo. June.
15. Ranunculus ovàlis Raf. Prairie Crowfoot. (I. F. f. 1607.) Pubescent, branching, I.5-4 dm. high. Lower and basal leaves oval, oblong, or ovateoblong, long-petioled, the blade $2-3 \mathrm{~cm}$. in length or more, crenate or slightly lobed, obtuse, the base more or less cuneate; upper cauline leaves sessile or short petioled, deeply divided into 3-7 linear or oblong obtuse lobes; flowers $18-24 \mathrm{~mm}$. broad; carpels and achenes oval or orbicular, minutely beaked. In fields and on prairies, Lab. and Ont. to the N. W. Terr., Ill. and Neb. March-May.
16. Ranunculus Hàrveyi (A. Gray) Britton. Harvey's Buttercup. (I. F. f. 1608.) Glabrous; stem erect, slender, branched, 2-4 dm. tall. Leaves thin, the basal and lower ones long-petioled, obtusely crenate or somewhat lobed, $1-3.5 \mathrm{~cm}$. wide, cordate, truncate at the base, the upper sessile or nearly so, deeply 3 -cleft or 3-parted into linear or narrowly oblong segments; flowers bright yellow, $\mathbf{1 2 - 1 8} \mathrm{mm}$. broad; petals $4-8,4$ or 5 times as long as the reflexed sepals; head of fruit globose, 4 mm . in diameter: achenes oblique, compressed, tipped with a minute straight style. On dry hillsides, Mo. and Ark. April-May.
17. Ranunculus abortivus L. Kinney-Leaved Crowfoot. (I. F. f. 1609.) Glabrous, or but sparingly pubescent, 1.5-6 dm. high, branched. Basal leaves long-petioled, bright green, thick, crenate or sometimes lobed, broadly ovate, obtuse, and generally cordate or reniform, the cauline sessile or nearly so, divided into oblong or linear somewhat cuneate lobes; receptacle short, pubescent; flowers 4-6 mm. broad. In woods and moist grounds, Newf., Lab. and N. S. to Manitoba, Fla., Ark. and Colo. April-June.

Ranunculus abortivus eucyclus Fernald. Stem and branches more slender, the latter flexuous; leaves thin, shining, some of the basal ones orbicular; flowers and achenes smaller. Me. and Quebec to Mass.
18. Ranunculus micránthus Nutt. Rock Crowfoot. (I. F. f. i6io.) Similar to the preceding species but usually smaller, villous with spreading hairs, flowering when very young, 1.5-4 dm. tall. Leaves thin, dull green, the basal ones ovate or suborbicular, 3-lobed or crenate, narrowed, rounded or subcordate at the base; segments of the upper leaves narrow; flowers about 6 mm . broad; sepals narrowed into a short claw; head of fruit rather longer than thick, the receptacle linear, glabrous or very nearly so. In rich woods, often on rocks, range apparently nearly that of $R$. abortivus. Roots tuberous. April-May.
19. Ranunculus Alleghaniénsis Britton. Mountain Crowfoot. (I. F. f. 1611.) Similar in aspect to $K$. abortivus and $R$. micranthus, glabrous; stem widely branched, 3-6 dm. tall. Basal leaves reniform or suborbicular, $1.5-5 \mathrm{~cm}$. wide, long-petioled, crenate or some of them lobed, the teeth and lobes subacute; stem leaves sessile or the lower petioled, divided into linear acute segments; flowers about 6 mm . broad; petals glandular; head of fruit 4 mm . in diameter; achenes slightly compressed and margined; styles of about one-half their length. Mountains of Va. and N. Car. to Penn., the Catskills, and eastern Mass. April-May.
20. Ranunculus sceleràtus L. Celery-leaved or Ditch Crowfoot. (I. F. f. 1612.) Stout, I.5-6 dm. high, freely branching. Basal leaves thick 3-5lobed, on long and broad petioles, the blade $3-5 \mathrm{~cm}$. broad, reniform or cordate, those of the stem petioled or the upper sessile, deeply lobed or divided; flowers 6-8 mm . broad, the petals about equalling the calyx; head of fruit oblong or cylindric, 8-12 mm. long; achenes 1 mm . long, very numerous, merely apiculate. In swamps and wet ditches, N. B. to Fla., Kans. and Minn. Also in Europe and Asia. April-Aug.
21. Ranunculus recurvàtus Poir. Hooked Crowfoot. (I. F. f. 1613.) Erect, 1.5-6 dm. high, usually hirsute, branching. Leaves all petioled, broadly reniform, 5-7 cm. wide, deeply 3 -cleft, the divisions broadly cuneate, acute, toothed and lobed; flowers light yellow, the petals not exceeding the reflexed calyx; head of fruit globose, 12 mm . wide; achenes compressed, margined. In woods, N. S. to Manitoba, south to Fla. and Mo. April-June.
22. Ranunculus àcris L. Tall or Meadow Buttercup. (I. F. f. 16i4.) Hairy, branched above, 6-9 dm. high. Basal leaves tufted, petioled, 3-7-divided, the divisions sessile and cleft into numerous narrow mainly acute lobes; upper leaves short-petioled and merely 3-parted; flowers about 2 cm . broad; petals twice or thrice the length of the calyx, obovate; head of fruit globose, $12-14 \mathrm{~mm}$. broad. In fields and meadows, common, especially in the Northern States and Canada. Nat. from Europe. May-Sept.
23. Ranunculus bulbòsus L. Bulbous Buttercup. (I. F. f. 1615.) Erect, hairy, I.5-4 dm. high. Leaves petioled, 3-divided, the terminal division stalked, the lateral ones sessile or nearly so, all variously lobed and cleft, flowers about 2 cm . broad; petals much longer than sepals, obovate, rounded; head of fruit globose, $10-12 \mathrm{~mm}$. broad; achenes compressed, very short-beaked. In fields and along roadsides, in the Eastern States. Nat. from Europe. May-July.
24. Ranunculus Pennsylvánicus L. f. Bristly Buttercup. (I. F. f. 1616.) Erect, branching, pilose-hispid, 3-6 dm. high, leafy. Leaves thin, 3divided; divisions deeply 3 -cleft, the lobes lanceolate, cuneate, acute, incised; flowers $6-8 \mathrm{~mm}$. wide; head of fruit 6 mm . thick, sometimes 12 mm . long; achenes smooth, pointed with a sharp beak one-third their length; receptacle hairy. In wet, open places, N. S. to Ga. and west to the Rocky Mts. and Br. Col. June-Aug.
25. Ranunculus Macòunii Britton. Macoun's Buttercup. (I. F. f. 1617.) Erect or diffuse, hairy, branching, 3-6 dm. high. Leaves 3-divided, the blade $5^{-8} \mathrm{~cm}$. long, the divisions broadly oblong, acute, cuneate, variously cleft and lobed; flowers $\mathbf{1 0} \mathbf{- 1 2} \mathrm{mm}$. broad; head of fruit oblong, 8 mm . thick; achenes smooth, pointed with a sharp beak about one-fourth their length. Western Ont., Iowa and west to the Pacific Coast, extending south in the Rocky Mts. to Ariz. Summer.
26. Ranunculus rèpens L. Creeping Buttercup. (I. F. f. I6IS.) Generally hairy, sometimes only slightly so. Leaves petioled, 3-divided, the terminal division, or all three stalked, all ovate, cuneate or truncate, acute, cleft and hord. often blotched; petals obovate, much exceeding the spreading sepals; head of fruit globose, 8 mm . in diameter; achenes margined, tipped with a stout short slightly bent beak. Fields and roadsides, Newf. to Va. and locally in the interior. Mainly introduced from Europe. May-July.
27. Ranunculus septentrionalis Poir. Swamp or Marsh Butterctip. (I. F. f. 1619 .) Roots fibrous; plant branching, 3-9 dm. high, glabrous, or sometimes pubescent, the later branches procumbent and sometimes rooting at the nodes. Leaves large, petioled, 3-divided; divisions mostly cuneate cleft into broad lobes; petals obovate, twice the length of the spreading sepals: head of fruit globose or oval, 8 mm . in diameter; achenes flat, strongly margined.

Mainly in swamps and low grounds, N. B. to Manitoba, Ga., Ky. and Kans., April-July.
28. Ranunculus híspidus Michx. Hispid Buttercup. (I. F. f. 1620.) Densely villous when young, sometimes merely appressed-pubescent or glabrate when old; stems ascending or spreading, 2-6 dm. long. Leaves pinnately 3-5divided, the divisions sharply cleft or lobed, usually thin; flowers $12-35 \mathrm{~mm}$. broad; petals about twice as long as the spreading sepals; head of fruit globoseoval or globose; achenes broadly oval, lenticular, narrowly margined. In dry woods and thickets, Ont. to the N. W. Terr., Ga. and Ark. March-May.
29. Ranunculus fasciculàris Muhl. Early or Tufted Buttercup. (I. F. f. 1621.) Pubescent; plant generally low, I.5-3 dm. high, tufted. Leaves petioled, 3-5-divided; divisions stalked (especially the terminal one), deeply lobed and cleft, the lobes oblong or linear; petals obovate, much longer than the spreading sepals, rounded, truncate or even emarginate; head of fruit globose, about 8 mm . in diameter; achenes flat, slightly margined. Woods, Ont. and N. Eng. to N. Car., west to Manitoba, Kans. and Tex. April-May.
30. Ranunculus párvulus L. Hairy Buttercup. (I. F. f. 1622.) Erect, hairy, $1.5-3.5 \mathrm{dm}$. high, branching. Basal and lower leaves broad-petioled, the blade about 5 cm . broad and long, 3 -divided or cleft, the divisions broadly ovate, cuneate, stalked, cleft and lobed, the upper sessile or nearly so, deeply cleft into linear-oblong obtuse segments; flowers yellow, $10-15 \mathrm{~mm}$. broad; petals much exceeding the reflexed calyx; head of fruit oblong, $4-\sigma \mathrm{mm}$. thick; achenes flat, strongly margined, short-beaked. In ballast grounds and waste places, N. B. to Va. and Fla. Fugitive from Europe. Summer.

3I. Ranunculus parvifiorus L. Siall-flowered Crowfoot. (I. F. f. 1623.) Hairy, slender, diffuse, branching from the base, ${ }^{15-25} \mathrm{~cm}$. high. Basal leaves long-petioled, the blade reniform or cordate-orbicular, 2.5 cm . broad or less, 3 -cleft, the lobes broadly oval, obtuse, cut and toothed; upper leaves short-petioled or nearly sessile, $3-5$-parted into linear-oblong lobes; flowers yellow, $2-4 \mathrm{~mm}$. wide, the petals not longer than the calyx; head of fruit globose, 4 mm . broad; achenes flat, margined, densely papillose, 3 mm . long, tipped with a sharp beak of about one-fourth their length. In waste places, Md. and eastern Va. to Fla., Ark. and Tex., and in ballast grounds about the northern seaports. Nat. or fugitive from Europe. Summer.
32. Ranunculus muricàtus L. Spiny-fruited Crowfoot. (I. F. f. 1624.) Glabrous or sparingly pubescent, branched from the base, 3-6 dm. high. Lower and basal leaves on long broad petioles, the blade reniform or cordate-orbicular, 35 cm . wide, 3 -lobed, cleft, or crenate; the upper 3 -divided, cuneate, short-petioled or sessile; flowers light yellow, $6-10 \mathrm{~mm}$. wide, the petals exceeding the calyx; head of fruit globular, $10-12 \mathrm{~mm}$. wide; achenes flat, 4 m . long, tipped with a stout slightly curved beak. Waste places, eastern Va. and southward, naturalized or fugitive from Europe. Also on the Pacific Coast. Native also in Asia and naturalized in tropical America. Summer.
33. Ranunculus arvénsis L. Corn Crowfoot. Hunger-weed. (I. F. f. 1625.) Erect, glabrous or sparingly pubescent, branched above, 3 dm . or more high. Lower leaves petioled, the upper sessile, all deeply cleft or divided into linear-oblong, obtuse cuneate, lobed or toothed segments or the lowest entire; flowers $12-16 \mathrm{~mm}$. broad, pale yellow, the petals exceeding the sepals; achenes 8 16 mm ., flattened, margined, 4 mm . long, tipped with a subulate beak. In waste grounds, Tom's River and Passaic, N. J., and in ballast about the northern seaports. Fugitive from Europe. Summer.

## 23. BATRÀCHIUM S. F. Gray.

Perennial aquatic or ditch herbs, with alternate dissected or palmately lobed leaves, the segments of the submerged ones often filiform, and solitary rather small white flowers, borne on peduncles opposite the leaves; sepals and petals usually 5 . Petals oblong or oval, the base sometimes yellowish, the claw bearing a small pit. Stamens several or numerous. Achenes oblique, compressed, not margined, nearly or quite beakless, transversely wrinkled. [Greek. referring to the aquatic habitat.] About 20 species of very wide geographic distribution. Besides the following, 3 others occur in northwestern N. Am.

Leaves all reniform, 3-5-lobed, about I cm. wide; receptacle glabrous.

1. B. hederaceum.

Leaves all dissected into filiform segments; receptacle hairy.
i.eaves sessile, circinate, the segments short, spreading around the stem nearly in one plane; beak of achene minute.
2. B. divaricatum.

Leaves more or less petioled, not circinate.
Beak of achene nearly 1 mm . long.
3. R. longirostris.

Beak of achene minute or none.
Petals 5-7 mm. long, broadly obovate; stamens many:
Segments of the leaves $10-15 \mathrm{~mm}$. long, rather rigid, scarcely collapsing when withdrawn from water. 4. B. trichophyllum. Segments of the leaves $15-30 \mathrm{~mm}$. long, flaccid, collapsing when withdrawn from water.
5. B'. flaccidum.

Petals less than 5 mm . long, oblong-obovate, stamens 5-12.
Stem slender; leaves not very flaccid.
6. B. Drouetii.

Stem filiform; leaves very flaccid.
7. B. confervoides.
I. Batrachium hederàceum (L.) S. F. Gray. Ivy-leaved Crowfoot. (I. F f. 1628.) Semi-aquatic, rooting extensively at the joints, branching, entirely glabrous. Leaves floating, or spreading on the mud, the lobes obtuse; flowers white, 4-6 mm . broad; head of fruit globose, 4 mm . wide; achenes rugose, minutely beaked. In ponds and pools, Newf. and southeastern Va. Nat. from Europe. June-Aug.
2. Batrachium divaricàtum (Schrank) Wimm. Circinate White WaterCrowfoot. (I. F. f. 1627.) Submerged, 3 dm . or more. Leaves distant, $\mathbf{I - 2}$ cm . broad, with very short lobes; stipules membranaceous, very short and broad, glabrate; peduncles $4-10 \mathrm{~cm}$. long; petals broadly obovate, about 5 mm . long; head of fruit globose. Very rare; most specimens referred here belong to the next. Lakes and ponds, N. Eng. to Minn. Also in Europe. June-Aug.
3. Batrachium longiróstris (Godr.) F. Schultz. Long-beaked White Water-Crowfoot. Stem very leafy, submerged. Petioles short; stipules broad and hairy; segments very numerous, about 15 mm . long, not flaccid; peduncles $2-4 \mathrm{~cm}$. long; petals broadly ovate, $5-7 \mathrm{~mm}$. long; head globose. Has been confused with the preceding. In ponds and streams, Ont. and N. Eng. to Minn., N. Mex. and Mo. June-Aug.
4. Batrachium trichophýllum (Chaix) Bossch. White Water-Crowfoot. (I. F. f. 1626.) Submerged; stems usually 3 dm . long or more. Leaves petioled, $3-5 \mathrm{~cm}$. long, stipules broad and short, hairy; flowers white, $\mathbf{1 2 - 1 8} \mathrm{mm}$. broad, on stout peduncles $2-5 \mathrm{~cm}$. long, blooming at the surface of the water; head of fruit globose, 4 mm . broad; receptacle hairy; achenes apiculate but beakless. In ponds and streams, N. S. to Br. Col., south to N. Car. and Cal. Also in Europe and Asia. The so-called var. caespitosus is a small mud form with rather fleshy leaf-segments. June-Sept.
5. Batrachium fláccidum (Pers.) Rupr. Flaccid White Water-Crowfoot. Like the next preceding except the leaves, which have longer, more slender petioles and very long flaccid leaf-segments, collapsing when withdrawn from water. In streams, Mass. to Wash., south to N. Car. and Lower Cal. Also in Europe, Asia and South Africa. May-Sept.
6. Batrachium Drouètii (F. Schultz) Nym. Drouet's White Water-Crow Fоот. Like B. trichophyllum. but more slender and with smaller flowers, fewer and more slender leaf-segments, narrower and glabrous stipules and fewer stamens. In streams, Vt. and R. I. to Alaska, south to Lower Cal. Also in Europe, Asia, Africa, and Bolivia.
7. Batrachium confervoides Fries. Filiform White Watfr-Crowfont. Resembling the last, but stem filiform, I-2 dm. long; leaves very flaccid and the receptacles conic, not ovoid. In cold pools, from Lake Wimnipeg according to Hiern) to Alaska, and south to the Yellowstone Park. Also northern Europe.
24. FICÀRIA Huds.

Glabrous slightly fleshy peremial herbs, with thickened tuherous roots. branched or simple spreading or erect stems, petioled entire or toothed cordate leaves, and large solitary yellow terminal or axillary flowers. Sepals 3 or some times 5 , deciduous. l'etals 7-12 (commonly 8 ), yellow, or red at the base, hearing
a small pit at the base of the blade. Stamens and pistils numerous. Achenes slightly compressed, blunt, not wrinkled nor ribbed. Cotyledon only one. [Latin, fig, from the fig.like thickened roots.] About 4 species, natives of the Old World.
I. Ficaria Ficària (L.) Karst. Lesser Celandine. (I. F. f. 1629.) Glabrous; flowering stems scapose, $10-12 \mathrm{~cm}$. high, bearing I or 2 leaves or naked. Leaves ovate, obtuse, crenate, somewhat fleshy, on broad petioles, the blade $3-5 \mathrm{~cm}$. long; flowers yellow, 2.5 cm . broad; head of fruit globose, $\mathbf{I} \mathrm{cm}$. broad; carpels beakless, truncate. College Point, Long Island; Staten Island; Philadelphia and D. C. Fugitive from Europe; also in western Asia. April-May.

## 25. CYRTORHYNCHA Nutt.

A glabrous perennial herb, with fibrous roots, slender erect stems, crenate or lobed leaves, and small yellow flowers. Sepals 5 , spreading, deciduous. Petals 5, narrowly spatulate or oblong, bearing a small pit near the base. Stamens and pistils numerous. Head of fruit globose. Achenes terete, longitudinally ribbed or nerved, tipped with the inflexed style. [Greek, curved-beak.] The genus as here recognized consists of the following species only.
I. Cyrtorhyncha ranuncùlina Nutt. Nuttall's Buttercup. (I. F. f. 1630.) Slender, glabrous, erect, branched above, $1.5-2.5 \mathrm{dm}$. high. Basal leaves on long slender petioles, bipinnate, parted into oblong or linear, acutish lobes; stem-leaves few, ternately or pinnately parted into linear lobes; flowers few, corymbose, about 12 mm . broad; sepals yellow, petaloid, spreading; petals spatulate; achenes $2-3 \mathrm{~mm}$. long, in a globose head, glabrous, oblong-cylindric. In gravelly soil, Wyo. and Colo. Reported from Neb. June.

## 26. OXYGRAPHIS Bunge.

Perennial herbs, with crenate dentate or lobed long-petioled leaves, and small yellow flowers, solitary or 2-7 together on scapes or scape-like peduncles. Sepals usually 5, spreading, tardily deciduous. Petals 5-12, each bearing a small nectarpit near the base. Stamens and pistils numerous. Head of fruit oblong, oval or subglobose. Achenes compressed, sometimes swollen, longitudinally striate, without a hard coat. [Greek, sharp-style.] About 10 species, the following of North America, Asia and southern South America, the others Asiatic.
I. Oxygraphis Cymbalària (Pursh) Prantl. Seaside Crowfoot. (I. F. f. 1631.) Low, glabrous, spreading by runners. Leaves mostly basal, slenderpetioled, the blade cordate-oval or reniform, crenate, $4-18 \mathrm{~mm}$. long; flowers $\mathbf{1}-7$, about $6-8 \mathrm{~mm}$. broad, borne on scapes $2-12 \mathrm{~cm}$. long, these sometimes bearing one or more leaves toward the base; head of fruit oblong, $6-16 \mathrm{~mm}$. long; achenes compressed, somewhat swollen, distinctly striate, minutely sharp-pointed. On sandy shores, N. J. to Lab., west to Alaska, Cal.; Mex. and Kans. Also in Asia and S. Am. Summer.

## 27. THALÍCTRUM L.

Erect perennial herbs. Leaves ternately decompound, basal and cauline, the latter alternate. Flowers perfect, polygamous or diœcious, generally small, green-ish-white, panicled or racemed. Sepals 4 or 5. Petals none. Carpels commonly few, one-seeded, ribbed or nerved, stipitate or nearly sessile. Stamens $\infty$, exserted. [Derivation doubtful.] A genus of about 75 species, most abundant in the north temperate zone, a few in the Andes of South America, India and South Africa. In addition to the species described below, about 8 others occur in southern and western N. Am.

## Flowers perfect.

Stem simple, scape-like; achenes sessile; filaments slender. 1. T. alpinum.
Stem branched, leafy; achenes long-stipitate; filaments spatulate, petal-like.
2. T. clavatum.

Flowers diœcious or polygamous.
Filaments filiform or slender, not wider than the anthers.
Flowers strictly diœcious; lower stem leaves distinctly petioled.
Achenes terete ; eastern species.
Leaflets thin, orbicular or broader; roots not yellow.
3. T. dioicum.

Leaflets thick, obovate or reniform ; roots bright yellow.
4. T. corzaceum. sessile.
6. I: purpurascens.

Filaments spatulate, often wider than the anthers ; plant not glandular.
7. 1. polygamum.

1. Thalictrum alpìnum L. Arctic or Dwarf Meadow-Rue. (I. F. f. 1632.) Smooth or slightly glandular, $3-10 \mathrm{~cm}$. high. Leaves small, tufted at the summits of scaly rootstocks, biternate; leaflets cuneate-obovate or orbicular, firm, 3 - 5 -lobed at the apex, margins revolute; panicle very simple, often racemose; stamens about IO; anthers oblong-linear, mucronate; stigma linear; achenes 3 mm . long, obliquely obovoid. Anticosti, Newf. and Arctic Am. Also in the Rocky Mts., Cal. and in Europe and Asia. Summer.
2. Thalictrum clavatum DC. Muuntain Meadow-Rue. (I. F. f. 1633.) Glabrous, branching, $1.5-6 \mathrm{dm}$. high. Leaves oval, ovate, or the terminal obovatecuneate, basal and cauline, large, biternate; leaflets thin, stalked, with 3 main lobes and a few secondary ones, their margins not revolute; inflorescence cymose; anthers oblong, blunt; achenes spreading, equalling their stipes or longer, obliquely ovoid, narrowed at each end, flattened; stigma minute. Mountains of Va. and W. Va. to Ga., Ala. and Tenn. May-June.
3. Thalictrum diòicum L. Early Meadow-Rue. (I. F. f. 1634.) Glabrous, erect, 3-6 dm. high, slender, leafy; leaves 3-4-ternate; leaflets pale beneath, often cordate and the terminal one somewhat cuneate, 5-9-lobed; flowers greenish; panicle elongated, of numerous lateral corymbs or umbels; filaments longer than the sepals; achenes ovoid, sessile or minutely stipitate, deeply grooved, much longer than the style. In woods, Lab. and Anticosti to Ala., west to Saskatch. and Mo. April-May.
4. Thalictrum coriàceum (Britton) Small. Thick-leaved Meadow-Rue. (I. F. f. 1635.) Tall, I-I. 5 m . high. Stem striate, paniculately branched above; leaves 3 -4-ternate, short-petioled, the lower petioles expanded at the base into stipule-like appendages; leaflets nearly white beneath, usually deeply and sharply incised, the veins prominent on the lower surface; staminate flowers nearly white; pistillate flowers purple; achenes oblong-ovoid, subacute, stalked, sharply ribbed. longer than the persistent style. In open places, mountains of Va., N. Car. and Ky. May-June.
5. Thalictrum venulòsum Trelease. Veiny Meadow-Rue. (I. F. f. 1636.) Glabrous, pale green and glaucous, stem purplish, erect, or assurgent at the base. 1.5-6 dm. tall. Leaves 3-4-ternate, long-petioled; leaflets firm, obovate or suborbicular, rounded at the apex, cuneate, obtuse or subcordate at the base, $8-16 \mathrm{~mm}$. long, 3 - 5 -lobed, the lower surface rather prominently rugose-veined; anthers linear, slender-pointed; achenes ovoid, nearly sessile, tapering into a short beak, thickwalled, 2-edged. In dry soil, Manitoba and S. Dak. to the N. W. Terr. and Wash., south to Colo. May-June.
6. Thalictrum purpuráscens L. Purplish Meadow-Rue. (I. F. f. 1637.) Stout, erect, I-2 m. high, leafy, branching above, glandular, pubescent or even glabrous; leaves 3-4-ternate; leaflets thick, oblong or obovate, dark green above, commonly waxy beneath, with revolute margins; anthers linear or linear-oblong, cuspidate; stigma linear, persistent; achenes ovoid, glabrous or pubescent. shortstipitate, with 6-8 longitudinal wings. In copses and woodlands, N. S. and Anticosti to Fla., west to Saskatch. and Ariz. Stems often purplish. June-Aug.
7. Thalictrum polygamum Muhl. Tall Meadow-Rue. (I. F. f. 1638.) Stout, I-2.5 m. high, branching, leafy, smooth or pubescent but not glandular nor waxy. Leaves 3-4-ternate; leaflets moderately thick, light green above and paler beneath, oblong, obovate or orbicular, with 3 main apical pointed or obtuse lobes; flowers polygamous, white; anthers oblong, short; achenes ovoid, stipitate, 0-S. winged, glabrous or pubescent. Lab. and Quebec to Fla., west to Ohio.

## 28. ADÒNIS L.

Leaves alternate, pinnately dissected into numerous linear segments. Flowers yellow or red, solitary; terminal. Petals 5-16, conspicuons. Carpels $x$, i ovuled. Achenes capitate or spicate, tipped with the persistent styles. [Mytholegrical name
for a favorite of Venus, changed into a flower.] A genus of Europe and Asia, consisting of the following and about five other species.
I. Adonis ánnua L. Pheasant's Eye. (I. F. f. 1639.) Annual, erect, 3-6 dm. high, glabrous. Leaves finely dissected, the lower petioled, the upper sessile, the segments acute ; sepals smooth, deciduous ; flowers $1.5-3.5 \mathrm{~cm}$. broad. nearly globular, the petals obovate, and darker colored at the base; achenes spicate, rugose or angular. Occasional in waste places, especially southward. Fugitive from Europe. Summer.

Family 6. BERBERIDÀCEAE T. \& G.

## Barberry Family.

Shrubs or herbs, with alternate or basal leaves, with or without stipules, and solitary or racemed mostly terminal flowers. Sepals and petals generally imbricated in several series. Stamens as many as the petals and opposite them, hypogynous. Flowers perfect and pistil one in our species. Anthers extrorse, opening by valves (except in Podophyllum). Style short; ovules $2-\infty$, anatropous. Fruit a berry or capsule. About 20 genera and Io5 species, widely distributed in the north temperate zone, the Andes and temperate S. Am., a few in tropical regions.
Shrubs : fruit baccate.
Herbs.
Anthers opening by valves.
Pericarp early bursting, leaving two large naked stalked seeds, resembling berries.
Fruit baccate ; stamens 6. 2. Caulophyllum.

Fruit capsular, half circumscissile.
3. Diphylleia.
nthers longitudinally dehiscent; fruit baccate ; stamens 6-18.
5. Podophyllum.

## 1. BERBERIS L.

Shrubs with yellow wood, simple or compound often spiny leaves, and yellow racemose (rarely solitary) flowers. Sepals 6-9, petaloid, bracted. Petals 6, imbricated in 2 series, each with 2 basal glands. Stamens 6, irritable, closing around the stigma when shocked; anthers dehiscent by valves opening from the apex. Pistil I; stigma peltate. Berry I-few-seeded. [From the Arabic name.] A genus of about 75 species, natives of N. Am., Europe, northern Asia and S. Am. Besides the following, about 10 others are found in the western parts of N. Am.
Leaves simple; racemes drooping ; berries scarlet.

Twigs ash-colored ; racemes many-flowered; petals entire.
Twigs dark brown; racemes few-flowered; petals notched. Leaves pinnate ; racemes erect; berries blue or purple.

1. B. vulgaris.
2. B. Canadensis.
3. B. Aquifolium.
t. Berberis vulgàris L. European Barberry. (I. F. f. 1640.) A glabrous shrub, $2-3 \mathrm{~m}$. high, the branches arched, the twigs gray. Leaves alternate or fascicled, obovate or spatulate, unifoliolate, obtuse, $2-5 \mathrm{~cm}$. long, bristly serrate, many of those on shoots reduced to 3 -pronged spines; racemes lateral, manyflowered, $2-10 \mathrm{~cm}$. long; flowers yellow. $6-8 \mathrm{~mm}$. broad ; petals entire ; berries oblong, scarlet when ripe, acid. In thickets, nat. from Europe in the Eastern and Middle States, adventive in Canada and the West. May-June.
4. Berberis Canadénsis Mill. American Barberry. (I. F. f. 1641.) A shrub. $0.3^{-2} \mathrm{~m}$. high, with slender, reddish brown branchlets. Leaves similar to those of $B$. vulgaris but with more divergent and distant teeth, or sometimes nearly entire ; racemes few-flowered; petals notched or emarginate at the apex : berries scarlet, oval or subglobose. In woods, mountains of Va. to Ga., and in Mo. June.
5. Berberis Aquifolium Pursh. Trailing Mahonia. (I. F. f. 1642.) A trailing glabrous shrub. Leaves petioled, pinnate: leaflets 3-7, ovate, oval, or nearly orbicular, oblique, obtuse, truncate or sightly cordate at the base, sessile, thick. persistent, finely reticulated, dentate with spine-bearing teeth, $2-5 \mathrm{~cm}$, long; racemes several, erect. dense. terminal, many-flowered; flowers yeilow, $6-8 \mathrm{~mm}$. broad, short-pedicelled ; bracts ovate, persistent : berry glubose. blue or purple, about 6 mm . in diameter. W. Neb., Ariz. and Br. Col. April-May.

## 2. CAULOPHÝLLUM Michx.

Erect herbs, with thickened rootstocks, and ternately compound leaves. Sepals 6, the calyx 3-4-bracted. Petals 6, smaller, cucullate, opposite the sepals. Stamens 6 ; anthers oblong, dehiscent by valves. Pistil 1; style short; stigma lateral; ovules 2 , ripening into large globose stipitate seeds, resembling berries, which in growth soon rupture the membranous caducous pericarp. [Greek, stem-leaf.]
I. Caulophyllum thalictroides (L.) Michx. Blue Cohosh. (I. F. f. 1643.) Glabrous, glaucous when young, 3-9 dm. high, with 2 or 3 large sheathing scales at the base, a large triternate nearly sessile leaf near the summit, and generally a smaller similar one near the base of the inflorescence. Divisions of the leaves long petioled, the ultimate segments thin, $2-8 \mathrm{~cm}$. long, oval, oblong or obovate, 3-5lobed near the apex; panicle terminal, $5-8 \mathrm{~cm}$. long; flowers greenish purple, $8-12$ mm . broad; seeds 8 mm . in diameter, blue, glaucous, borne on stout stalks about 6 mm . long. In woods, N. B. to S. Car., Minn., Neb. and Mo. April-May.

## 3. DIPHYLLEİA Michx.

Herbs with horizontal rootstocks, large peltate leaves, and cymose white flowers. Sepals 6, petaloid. Petals 6, flat. Stamens 6; anthers dehiscent by valves. Pistil I; ovules few, arranged in 2 rows. Fruit a berry. Seeds oblong, curved. [Greek, double-leaf.] Two species, one of eastern N. Am., the other of Japan.
I. Diphylleia cymòsa Michx. Umbrella-leaf. (I. F. f. I644.) Erect, stout, 3-6 dm. high, glabrous or nearly so. Basal leaves solitary, long-petioled, 3-6 dm . in diameter, peltate, deeply 2 -cleft, many-lobed, the lobes acute or acuminate, sharply dentate; cauline leaves 2 , similar. smaller, petioled, constricted in the middle and generally peltate near the margin; cyme many-flowered, $5-8 \mathrm{~cm}$. broad; petals oblong, obtuse; fruiting pedicels slender, 2 cm . long or more; berries blue, oblong, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. long. In woods, Va. to Tenn. and Ga. along the mountains. May-June.

## 4. JEFFERSÒNIA Bart.

Glabrous herbs, with basal palmately-veined or palmately-lobed leaves, and solitary white flowers on slender scapes. Sepals 4, petaloid, caducous. Petals 8, flat, longer than the sepals. Stamens 8; anthers dehiscent by valves. Pistil i, many-ovuled. Capsule leathery, pyriform, half-circumscissile near the summit. Seeds oblong, arillate. [In honor of Thomas Jefferson.] Two species, one of eastern N. Am., the other of Mantchuria.
I. Jeffersonia diphýlla (L.) Pers. Twin-leaf. (I. F. f. 1645.) Scape erect, I.5-2 dm. high when in flower, attaining 4-4.5 dm. in fruit. Leaves glaucous beneath, long-petioled, cordate or reniform, $7-15 \mathrm{~cm}$. long, $5-10 \mathrm{~cm}$. wide, parted longitudinally into 2 obliquely ovate obtuse lobed or entire divisions; flowers about 2.5 cm . broad; petals oblong; stigma peltate, undulate; capsule about 2.5 cm . long, short-stipitate. In woods, Ont. to Wis., Va. and Tenn. May.

## 5. PODOPHÝLLUM L.

Erect herbs, with horizontal poisonous rootstocks, large peltate palmately lobed leaves, and solitary white flowers. Sepals 6, petaloid, fugacious. Petals 9-6, flat, obovate, longer than the sepals. Stamens as many or twice as many as the petals; anthers linear, longitudinally dehiscent. Pistil I (rarely several). many-ovuled, forming a large fleshy berry in fruit. Seeds numerous, obovate, enclosed in fleshy arils. [Greek, duck-foot leaf.] About 4 species, one of eastern N. Am., the others Asiatic.
r. Podophyllum peltàtum L. May Apple. Wild Mandrake. (I. F. f. 1646.) Erect, 3-4 dm. high. Basal leaves centrally peltate, nearly 3 dm . in diameter, long petioled, deeply 5-7-lobed, glabrous, or pubescent on the lower surface; lobes 2 -cleft and dentate at the apex; flowering stems bearing $\mathbf{I}-3$ similar leaves, or occasionally leafless; flower stout-peduncled, nodding. 5 cm . broad. appearing from the base of the upper leaf and generally from immediately between the two leaves; fruit ovoid, yellowish 5 cm . long, edible. In low woods, Quebec and Ont, to Minn., Fla., La. and Tex. May.

## Family 7. MENISPERMÀCEAE DC.

## Moonseed Family.

Vines with alternate entire or lobed leaves, no stipules, and small diœecious panicled racemose or cymose flowers. Sepals 4-12. Petals 6, imbricated in 2 rows, sometimes fewer, or none. Stamens about the same number as the petals. Carpels $3-\infty$ (generally 6 ), 1 -ovuled separate ; styles commonly recurved. Fruit drupaceous. Embryo long, curved. About 55 genera and 150 species, mainly of tropical distribution, a few extending into the temperate zones.

Petals none.
Petals present.
Stamens 6; drupe red.
Stamens 12-many ; drupe black.

1. Calycocarpum.
2. Cebatha.
3. Menispermum.

## 1. CALYCOCARPUM Nutt.

Leaves large, petioled, palmately lobed. Flowers greenish in long narrow drooping panicles. Sepals 6, oblong, obtuse. Stamens about 12, nearly equalling the sepals; anthers 2 -celled. Pistils 3 ; stigma laciniate. Drupe oval, the stone flattened and hollowed out on one side. [Greek, cup-fruit, in allusion to the cuplike stone.] A monotypic genus of eastern N. Am.
I. Calycocarpum Lỳni (Pursh) Nutt. Cup-seed. (I. F. f. I647.) Climbing to the tops of trees, glabrous or slightly pubescent. Leaves thin, broadly ovate or nearly orbicular in outline, $\mathbf{1 - 2}$ dm. long, cordate with a broad sinus, 5-7-lobed, glabrous above, more or less pubescent on the veins beneath; lobes ovate or oblong, acute or acuminate, repand, dentate or entire; panicles axillary, $\mathrm{r}-2.5 \mathrm{dm}$. long; flowers 4 mm . broad; drupe nearly 2.5 cm . long, tlack, the stone toothed or erose along the margin of its lateral cavity; pistillate flowers sometimes containing abortive stamens. In rich woods, Ill. to Mo., Kans., Fla. and Tex. May-June, the fruit ripe in August.

## 2. CÉBATHA Forsk.

Flowers small, diœcious, panicled. Sepals 6, in two series. Petals 6, shorter than the sepals, concave. Stamens 6; anthers 4 -celled or 4 -lobed. Pistils 3-6, sometimes accompanied by sterile filaments; styles erect; stigma entire. Drupe globose or ovoid, the stone flattened, curved. [Name Arabic.] About io species, mainly of tropical regions, two or three in the temperate zones.
I. Cebatha Carolina (L.) Britton. Carolina Moonseed. (I. F. f. 1648.) Trailing or climbing, the stem glabrous or pubescent. Leaves broadly ovate, 5-10 cm . long, cordate or rounded at the base, entire or lobed, sometimes densely pubescent beneath, mainly glabrous above; petioles $2-10 \mathrm{~cm}$. iong; panicles loose, $2-13 \mathrm{~cm}$. long; flowers about 2 mm . broad; drupe red, laterally flattened, $4-6 \mathrm{~mm}$. in diameter, the stone curved into a closed spiral, crested on the sides and back. Along streams, Va. to Ill., Kans., Fla. and Tex. June-Aug.

## 3. MENISPÉRMUM L.

Flowers small, panicled. Sepals $4-8$, in two series, longer than the $6-8$ petals. Stamens 12-24. Anthers 4 -celled. Pistils 2-4, on a slightly elevated receptacle, generally accompanied by 6 sterile filaments. Drupe nearly globular, or ovoid, laterally flattened, the stone curved into a spiral and crested on the sides and back. [Greek, moonseed.] Two species, one of eastern N. Am., the other of eastern Asia.
I. Menispermum Canadénse L. Canada Moonseed. (I. F. f. 1649.) Stem slender, slightly pubescent, or glabrous. Leaves slender-petioled, broadly ovate, $\mathrm{I}-2 \mathrm{dm}$. wide, cordate or sometimes nearly truncate at base, entire, or with 3-7 lobes, pale beneath, peltate near the base; flowers greenish white, 4 mm . wide: panicles loose, bracteolate; drupe bluish black. globose-oblong, $6-8 \mathrm{~mm}$. in diameter. In woods, Quebec to Manitoba, Ga, and Ark. June-July.

## Family 8. CALYCANTHACEAE Lindl.

Strawberry-shrub Family.
Shrubs, with opposite entire short-petioled leaves, no stipules, and terminal solitary large flowers on leafy branches. Sepals and petals imbricated in many series. Stamens $\infty$, the inner sterile, short, inserted on the receptacle; anthers innate. Pistils $\infty$, nearly enclosed in the hollow receptacle; ovules i or 2 , anatropous. Fruit accessory, consisting of the enlarged ovoid oblong or pyriform receptacle, to which the bases of petals, sepals and bracts are adnate, enclosing few to many smooth shining achenes. Seed erect ; cotyledons foliaceous, convolute. A family of 2 genera and about 5 species, natives of N. Am. and eastern Asia.

## I. BUTNERIA Duham.

Stamens inserted in several rows. Flowers purple or red. Otherwise as in the family. [Name in honor of Butner or Buettner.] The genus comprises 3 species, one additional to those here described occurring on the Pacific Coast. Chimonanthus Lindl. of Japan and China comprises 2 species.
Leaves pubescent beneath; flowers fragrant. I. B. forida. Leaves green, often glaucous beneath, smooth or rough above; flowers not fragrant.
2. B. fertilis.
x. Butneria flórida (L.) Kearney. Hairy Strawberry-shrub. (I. F. f. 1650.) A branching shrub, $1-3 \mathrm{~m}$. high, the branchlets and petioles pubescent. Leaves ovate or oval, rough above; flowers dark purple, about 2.5 cm . broad, with a strong odor of strawberries when crushed; sepals and petals linear or oblong, 12-16 mm. long. In rich soil, Va. (?), N. Car. to Ga., Ala. and Miss. April-Aug.
2. Butneria fértilis (Walt.) Kearney. Smooth Strawberry-shrub. (I. F. f. 1651.) Branchlets and petioles glabrous or nearly so. Leaves ovate, ovate-lanceolate or oblong-lanceolate, acute or acuminate, rough and dark green above, glaucous and sometimes slightly pubescent beneath or bright green and smooth on both sides; sepals and petals linear or linear-lanceolate, acute; flowers greenishpurple, inodorous. In rich woods, Penn. to N. Car., Tenn. and Ga. March-Aug.

## Family 9. LAURÀCEAE Lindl.

## Laural Family.

Aromatic trees and shrubs, with alternate (very rarely opposite) mostly thick, punctate exstipulate leaves. Flowers small, perfect, polygamous, diœcious, or sometimes monœcious, usually fragrant, yellow or greenish, in panicles, corymbs, racemes or umbles. Calyx 4-6-parted, the segments imbricated in 2 series in the bud. Corolla none. Stamens inserted in 3 or 4 series of 3 on the calyx, distinct, some of them commonly imperfect or reduced to staminodia; anthers opening by valves. Ovary superior, free from the calyx, i-celled; ovule solitary, anatropous, pendulous; stigma discoid or capitate. Fruit a I-seeded drupe or berry. Endosperm none. Cotyledons plano-convex, accumbent. About 40 genera and 900 species, widely distributed in tropical regions; a few in the temperate zones.
Flowers perfect, panicled, not involucrate : leaves evergreen. Persea.
Flowers mostly diocious, racemose or umbellate, involucrate ; leaves deciduous. Flowers mostly diocious, racemose or umbellate, involucrate ; leaves deciduous.

Anthers 4-celled.
Flowers in umbelled racemes : leaves, or some of them, lobed. 2. Sassafras.
Flowers in capitate umbels ; leaves all entire. 3. Malapoenna.
Anthers 2 -celled; leaves entire. 4. Bensoin.

## r. PÉRSEA Gaertn. f.

Leaves alternate, coriacenus, persistent entire. Calyx 6-parted, persistent. Stamens 12, in 4 serjes of 3 , the inner series reduced to gland-like staminodia, the

3 other series anther-bearing, their anthers 4 -celled, 4 -valved, those of the third series extrorse and the others introrse in our species. Staminodia large, cordate, stalked. Fruit a berry. [Ancient name of some oriental tree.] About 50 species, natives of America. Besides the following another occurs in Fla.

Twigs and petioles puberulent or nearly glabrous.

1. P. Borbonia.

Twigs and petioles densely tomentose.
2. F. pubescens.
I. Persea Borbònia (L.) Spreng. Red Bay. Isabella-wood. (I. F. f. I652.) A tree, with dark red bark. Leaves lanceolate, oblong or oblong-lanceolate, bright green above, paler beneath, glabrous when mature, $2-5 \mathrm{~cm}$. wide, obscurely veined, narrowed at the base; petioles $1-2.5 \mathrm{~cm}$. long; peduncles short, axillary, often little longer than the petioles, bearing few-flowered panicles; calyx puberulent, spreading in fruit, its inner segments longer than the outer; berries dark blue, about $\mathbf{I}_{2}$ mm . in diameter, their pedicels thick, red. Along streams and borders of swamps, Del. (?), Va. to Fla., Tex. and Ark. April-June. Fruit ripe Aug.-Sept.
2. Persea pubéscens (Pursh) Sarg. Swamp Bay. (I. F. f. 1653.) Bark brown ; leaves oval, oblong or lanceolate, glabrous and shining above when mature, pubescent beneath or also tomentose on the veins, strongly veined, $\mathrm{I}-4 \mathrm{~cm}$. wide; petioles $0.8-\mathbf{1} .6 \mathrm{~cm}$. long ; peduncles tomentose, mostly longer than the petioles, sometimes $5-8 \mathrm{~cm}$. long; calyx tomentose, its inner segments longer than the outer; berry dark blue, $12-18 \mathrm{~mm}$. in diameter. In swamps and along streams, S. Va. to Fla. and Miss. May-July. Fruit ripe Sept.

## 2. SÁSSAFRAS Nees \& Eberm.

A rough-barked tree, with broad entire or 2-6-lobed leaves, and yellow diœcious flowers in involucrate umbelled racemes at the ends of twigs of the preceding season, unfolding with or before the leaves, the involucre composed of the persistent bud-scales. Calyx 6 -parted, that of the pistillate flowers persistent, its segments equal. Staminate flowers with 3 series of 3 stamens, the 2 outer series with glandless filaments, those of the inner series with a pair of stalked glands at the base. Anthers introrse, 4 -valved. Pistillate flowers with about 6 staminodia and an ovoid ovary. Fruit an oblong-globose blue drupe. [The popular Spanish name.] A monotypic genus of eastern N. Am.
I. Sassafras Sássafras (L.) Karst. Sassafras or Ague Tree. (I. F. f. 1654.) A tree sometimes 40 m . high, the twigs and leaves mucilaginous, pubescent when young but becoming glabrous. Leaves oval or often as wide as long, membranous, pinnately veined, petioled; racemes several or numerous in the umbels, peduncled; flowers about 6 mm . broad; stamens about equalling the calyx-segments; fruiting pedicels red, much thickened below the calyx; drupe nearly 1.2 cm . high. In dry soil, Me. to Ont., Mich., Fla. and Tex. April-May. Fruit ripe July-Aug.

## 3. MALAPOENNA Adans.

Leaves entire, deciduous in our species. Flowers small. greenish or yellow, in umbels or almost capitate, involucrate by the bud-scales. axillary, or in the following species unfolding before the leaves at the nodes of twigs of the previous season. Calyx 6-parted, deciduous. Staminate flowers much as in Sassafras, bearing 3 series of 3 stamens, their anthers all 4-celled, 4 -valved and introrse. Pistillate flowers with 9 or 12 staminodia and a globose or oval ovary. Fruit a small drupe. [Malabar name.] About 100 species, natives of tropical and warm regions of both the Old World and the New, only the following known in N. Am.

1. Malapoenna geniculàta (Walt.) Coulter. Pond Spice. (I. F. f. 1655) A much-branched shrub, with terete smooth zigzag twigs. Leaves oblong, firm, $1-5 \mathrm{~cm}$. long, $6-13 \mathrm{~mm}$. wide, narrowed at the base, glabrous above, paler and puberulent, at least on the veins, beneath, or quite glabrous when mature; umbels $2-4$-flowered, sessile; involucres of $2-4$ scales; flowers yellow, less than 4 mm . broad; drupe globose. red. about 6 mm . in diameter. In swamps and wet soil, S Va. to Fla. March-April.

## 4. BÉNZOIN Fabric.

Leaves alternate, pinnately veined and in our species deciduous. Flowers ciœcious or polygamous, yellow, in lateral sessile involucrate clusters unfolding
before the leaves, the involucre of 4 deciduous scales. Calyx-segments 6, equal, deciduous. Staminate flowers with 3 series of 3 stamens, the filaments of the inner series lobed and gland-bearing at the base, those of the two outer series glandless; anthers introrse, 2.valved. Pistillate flowers with 12-15 staminodia and a globose ovary. Fruit a red drupe. [Named from Benzoin gum, from its similar fragrance.] About 7 species, of eastern N. Am. and Asia. Only the following are North American.
Shrub glabrous or nearly so throughout; leaves narrowed at the base.

1. B. Benzoin.

Twigs and lower surfaces of the leaves pubescent; leaves rounded or subcordate at the base.

2. B. melissaefolium.

I. Benzoin Bénzoin (L.) Coulter. Spice-bush. Benjamin-bush. (I. F. f. 1656.) A shrub, I-7 m. high, with smooth bark. Leaves obovate, oval or elliptic, $5-13 \mathrm{~cm}$. long, 2-6 cm. wide, or those of shoots much larger, acute, short-acuminate or some of them rounded at the apex, narrowed at the base; petioles $6-12 \mathrm{~mm}$. long; flowers about 3 mm . broad, fragrant; pedicels about equalling the calyxsegments; ovary about as long as the style; drupe $8-10 \mathrm{~mm}$. long, about 6 mm . in diameter. In moist woods, thickets and along streams, Me. to Ont., Mich., N. Car., Tenn. and Kans. March-May. Fruit ripe Aug.-Sept.
2. Benzoin melissaefolium (Walt.) Nees. Hairy Spice-bush. (I. F. f. 1657.) Similar to the preceding, but the young twigs, buds and lower surfaces of the leaves densely pubescent. Leaves ovate-lanceolate or oblong, acute or acuminate at the apex, rounded or subcordate at the base, $5-10 \mathrm{~cm}$. long, $1.5-3.6$ cm . wide; petioles $2-6 \mathrm{~mm}$. long; pedicels equalling or slightly longer than the calyx-segments; drupe $6-10 \mathrm{~mm}$. high. In swamps and wet soil, Ill. and Mo. to N. Car., Ala. and Fla. Feb.-March.

## Order 15. PAPAVERÀLES.

Mostly herbs, with clustered, regular and perfect flowers. Petals, with very rare exceptions, present, separate. Sepals usually separate. Stamens hypogynous. Ovary superior, free from the calyx, compound, composed of two united carpels, or more.

Sepals 2 (very rarely 3 or 4); endosperm fleshy.
Fam. 1. Papaveraceae.
Sepals or calyx-segments 4-8; endosperm none.
Capsule 2 -celled by a longitudinal partition, usually 2 -valved, rarely indehiscent ; sepals and petals 4.

Fam. 2. Cruciferae.
Capsule 1-celled, of 2-6 carpels.
Sepals and petals 4 , regular, or petals irregular ; capsule of 2 carpels, 2 -valved.
Fam. 3. Capparidaceae.
Sepals and petals $4^{-8}$, irregular ; capsule of $3^{-6}$ carpels, $3^{-6}$ valved at the top ; disk large.

Fam. 4. Resedaceae.

## Family I. PAPAVERACEAE B. Juss.

## Poppy Family.

Herbs, with milky or colored sap, and alternate leaves or the upper rarely opposite. Stipules none. Flowers perfect, regular or irregular. Sepals 2 (rarely 3 or 4 ), caducous. Petals $4-6$ or rarely more, imbricated, often wrinkled, deciduous. Stamens hypogynous, distinct; filaments filiform; anthers longitudinally dehiscent. Ovary I, many-ovuled, mainly i-celled; style short; ovules anatropous. Fruit a capsule, generally dehiscent by a pore, or by values, rarely indehiscent. About 26 genera and 200 species, widely distributed, most abundant in the north temperate zone.

## * Fiowers regular.

Pod dehiscent at the top, or only to the middle.
Leaves not spiny-toothed. . I. Papaver.
Leaves spiny-toothed. - 2. Argemone.
Pod dehiscent to the base.
Flowers white; juice red.
Flowers and juice yellow.
Capsule oblong or short-linear, bristly.
Capsule long-linear, rough, tipped with a dilated stigma: 4. 5. Glaucium.
Capsule linear, smooth, tipped with a subulate style and minute stigma.
6. Chelidonium.
** Flowers irregular. Family Fumariaceae DC.
Each of the 2 outer petals spurred at the base.
Corolla deeply cordate at base; petals slightiy coherent. 7. Bicuculla.
Corolla rounded or slightly cordate; petals permanently coherent, persistent.
8. Adlumia.

One of the outer petals spurred at base.
Capsule 2-valved, few-several-seeded. 9. Capnoides.
Fruit globose, indehiscent, 1 -seeded.
10. Fumaria.

## I. PAPAVVER L.

Sap milky. Leaves lobed or dissected, alternate. Flowers and flower-buds nodding. Sepals 2 or occasionally 3. Petals $4-6$. Stamens $\infty$. Anthers extrorse. Ovules $\infty$, borne on numerous internally-projecting placentae. Stigmas united into a radiate persistent disk. Capsule globose, obovoid, or oblong, dehiscent near the summit. Seeds marked with minute depressions. [Classic Latin name of the poppy.] About 25 species, mostiy natives of the Old World, but 2 or 3 indigenous in western America.
Glabrate and glaucous; leaves lobed, clasping; capsule subglobose.

1. P. somniferum.

Green, hirsute; leaves pinnately divided.
Stems branching, leafy; weeds of waste or cultivated ground.
Capsule glabrous.
Capsule subglobose or top-shaped. 2. P. Rhoeas.
Capsule oblong, narrowed below. Capsule oblong, hispid with a few erect hairs.
4. P. Argemone.

Leaves all basal ; capsule obovoid, densely hispid with erect hairs; arctic.
5. P. alpinum.
I. Papaver somníferum L. Opium or Garden Poppy. (I. F. f. 1658.) Erect, glaucous, 3-9 dm. high. Leaves clasping by a cordate base, I-2 dm. long, oblong, wavy, lobed or toothed; flowers $7-10 \mathrm{~cm}$. broad, bluish-white with a purple centre; filaments somewhat dilated upward; capsule glabrous. Occasional in waste grounds and on ballast. Fugitive from Europe. Summer.
2. Papaver Rhoèas L. Field, Red or Corn Poppy. (I. F.f. i659.) Erect, 3-9 dm. high, hispid with spreading bristly hairs. Lower leaves petioled, I-I.5 dm. long, the upper smaller, sessile, all pinnatifid; lobes lanceolate, acute, serrate; flowers $5-10 \mathrm{~cm}$. broad, scarlet with a darker centre; filaments not dilated; capsule glabrous, the disk with 10 or more stigmatic rays. In waste places and on ballast, Me . to Va. Fugitive from Europe. Summer.
3. Papaver dùbium L. Long Snooth-fruited Poppy. (I. F. f. r66o.) Slender, $3^{-6} \mathrm{dm}$. high. hirsute with spreading hairs. Lower leaves petioled, I-I. 5 dm . long, the upper smaller, nearly sessile, all deeply pinnately divided; lobes oblong, pinnatifid, cleft or sometimes entire; flowers 5 cm . broad, scarlet, sometimes darker in the centre; filaments not dilated; capsule oblong, glabrous, I. $6-2 \mathrm{~cm}$. long, narrowed below; stigmatic rays $6-10$. In waste and cultivated grounds. Penn. to Va. and southward. Adventive from Europe. Summer.
4. Papaver Argemòne L. Pale or LoNg Rough-fruited Poppy. (I. F. f. 166 r .) Slender, 3-6 dm. high. Leaves all but the upper petioled. lanceolate in outline, pinnately divided, the divisions pinnatifid and toothed; flowers $2-5 \mathrm{~cm}$. broad, pale red, often with a darker centre; filaments not dilated; capsule oblong, I. $\overline{-}-2 \mathrm{~cm}$. long, narrowed at the base, bristly hairy. Waste grounds, Philadelphia, and in ballast about the seaports. Fugitive from Europe. Summer. Old name Wind-rose.
5. Papaver alpinnum L. Arctic Poppy. (I. F. f. 1662.) Perennial, more or less hirsute. Leaves all basal, pinnately lobed or cleft, the lobes linear-oblong; scape erect, slender, o.5-3 dm. tall, much exceeding the leaves; flower solitary, $2-8 \mathrm{~cm}$. broad, yellow or red; filaments filiform; capsule narrowly obovoid, $\mathbf{1}-\mathbf{1} .6$ cm . high, about 8 mm . in greatest diameter, densely beset with erect bristly hairs. Greenland and Lab. to Alaska and Br. Col. Also in Europe and Asia. Summer.

## 2. ARGEMONE L.

Glaucous herbs, with yellow sap, spiny-toothed leaves and large flowers. Sepals 2 or 3. Petals 4-6. Stamens $\infty$. Placentae 4-6, many-ovuled. Style very short. Stigma dilated, 3-6-radiate. Capsule prickly, oblong, dehiscent at the apex by valves. Seeds numerous, cancellate. [Greek, an eye disease, supposed to be relieved by the plant so called.] A genus of about 10 species, natives of the warmer parts of America.
Petals yellow or ochroleucous. I. A. Mexicana.
Petals white or pinkish.
Stem spiny or unarmed, not hispid-pubescent.
Horns of the sepals nearly erect, the terminal spine $\mathbf{x - 1 . 5 ~ m m . ~ l o n g ; ~ f l o w e r s ~}$ peduncled. 2. A. alba.

Horns of the sepals diverging, the terminal spine $2-4 \mathrm{~mm}$. long ; flowers usually sessile.
Stem spiny and also hispid-pubescent.
3. A. intermedia.
I. Argemone Mexicàna L. Mexican or Prickly Poppy. (I. F. f. 1663.) Stem 3-6 dm. high, spiny or sometimes nearly unarmed. Leaves sessile, clasping by a narrowed base, $\mathbf{1}-2.5 \mathrm{dm}$. long, glaucous, runcinate-pinnatifid, spiny-toothed and more or less spiny on the veins; flowers orange or yellow, sessile or subsessile, $2-8 \mathrm{~cm}$. broad; sepals acuminate, bristly-pointed; capsule 2.5 cm . long or more; stigma sessile. In waste places, N. J. and Penn. to Fla. and Tex. Also in ballast about the northern seaports. Adventive from tropical America. June-Sept.

Argemone Mexicana ochroleùca Lindl. Flowers ochroleucous ; style distinct. Occasional with the type.
2. Argemone álba Lestib. White Prickly Poppy. (I. F. f. 1664.) Similar to the preceding species, but commonly stouter and taller. Leaves pinnatifid or pinnately lobed, sometimes whitish along the veins; flowers white, usually larger, $7-10 \mathrm{~cm}$. broad, distinctly peduncled; petals generally cuneate-obovate; terminal spine of the nearly erect, flattened sepal-tips, $\mathbf{I} \mathbf{- 1 . 5} \mathbf{~ m m}$. long; capsules oval-ellipsoid, $2.5-4 \mathrm{~cm}$. long. Fla. to Mo. and Tex. May-Aug.
3. Argemone intermédia Sweet. Leafy, the flowers usually sessile or nearly so. Petals broadly obovate, often as wide as long; horns of the sepals pyramidal, not much flattened, diverging, the terminal spine $2-4 \mathrm{~mm}$. long; capsule cylindricellipsoid. Plains, S. Dak. to Idaho, Tex. and Mex. May-Aug.
4. Argemone híspida A. Gray. Plant spiny, and also densely hispid-pubescent. Petals obovate; horns of the sepals triangular-lanceolate, more or less spiny and hispid. Kans, to N. Mex, and Cal.

## 3. SANGUINÀRIA L.

Rootstock horizontal, thick ; juice red. Leaves basal, palmately veined and lobed, cordate or reniform. Scape 1 -flowered (rarely 2). Flower white. Sepals 2, fugacious. Petals $8-12$, arranged in 2 or 3 rows. Stamens $\infty$. Stigmas grooved. Placentae 2. Capsule oblong, dehiscent to the base, the valves persistent. Seeds smooth, crested. [Name from the red juice.] A monotypic genus of eastern N. Am.
I. Sanguinaria Canadénsis L. Bloodroot. (I. F. f. 1605.) Glabrous, glaucous, especially when young. Rootstock several inches long. clothed with thick fibrous roots; petioles $1.5-3.5 \mathrm{dm}$. long; leaves I.5-3 dm. broad, I-2 dm. long, palmately $5-0$-lobed, the lobes repand, or cleft at the apex; flower $2.5-+\mathrm{cm}$. broad; petals oblong or obovate, early deciduous; capsule oblong, narrow, i-celled. 2 -valved, $2-3 \mathrm{~cm}$. long. In rich woods, N. S. to Manitobra. Neh., Fla. and Ark. April-May.

## 4. STYLÓPHORUM Nutt.

Herbs, with stout rootstocks, yellow sap, pinnatifid leaves and clustered or solitary flowers. Sepals 2. Petals 4. Stamens $\infty$. Placentae 2-4; stigma 2-4lobed, radiate. Capsule dehiscent to the base. Seeds cancellate, crested. [Name Greek, style-bearing.] About 4 species, natives of eastern N. Am. and Asia.
I. Stylophorum diphýllum (Michx.) Nutt. Yellow or Celandine Poppy. (I. F. f. 1666.) Glaucous, especially the lower surfaces of the leaves, sparingly pubescent, $3-4.5 \mathrm{dm}$. high. Leaves $\mathrm{I}-2.5 \mathrm{dm}$. long, slender-petioled, I-2-pinnatifid, the divisions obovate, obtuse, lobed or irregularly crenate, those of the stem $2-4$, the upper opposite; flowers $2-4$, terminal, about 2.5 cm . broad, deep yellow; sepals hirsute, caducous; petals obovate, rounded; capsule 2.5 cm . long, ovoid, acute at each end, hirsute, tipped with the persistent style. In low woods, western Penn. (?), Ohio to Tenn., Wis. and Mo. March-May.

## 5. GLAÙCIUM Juss.

Glaucous herbs, with alternate lobed or dissected leaves, and saffron-colored sap. Sepals 2. Petals 4. Stamens $\infty$. Placentae 2, rarely 3; stigma sessile, dilated, 2 -lobed, the lobes convex. Capsule long-linear, 2 -celled, dehiscent to the base. Seeds cancellate, crestless. [Name Greek, from the glaucous foliage.] About 6 species, natives of the Old World.
I. Glaucium Glaùcium (L.) Karst. Vellow Horned or Sea Poppy. (I. F. f. 1667.) Stout, 6-9 dm. high. Leaves thick, ovate or oblong, o.7-2 dm. long, scurfy, the lower petioled, the upper sessile, clasping, all pinnatifid, the divisions toothed; flowers axillary and terminal, yellow, $2-5 \mathrm{~cm}$. broad; capsule narrowly linear, $1.5-3 \mathrm{dm}$. long, tipped with the persistent stigma. In waste places, R. I. to Va. Adventive from Europe. Summer.

## 6. CHELIDÒNIUM L.

Erect branching herbs, with alternate, deeply pinnatifid leaves, yellow sap and yellow flowers. Sepals 2. Petals 4. Stamens $\infty$. Placentae 2. Styles distinct; stigma not dilated, 2-lobed. Capsule linear, dehiscent to the base. Seeds smooth, shining, crested. [Name Greek for the swallow.] A monotypic genus of Europe and Asia.
I. Chelidonium màjus L. Celandine. (I. F. f. 1668.) Weak, 3-6 dm. high, sparingly pubescent. Leaves thin, I-2 dm. long, glaucous beneath, I-2pinnatifid, the segments ovate or obovate, crenate or lobed; petioles often dilated at the base; flowers $12-16 \mathrm{~mm}$. broad, in axillary pedunculate umbels; petals rounded; pedicels slender, elongating in fruit; capsule glabrous, $2-5 \mathrm{~cm}$. long, tipped with the persistent style and stigma. Waste places, roadsides and woods, common in the East. Nat. or adventive from Europe. Summer. April-Sept.

## 7. BICUCULLA Adans.

Herbs, with dissected leaves, and clustered irregular flowers. Pedicels 2bracted. Sepals 2, scale-like. Corolla cordate at base ; petals 4, in 2 pairs, connivent, slightly coherent, the exterior pair oblong, concave, spurred at the base, spreading at the apex, the inner narrow, clawed, coherent above, crested or winged on the back. Stamens 6, in two sets placed opposite the outer petals; filaments more or less diadelphous. Placentae 2; style slender; stigma 2-4-lobed. Capsule oblong or linear, dehiscent to the base by 2 valves. Seeds crested. [Name from the Latin, double-hooded.] About 14 species, natives of N. Am. and western Asia.
Raceme simple; flowers white or whitish.

Spurs divergent ; inner petals minutely crested.
Spurs short, rounded; inner petals conspicuously crested.
Raceme compound; flowers deep pink.
I. B. Cucullaria.
2. B. Canadensis.
3. B. eximia.
r. Bicuculla Cucullària (L.) Millsp. Dutchman's Breeches. Soldier's CAP. (I. F. f. 1669 .) Delicate, glabrous, $1-2.5 \mathrm{dm}$. high, from a bulbous base. Leaves basal, pale beneath, slender-petioled, ternately compound, the divisions stalked and dissected into linear or oblanceolate segments; scape slender; raceme secund, 4-10-flowered; flowers nodding, pedicelled, $12-16 \mathrm{~mm}$. long, $6-20 \mathrm{~mm}$.
broad at the base, white, or faintly pink, yellow at the summit; spurs widely divergent. In woods, N. S. to Minn., Wash., N. Car., Neb. and Mo. April-May.
2. Bicuculla Canadénsis (Goldie) Millsp. Squirrel Corn. (I. F. f. 1670.) Similar, the rootstock bearing numerous small tubers. Leaves decidedly glaucous beneath; flowers nodding, short-pedicelled, $14-18 \mathrm{~mm}$. long, 10 mm . broad at the base, greenish white, purplish tinged, slightly fragrant; spurs short, rounded. In rich woods, N. S. to Minn., Va., Ky., Neb. and Mo. May-June.
3. Bicuculla exímia (Ker) Millsp. Wild Bleeding-heart. (I. F. f. I671.) Glabrous, somewhat glaucous, 3-6 dm. high; rootstock scaly. Leaves larger than those of the preceding species, ternately parted, the divisions stalked, finely pinnatifid into oblong or ovate segments; scape slender, about equalling the leaves; raceme compound; flowers clustered in cymes, slender-pedicelled, pink, nodding, 16-20 mm . long, $6-8 \mathrm{~mm}$. broad at the base; spurs short, rounded, incurved; outer petals spreading at the apex. In rocky places, W. N. Y. to Ga. and Tenn. May-Sept.

## 8. ADLÙMIA Raf.

A glabrous climbing vine, with decompound leaves. Sepals 2, scale-like. Petals 4, permanently united into a narrowly ovate cordate persistent spongy corolla 4-lobed at the apex. Stamens 6, monadelphous below, diadelphous above, adherent to the petals. Capsule oblong, included in the persistent corolla. Seeds crestless. Closely'related to certain Asiatic species of Bicuculla. [In honor of John Adlum, a gardener of Washington.] A monotypic genus of eastern N. Am.
r. Adlumia fungòsa (Ait.) Greene. Climbing Fumitory. Alleghany Vine. (I. F. f. 1672.) Weak, slender, climbing by slender petioles. Leaves bipinnate, the divisions slender-stalked; ultimate segments lobed or entire, very thin, ovate or cuneate, pale beneath; flowers numerous in axillary drooping cymes, ro- 14 mm . long, 6 mm . broad at the base, greenish purple; capsule 2 -valved, fewseeded. In moist woods and thickets, N. B. to Ont., N. Car. and Tenn. June-Oct.

## 9. CAPNOIDES Adans.

Herbs, with decompound leaves, and racemose flowers. Sepals 2, small. Corolla irregular, deciduous; petals 4, erect-connivent, one of the outer pair spurred at the base, the interior ones narrow, keeled on the back. Stamens 6, in 2 sets, opposite the outer petals. Placentae 2 ; style entire, dilated or lobed, persistent. Capsule linear or oblong, 2-valved. [Greek, smoke-like. in allusion to the smokelike odor of some species, as in Fumaria.] About 110 species, natives of the north temperate zone and South Africa.
Stems tall; flowers pink with yellow tips.

1. C. sempervirens.

Stems low, diffuse or ascending; flowers yellow.
Flowers 6-8 mm. long; spur short.
Seeds sharp-margined, wrinkled; pods drooping or spreading.
2. C. flavulum.

Seeds blunt-margined, smooth, shining; pods ascending. 3. C. micranthum.
Flowers $8-16 \mathrm{~mm}$. long ; spur conspicuous.
Pods smooth.
Seeds smooth or obscurely reticulated; pods spreading or pendulous. Capsules spreading or drooping, distinctly torulose ; eastern.
4. C. aureum.

Capsules ascending, terete or slightly torulose; western.
5. C. montanum.

Seeds finely reticulated; pods ascending.
Pods densely covered with transparent vesicles.
6. C. curvisiliqum.
7. C. crystallinum.
I. Capnoides sempérvirens (L.) Borck. Pink Corydalis. (l. F. f. 1673.) Glabrous, glaucous, 3-6 dm. high. Lower leaves 2-10 cm. long, short-petialed, the upper nearly sessile, pinnately decompound, the ultimate segments obovate or cuneate, toothed or entire, obtuse, often mucronulate; flowers numerous, $10-10 \mathrm{~mm}$. long, pink with a yellow tip; spur rounded, about 2 mm . long; capsules narrowly linear, erect, $2-5 \mathrm{~cm}$. long, nodose when mature ; seeds shining, minutely reticulated. In rocky places, N. S. to Alaska, N. Car. and Minn. April-sept.
2. Capnoides flávulum (Raf.) Kuntze. Pale Corydalis. (I. F. f. I674.) Slender, glabrous, diffuse or ascending, I.5-3.5 dm. high. Lower leaves petioled, the upper nearly sessile, all finely dissected into linear or oblong, sometimes cuneate, segments ; pedicels very slender; bracts conspicuous, broadly oblong, acute or acuminate, $4-8 \mathrm{~mm}$. long; spur I mm . long, rounded ; outer petals sharp-pointed; crest dentate ; pods torulose ; seeds sharp-margined, finely reticulated. In rocky woods, S. N. Y. to S. W. Ont., Minn., Va., Kans. and La. May-June.
3. Capnoides micránthum (Engelm.) Britton. Small-flowered Corydalis. (I. F. f. 1675.) Habit and foliage nearly as in the preceding, the ultimate leafsegments generally slightly broader. Flowers similar. the crest entire ; or sometimes cleistogamous and minute. spurless; pods ascending, short-pedicelled, torulose; seeds obtuse-margined, smooth, shining. In woods, Minn. to Mo., Kans., Tex., Va. and Fla. Feb.-April.
4. Capnoides àureum (Willd.) Kuntze. Golden Corydalis. (I. F. f. 1676.) Glabrous. $1-3.5 \mathrm{dm}$. high, diffuse. Leaves all but the uppermost petioled, finely dissected into oblong obovate or cuneate segments ; flowers 12 mm . long ; spur onehalf the length of the body of the corolla. or more, rounded ; outer petals keeled, not crested ; pedicels short, slender ; pods spreading or pendulous, torulose ; seeds obtuse-margined, shining, obscurely reticulated. In woods, N. S. to Minn., Penn. and Wis. March-May.
5. Capnoides montànum (Engelm.) Britton. Mountain Corydalis. (I. F. f. 1677.) Closely resembles C. aureum, but lighter green, and the leaves rather more finely divided. Flower-clusters spicate-racemose, the pedicels usually very short; flowers $12-16 \mathrm{~mm}$. long; spur of the corolla as long as its body, or less; capsules spreading or somewhat ascending; seeds sharp margined, shining or obscurely reticulated. In dry soil, S. Dak. to Kans., Tex., Ore. (?), Utah and Ariz. April-Aug.
6. Capnoides curvisıliqum (Engelm.) Kuntze. Curved-fruited CoryDalis. (I. F. f. 1678.) Similar to the two preceding species, often rather taller than either. Flowers spicate or spicate-racemose, about 16 mm . long. conspicuous; spur of the corolla conspicuous: pods curved upward, very short-pedicelled, stout, somewhat 4 -sided; seeds sharp-margined, finely murıculate. S. Dak. to Neb., Tex. and Chihuahua. April-June. The plant of our area is perhaps specifically distinct from the Texan type.
7. Capnoides crystállinum (Engelm.) Kuntze. Vesicular Corydalis. (I. F. f. 1679.) Erect or ascending, glabrous, 2-5 dm. high. Lower leaves slender-petioled, the upper sessile. all finely dissected into oblong or cuneate segments; pedicels stout, short, diverging; flowers spicate, 12-16 mm. long; spur $6-8 \mathrm{~mm}$. long; crest large, dentate; capsules 18 mm . long, ascending or erect. densely covered with transparent vesicles; seeds acute-margined, reticulated. Prairies, Mo., Kans. and Ark. April-June.

## io. FUMARIA L.

Herbs, with finely dissected leaves, and small racemose flowers. Sepals 2, scale-like. Petals 4, erect-connivent. the outer pair larger, I of them spurred, the inner narrow, coherent at the apex. keeled or crested on the back. Stamens 6, diadelphous. opposite the outer petals. Ovule I; style slender; stigma entire or lobed. Fruit I-seeded. nearly globose. indehiscent. [Name from the Latin. smoke, from the smoke-like smell of some species.] About 15 species, all natives of the Old World.
i. Fumaria officinàlis L. Fumitory. Hedge Fumitory. (I. F. f. i68o.) Glabrous; stems diffuse or ascending, I.5-9 dm. long. Leaves petioled, finely dissected into entire or lobed linear oblong or cuneate segments; racemes $2-8 \mathrm{~cm}$. long, narrow; pedicels $2-4 \mathrm{~mm}$. long, axillary to small bracts; flowers purplish, 4-6 mm. long, darker at the summit; spur rounded, 1 mm . long; nut 2 mm . in diameter, depressed-globose. In waste places and on ballast, N. S. to Fla. and the Gulf States, and locally in the interior. Fugitive or adventive from Europe. Summer.

Family 2. CRUCIFERAE B. Juss.

## Mustard Family.

Herbs, rarely somewhat woody, with watery acrid sap, alternate leaves, and racemose or corymbose flowers. Sepals 4, deciduous, or rarely persistent, the 2 outer narrow, the inner similar, or concave, or saccate at the base. Petals 4, hypogynous, cruciate, nearly equal, generally clawed. Stamens 6, hypogynous, tetradynamous, rarely fewer. Pistil I, compound, consisting of 2 united carpels, the parietal placentae united by a dissepiment; style generally persistent, sometimes none; stigma discoid or usually more or less 2-lobed. Fruit a silique or silicle, generally 2 -celled, rarely r-celled, in a few genera indehiscent. Seeds attached to both sides of the septum; endosperm none; cotyledons incumbent, accumbent or conduplicate. About 185 genera and 1500 species, of wide geographic distribution.

The following wholly artificial key is designed to apply only to the species and genera of our Flora. The natural alliances of the genera are largely based on minute characters. The family is also known as Brassicaceae.

* Pod a silique or silicle, dehiscent into two valves to the base.
$\dagger$ Pod an elongated-linear silique, or at least twice as long as wide. (See also species of No. 29.)
I. Silique borne on a long stipe.

1. Stanleya.
2. Silique terete, 4 -sided, or compressed, very short-stipitate, or sessile on the receptacle.
a. Silique tipped with the short slender style, or style none.

Seeds globose or oblong, wingless.
Seeds in 2 rows in each cell of the pod.
Pubescence, when present, of simple hairs. 17. Roripa.
Pubescence of forked hairs; leaves finely dissected.
30. Sophia.

Seeds in only I row in each cell.
Leaves auricled at the base; flowers violet. 17. Iodanthus.
Leaves reniform or cordate, undulate or repand; flowers white.
8. Alliaria.

Leaves dentate or pinnatifid; hairs simple; flowers yellow.
9. Sisymbrium.

Leaves finely dissected; pubescence of forked hairs; flowers yellow.
31. Sophia.

Leaves entire, or slightly toothed.
Stigma nearly entire, discoid; plant glabrous. 2. Thelypodium.
Stigma 2-lobed ; plants more or less pubescent.
Flowers white or pink.
Valves of the silique nerved.
Leaves dentate to pinnatifid. 9. Sisymbrium.
Leaves entire, cordate. 39. Conringia.
Valves of the silique nerveless, rounded
Flowers yellow. 34. Erysimum.
Flowers large, purple, purplish or white. .38. Hesperis.
Seeds flat, wingless or winged.
Siliques 4 -angled, the valves keeled; flowers yellow. 16. Barbarea.
Siliques flat or flattish.
Valves of the silique nerveless.
Seeds winged; stem scape-like; flowers few. 23. Leavenzuorthia. Seeds wingless; valves of the silique elastically dehiscent.

Stems leafy below or throughout. 19. Cardamine.
Stems leafless below, 2-4-leaved above. 20. Dentaria.
Valves of the silique 1 -nerved or veiny, not elastically dehiscent.
33. Arabis.
b. Silique produced into a beak beyond the valves.

Beak conic, very short in no. 13.
Silique terete; seeds in row. 13. Brassica.
Silique flat ; seeds in 2 rows. I4. Diplotaxis.
Beak flat, sword-shaped.
12. Sinapis.
3. Silique elliptic or oblong, very flat, $2-3$ times as long as broad, clearly stipitate.

Flowers violet ; funiculus of the seed adnate to the septum of the pod.
21. Lunaria.

Flowers yellow; funiculus of the seed free from the septum.
22. Selenia.
$\dagger \dagger$ Pod an orbicular globose or oblong silicle, or but little more than twice as iong as wide (except in some species of no. 29).
I. Silicle globose, or flattened parallel with the septum.
a. Plants terrestrial, or not strictly aquatic.

+ Silicle globose, or terete-oblong, little or not at all compressed.
Plants not maritime.
Petals not 2 -cleft.
Seeds minute, round, not flattened, in 2 rows in each cell.

18. Roripa.

Seeds flat ; silicle inflated; plants stellate-pubescent.

Petals 2-cleft.
Plants maritime, fleshy, northern.
++ Silicle didymous, its cells globose-inflated.
+++ Silicle compressed or flat, many-seeded.
2-8-seeded.
Flowers yellow. Flowers white.
++++ Silicle pear-shaped, or obovoid, many-seeded.
b. Wholly submersed small aquatic ; silicle globose or oblong.
2. Silicle flattened at right angles to the narrow septum.

Seeds several in each cell of the silicle.
Silicle triangular, obcuneate.
Silicle elliptic, wingless, its valves with a strong midvein.
Silicle oblong or orbicular, winged all around.
Seeds solitary in each cell, compressed.
** Pod indehiscent, short or elongated.
Pod broader than long, more or less didymous.
Pod globose, reticulated.
Pod elongated.
Pod of 2 joints, separating at maturity ; plants maritime.
Pod constricted between the seeds, not jointed, beaked:
Pod obcuneate to spatulate, flattened.
25. Lesquerella.
37. Berteroa.
7. Cochlearia.
24. Physaria.
30. Draba.
35. Alyssum.
36. Koniga.
28. Camelina.
3. Subularia.
27. Bursa.
26. Hutchinsia.
6. Thlaspi.
4. Lepidium.
5. Coronopus.
29. Neslia.
10. Cakile.
15. Raphanus.
II. Myagrum.
I. STÁNLEYA Nutt.

Glabrous and glaucous, perennial tall herbs, with large yellow bractless flowers in elongated terminal racemes. Sepals linear, narrow. Petals narrow, longclawed. Stamens 6, very nearly equal; anthers twisted. Ovary short-stipitate; style short or none. Siliques linear, long-stipitate, spreading or recurving, somewhat compressed, dehiscent, the valves with a strong midnerve. Seeds in I row in each cell, numerous, pendulous. Cotyledons straight, incumbent. [Named for Lord Edward Stanley, President of the Linnaean Society.] About 3 species, of western N. Am.
I. Stanleya pinnàta (Pursh) Britton. Stanleya. (I. F. f. I681.) Stems $0.6-\mathrm{I} .5 \mathrm{~m}$. tall, sometimes decumbent. Lower leaves pinnatifid or pinnately divided, or entire, I-2 dm. long, long-petioled; upper leaves similar, or less divided, or narrowly oblong or lanceolate, entire, short-petioled; petals $1.5-2.5 \mathrm{~cm}$. long; filaments filiform, exserted; siliques $5-8 \mathrm{~cm}$. long, about 2 mm . thick, $2-3$ times as long as their stipes, downwardly curved, somewhat constricted between the seeds when dry. In dry soil, S. Dak. and Neb. to Cal., N. Mex. and Ariz. May-July.

## 2. THELYPODIUM Endl.

Erect biennial or perennial herbs, with entire toothed or pinnatifid leaves, and racemose flowers. Siliques nearly terete, linear, with a short stipe in some species; valves I-nerved, dehiscent ; stigma nearly entire. Seeds in I row in each cell of the pod, oblong, marginless; cotyledons obliquely incumbent. [Greek, femalestalk, from the stiped ovary.] About 18 species, natives of N. Am.
I. Thelypodium integrifòlium (Nutt.) Endl. Entire-leaved Thelypodium. (I. F. f. 1682.) Glabrous, $0.9-1.8 \mathrm{~m}$. high. Leaves entire, thickish,
the basal and lower ones petioled, narrowly oval or oblong, $5-10 \mathrm{~cm}$. long, the upper sessile, linear, lanceolate or oblong-lanceolate, acute or acuminate; flowers pink, in short racemes; pedicels slender, $4-8 \mathrm{~mm}$. long.; petals obovate or spatulate, long-clawed ; pods about 2.5 cm . long and I mm. wide; stipe very short ; style slender, nearly 2 mm . long. Neb. and Wyo. to Ore., Utah and N. Mex. JulySept.

## 3. SUBULARIA L.

Small annual aquatic submersed herbs, with basal linear subulate leaves, and minute racemose white flowers. Silicles short-stipitate, oblong or elliptic, the valves convex, ribbed on the back. Stigma sessile, entire. Seeds few, in 2 rows in each cell, marginless. Cotyledons incumbent, curved above their base. [Latin awl, from the awl-shaped leaves.] A monotypic genus of the northern hemisphere.
I. Subularia aquática L. Water Awlwort. (I. F. f. 1683.) Tufted, glabrous, $2-10 \mathrm{~cm}$. high, growing in shallow water. Flowering scape simple, lateral; leaves nearly cylindric, $\mathbf{I}-3 \mathrm{~cm}$. long; flowers few, distant; pedicels slender, $2-6 \mathrm{~mm}$. long in fruit; pods $2-3 \mathrm{~mm}$. long. In clear, cold lakes, Newf. to Br. Col., Me., Vt. and Ont., south in the Rocky Mts. to Wyo., and to Cal. Also in Europe and Siberia. June-Sept.

## 4. LEPIDIUM L.

Erect or rarely diffuse herbs, with pinnatifid lobed or entire leaves and racemose white or whitish flowers. Stamens often fewer than 6. Petals short, sometimes none. Silicles oblong or obovate, flattened contrary to the partition, winged or wingless; valves keeled, dehiscent. Seeds solitary in each cell, flattened; cotyledons incumbent or rarely accumbent. [Greek, a little scale, from the flat scalelike pods.] About 65 species, widely distributed. In addition to the following, about 16 others occur in western N. Am.

| Stem-leaves clasping by an auriculate base. | 1. L. campestre. |
| :--- | :--- |
| Pods broadly ovate, winged. | 2. L. Draba. |
| Pods wingless, broader than long. | 3. L. ruderale. |

Pods slightly winged above, orbicular or oval, about 2 mm . broad; petals present or none.
Cotyledons accumbent; petals generally present, 4. L. Virginicum.
Cotyledons incumbent; petals minute or wanting. 5. L. apetalum.
Pods oblong, winged all around, longer than wide, about 4 mm . high.
6. L. sativum.

1. Lepidium campéstre (L.) R. Br. Field or Cow Cress. (I. F. f. 1684.) Annual or biennial, erect, $2-4.5 \mathrm{dm}$. high, branching above, hoary pubescent with scale-like hairs or rarely nearly glabrous. Basal leaves entire, or pinnatifid in the lower part, obtuse, petioled, $5-8 \mathrm{~cm}$. long; stem-leaves oblong or lanceolate, entire or slightly dentate, sessile, clasping ; flowers white or yellowish ; pedicels rather stout, spreading, $4-8 \mathrm{~mm}$. long in fruit ; pods forming dense elongated racemes, broadly ovate, slightly curved upward, broadly winged at the apex, notched. tipped with a minute style. In fields and waste places, N. S. and Ont. to Va., Kans.. and on the Pacific Coast, a bad weed in the Middle States. Nat. from Europe. May-July.
2. Lepidium Dràba L. Hoary Cress. (I. F. f. 1685.) Perennial, erect or ascending, $2-4.5 \mathrm{dm}$. high, hoary-pubescent. Leaves oblong or lanceolate-oblong. obtuse, slightly dentate or entire, $3-5 \mathrm{~cm}$. long, the lower petioled, the upper sessile and clasping; pedicels $6-12 \mathrm{~mm}$. long in fruit ; flowers white, about 4 mm . broad; pods broadly ovate, or cordate, 3 mm . long, in short racemes ; valves papillose. keeled, tipped with a style $\mathbf{1 - 2} \mathrm{mm}$. long. Near Astoria and Syracuse, N. V., and on ballast about the seaports. Also in Colo. and Cal. Fugitive from Furope. April-June.
3. Lepidium ruderàle L. Roadside Perper-grass. (I. F. f. 1686.) Annual, $\mathbf{1}$.5-4 dm. high, glabrous, wiry. Basal and lower leaves oblong in outline. 2-10 cm. long, 1-2-pinnatifid into linear or oblong ohtuse segments; upper leaves
smaller, entire or with a few lobes ; flowers I mm. broad or less, greenish ; petals none ; stamens 2 ; pods flat, not margined, about 2 mm . in length, short-oval or suborbicular; pedicels slender, $3-4 \mathrm{~mm}$. long in fruit; valves sharply keeled, barely winged ; cotyledons incumbent. In waste places, on ballast and along roadsides, N. S. to Tex. Nat. from Europe. Summer.
4. Lepidium Virgínicum L. Wild Pepper-Grass. (I. F. f. 1687.) Similar to L. ruderale. Basal leaves obovate or spatulate in outline, less pinnatifid, generally with a large terminal lobe and numerous small lateral ones, all dentate, glabrous or slightly pubescent; stem-leaves lanceolate or oblong-linear, sessile, or the lower stalked; flowers I-2 mm. broad, white ; petals generally present, sometimes wanting in the later flowers; pedicels slender, spreading, $4-6 \mathrm{~mm}$. long in fruit; pod flat, short-oval or orbicular, minutely winged above ; cotyledons accumbent. In fields and along roadsides, Quebec to Minn., Neb., Fla., Tex. and Mex. Also in the West Indies. May-Nov.
5. Lepidium apétalum Willd. Apetalous Pepper-grass. (I. F. f. 1688.) Much like L. ruderale and L. Virginicum. Basal leaves pinnatifid. Pods nearly orbicular, slightly wing-margined above, about 2 mm . in diameter; flowering pedicels ascending, forming narrow racemes, or in fruit spreading ; petals minute or wanting; cotyledons incumbent. In dry soil, Me. and Ont. to Cal., D. C. and Tex. Apparently nat. from Asia. May-Aug.

Lepidium mèdium Greene, with rather large white petals, orbicular pods, 3 mm . broad, and incumbent cotyledons, is found by Mr. Bicknell near New York city, and on Mt. Desert Island, Me. It is native of Western N. Am.
6. Lepidium satìvum L. Garden, Town, or Goldes Pepper-grass. (I. F. f. 1689.) Glabrous, bright green ; stem about 3 dm . high. Lower leaves 2 pinnate, or pinnate with the segments lobed or pinnatifid, o.7-2 dm. long; upper leaves sessile or nearly so, much smaller; flowers in loose elongated racemes, about 2 mm . broad; petals present, often pinkish ; silicles oval, about 2 mm . wide, equalling or longer than their pedicels, emarginate, winged all around; style very short. In waste places, Quebec to N. Y. and Br. Col. Escaped from gardens. Native of Europe. May-Aug.

## 5. CORÓNOPUS Gaertn.

Annual or biennial, diffuse herbs, with mostly pinnatifid leaves, and small whitish flowers. Silicles small, didymous, laterally compressed, sessile. Stamens often only 2 or 4 . Valves of the capsule oblong or subglobose, obtuse at each end, indehiscent. falling away from the septum at maturity. Seeds I in each cell; cotyledons narrow, incumbent or conduplicate. [Greek, crow-foot, from the shape of the leaves.] About 6 species, of wide distribution.
Pod rugose, not crested.

1. C. didymus.

Pod coarsely wrinkled, crested.
2. C. Coronopus.
I. Coronopus dídymus (L.) J. E. Smith. Lesser Wart-cress. (I. F. f. 1690.) Tufted, spreading on the ground, sparingly pubescent. Stems 0.5-4 dm. long; leaves deeply I-2-pinnatifid; flowers white. racemose ; pedicels slender, 2-3 mm . long in fruit ; pod about 2 mm . broad and slightly more than I mm. high ; valves obtuse at each end and readily separating into 2 ovoid nutlets. In waste places, Newf. to Fla., Mo. and Tex., west to Cal. Summer. Nat. from the south.
2. Coronopus Corónopus (L.) Karst. Wart or Swine's Cress. (I. F. f. 1691.) Tufted, spreading on the ground, succulent, glabrous and glaucous, or with a few spreading hairs. Leaves similar to those of the last species, generally larger, sometimes less divided; flowers similar; pedicels stout, 2 mm . long or less ; pod 4 mm . broad and about 3 mm . high. flattish. rounded. apiculate at the summit, marked with coarse wrinkles which form a crest around the margin; valves not distinctly separate. In waste places and on ballast, N. B. to Fla. and Tex., and on the Pacific Coast. Fugitive or adventive from Europe. Summer.

## 6. THLÁSPIL.

Erect glabrous herbs. with entire or dentate leaves, those of the stem, or at least the upper ones, auriculate and clasping. Flowers white or purplish. Siliques obcuneate, obcordate, or oblong-orbicular, mostly emarginate, flattened at right angles to the narrow septum, crested or winged, Valves dehiscent. Seeds 2 or
several in each cell, wingless. Cotyledons accumbent. [Greek, to flatten, from the flat pod.] A genus of about 25 species, natives of temperate, arctic and alpine regions. In addition to the following, 2 others occur in western N. Am.

Lower stem-leaves not clasping; seeds rugose.
All the stem-leaves cordate-clasping; seeds smooth.

1. T. arvense.
2. T. perfoliatum.
I. Thlaspi arvénse L. Field Penny-cress. (I. F. f. 1692.) Annual, glabrous, $\mathbf{I} .5-4.5 \mathrm{dm}$. high. Basal leaves petioled, oblanceolate, early deciduous; stem-leaves oblong or lanceolate, sparingly dentate, the upper clasping the stem by an auricled base; flowers white, about 1 mm . broad; pedicels spreading or curved upward, slender, $1-2 \mathrm{~cm}$. long in fruit; pods nearly orbicular, $8-12 \mathrm{~mm}$. broad, very flat, broadly winged all around, notched at the apex, in long racemes; style minute, or none; seeds about 6 in each cell. In waste places and on ballast, Quebec to Man., the N. W. Terr., N. Y. and Kans. June-Aug.
3. Thlaspi perfoliàtum L. Perfoliate Penny-cress. (I. F.f. 1693.) Annual, glabrous; stems $0.5^{-2} \mathrm{dm}$. tall. Basal leaves ovate or suborbicular; stemleaves oblong or oblong-lanceolate, sessile, clasping, $\mathbf{I}-2.5 \mathrm{~cm}$. long; pedicels filiform, spreading; silicle obovate-orbicular, 4-6 mm . broad, rather narrowly winged, broadly notched at the summit; style short but manifest; seeds usually 4 in each cell. Near Hamilton, Ont. Fugitive or adventive from Europe. May-Aug.

## 7. COCHLEARIA L.

Maritime herbs, with simple mostly fleshy leaves, and white or rarely purplish or yellowish racemose flowers. Silicle inflated, oblong or globose. Valves very convex, dehiscent. Stigma nearly simple, or capitate. Seeds several in each cell of the pod, usually in 2 rows, marginless. Cotyledons mainly accumbent. [Greek, spoon, from the shape of the leaves.] About 25 species, natives of the colder parts of the north temperate zone. Besides the following, about three others are found on the arctic and northern Pacific coasts of N. Am.
Stem-leaves oval or oblong, subsessile or with a broad-winged petiole. I. C. officinalis. Stem-leaves deltoid to hastate, all except the uppermost slender petioled.
2. C. Danica.

1. Cochlearia officinàlis L. Scurvy-Grass. (I. F. f. 1694.) Annual to perennial, diffuse, branching, glabrous, some what fleshy, the branches $15-30 \mathrm{~cm}$. long. Lower leaves long-petioled, oblong, orbicular or reniform, obtuse, $1-3 \mathrm{~cm}$. long, dentate or entire; flowers white, $4-5 \mathrm{~mm}$. broad; petals emarginate, or entire; pods globose or ovoid, 4-6 mm. long, smooth or reticulated. Along seacoasts and rivers, Anticosti to Greenland and arctic America. Also in arctic Europe and Asia. Summer.
2. Cochlearia Dánica L. Danish Scurvy-grass. Annual with slender diffuse branches, $\mathbf{I - 2} \mathrm{dm}$. long. Lower leaves rounded, reniform, 3-6 mm. in diameter, subentire; flowers about 3 mm . broad, white; petals entire. Fruit ellipsoid, about 4 mm . long. Along seacoast, Newf. to Greenland and the arctic coast; also in Europe. Summer.

## 8. ALLIARIA Adans.

Biennial or perennial, sparingly pubescent or glabrous herbs, with broad dentate cordate or reniform leaves, and rather large racemose white flowers. Sepals short. Petals oblong, clawed. Stamens 6. Style short, conic. Siliques linear, slightly constricted between the seeds when dry, the valves with a strong midnerve, dehiscent from the base. Seeds oblong, striate, in I row in each cell; cotrledons flat, incumbent. [From Allium, garlic, on account of its similar odor.] About 5 species, natives of Europe and Asia.
r. Alliaria Alliària (L.) Britton. Hedge-garlic. Gartic Mustard. (I. F. f. 1695.) Erect, 3-9 dm. high, glabrous, or with a few hairs on the petioles and leaf-margins. Leaves crenate or undulate, the lower $0.5-2 \mathrm{dm}$. broad on long petioles, the upper smaller, sessile or nearly so: pedicels +0 mm . longs spreading and very stout in fruit; flowers $6-8 \mathrm{~mm}$. broad; poels glabrous, stifl. $2-5 \mathrm{~cm}$. lons. 2 mm . thick. pointed, 4 -sided when Hry. Waste places, woods and along roaisides, Ont., N. Y., N. J. and Va. May-June,

## 9. SISÝMBRIUM L.

Annual or biennial, mostly tall herbs, with simple entire lobed or pinnatifid leaves, and yellow white or rarely pink flowers. Petals generally elongated. Siliques elongated, linear, many-seeded. Valves mostly 3 -nerved, dehiscent. Stigma nearly simple, or with 2 short lobes. Seeds in I row in each cell of the pod, marginless. Cotyledons incumbent. [Ancient Greek name of some crucifer.] A genus of about 50 species, of wide distribution. In addition to the following, about 8 others are found in western N. Am.
Leaves runcinate-pinnatifid.

Flowers yellow ; pods $1-1.5 \mathrm{~cm}$. long, appressed.
Flowers cream-color; pods $5-10 \mathrm{~cm}$. long, divergent.
Leaves oblong or spatulate, dentate; flowers white or pink.

1. S. officinale.
2. S. altissimum.
3. S. humile.
r. Sisymbrium officinàle (L.) Scop. Hedge Mustard. (I. F. f. 1696.) Erect, 3-9 dm. high, with rigid spreading branches. Leaves runcinate-pinnatifid, the lower petioled, the upper nearly sessile ; lobes oblong, ovate or lanceolate, the lower ones often recurved ; pedicels 2 mm . long, erect in fruit; flowers yellow, 3 mm . broad, pods linear, acuminate, glabrous or slightly hairy, closely appressed; valves with a strong prominent midrib. In waste places, common throughout our area, except the extreme north. Nat. from Europe. May-Nov.
4. Sisymbrium altissimum L. Tall Sisymbrium. (I. F. f. 1697.) Erect, 6-12 dm. high, freely branching, glabrous or nearly so. Lowest leaves runcinatepinnatifid, petioled, the lobes often auriculate; upper leaves shorter petioled, deeply pinnatifid, the lobes linear or lanceolate, often with a narrow projection on the lower side near the base ; uppermost leaves often reduced to linear bracts; flowers yellowish, about 6 mm . broad; pedicels $6-8 \mathrm{~mm}$. long, spreading or ascending, thickened in fruit ; pods narrowly linear, divergent, I mm. wide ; valves with a prominent midrib. In waste places, Quebec and Ont. to Alberta, D. C. and Mo. Adventive from Europe. Summer.
5. Sisymbrium hùmile Meyer. Low or Northern Rock-cress. (I. F. f. 1698.) Perennial, erect, I-2.5 dm. high, sparingly pubescent, with branched hairs. Leaves spatulate, or oblanceolate, the lower obtuse, $2-5 \mathrm{~cm}$. long, narrowed into a petiole, sharply dentate or rarely entire, the upper smaller, often acute; flowers white or pink, $3-4 \mathrm{~mm}$. broad; pedicels $4-6 \mathrm{~mm}$. long in fruit; pods nearly terete, narrowly linear, $\mathbf{I}-2 \mathrm{~cm}$. long. $\mathbf{I} \mathrm{mm}$. wide; valves finely nerved; style $\mathbf{I}$ mm . long. In rocky places, Anticosti, Willoughby Mountain, Vt., Lake Superior, to Alaska and Oregon. July.

## ro. CAKİLE Gaertn.

Annual, glabrous fleshy branching herbs, with purplish flowers. Siliques elongated, sessile, flattened or ridged, indehiscent, 2 -jointed, the joints I-celled and I-seeded. Style none; cotyledons accumbent. [Old Arabic name.] A genus of about 3 species, natives of sea and lake shores of Europe and N. Am.
I. Cakile edéntula (Bigel.) Hook. American Sea Rocket. (I. F. f. 1699.) Bushy-branched from a deep root, the lower branches spreading or ascending, the central ones erect, 3 dm . in height or less. Leaves oblanceolate, or obovate, obtuse, sinuate-dentate or lobed, narrowed at the base, the lower $7-13 \mathrm{~cm}$. long ; flowers light purple, 4-6 mm . broad; petals long-clawed. more than twice the length of the sepals; pod I-2 cm. long, upper joint slightly longer than the lower, ovoid, flattened, narrowed into a beak above; lower joint obovoid, not flattened. In sands of the seashore, Newf. to Fla., and along the Great Lakes, N. Y. to Minn. Also on the California coast. Summer.

## 11. MỲAGRUM L.

An annual glabrous glaucous branching herb, with entire or undulate oblong to lanceolate leaves, the lower petioled, the upper sessile and deeply auricled at the base. Flowers small, yellow. in elongating racemes ; pedicels short, erect-ascending, bractless. Sepals nearly erect. Petals short ; longer stamens somewhat connate in pairs. Silicle obcuneate to spatulate. flattened, indehiscent, falsely 3 -celled, r-seeded, tipped by the short style. Seed pendulous; cotyledons incumbent. [Greek. a fly-trap.] A monotypic genus of Europe and Asia,

1. Myagrum perfoliàtum L. Myagrum. (I. F. f. 1699a.) Lower leaves narrowed into petioles; upper leaves $5-\mathbf{1} 3 \mathrm{~cm}$. long, the basal auricles mostly rounded ; pedicels $2-4 \mathrm{~mm}$. long, $2-3$ times shorter than the pods; longer stamens about equalling the petals. In waste places about Quebec. Fugitive or adventive from Europe. Summer.

## 12. SINÁPIS L.

Annual or biennial, usually erect, branching more or less hispid herbs, with pinnatifid or lobed leaves, and rather large, mostly yellow flowers in terminal racemes. Siliques linear, nearly terete, constricted between the seeds, sessile in the calyx, densely hispid in our species, tipped with a very long flat sword-like beak which sometimes contains a seed near its base. Seeds oblong or subglobose, not winged nor margined. Cotyledons conduplicate. [Name Greek, said to come from the Celtic for turnip.] About 5 species, natives of southern Europe. Only the following is known from N. Am.
I. Sinapis álba L. White Mustard. (I. F. f. 1700.) Erect, 3-6 dm. high, more or less pubescent with stiff spreading hairs. Lower leaves $1.5-2 \mathrm{dm}$. long, obovate in outline, deeply pinnatifid or pinnate, with a large terminal leaflet or lobe and several pairs of smaller lateral ones, dentate all around ; uppermost leaves lanceolate or oblong, merely dentate, short-petioled ; flowers yellow, 14-18 mm . broad; pedicels rather stout, spreading, $\mathbf{1 0} \mathbf{- 1 4} \mathrm{mm}$. long in fruit; pods spreading or ascending, terete, constricted between the seeds; beak flat, equalling or sometimes longer than the pod; seeds light brown. In waste places and fields, occasional, mostly escaped from cultivation. Adventive from Europe. Native also of western Asia. Summer.

## 13. BRÁSSICA L.

Erect branching herbs, with pinnatifid basal leaves, and showy yellow flowers in elongated racemes. Siliques elongated, sessile, terete or 4 -sided, tipped with an indehiscent conic usually I-seeded beak. Valves convex, 1-3-nerved. Seeds in I row in each cell, oblong, marginless: cotyledons conduplicate. [Latin name of the Cabbage.] About 80 species, natives of Europe, Asia and northern Africa.
None of the leaves clasping the stem, the upper sessile.
Pods slender, $1-2.5 \mathrm{~cm}$. long, appressed. 1. B. nigra.
Pods rather slender, $2-5 \mathrm{~cm}$. long, erect, not appressed, on slender pedicels $6-10 \mathrm{~mm}$. long.
Leaves merely toothed or lyrate-pinnatifid.
2. B. juncea.

Leaves laciniate, at least marginally.
3. B. Japonica.

Pods spreading or ascending at maturity, on stout pedicels $4^{-6} \mathrm{~mm}$. long.
4. B. arvensis.

Upper leaves clasping by an auricled base.
5. B. campestris
x. Brassica nìgra (L.) Koch. Black Mustard. (I. F. f. ifor.) Erect, $0.5^{-2.1 ~ m}$. high, freely branching. Lower leaves slender-petioled, with I terminal large lobe and 2-4 smaller lateral ones, dentate all around, the uppermost reduced to lanceolate or oblong entire blades; flowers bright yellow, $6-10 \mathrm{~mm}$. broad; pedicels slender, appressed, 4 mm . long in fruit; pods narrowly linear, 4 -sided. 1-1. 5 cm . long, I mm. wide, appressed; beak slender, $2-4 \mathrm{~mm}$. long; seeds dark brown. In fields and waste places, common throughout our area. Nat. from Europe. June-Nov.
2. Brassica júncea (L.) Cosson. Indian Mustard. (I. F. f. 1702.) Pale. glabrous, or slightly pubescent, somewhat glaucous; stem erect, 3-12 dm. tall. Lower leaves long-petioled, $\mathbf{I}-\mathbf{I} .5 \mathrm{dm}$. long, the uppermost sessile or nearly so. lanceolate or linear, commonly entire, much smaller; flowers $1.2-1.8 \mathrm{~cm}$. wide; pedicels $6-10 \mathrm{~mm}$. long, not appressed: pods $2-5 \mathrm{~cm}$. long, rather more than 2 mm . wide, the conic-subulate empty beak one-fourth to one-third the length of the body. In waste places, N. H. to Penn., Mich., Va, and Kans. Adventive or nat. from Asia. May-July.
3. Brassica Japònica Siebold. Similar to the preceding, but the leaves laciniate, sometimes deeply so, often much crisped. In waste places. Me. to Cra. Adventive from Asia.
4. Brassica arvénsis (L.) B. S. P. Charlock. Wild Mustard. (I. F. f. 1703.) Erect, 3-6 dm. high, hispid with scattered stiff hairs, or glabrate. Leaves similar to those of B. nigra but generally not so much pinnatifid; flowers 1-1. 6 cm . broad; pedicels stout; pods glabrous, spreading or ascending, somewhat constricted between the seeds, $\mathbf{I}-1.6 \mathrm{~cm}$. long, 2 mm . wide, tipped with a flattened elongated-conic often $\mathbf{I}$-seeded beak $\mathbf{1 0} \mathbf{- 1 2} \mathbf{~ m m}$. long, the valves strongly nerved. In fields and waste places, frequent or occasional. Adventive from Europe. MayNov.
5. Brassica campéstris L. Turnip. Wild Navew. (I. F. f. 1704.) Stem 3-9 dm. high, glabrous and glaucous, or sometimes slightly pubescent. Lower leaves petioled, pubescent, more or less lobed or pinnatifid; upper leaves lanceolate or oblong, sessile and clasping by an auricled base; glabrous; flowers bright yellow, $8-10 \mathrm{~mm}$. broad; pedicels spreading or ascending, often 2.5 cm . long in fruit; pods $3-5 \mathrm{~cm}$. long, tipped with a beak $8-10 \mathrm{~mm}$. long. In cultivated grounds, sometimes persisting for a year or two, and occasional in waste places. Fugitive from Europe. April-Oct.

Brassica Nàpus L. (RaPE) has all the leaves glabrous, and is sometimes found in waste places.

Brassica oleràcea L. (CABBAGE) is occasionally found in waste places.

## 14. DIPLOTÁXIS DC.

Herbs similar to the Mustards, with pinnatifid or lobed leaves, and rather large yellow flowers in terminal racemes. Silique elongated, linear, flat or flattish, short-beaked or beakless, the valves mostly i-nerved. Style usually slender. Seeds in two complete or incomplete rows in each cavity of the silique, marginless; cotyledons conduplicate. [Greek, referring to the double rows of seeds.] About 20 species, natives of the Old World, the following fugitive or adventive in our territory.

Perennial; stem leafy nearly to the inflorescence.
Annual; leaves mostly basal, oblanceolate.

1. D. tenuifolva.
2. D. muralis.
3. Diplotaxis tenuifolia (L.) DC. Wall Rocket. (I. F. f. 1705.) Glabrous or nearly so, somewhat glaucous; stem bushy, 3-12 dm. high. Leaves pinnatifid, thin, the lower $7-15 \mathrm{~cm}$. long, the lobes mostly narrow; flowers $1.5-2$ cm . broad; pods $2-3 \mathrm{~cm}$. long, about 2.5 mm . wide, nearly erect; pedicels slender, 2-4 cm. long in fruit. In waste places and ballast, N. S. to N. J. and Penn. Adventive from Europe. June-Aug.
4. Diplotaxis muràlis (L.) DC. Sand Rocket. (I. F. f. 1706.) Branched from the base, sparingly hispid or glabrous, leafy only below. Leaves oblanceolate, sinuate-lobed or pinnatifid, $5-10 \mathrm{~cm}$. long, narrowed at the base, mostly slender-petioled; flowers $12-16 \mathrm{~mm}$. broad; pod about 2.5 cm . long and 2 mm . wide, erect, flattish; fruiting pedicels $8-16 \mathrm{~mm}$. long. In waste places and ballast, range of the preceding. Adventive from Europe. June-Aug.

## 15. RÁPHANUS L.

Mainly biennial herbs, with lyrate leaves and showy flowers. Silique elongatedlinear, coriaceous, fleshy or corky, constricted or continuous and spongy between the seeds, indehiscent. Style slender. Seeds subglobose; cotyledons conduplicate. [Greek, quick-appearing, from its rapid germination.] A genus of about 6 species, natives of Europe and temperate Asia.
Flowers yellow, fading white; pod longitudinally grooved, 4-ro-seeded.

1. R. Raphanistrum.

Flowers pink or white; pod not longitudinally grooved, 2-3-seeded.
2. R. sativus.
I. Raphanus Raphanístrum L. Wild Radish. Jointed or White Charlock. (I. F. f. 1707.) Biennial or annual from a slender root, $3-7.5 \mathrm{dm}$. high, sparsely pubescent or rarely glabrous. Basal and lower leaves lyrate-pinnatifid, I-2 dm. long, with a large terminal lobe and 4-6 pairs of successively smaller lateral ones, all crenate or dentate; upper leaves small, oblong; flowers $\mathbf{I}-2 \mathrm{~cm}$. broad, yellow, fading to white, purplish-veined; pedicels $6-16 \mathrm{~mm}$. long
in fruit; pods $2.5-4 \mathrm{~cm}$. long, 6-10-seeded, nearly cylindric when fresh, constricted between the seeds when dry, tipped with a conic beak $\mathbf{1}-2 \mathrm{~cm}$. long. In fields and waste places, Penn. to Ont. and N. B. Introduced also in Br. Col. Nat. from Europe. Summer.
2. Raphanus sativus L. Garden Radish. (I. F. f. I708.) Similar to the last, but flowers pink or white. Root deep, fusiform or napiform, fleshy. Pods fleshy, $2-3$-seeded, not longitudinally grooved, often equalled or exceeded by the long conic beak. Cultivated and occasionally spontaneous for a year or two in gardens or fields, rarely in waste places. Natives of Asia. June-Oct.

## 16. BARBAREA R. Br.

Erect glabrous biennial or perennial branching herbs, with angled stems, pinnatifid leaves, and racemose yellow flowers. Stamens 6. Silique elongated, linear, 4 -angled. Valves keeled or ribbed. Style short. Seeds in 1 row in each cell, flat, oblong, marginless; cotyledons accumbent. [Name from St. Barbara.] About 6 species, natives of the temperate zones.
Pods obtusely 4-angled, slender-pedicelled; leaf-segments 1-4 pairs. Pods divergent or ascending.

1. B. Barbarea.

Pods erect, appressed.
2. B. stricta.

Pods sharply 4 -angled, stout-pedicelled; leaf-segments $4-8$ pairs. 3. B. praecox.

1. Barbarea Barbarèa (L.) MacM. Yellow Rocket or Cress. (I. F. f. 1709.) Tufted; stems 3-6 dm. high. Lower leaves petioled, $5-13 \mathrm{~cm}$. long, pinnatifid; terminal division much larger than the 1-4 pairs of lateral ones, all oval or obovate ; upper leaves sessile or nearly so; flowers $6-8 \mathrm{~mm}$. broad ; pods spreading or ascending, about 2.5 cm . long, obscurely 4 -angled; pedicels about 4 mm . long. In fields and waste places, Lab. to Va. and locally in the interior. Also on the Pacific coast. Nat. from Europe. April-June.
2. Barbarea stricta Andrz. Erect-fruited Winter Cress. (I. F. f. 1710.) Similar to the preceding. Lateral segments of the leaves comparatively larger ; pods obtusely or obscurely 4 -angled, about 2.5 cm . long, erect and appressed against the rachis of the raceme on erect or ascending slender pedicels. In fields and waste places, Quebec to Minn., the N. W. Terr., Fla. and Neb. Nat. from Europe. April-June.
3. Barbarea praecox (J. E. Smith) R. Br. Early Winter or Belle Isle Cress. (I. F. f. $\mathbf{1 7}$ II.) Closely resembles the last species. Divisions of the leaves more numerous; pods sharply 4 -sided, slightly compressed, $3-8 \mathrm{~cm}$. long, on stout pedicels. In waste places, S. N. Y. to Fla. Adventive from Europe. April-June.

## 17. IODÁNTHUS T. \& G.

A glabrous erect perennial herb, with dentate leaves auricled at the base, or the lower and basal ones lyrate-pinnatifid, and violet or white flowers in panicled racemes. Sepals much shorter than the petals, the inner ones slightly gibbous at the base. Petals long-clawed. Style stout; stigma subcapitate. Silique linear-cylindric, somewhat constricted between the seeds. Seeds oblong, rounded, in I row in each cell. Cotyledons accumbent. [Greek, violet-colored flower.] A monotypic genus of S. N. Am.

1. Iodanthus pinnatífidus (Michx.) Steud. Purple or Faise Rocket. (I. F. f. 1712.) Stem slender, 3-10 dm. high. Lower leaves ovate or oblong (occasionally cordate), o.5-2 dm. long, dentate, tapering into a margined petiole which is clasping and auriculate at the base, the lower part of the blade often pinnatifid into 2-6 pairs of small segments; stem-leaves similar or merely dentate, narrower, sometimes ovate-lanceolate, the upper nearly sessile; flowers numerous, $6-8 \mathrm{~mm}$. broad; pedicels spreading, $2-4 \mathrm{~cm}$. long in fruit; pods linear, $4-6 \mathrm{~mm}$. long, 1 mm . wide, spreading or ascending; style 2 mm . long. On river banks, W. Penn. to Minn., Tenn., Kans., La. and Tex. May-June.

## 18. RORİPA Scop.

Branching herbs, with simple or pinnate lobed dissected or rarely entire leaves. Sepals spreading. Stamens 1-6. Pods short or elongated, terete or nearly so. Stipe none. Valves generally r-nerved. Style short or slender. Stigma 2-lobed
or nearly entire. Seeds turgid, minute, in 2 rows in each cell (very rarely in $\mathbf{I}$ row). Cotyledons accumbent. [Name unexplained.] About 25 species, of wide geographic distribution. Besides the following, there are about 5 other North American species, natives of the southern and western parts of the continent. The white-flowered species perhaps represent different generic types.
Flowers yellow.
Flowers and pods distinctly pedicelled.
Plants perennial by creeping or subterranean branches.
Leaves pinnately divided; style very short; naturalized European species.

1. R. sylvestris.

Leaves pinnatifid; style slender; native western species.
Pedicels and pods glabrous or nearly so.
2. R. sinuata.

Pedicels and pods scurfy-puberulent.
3. R. calycina.

Plants annual or perennial, with fibrous roots.
Pods $2-10 \mathrm{~mm}$. long, straight.
Fruiting pedicels $2-4 \mathrm{~mm}$. long; stem diffuse. Pods linear to oblong, $6-10 \mathrm{~mm}$. long.
Pods subglobose, about 2 mm . in diameter.
4. R. obtusa.
5. R. sphaerocarpa.

Fruiting pedicels $4^{-8} \mathrm{~mm}$. long; stem erect.
Stem nearly or quite glabrous; pods linear or linear-oblong.
6. $R$. palustris.

Stem hispid-pubescent; pods globose or oval. Pods $8-14 \mathrm{~mm}$. long, strongly curved upward.
Flowers and pods very nearly sessile. Flowers white.

Leaves pinnately divided ; pods linear. Io. R. Nasturtium.
Leaves simple or the lower pinnatifid ; pods oblong or globose. Terrestrial, tall; leaves crenate, or the lower lobed or pinnatifid.

1I. R. Armoracia.

> Aquatic; immersed leaves finely dissected.
12. R. Americana.
I. Roripa sylvéstris (L.) Bess. Creeping Yellow Water-cress. (I. F. f. 1713.) Perennial, glabrous; stems creeping, branches ascending. Leaves pinnately divided or deeply pinnatifid, petioled, $7-13 \mathrm{~cm}$. long, $2-5 \mathrm{~cm}$. broad, the divisions obovate, or oblong, toothed or lobed; pedicels slender, about 6 mm . long; flowers yellow, $6-10 \mathrm{~mm}$. broad; pod linear, $8-\mathbf{1 2} \mathrm{mm}$. long; style very short. In low grounds and waste places, Newf. to Mass., Va. and Mich. Adventive or nat. from Europe. Summer.
2. Roripa sinuàta (Nutt.) A. S. Hitchcock. Spreading Yellow-cress. (I. F. f. 1714.) Perennial, diffuse, glabrous, the branches ascending. Leaves oblong, lanceolate, or oblanceolate, $5-8 \mathrm{~cm}$. long, $\mathrm{I}-2.5 \mathrm{~cm}$. wide, pinnatifid, the lobes linear or oblong, obtuse; pedicels slender, 6 mm . long; flowers yellow, $6-8 \mathrm{~mm}$. broad; pods linear-oblong, often curved, $8-15 \mathrm{~mm}$. long; style slender, $2-4 \mathrm{~mm}$. long. Minn. to S. Dak., Mo., west to the Sierra Nevada. June-Sept.
3. Roripa calycína (Engelm.) Rydb. Scurfy Yellow-cress. Similar to $R$. sinuata, the leaves rather more deeply pinnatifid; flowers about one-half the size, and pods and pedicels scurfy-puberulent. W. Neb., Wyo. and Mont. Has been referred to R. curvisiliqua. June-Aug.
4. Roripa obtùsa (Nutt.) Britton. Blunt-leaved Yellow-cress. (I. F. f. 1715.) Annual or biennial, diffuse. Leaves oblong or oblanceolate, $5-10 \mathrm{~cm}$. long, pinnately divided, or pinnatifid, the lobes obtuse, repand-toothed, or sometimes entire; pedicels $2-4 \mathrm{~mm}$. long; flowers yellow, $2-3 \mathrm{~mm}$. broad or less; pods narrowly oblong, or linear, $6-10 \mathrm{~mm}$. long, ascending; style 1 mm . long. In low grounds, Mich. to Tex., west to the Pacific coast. April-Aug.
5. Roripa sphaerocàrpa (A. Gray) Britton. Round.fruited Cress. (I. F. f. 1716.) Glabrous, I-3 dm. high. Leaves oblong, obtuse, the lower lyrate-pinnatifid or incised, the upper sometimes nearly entire, petioled or the upper subsessile; petioles narrowly margined, somewhat clasping; flowers 2 mm . broad or less; petals yellow, about equalling the sepals; silicle globose, about 2 mm . in diameter, about as long as its pedicel; style very short. Ill. to Kans., Tex. and Cal. June-July.
6. Roripa pàlústris (L.) Bess. Marsh or Yellow Water-cress. (I. F. f. 1717.) Annual or biennial, erect, glabrous or slightly pubescent, 3-10 dm. high. Lower leaves petioled, $7-17 \mathrm{~cm}$. long, oblong or oblanceolate, pinnatifid, the lobes repand or toothed; upper leaves nearly sessile, dentate or somewhat lobed; pedi-
cels slender, 6 mm . long in fruit; flowers yellow, $4-6 \mathrm{~mm}$. broad; pods linear, or linear-oblong, 2-6 times as long as thick, about equalling the pedicels, spreading or curved; style I mm. long or less. In wet places, nearly throughout N. Am. except the extreme north. Apparently nat. from Europe. May-Aug.
7. Roripa híspida (Desv.) Britton. Hispid Yellow-cress. (I. F. f. 1718. ) Resembling the preceding, but often stouter, sometimes 12 dm . high, the stem, branches, petioles and veins of the lower surfaces of the leaves hirsute. Leaves lyrate-pinnatifid; pedicels slender, spreading, about 6 mm . long, longer than the globose or ovoid pod, which is $\mathbf{I}-2$ times as long as thick. In wet places, N. B. to Br. Col., Fla. and N. Mex. Summer.
8. Roripa curvisíliqua (Hook.) Bessey. Curved-fruited Cress. (I. F. f. 1719.) Annual or biennial, sparingly pubescent or glabrous; stems $1.5-4.5 \mathrm{dm}$. high. Leaves oval or oblanceolate, pinnatifid, pinnately lobed or toothed, the lower $2-8 \mathrm{~cm}$. long; flowers light yellow, 4 mm . broad in short racemes; petals rather longer than the sepals; style short; pods linear, $8-16 \mathrm{~mm}$. long, less than 2 mm . wide, strongly curved upward; pedicels spreading or ascending, $2-4 \mathrm{~mm}$. long. In moist soil, Mont. to Br. Col. and Cal. Not certainly known within our range. May-Aug.
9. Roripa sessilifiòra (Nutt.) A. S. Hitchcock. Sessile-flowered Cress. (I. F. f. 1720.) Annual or biennial, erect, glabrous, $2-5 \mathrm{dm}$. high. Leaves petioled, the lower $7-10 \mathrm{~cm}$. long, obovate or oblong, obtuse, crenate, lobed or pinnatifid, with obtuse lobes; flowers yellow, 2 mm . broad, nearly sessile; pods very slightly pedicelled, $6-12 \mathrm{~mm}$. long, 2 mm . broad, narrowly oblong; style very short. In low grounds, Tenn., Ill. and Iowa to Kans., Fla. and Tex. April-June.
10. Roripa Nastúrtium(L.) Rusby. Water-cress. (I. F. f. I721.) Aquatic, glabrous, rooting from the nodes. Leaves odd-pinnate, of 3-9 segments, the terminal one larger than the lateral, all obtuse, ovate or oval, or the terminal one nearly orbicular; flowers white, $4-5 \mathrm{~mm}$. broad; pods $\mathrm{I}-3.5 \mathrm{~cm}$. long, 2 mm . wide, slightly curved upward, on pedicels of about their length; seeds in 2 rows. In brooks and streams, N. S. to Manitoba, Ore., Va. and Neb. and Ariz. Nat. from Europe. April-Nov.

I I. Roripa Armoràcia (L.) A. S. Hitchcock. Horseradish. (I. F. f. i722.) Erect, 6-10 dm. high, from deep thick roots. Basal leaves on thick petioles r.5-3 dm. long, the blade oblong, often nearly as long, crenate, sinuate or even pinnatifid, rough but glabrous; upper leaves sessile, narrowly oblong or lanceolate, crenate or dentate; racemes paniculate; pedicels slender, ascending, $4-6 \mathrm{~mm}$. long; flowers white, $4-8 \mathrm{~mm}$. broad; pods oblong or nearly globose; style very short. Escaped from gardens into moist grounds, especially along streams. Adventive from Europe. Summer.
12. Roripa Americàna (A. Gray) Britton. Lake Water-cress. (I. F. f. 1723.) Aquatic, branching, $3-6 \mathrm{dm}$. long. Immersed leaves $5-8 \mathrm{~cm}$. long, pinnately dissected into numerous filiform divisions; emersed leaves oblong, 2-8 cm . long; pedicels $6-8 \mathrm{~mm}$. long, slender, spreading; flowers white; style slender, about 2 mm . long; pods ovoid, 4 mm . long, I -celled. In lakes and slow streams, Vt. and Quebec to Ont., Minn., Fla., La. and Ark. Summer.

## 19. CARDÁMINE L.

Erect or ascending herbs, with scaly or tuberiferous rootstocks or fibrous roots, entire lobed or divided leaves, and racemose or corymbose white or purple flowers. Stamens 6, rarely 4. Siliques elongated, flat; valves nerveless or faintly nerved, elastically dehiscent at maturity. Stipe none. Seeds in I row in each cell, compressed, marginless; cotyledons accumbent. [Greek, heart-strengthening.] About 75 species, natives of temperate regions.

[^24]Mature pods erect, $0.5-1 \mathrm{~mm}$. wide.
Flowers $4-5 \mathrm{~mm}$. wide; plants of swamps, streams, or wet grounds.
Segments of basal leaves $4^{-25} \mathrm{~mm}$. wide; plant $2-9 \mathrm{dm}$. tall.
3. C. Pennsylvanica. Segments of basal leaves $\mathrm{x}-3 \mathrm{~mm}$. wide; plant $\mathrm{x}-3 \mathrm{dm}$. tall.
4. C. arenicola. Flowers $2-3 \mathrm{~mm}$. wide; plant of dry rocky situations.

> 5. C. parviflora.

Mature pods divergent or ascending, more than I mm . wide.
6. C. fexuosa.

Leaf-segments few, large, the terminal one $2-5 \mathrm{~cm}$. wide, deeply cordate.
7. C. Clematitis.
** Leaves entire, toothed, or rarely with i or 2 lateral segments.

Dwarf, alpine; leaves nearly entire, long-petioled.
Erect or decumbent; leaves more or less toothed or lobed.
Flowers purple; stem erect.
Flowers white.
Stem erect from a tuberous base. 1o. C. bulbosa. Stem decumbent, stoloniferous; roots fibrous. II. C. rotundifolia.
8. C. bellidifolia.
9. C. purpurea.

1. Cardamine praténsis L. Meadow Bitter-Cress. Cuckoo-flower. (I. F. f. 1724.) Glabrous, 2-5 dm. high; roots fibrous. Leaves pinnately divided, lanceolate or oblong in outline, the lower petioled, the upper sessile; divisions 3-7 pairs and an odd one; petals three times the length of the calyx; pedicels slender, $8-12 \mathrm{~mm}$. long in fruit; pods $1.5-3 \mathrm{~cm}$. long, 2 mm . wide; style $1-2 \mathrm{~mm}$. long, thick. In wet meadows and swamps, Lab. to N. J., Br. Col. and Minn. Also in Europe and northern Asia. April-May.
2. Cardamine hirsùta L. Hairy Bitter-cress. (I. F. f. 1725.) More or less pubescent; stem usually little branched, $\mathbf{1}-\mathbf{2} .5 \mathrm{dm}$. tall. Leaves nearly all basal, $2-10 \mathrm{~cm}$. long, pinnate, the terminal segment orbicular or broader than long, entire or few-toothed, the lateral ones $2-5$ pairs; stem leaves few, their segments linear, or linear-oblong; flowers 4 mm . broad, white; pods linear, about 2.5 cm . long and I mm. wide, erect on ascending pedicels $4-8 \mathrm{~mm}$. long when mature; style almost none. In moist places, Penn. to Mich., Neb. and N. Car. Also in Europe and Asia. March-May.
3. Cardamine Pennsylvánica Muhl. Pennsylvania Bitter-cress. (I. F. f. 1726.) Glabrous or rarely with a few hairs; stem erect, 2-9 dm. tall, usually much branched, leafy. Basal leaves $0.5-\mathbf{1} .5 \mathrm{dm}$. long, the terminal segment obovate, oval or suborbicular, the lateral $4-8$ pairs oblong, oval, or obovate; flowers about 4 mm . broad, white; pods narrowly linear, $1.5-3 \mathrm{~cm}$. long, less than 1 mm . wide, erect when mature on ascending or divergent pedicels $4-6 \mathrm{~mm}$. long; style about 1 mm . long. In swamps and wet places, Newf. to Minn., Mont., Fla., Tenn. and Kans. April-June.
4. Cardamine arenícola Britton. Sand Bitter-cress. (I. F. f. 1727.) Glabrous, usually branched from the base, leafy, erect, 1.5-3 dm. high. Segments of the leaves numerous, linear or linear-oblong, $\mathrm{I}-3 \mathrm{~mm}$. wide, obtusish, entire, or with I-3 small teeth; flowers about 4 mm . broad, white; mature pods erect, about 2 cm . long, $0.5-1 \mathrm{~mm}$. wide, their pedicels ascending; style almost wanting. In moist or wet sandy soil, Conn. to Fla., Ky. and Tern. March-April.
5. Cardamine parviflòra L. Small-flowered Bitter cress. (I. F. f. 1728.) Glabrous or sparingly pubescent; stem weak, erect or ascending, very slender or almost filiform, $0.5-4 \mathrm{dm}$. long, usually leafy up to the racemes, the leaves scattered. Segments of the leaves numerous, oblong or linear, or the terminal one sometimes orbicular, $\mathbf{I}-4 \mathrm{~mm}$. wide; mature pods $2-5 \mathrm{~cm}$. long or less, rather less than 1 mm . wide, erect on ascending pedicels, $4-10 \mathrm{~mm}$. long, the axis of the racemes commonly zigzag; flowers scarcely more than I mm. broad, white; style almost wanting. On rocks, Quebec to W. Ont., Ore., south to Mass. and Ga. Also in northern Europe and Asia. April-May.
6. Cardamine flexuòsa With. Wood Bitter-cress. (I. F. f. 1729.) Glabrous; stem leafy, $1.5-4 \mathrm{dm}$. tall. Leaf-segments obovate, oval, oblong or linear, the terminal one sometimes orbicular, narrowed rounded or subcordate at the base, $\mathbf{I - 2} \mathrm{cm}$. wide, the lateral ones usually much narrower; flowers white, 4 mm . broad; pods ascending or divergent, on spreading or ascending pedicels, $1.5-3 \mathrm{~cm}$. long, I mm . wide or rather more; style minute or none. In wet woods, streams and
mountain swamps, Me. to Mich. and N. Car. Also in Europe and Asia. MayAug.
7. Cardamine Clematitis Shuttlw. Mountain Bitter-Cress. (I. F. f. 1730.) Glabrous, dark green; stem weak, slender, 1-4 dm. long. Leaves various, some of them of a single orbicular or reniform, deeply cordate terminal segment, some of them with two additional ovate oblong or rounded lateral segments, the uppermost occasionally linear-oblong and entire; flowers in short racemes, white, $6-8 \mathrm{~mm}$. wide; pedicels ascending, 6-12 mm . long; pods ascending or divergent, $2-4 \mathrm{~cm}$. long, less than 2 mm . wide; style $2-4 \mathrm{~mm}$. long, subulate. In wet woods, high mountains of Va. and N. Car. to Ala. May-July.
8. Cardamine bellidifolia L. Alpine Cress. (I. F. f. 173I.) Tufted, glabrous, ${ }^{5-13} \mathrm{~cm}$. high; roots fibrous. Lower leaves long-petioled, ovate, obtuse, the blade $8-12 \mathrm{~mm}$. long, abruptly contracted into the petiole, entire, or with a few rounded teeth; upper leaves similar, shorter-petioled; flowers $\mathbf{1}-5$, white; petals about twice the length of the calyx; pods erect, linear, 2.5 cm . long, 2 mm . wide, narrowed at each end; pedicels $2-6 \mathrm{~mm}$. long; style stout, less than 2 mm . long. Alpine summits of the White Mountains, N. H. ; Mt. Katahdin, Me.; Greenland and arctic Am. : the Canadian Rocky Mts.; Cal. Also in Europe. July.
9. Cardamine purpùrea (Torr.) Britton. Purple Cress. (I. F. f. 1732.) Glabrous, $1.5-4 \mathrm{dm}$. high from tuberiferous rootstocks. Basal leaves slenderpetioled, $2-3 \mathrm{~cm}$. broad, ovate or orbicular, cordate, thickish, the upper sessile, dentate or entire; pedicels $8-25 \mathrm{~mm}$. long; flowers purple, $\mathbf{I - 2} \mathrm{cm}$. broad; pods nearly erect, 2.5 cm . long, 2 mm . broad, pointed at each end; style 4 mm . long. In cold, springy places, Quebec and arctic Am. to the Canadian Rocky Mts., Md. and Wis. April-May.
10. Cardamine bulbòsa (Schreb.) B.S.P. Búlbous Cress. (I. F. f 1733.) Glabrous, erect from a tuberiferous base, 2-4.5 dm. high. Basal leaves oval, or nearly orbicular, $2-4 \mathrm{~cm}$. long, sometimes cordate, angled or entire, long-petioled; stem-leaves sessile or the lower petioled, oblong or lanceolate, dentate or entire; pedicels $8-25 \mathrm{~mm}$. long; flowers white, I-I. 5 cm . broad; petals three or four times the length of the calyx; pods 2.5 cm . long, erect, linear-lanceolate, narrowed at each end; style $2-4 \mathrm{~mm}$. long; stigma prominent; seeds short-oval. In wet meadows and thickets, N. S. to Ont. and Minn., Fla. and Tex. April-June.
ir. Cardamine rotundifòlia Michx. Round-leaved or American WaterCress. (I. F. f. 1734.) Weak, ascending or decumbent, forming long stolons; roots fibrous. Basal leaves and stem-leaves similar, the lower petioled, the upper sessile, ovate, oval, or orbicular, obtuse, undulate angled or entire, thin; pedicels $1-2.5 \mathrm{~cm}$. long in fruit; flowers white, $4-6 \mathrm{~mm}$. broad; pods linear, $14-16 \mathrm{~mm}$. long, I mm. wide, pointed; style 2 mm . long; stigma minute; seeds oblong. In cold springs, N. J. to Ohio, N. Car. and Ky. May-June.

## 20. DENTÀRIA L.

Perennial herbs, with horizontal scaly or toothed rootstocks, erect, mostly unbranched stems leafless below, 3-divided or palmately laciniate petioled leaves, and corymbose or short racemose white rose-colored or purple flowers. Petals much longer than the sepals. Stamens 6. Style slender. Silique linear, flat, elastic. ally dehiscent from the base, its valves nerveless or with a faint midnerve; stipe none. Seeds in I row in each cell, thick, oval, flattened, wingless; cotyledons thick, accumbent. [Greek, tooth, from the toothlike divisions of the rootstock.] About 15 species, natives of the northern hemisphere. Besides the following, some 7 others occur in western N. Am.
Basal leaves and stem-leaves similar.
Leaf-divisions lanceolate or oblong, lobed or cleft. I. D. laciniata.
Leaf-divisions ovate or ovate-oblong, crenate or lobed.
Stem-leaves 2, opposite, or close together ; rootstock continuous.
2. D. diphylla.

Stem-leaves 2-5, alternate; rootstock jointed. 3. D. maxima.
Divisions of the stem-leaves linear or lanceolate ; those of the basal leaves ovate, much broader.
4. D. heterophylla.

1. Dentaria laciniàta Muhl. Cut-leaved Toothwort or Pepper-root. (I. F. f. 1735.) Pubescent or glabrous, scapose, 2-4 dm. high; rootstock deep.
tubercled, jointed. Leaves $5-13 \mathrm{~cm}$. broad, those of the stem generally 3 and approximate or verticillate, 3 -parted nearly to the base; divisions lanceolate, linear or oblong, the lateral ones often deeply 2 -cleft, all incisely toothed or lobed; basal leaves similar, rarely developed at flowering time; pedicels ascending, stout, 1.5-2 cm . long in fruit; flowers $1.4-2 \mathrm{~cm}$. broad, white or pink; pods linear, ascending, $2-4 \mathrm{~cm}$. long; style $6-8 \mathrm{~mm}$. long. In moist or rich woods, Quebec to Fla., Minn., Kans. and La. April-June.
2. Dentaria diphylla Michx. Two-leaved Toothwort. (I. F. f. 1736.) Stout, scapose, glabrous, 2-4 dm. high; rootstock continuous, toothed. Basal leaves long-petioled, $\mathbf{I - 1 . 3 ~ d m . ~ b r o a d , ~ t e r n a t e , ~ t h e ~ d i v i s i o n s ~ s h o r t - s t a l k e d , ~ b r o a d l y ~}$ ovate, dentate, or somewhat lobed, about 5 cm . long; stem-leaves generally 2 , opposite or nearly so; pedicels $2-4 \mathrm{~cm}$. long; flowers white, $1.4-1.6 \mathrm{~cm}$. broad; pods 2.5 cm . long or more. In rich woods and meadows, N. S. to Minn., S. Car. and Ky. May.
3. Dentaria máxima Nutt. Large Toothwort. (I. F. f. 1737.) Similar to the preceding but larger; rootstock jointed, tubercled. Stem-leaves 2-7 (generally 3), alternate, similar to the basal ones; flowers pale purple, $1.5^{-2} \mathrm{~cm}$. broad. Vt. to N. Y. and Penn. May.
4. Dentaria heterophylla Nutt. Slender Toothwort. (I. F. f. 1738.) Slender, glabrous or somewhat pubescent, 2.5-3.5 dm. high; rootstock jointed. Basal leaves long-petioled, ternate; divisions ovate, the terminal one cuneate or rounded at the base, the lateral ones inequilateral, the lobes or teeth mucronate; stem-leaves generally 2 , opposite or nearly so, ternate, the divisions linear or lanceolate; pedicels 2.5 cm . long in fruit; flowers light purple, $1.6-1.8 \mathrm{~cm}$. broad; pods ascending, 2.5 cm . long. In woods, N. J. and Penn. to Ga. and Tenn. AprilMay.

## 21. LUNARIA L.

Pubescent erect herbs, with broad dentate or denticulate mostly cordate leaves, and large violet flowers in terminal racemes. Lateral sepals saccate at the base. Petals obovate, clawed. Siliques long-stipitate, very flat, oblong or elliptic, dehiscent, the papery valves reticulate-veined. Style filiform; septum hyaline, translucent, shining. Seeds circular or reniform, very large, winged, borne on long funiculi, which are adnate to the septum: cotyledons large, accumbent. [Latin, moon, in allusion to the shining partition of the pod.] Two known species, natives of Europe and Asia.

Siliques oblong, pointed at both ends; perennial.
Siliques elliptic, rounded at both ends; annual or biennial.

1. L. rediviva.
2. L. annua.
I. Lunaria redivìva L. Perennial Satin-pod or Satin-flower. (I. F. f. 1739.) Pubescent with short simple hairs; stem 3-12 dm. tall. Leaves broadly ovate, acuminate at the apex, cordate or rounded at the base, thin, the lower long-
 oblong, 5-8 mm. long, drooping, borne on slender stipes of about one-half their length; seeds reniform, broader than long. In thickets, Canadian side of Niagara Falls. Escaped from gardens or fugitive from Europe. May-July.

2 Lunaria annua L. Honesty. (I. F. f. 1740.) Resembles the preceding species when in flower, but the root is annual or biennial. Siliques elliptic or broadly oval, $3-5 \mathrm{~cm}$. long, 2.5 cm . wide or rather more, rounded at both ends; seeds suborbicular, cordate, about as long as wide. Escaped from gardens to roadsides in southwestern Connecticut. Both this species and the preceding are occasionally cultivated for their remarkably large pods, which are gathered for dry bouquets, the valves falling away at maturity and leaving the septum as a shining membrane. May-June.

## 22. SELENIA Nutt.

Annual tufted glabrous herbs, with pinnatisect leaves, and racemose leafybracted yellow flowers. Sepals spreading. Petals narrow, erect, with io hypogynous glands at their bases. Silique stalked, very flat, oblong, narrowed at each end, dehiscent; valves nerveless, thin, finely veined. Style long, slender. Seeds
few, in 2 rows in each cell of the pod, orbicular, flat, broadly winged, free from the septum. Cotyledons accumbent. [Greek, moon, from the resemblance of this genus to Lunaria.] Two or three species, natives of the south-central United States and northern Mexico.
r. Selenia aùrea Nutt. Selenia. (I. F. f. 174I.) Stems simple, numerous, $0.5-2 \mathrm{dm}$. high. Basal leaves $2-5 \mathrm{~cm}$. long, narrow, $\mathbf{I - 2}$ pinnatifid into numerous oblong dentate segments; stem-leaves similar, smaller; bracts of the raceme pinnatifid, resembling the upper leaves; flowers $6-8 \mathrm{~mm}$. high, numerous; pedicels I-I. 5 cm . long in fruit, spreading or ascending; pod $\mathrm{I}-2 \mathrm{~cm}$. long, $4-6 \mathrm{~cm}$. broad; style 4 mm . long, very slender. In open places, Mo. and Kans. to Tex. MarchApril.

## 23. LEAVENWÓRTHIA Torr.

Low annual glabrous scapose herbs, with lyrate-pinnatifid persistent basal leaves, and few or solitary terminal flowers. Petals wedge-shaped. Siliques flat, broadly linear or oblong, short-stipitate, dehiscent ; valves nerveless, finely retic-ulate-veined. Seeds in I row in each cell of the pod, flat, winged or margined; radicle short, slightly bent toward the cotyledons. [In honor of Dr. M. C. Leavenworth, U. S. A.] A genus of about 4 species, natives of southeastern North Am.
Pods not constricted between the seeds. Pods constricted between the seeds.

1. L. uniflora.
I. Leavenworthia unifìra (Michx.) Britton. Michaux's Leavenworthia. (I. F. f. 1742.) Tufted, $7-15 \mathrm{~cm}$. high. Basal leaves rosulate, $2-10 \mathrm{~cm}$. long, the segments $5-17$, dentate or angled, 4-6 mm. long, the terminal one somewhat larger, all narrowed near the base; stem-leaves none, or $1-3$, smaller; flowers about 6 mm . broad; petals white or purplish with a yellow base, about twice the length of the sepals; pods oblong or linear, $\mathbf{I}-3 \mathrm{~cm}$. long, 4 mm . wide when mature; seeds winged; style about I mm. long. In open, dry places, S. Ind. to Tenn. and Mo. April.
2. Leavenworthia torulòsa A. Gray. Necklace Leavenworthia. (I. F. f. I743.) Closely resembles the preceding, but the pods are narrower and constricted between the seeds. Style 3-4 mm. long; seeds sharp-margined, barely winged ; terminal segment of the basal leaves decidedly broader than the lateral ones. Barrens of Ky. and Tenn. April.

## 24. PHYSÀRIA A. Gray.

Low perennial stellate-canescent herbs, with usually simple stems, spatulate mostly entire leaves, the basal ones tufted, and yellow flowers in terminal racemes. Petals longer than the sepals. Style filiform. Silicles membranous, stellate-pubescent, their cavities inflated, subglobose, the septum narrow. Seeds not margined; cotyledons accumbent. [Greek, bellows, from the resemblance of the inflated fruit.] About 4 species, natives of western N. Am.
I. Physaria didymocàrpa (Hook.) A. Gray. Double Bladder-pod. (I. F. f. 1744.) Root long and deep. Stems slender, o.7-3 dm. long; leaves spatulate, the basal ones obtuse, entire, or few-lobed, narrowed into margined petioles; blade, or terminal segment, $2-\mathbf{1} 3 \mathrm{~cm}$. long; stem-leaves nearly sessile, acute or subacute, much smaller; flowers $\mathbf{I}-\mathbf{I} .3 \mathrm{~cm}$. broad; pods didymous, variable, often $\mathbf{I} \mathrm{cm}$. thick through the strongly inflated cavities, emarginate at base and summit, commonly broader than high; seeds numerous. In dry soil, N. W. Terr. to Br. Col., Neb., Colo. and Nev. May-Aug.
25. LESQUERÉLLA S. Wats.

Low herbs, with stellate pubescence, simple leaves, and racemose mainly yellow flowers. Petals entire. Anthers sagittate. Pod generally inflated, globose or oblong; valves nerveless; septum translucent, nerved from the apex to the middle. Seeds several or many in each cell of the pod, flattened, marginless or narrowmargined; cotyledons accumbent. [Dedicated to Leo Lespuereux, ISo5-IS8o. Swiss and American botanist.] About 35 species, natives of America, and mainly of the western parts of the U.S.

Pods densely stellate-pubescent.
Pods oblong to globose, acute, 4 mm . long; low perennial. 1. L. spathuiata.

Pods globose, 2 mm . in diameter; tall annual.
Pods oval or globose, $4-5 \mathrm{~mm}$. long; tall biennial or perennial.
2. L. globosa.
3. L. argentea. Pods glabrous or very nearly so.

Annual, sparingly pubescent; stem slender, $3^{-6} \mathrm{dm}$. tall, much branched; south-

$$
\text { western. } 4 . \text { L. gracilis. }
$$

Perennial, densely stellate ; stem rather stout, I.5-3 dm, tall, simple ; western.
5. L. ovalifolia.

Perennial, $2-15 \mathrm{~cm}$. tall ; stem simple ; arctic.
6. L. arctica.
I. Lesquerella spathulàta Rydberg. Low BLADDER-POD. (I. F. f. 1745.) Perennial, I-I. 3 dm . high; stems slender, simple. Lower leaves oblanceolate or spatulate, $\mathbf{I}-\mathbf{2 . 5} \mathrm{cm}$. long, acutish, narrowed into a petiole; the upper linear; flowers about 4 mm . broad; pedicels $6-\mathbf{1 2} \mathrm{mm}$. long, recurved in fruit; pods oblong or nearly globose, finely canescent, about 4 mm . long, few-seeded, tipped with a style of about their own length. Dry hills, Neb. and S. Dak. to Mont. and the N. W. Terr. June.
2. Lesquerella globòsa (Desv.) S. Wats. Short's Bladder-pod. (I. F. f. 1746.) Slender, sparingly branched, 1.5-5 dm. high. Basal leaves obovate, $2-4 \mathrm{~cm}$. long, obtuse; stem-leaves narrower, linear or oblong, smalker, sessile; petals $4-6 \mathrm{~mm}$. long; pedicels slender, spreading, $8-10 \mathrm{~mm}$. long in fruit; pod nearly globular, 2 mm . in diameter, glabrous when mature; seeds 1 or 2 in each cavity; style slender, 4 mm . long. In open places, Ky. and Tenn. to Mo. April.
3. Lesquerella argéntea (Pursh) MacM. Silvery Bladder-pod. (I. F. f. 1747.) Tufted, nearly simple, 1.5-4.5 dm. high. Leaves linear, oblong or oblanceolate, the lower $5-8 \mathrm{~cm}$. long, blunt, entire or sparingly repand-toothed; petals 6 mm . long; pedicels slender, $1.5-2.5 \mathrm{~cm}$. long in fruit, spreading or recurved; pod slightly stipitate, stellate-pubescent, globose to oval, $4-5 \mathrm{~mm}$. long; style about equalling the pod. On plains, Minn. to Neb., Kans., Dak. and Ariz. May-June.
4. Lesquerella grácilis (Hook.) S. Wats. Slender Bladder-pod. (I. F. f. 1748.) Weak; stem slender, $2.5-6 \mathrm{dm}$. high, freely branching, sparsely stellatepubescent. Leaves linear or oblanceolate, $1.5-5 \mathrm{~cm}$. long, their margins often undulate; petals about 6 mm . long; pedicels spreading, sometimes 2.5 cm . long in fruit, ascending or upwardly curved; pod globose, glabrous, 4 mm . in diameter, stipitate; style 4 mm . long. Prairies, Neb. to Tex. March-May.
5. Lesquerella ovalifòlia Rydberg. Oval-Leaved Bladder-pod. (I. F. f. 1749.) Basal leaves tufted, broadly oval to nearly orbicular, entire, pale, 2-5 cm . long, narrowed into petioles; stem-leaves distant, linear-oblanceolate or narrowly spatulate; fruiting pedicels comparatively stout, ascending, $\mathbf{I}-2 \mathrm{~cm}$. long; pods very short-stipitate, subglobose, $5-6 \mathrm{~mm}$. in diameter, glabrous; style about 6 mm . long. In dry soil, Neb. and Kans.
6. Lesquerella àrctica (DC.) S. Wats. Arctic Bladper-pod. (I. F. f. 1750.) Tufted; stem nearly or quite simple, $2-15 \mathrm{~cm}$. tall. Leaves oblanceolate, spatulate, or oblong, 2.5 cm . long or less, obtuse, entire, the basal ones narrowed into broad petioles, the upper sessile; petals about 4 mm . long; pods oval or subglobose, 4-6 mm. high; septum perforated; style 2 mm . long or less. Greenland and arctic Am. Summer.

Lesquerella àrctica Púrshii S. Wats. Taller, sometimes 1.5 dm . high; septum of the sparsely stellate-pubescent pod unperforated. Anticosti.

## 26. HUTCHÍNSIA R. Br.

Low mostly diffuse herbs, more or less pubescent with forked hairs, our species annual, the small white flowers in terminal racemes, the axis elongating in fruit. Stamens 6. Style wanting or very short. Silicles oval, compressed at right angles to the partition, the valves with a strong midvein. Seeds numerous; cotyledons incumbent or accumbent. [Name in honor of Miss Hutchins, of Bantry, Ireland, an eminent botanist.] About 8 species, natives of the northern hemisphere, only the following known in N. Am.
r. Hutchinsia procúmbens (L.) Desv. Prostrate Hutchinsia. (I., F. f. 1751.) Tufted, branching near the base, the branches slender, $5-15 \mathrm{~cm}$. long.

Lower leaves short-petioled, pinnatifid, lobed, dentate or sometimes entire, I-2.5 cm . long; upper leaves sessile or very nearly so; flowers about 1 mm . broad; pedicels slender, ascending or spreading, 6-12 mm. long in fruit; pods elliptic or oval, mostly obtuse or emarginate, $3-4 \mathrm{~mm}$. long. In moist ground, often in saline situations, Lab. to Br. Col., and widely distributed in the Pacific States. Also in Europe, Asia and Australia. June-Aug.

## 27. BÚRSA Weber.

Annual or winter-annual erect herbs, pubescent with forked hairs, the basal leaves tufted. Flowers racemose, small, white. Silicles cuneate, obcordate or triangular, compressed at right angles with the septum, their valves boat-shaped, keeled. Style short. Seeds numerous, marginless; cotyledons accumbent. [Middle Latin, purse, from the shape of the pod.] About 4 species, natives of the northern hemisphere. In addition to the following, another occurs in western N. Am.
I. Bursa Bursa-pastòris (L.) Britton. Shepherd's Purse. (I. F. ł. 1752.) Branching, I.5-5 dm. high from a deep root, pubescent below, mainly glabrous above. Basal leaves lobed, pinnatifid, or rarely entire, $5-15 \mathrm{~cm}$. long; stem-leaves few, lanceolate, auricled; flowers about 2 mm . long; pedicels $1-1.5 \mathrm{~cm}$. long in fruit; pods triangular, cuneate at the base, truncate or emarginate, $4-8 \mathrm{~mm}$. long; seeds 10 or 12 in each cell. In fields and waste places, very common. Nat. from Europe. Jan.-Dec.

## 28. CAMÉLiNA Crantz.

Erect annual herbs, with entire toothed or pinnatifid leaves, and small yellowish flowers. Silicles obovoid or pear-shaped, slightly flattened; valves very convex, I-nerved. Seeds oblong, marginless, in 2 rows. Stigma entire; style slender. Cotyledons incumbent. [Greek, low flax.] About 5 species, natives of Europe and Asia.

Glabrous or nearly so ; pod 6-8 mm. long.
Pubescent, at least below ; pod $4^{-6} \mathrm{~mm}$. long.
I. C. sativa.
2. C. microcarpa.
t. Camelina sativa (L.) Crantz. Gold-of-Pleasure. False Flax. (I. F. f. 1753.) Glabrous, or nearly so, 3-6 dm. high. Lowest leaves petioled, $5^{-8} \mathrm{~cm}$. long, lanceolate, acutish; upper leaves sessile, smaller, clasping by a sagittate base, mostly entire; pedicels slender, spreading or ascending, $1-2 \mathrm{~cm}$. long in fruit; flowers numerous, about 6 mm . long; pod obovoid or pyriform, margined, slightly flattened, $6-8 \mathrm{~mm}$. long; style slender, 3 mm . long. In fields and waste places, frequent or occasional throughout our area. Adventive or nat. from Europe. June-July.
2. Camelina microcàrpa Andrz: Small-fruited False-flax. (I. F. f. 1753a.) Stem pubescent, at least below. Leaves lanceolate, sessile, auricled, or the lower narrowed at the base; fruiting racemes much elongated, often 3 dm . long or more; pedicels relatively somewhat shorter than those of $C$. satiz' $\pi$ : pod rather more flattened, $4-6 \mathrm{~mm}$. long, strongly margined. In waste places. R. I. to W. Va., Idaho, Br. Col. and Kans. Nat. or adventive from Europe. May-Iuly.

## 29. NESLIA Desv.

Annual erect branching herbs, hispid with branched hairs, with entire leaves, and small yellow racemose flowers. Silicles small, globose, wingless, reticulated, indehiscent, I-celled, I-seeded or rarely 2 -seeded. Style filiform. Seds horizontal; cotyledons incumbent. [Dedicated to J. A. N. De Nesle, a French botanist.] A monotypic genus of Europe and eastern Asia.
I. Neslia paniculàta (L.) Desv. Ball Mustard. (I. F. f. 1754.) Slender. rather densely rough-hispid, 3-6 dm. high. Leaves lanceolate, sagittate-clasping at the base, $2-6 \mathrm{~cm}$. long, $4-16 \mathrm{~mm}$. wide; racemes clongated; flowers yellow. nearly 2 mm . broad; pedicels filiform, ascending. 0.10 mm . long in fruit; silicles about 2 mm . in diameter. In waste places, Ont., Manitoba and Br. Col., and in ballast about the eastern seaports. Adventive or fugitive from Europe. May-Scpt.

Rapístrum rugòsum (L.) All., a plant with 2 -jointed indehiscent pods, erect on appressed pedicels, in long racemes, has been found as a waif at Easton, Penn., and plentifully in ballast about the seaports. It is nearly related to Raphanus.

## 30 DRABA L.

Low tufted mostly stellate-pubescent herbs, with simple leaves, and mainly racemose flowers. Silicles elliptic, oblong or linear, flat, few to many-seeded. Stigma nearly entire. Seeds wingless, in 2 rows in each cell of the pod, numerous; valves dehiscent, nerveless; cotyledons accumbent. [Greek name for some plant of this family.] Species about 150, mainly natives of temperate and arctic regions. Besides the following, some 25 others occur in western N. Am.
Flowers white or whitish.
Petals deeply 2 -cleft.

1. D. verna.

Petals entire, toothed, or emarginate.
Flowering stems scapose, leafy only below.
Plants annual, not arctic.
Leaves entire, obovate or oblong. 2. D. Caroliniana.
Leaves dentate, cuneate to spatulate. 3. D. cuneifolia. Low arctic perennials.

Leaves pilose-ciliate or glabrous.
Leaves stellate-canescent.
4. D. Fladnizensis.
5. D. nivalis.

Flowering stems leafy throughout up to the inflorescence. Leaves entire or sparingly dentate. Leaves sharply dentate.
6. D. incana.
7. D. ramosissima.

Flowers yellow ; stems leafy. Pods oblong, $2-4 \mathrm{~mm}$. long. 8. D. brachycarpa. Pods linear or lanceolate, $6-14 \mathrm{~mm}$. long.

Annual ; pods 6-8 mm. long ; pedicels divaricately spreading.

Perennial ; pods 8-14 mm. long; pedicels erect.
Flowers yellow ; stems scapose.
9. D. nemorosa.
10. D. aurea.
II. D. alpina.

1. Draba vérna L. Vernal Whitlow-grass. (I. F. f. 1755.) Annual, the leafless scapes numerous, $2-13 \mathrm{~cm}$. high, arising from a tuft of basal leaves, which are oblong or spatulate-oblanceolate, $\mathbf{1}-2.5 \mathrm{~cm}$. long, acutish and pubescent with stellate hairs; flowers $3-4 \mathrm{~mm}$. broad; pedicels $\mathbf{1 - 2 . 5} \mathrm{cm}$. long in fruit; pods oblong, glabrous, $6-8 \mathrm{~mm}$. long, 2 mm . broad, obtuse, shorter than their pedicels; style minute; seeds numerous. In fields, common except in the extreme north. Nat. from Europe. Feb.-May.
2. Draba Caroliniàna Walt. Carolina Whitlow-grass. (I. F. f. 1756.) Annual; scapes $2-13 \mathrm{~cm}$. high from a short leafy stem. Leaves tufted, obovate, 8-20 mm. long, obtuse, entire or rarely with 3 or 4 teeth, pubescent with stellate hairs; scapes nearly glabrous ; flowers $3-4 \mathrm{~mm}$. broad; petals entire, sometimes wanting in the later flowers; pedicels $2-4 \mathrm{~mm}$. long in fruit; pods linear, $8-\mathbf{1 2} \mathrm{mm}$. long, nearly 2 mm . broad, glabrous; style none. In sandy fields, Mass. to Ont., Minn., Neb., Ga. and Ark. March-June.

Draba Caroliniàna micrántha (Nutt.) A. Gray. Differs from the type in the ap-pressed-hispid pods. Petals often wanting. Prairies, Ill. to Tex., N. Mex. and Wash.
3. Draba cuneifòlia Nutt. Wedge leaved Whitlow-grass. (I. F. f. 1757.) Annual, stellate-pubescent, I-2 dm. high, branching and leafy below. Leaves obovate, cuneate, or the lowest spatulate, $1-4 \mathrm{~cm}$. long, obtuse, dentate toward the apex; flowers 4 mm . broad ; petals emarginate, twice or thrice the length of the calyx: pedicels ascending or spreading, 4-8 mm . long in fruit; pods linear-oblong, obtuse, $8-10 \mathrm{~mm}$. long, 2 mm . wide, minutely hairy; style none. In fields, Ky. to Kans., Fla. and Cal. Feb.-April.
4. Draba Fladnizénsis Wulf. White Arctic Whitlow-grass. (I. F. f. 1758.) Tufted. Leaves oblanceolate, basal, rosulate, acutish, entire, stellatecanescent or with some simple hairs, ciliate or rarely nearly glabrous, $8-16 \mathrm{~mm}$. long; flowers whitish; scapes glabrous; pedicels ascending, $2-4 \mathrm{~mm}$. long in fruit; pods oblong, glabrous, 4-6 mm . long, nearly 2 mm . wide; style almost wanting. Gaspé, Quebec, and through arctic America, south in the Rocky Mts. to Colo. Also in arctic and alpine Europe and Asia. Summer.
5. Draba nivàlis Lilj. Yellow Arctic Whitlow-grass. (I. F. f. 1759.) Perennial by a short caudex; scapes tufted, pubescent, slender, $2-10 \mathrm{~cm}$. high, sometimes bearing a small sessile leaf. Basal leaves oblanceolate or spatulate, 4-14 mm. long, entire, acutish or acute at the apex, narrowed into a short petiole, stellate-canescent; flowers about 4 mm . broad; calyx pubescent; style short; pods oblong or linear-oblong, narrowed at both ends, glabrous or but little pubescent, on ascending pedicels $2-6 \mathrm{~mm}$. long. Lab, through arctic. America to Alaska, south in the Rocky Mts. to Colo., and in the Sierra Nevada to Nev. Also in northern Europe and Asia. Summer.
6. Draba incàna L. Hoary or Twisted Whitlow-grass. (I. F. f. 1760.) Perennial or biennial, leafy, stellate-pubescent, 1.5-3 dm. high. Leaves lanceolate, oblanceolate or ovate, $8-25 \mathrm{~mm}$. long, acutish or obtuse, dentate or nearly entire; flowers $2-3 \mathrm{~mm}$. broad; petals notched, twice as long as the calyx; pods oblong or lanceolate, acute, twisted when ripe, on short pedicels, densely pubescent or nearly glabrous; style minute. In rocky places, Vt., Quebec to arctic America, Br. Col., south in the Rocky Mts. to Colo. Also in arctic and alpine Europe and Asia. Summer.

Draba incàna arábisans (Michx.) S. Wats. Stem branched below, bearing tufts of spatulate narrow leaves; pods glabrous, twisted; style I mm. long. Me., Vt., and N. Y. to Lab., west along the Great Lakes to Minn. and Manitoba.
7. Draba ramosíssima Desv. Branching Whitlow-grass. (I. F. f. 1761.) Erect, much branched below, 1.5-3.5 dm. high, stellate-pubescent, the branches bearing tufts of leaves, the inflorescence corymbose-paniculate. Lower leaves spatulate or oblanceolate, $2-5 \mathrm{~cm}$. long, acute, dentate with spreading teeth; upper leaves oblong or ovate, similarly dentate; flowers white, $4-6 \mathrm{~mm}$. broad; petals entire or erose, twice or thrice the length of the sepals; pedicels $6-8 \mathrm{~mm}$. long in fruit; pods oblong or lanceolate, hairy, 6-8 mm . long, twisted; style slender, 2-4 mm . long. Mountains of Va., Ky., N. Car. and Tenn. April-May.
8. Draba brachycàrpa Nutt. Short-fruited Whirlow-Grass. (I. F. f. 1762.) Annual, tufted, $4-13 \mathrm{~cm}$. high, loosely stellate-pubescent, leafy. Basal leaves ovate or obovate, $8-12 \mathrm{~mm}$. long, obtuse, sparingly dentate or entire; stemleaves smaller, sessile, oblong, entire; pedicels $2-4 \mathrm{~mm}$. long in fruit; flowers yellow, 2 mm . broad; petals somewhat longer than the calyx, sometimes wanting; pods oblong, acute, $2-4 \mathrm{~mm}$. long, I mm. broad; style minute. Dry hills and fields, Va. to Ill., Kans., Ga. and La. March-May.
9. Draba nemoròsa L. Wood Whitlow-Grass. (I. F. f. I763.) Annual, loosely stellate-pubescent, $1.5-3 \mathrm{~cm}$. high, branching below, leafy. Leaves oblongovate, or lanceolate, obtuse, sessile, dentate, the lower $1-2.5 \mathrm{~cm}$. long, $\mathbf{I}-\mathbf{I} .5 \mathrm{~cm}$. wide, the upper smaller; flowers yellow, fading to whitish, 2 mm . broad; petals notched, slightly exceeding the calyx ; pedicels spreading in fruit, glabrous, 6-20 mm . long; pods pubescent, or nearly glabrous, oblong, obtuse, $6-8 \mathrm{~mm}$. long; style none. W. Ont., Mich. and Minn. to Ore., arctic Am. and in the Rocky Mts. Also in northern Europe and Asia. Summer.
10. Draba àurea Vahl. Golden Whitlow-grass. (I. F. f. 1764.) Perennial, pubescent with stellate and simple hairs; stem 1.5-2.5dm. high, leafy. Basal leaves oblanceolate or spatulate, $\mathbf{1 - 2 . 5} \mathbf{~ c m}$. long, slightly dentate or entire, often ciliate at the base ; stem-leaves oblong or lanceolate, acute; pods lanceolate or ob-long-lanceolate, $8-12 \mathrm{~mm}$. long; flowers yellow, 4 mm . broad; petals twice the length of the calyx; pods acute, pubescent or rarely glabrous, at length slightly twisted, $8-14 \mathrm{~mm}$. long, on erect pedicels; style $\mathbf{I} \mathrm{mm}$. long. Mignon İsland. Gulf of St. Lawrence, to Greenland; arctic Am. and in the Rocky Mits. south to Ariz. Summer.
II. Draba alpìna L. Alpine Whitlow-grass. (I. F. f. 1765.) Perennial by a branched caudex, densely tufted; scapes pubescent. I-I5 cm. high. Leaves basal, entire or few-toothed, oblong, or oblong-lanceolate, mostly narrowed at the base, ciliate, or villous-pubescent, sometimes with some stellate hairs. $4-12 \mathrm{~mm}$. long, sessile or short-petioled; flowers about 6 mm . broad; calyx pubescent or villous; style 1 mm . long or less; pod oval or ovate, narrowed at hoth ends. 5-S mm . long; pedicels $2-10 \mathrm{~mm}$. long. Hudson Bay to Br . Col. and Alaska. Also in northern Europe and Asia. Summer.

## 31. SOPHIA Adans.

Herbs (some exotic species shrubby), canescent or pubescent with short forked hairs, with slender stems, 2 -pinnatifid or finely dissected leaves, and small yellow flowers in terminal racemes. Calyx early deciduous. Style very short. Siliques linear or linear-oblong, the valves I-nerved. Seeds small, oblong, wingless; cotyledons incumbent. [Name in allusion to reputed medicinal properties.] About $\mathrm{I}_{5}$ species, natives of the north temperate zone, the Canary Islands, and the Andes of S. Am. Besides the following, another occurs in the southwestern U. S.

Pods narrowly linear, $1.5-2.5 \mathrm{~cm}$. long, I mm . wide, curved upward ; pedicels ascending. 1. S. Sophia.

Pods linear-oblong, $5-14 \mathrm{~mm}$. long, $\mathrm{r}-2 \mathrm{~mm}$. wide, straight or nearly so.
Densely and finely canescent: pedicels horizontal: pods ascending. 2. S. pinnata. Glabrate or somewhat canescent.

Pedicels and pods horizontal. 3. S. myriophylla.
Pedicels ascending or erect ; pods almost erect. Pedicels mostly longer than the pods.

Leaves oblong or oblanceolate in outline; terminal segment of the pinnae not very broad; style evident but short. 4. S. intermedia.
Lower leaves obovate in outline; terminal segment of the pinnae much broader than the others; style obsolete. 5. S. brachycarpa.
Pedicels shorter than or equalling the pods.
6. S. Hartwegiana.
I. Sophia Sòphia (L.) Britton. Flixweed. Herb-Sophia. (I. F. f. 1766.) Minutely hoary-canescent; stem usually much branched, 3-7.5 dm. tall. Leaves 2-3-pinnatifid into narrowly linear or linear-oblong segments; flowers numerous, about 6 mm . long; pedicels ascending, slender, $\mathbf{1 2 - 1 6 ~ m m}$. long, glabrous or nearly so; seeds in I row in each cell of the pod. In waste places, N. B. to Ont., N. Y., Ill. and Neb. Nat. from Europe. June-Aug.
2. Sophia pinnàta (Walt.) Britton. Tansy-Mustard. (I. F. f. 1767.) Densely canescent ; stem $2-6 \mathrm{dm}$. tall, the branches ascending. Leaves $5-10 \mathrm{~cm}$. long, oblong in outline, 2 -pinnatifid into numerous small obtuse segments; pedicels slender, spreading nearly or quite at right angles to the axis, $10-14 \mathrm{~mm}$. long, usually longer than the pods; flowers $2-3 \mathrm{~mm}$. broad; pods ascending, oblong or linear-oblong, $6-8 \mathrm{~mm}$. long, 2 mm . wide; style minute; seeds in 2 rows in each cell. In dry soil, Va. to Fla. and Tex. May-July.
3. Sophia myriophylla (DC.) Rydb. Southern Tansy-Mustard. Generally taller and less leafy than the preceding, with broader leaves, oval in outline, less dissected, very thin; whole plant almost perfectly glabrous; pedicels 15-20 mm . long; pods club-shaped, less than 1 cm . long; style short; seeds in 2 rows. [Sisymbrium myriophyllum DC.] Ky. to Tex. May-June.
4. Sophia intermédia Rydb. Western Tansy-Mustard. (I. F. f. 1768.) Resembles S.pinnata, but is greener, nearly glabrous, or the pubescence mixed with short glandular hairs. Leaves pinnately divided, and the pinnae r-2-pinnatifid into linear-oblong entire or toothed segments; fruiting pedicels widely ascending, 1-2 $\mathbf{c m}$. long, usually longer than the pods; pods $8-\mathbf{1} 4 \mathrm{~mm}$. long, about 2 mm . thick, almost erect; seeds in I row. In dry soil, Minn. to the N. W. Terr., Br. Col., Tenn., Kans., Tex. and Cal. Has been mistaken for S. pinnata and S. incisa. May-Aug.
5. Sophia brachycarpa (Richards.) Rydb. Northern Tansy-Mustard. In general habit and form of the leaves closely resembling S. Sophia, but the leaf segments are shorter, broader and more obtuse; pods short, clavate, $5-8 \mathrm{~mm}$. long, with an obsolete style [Sisymbrium brachycarpon Richardson]. Canada (Pursh: and Presque Isle, Mich. (Houghton), to Assiniboia and northward. May-July.
5. Sophia Hartwegiàna (Fourn.) Greene. Hartweg's Tansy-Mustard. (I. F. f. 1769.) Minutely canescent or puberulent; stem 3-6 dm. tall. Leaves pinnately divided into 5-7 pinnae, which are pinnatifid, with obtuse segments and lobes; fruiting pedicels erect-appressed, $3-8 \mathrm{~mm}$. long, shorter than or equalling the pods; pods erect or nearly so, linear, $8-10 \mathrm{~mm}$. long, about $\mathbf{I} \mathrm{mm}$. thick; seeds in I row. In dry soil, Minn. to the N. W. Terr., Ore., Utah, Mex. and Cal. May-July.

## 32. STENOPHRAGMA Celak.

Herbs with the aspect of some species of Arabis, pubescent with forked hairs, with slender stems, and small white flowers in terminal racemes. Style very short; stigma 2-lobed. Siliques narrowly linear, dehiscent, the valves rounded, nerveless. Seeds in I row in each cell in the following species, in some European species in 2 rows; cotyledons incumbent. [Greek, narrow septum.] About io species, natives of Europe and Asia, the following are annual weed.
I. Stenophragma Thàliana (L.) Celak. Mouse-Ear Cress. (I. F. f. 1770.) Stem erect, $2-40 \mathrm{~cm}$. high, freely branching, pubescent, especially below. Basal leaves $2-5 \mathrm{~cm}$. long, obtuse, oblanceolate or oblong, narrowed into a petiole, entire or slightly toothed; stem-leaves smaller, sessile, often entire; pedicels slender, spreading or ascending, $4-8 \mathrm{~mm}$. long in fruit; flowers white, about 3 mm . long; petals about twice the length of the sepals; pods $8-20 \mathrm{~mm}$. long, acute, often curved upward, glabrous. In sandy fields and rocky places, Mass. and S. Ont. to Minn., Ga. and Mo. Nat. from Europe. April-May.

## 33. ÁRABIS L.

Glabrous or pubescent herbs, with white or purple flowers. Siliques linear, elongated, flat; valves smooth, keeled or ribbed, mostly i-nerved, not elastically dehiscent. Seeds in 1 or 2 rows in each cell, flattened, winged; cotyledons accumbent. [Name from Arabia.] About 80 species, mainly natives of the northern hemisphere. In addition to the following, about 26 others occur in the northern and western parts of the continent.
Seeds in 1 row, or in 2 incomplete rows in each cavity of the pod.
Basal leaves pinnatifid; pods ascending.
Seeds about 2 mm . broad, orbicular, wing-margined ; stem-leaves pinnatifid.

1. A, Virginica.

Seeds minute, oblong, wingless ; stem-leaves entire, or dentate.
2. A. lyrata.

Leaves small, mostly entire ; pods drooping ; seeds oblong, wingless; arctic.

Basal leaves merely dentate or lyrate.
Seeds minute, oblong, wingless.
Seeds larger, oblong, winged or margined.
Pods curved upward, nearly 2 mm . broad.
Pods nearly erect, 1 mm . broad.
Flowers white, 8 mm . broad ; pods not appressed ; style 1 mm . long. 6. A. patens.

Flowers white or greenish-white, $4^{-6} \mathrm{~mm}$. broad ; pods appressed ; style none.
Pods recurved-spreading.
Plant glabrous throughout.
Leaves and lower part of stem hairy.
Seeds in 2 distinct rows in each cavity of the pod. Pods spreading or ascending; seeds winged. Pods erect, appressed ; seeds wingless or narrowly winged. Pods reflexed; seeds winged.
3. A. arenicola.
4. A. dentata.
5. A. alpina. 7. A. hirsuta.
8. A. laevigata.
9. A. Canadensis.
10. A. brachycarpa.
11. A. glabra.
12. A. Holboellii.
i. Arabis Virgínica (L.) Trelease. Virginia Rock-cress. (I. F. f. i77ı.) Annual or biennial, diffuse, glabrate; stems ascending, 1.5-3 dm. high. Leaves oblong, narrow, deeply pinnatifid, $2-8 \mathrm{~cm}$. long, the lower petioled, the upper nearly sessile, sometimes reduced to lobed or entire bracts; pedicels 4 mm . long in fruit; flowers very small, white; pods linear, ascending, $1.5-2.5 \mathrm{~cm}$. long, about 2 mm . broad; seeds nearly as broad as the pod. In open places, Va. and Ky. to Kans., Fla. and Tex., west to Lower Cal. March-May.
2. Arabis lyràta L. Lyre-leaved Rock-cress. (I. F. f. 1772.) Tufted, perennial or biennial, erect, I-3 dm. high, glabrous, or pubescent below. Basal leaves lyrate-pinnatifid, $2-5 \mathrm{~cm}$. long, spatulate or oblanceolate: stem-leaves spatulate or linear, $\mathbf{I}-2.5 \mathrm{~cm}$. long; pedicels $6-8 \mathrm{~mm}$. long in flower; flowers white, $6-\mathrm{S}$ mm . broad; petals much exceeding the calyx; pods $1.5-3 \mathrm{~cm}$. long. linear, less than 2 mm . broad, their valves firm, nerved; style 1 mm . long; seeds 0.5 mm . long. Rocky and sandy places, Ont. to Va., Tenn., Manitoba and Mo, AprilSept.

Arabis lyràta occidentalis S . Wats. Valves of the pod thin, faintly nerved; stigma sessile or very nearly so. Lake Erie; Br. Col. to Alaska.
3. Arabis arenícola (Richards.) Gelert. Arctic Rock Cress. (I. F. f. 1773.) Perennial, pubescent below, or glabrous; stems diffuse or ascending, 0.7-1.5 dm. long. Leaves spatulate or oblong, nearly entire, $8-\mathrm{r} 6 \mathrm{~mm}$. long, the lower petioled; flowers purplish or white, about 6 mm . broad; style very short; pods linear, flat, at length drooping, $1.5-2.5 \mathrm{~cm}$. long, rather more than $\mathbf{I} \mathrm{mm}$. wide, the valves very faintly nerved; seeds in 2 incomplete rows in each cell; cotyledons imperfectly accumbent. Greenland and Lab, to Hudson Bay and the N. W. Terr. Summer. [A. humifusa S. Wats.]
4. Arabis dentàta T. \& G. Toothed Rock-cress. (I. F. f. 1774.) Slender, 3-6 dm. high, finely rough-pubescent. Basal leaves with margined petioles, obovate, dentate, $5-10 \mathrm{~cm}$. long, obtuse; stem-leaves sessile, clasping by an auricled base, dentate ; pedicels $2-4 \mathrm{~mm}$. long; flowers greenish white, $2-4 \mathrm{~mm}$. broad, the petals hardly exceeding the calyx : pods narrowly linear, $2-3 \mathrm{~cm}$. long, spreading ; style almost none. W. N. Y. to Minn., Tenn., Mo. and Kans. April-June.
5. Arabis alpina L. Alpine Rock cress. (I. F. f. 1775.) Densely and finely pubescent, $\mathbf{I}-3 \mathrm{dm}$. high. Basal leaves $2-5 \mathrm{~cm}$. long, obovate or spatulate, obtuse, dentate, on margined petioles; stem-leaves ovate, sessile, clasping by an auricled base, dentate; flowers white, $4-6 \mathrm{~mm}$. broad; petals much exceeding the calyx; pedicels 8 mm . long in fruit; pods $2-4 \mathrm{~cm}$. long, curved upward. narrowly linear, 2 mm . broad. Quebec to Lab. and Alaska. Europe and Asia. Summer.
6. Arabis patens Sulliv. Spreading Rock-cress. (I. F. f. 1776.) Erect, 3-6 dm. high, pubescent at least below. Basal leaves dentate, $2-8 \mathrm{~cm}$. long, on margined petioles; stem-leaves $2-5 \mathrm{~cm}$. long, ovate or oblong, acute or acutish, sessile, dentate or nearly entire, partly clasping; pedicels $12-16 \mathrm{~mm}$. long in fruit; pods $2-4 \mathrm{~cm}$. long, I mm. broad, not appressed. E. Penn. to Minn., Ala. and Mo. Summer.
7. Arabis hirsùta (L.) Scop. Hairy Rock-cress. (I. F. f. 1777.) Stem erect, 3-6 dm. high. Basal leaves with margined petioles, obovate or spatulate, obtuse, dentate or repand, $2-5 \mathrm{~cm}$. long : stem-leaves sessile, clasping, lanceolate or oblong ; pedicels nearly erect, 6-12 mm. long in fruit; pods narrowly linear, erect, $2-5 \mathrm{~cm}$. long, about I mm . wide; seeds 1 -rowed, or when young obscurely 2 -rowed, oblong or nearly orbicular. In rocky places, N. B. to Br. Col., Ga., Ariz. and Cal. Also in Europe and Asia. May-Sept.
8. Arabis laevigàta (Muhl.) Poir. Smooth Rock-cress. (I. F. f. 1778.) Glaucous, glabrous, 3-9 dm. high. Basal leaves petioled, spatulate or obovate, sharply dentate, $5-8 \mathrm{~cm}$. long ; stem-leaves sessile, lanceolate, or the upper linear, acute, clasping by an auricled or sagittate base; pedicels $8-10 \mathrm{~mm}$. long in fruit ; petals nearly twice the length of the calyx; pods $7-10 \mathrm{~cm}$. long, 2 mm . wide, re-curved-spreading; seeds broadly winged; style almost none. In rocky woods, Quebec to Minn., Kans., Ga. and Ark. April-May.

Arabis laevigàta laciniàta T. \& G. Stem-leaves deeply and narrowly laciniate-toothed Ky.

Arabis laevigàta Búrkii Porter. Leaves linear or lanceolate, elongated, entire or sparingly toothed, not auricled at the base; flowers one-half the size of the type; petals equalling the sepals. Penn. to N. Car.
9. Arabis Canadénsis L. Sickle-pod. (I. F. f. 1779.) Stem 3-9 dm. high, pubescent below. Basal leaves narrowed into a petiole, dentate or lyrately lobed, $7-\mathrm{I} 6 \mathrm{~cm}$. long; stem-leaves sessile, lanceolate or oblong, narrowed at each end, toothed, or the upper entire, pubescent ; pedicels spreading or recurved and $8-12 \mathrm{~mm}$. long in fruit ; petals twice as long as the calyx; pods $5-9 \mathrm{~cm}$. long, 3 mm . broad, scythe-shaped, pendulous; style almost none. In woods, Ont. to N. H., Ga., Minn., Kans. and Tex. June-Aug.
10. Arabis brachycàrpa (T. \& G.) Britton. Purple Rock-Cress. (I. F. f. 1780.) Glaucous, generally purplish, glabrous except at the base, 3-9 dm. high. Basal leaves stellate-pubescent, obovate or spatulate, $2-8 \mathrm{~cm}$. long, dentate, narrowed into a petiole; stem-leaves sessile, auricled, lanceolate or oblong-linear, entire or with a few teeth; pedicels $6-10 \mathrm{~mm}$. long in fruit; flowers white or pink, 8 mm . broad; petals twice the length of the calyx; pods narrowly linear, nearly
straight, $2-8 \mathrm{~cm}$. long, 2 mm . wide, spreading or ascending. Quebec to Manitoba, the N. W. Terr., Mass., N. Y., Ill. and Minn. June-July.
II. Arabis glàbra (L.) Bernh. Tower Mustard. (I. F. f. 178ı.) Glabrous, glaucous above, pubescent at the base, 6-12 dm. high. Basal leaves petioled, $0.5-2.5 \mathrm{dm}$. long, oblanceolate or oblong, dentate or sometimes lyrate, hairy; stem-leaves sessile, with a.sagittate base, glabrous, lanceolate or oblong, acutish; pedicels $4-12 \mathrm{~mm}$. long, erect; flowers yellowish-white, 4 mm . broad; petals slightly exceeding the calyx; pods narrowly linear, $5-8 \mathrm{~cm}$. long, I mm . wide, erect and appressed; style none. In fields and rocky places, Quebec to S . N. Y., Penn., west to the Pacific Coast. Also in Europe and Asia. May-Aug.
12. Arabis Holboèllii Hornem. Holboell's Rock-cress. (I. F. f. 1782.) Erect, 2-6 dm. high. Lower leaves spatulate or oblanceolate, tufted, petioled, I-5 cm. long, obtuse, entire or sparingly toothed; stem-leaves sessile, erect, clasping; pedicels reflexed or the upper ascending, 6-10 mm . long in fruit; flowers purple or whitish, $6-8 \mathrm{~mm}$. long; petals twice the length of the calyx; pods linear, $2-5 \mathrm{~cm}$. long, slightly more than 1 mm . wide, reflexed; style very short or none. Manitoba and Arctic Am. to Neb., N. Mex. and Cal. Summer.

## 34. ERÝSIMUM L.

Annual or biennial herbs, more or less pubescent or hoary, with simple leaves. Flowers mostly yellow. Siliques elongated, linear, 4 -angled or rarely terete; valves strongly keeled by a prominent midvein. Stigma lobed. Seeds oblong, in I row in each cell, marginless or narrowly margined at the top; cotyledons incumbent. [Greek, name of a garden plant, meaning, perhaps, blister-drawing.] About 85 species, natives of the north temperate zone. In addition to the following, 2 others are found in the Rocky Mts. and one on the Californian coast.
Flowers 4-8 mm. high.
Pedicels slender, spreading ; pods very narrow, $1-2.5 \mathrm{~cm}$. long.
I. E. cheiranthoides.

Pedicels stout, short ; pods $1.5-5 \mathrm{~cm}$. long.
Pods $2-5 \mathrm{~cm}$. long, less than 2 mm . thick; plant green, appressed-pubescent.
2. E. inconspicuит.

Pods $1.5-3.5 \mathrm{~cm}$. long, about 2 mm . thick ; plant pale, appressed-canescent.
3. E. syrticolum.

Flowers $16-25 \mathrm{~mm}$. high, conspicuous.
Stem-leaves linear, grayish strigose ; pods widely spreading. 4. E. asperum.
Stem-leaves lanceolate, green ; pods less spreading.
5. E. Arkansanum.

## I. Erysimum cheiranthoìdes L. Worm-seed or Treacle Mustard.

 (I. F. f. I783.) Minutely rough-pubescent, 2-6 dm. high. Leaves lanceolate or oblong-lanceolate, $2-10 \mathrm{~cm}$. long, entire or slightly dentate, tapering into a short petiole or the upper sessile; pedicels spreading or somewhat ascending, $6-8 \mathrm{~mm}$. long in fruit; flowers about 5 mm . high; pods linear, obtusely 4 -angled, glabrous, $\mathbf{I}-2.5 \mathrm{~cm}$. long, less than 2 mm . broad, nearly erect on spreading pedicels; style I mm. long. Along streams and in fields, Newf. to Br. Col., Tenn. Also in northern Europe. June-Aug.2. Erysimum inconspícuum (S. Wats.) MacM. Small Erysimum. (I. F. f. 1784.) Roughish puberulent; stem 3-6 dm. tall. Leaves oblanceolate or linear, $2-8 \mathrm{~cm}$. long, obtuse, entire or dentate, the upper sessile, the lower slenderpetioled; flowers about 8 mm . high; pedicels stout, about 4 mm . long in fruit, ascending; pods narrowly linear, minutely rough-puberulent, ascending or erect; style very stout, $\mathbf{1 - 2} \mathrm{mm}$. long. In dry soil, Ont. and Minn. to Manitoba, Alaska, Kans., Colo. and Nev. July-Aug.
3. Erysimum syrtícolum Sheldon. Sand Erysimum. (I. F. f. 1785.) Similar to the preceding, but pale and finely appressed-canescent, the stems $3-8$ dm. tall. Leaves firm, linear-lanceolate, entire or denticulate, early falling away; stigma conspicuously 2 -lobed; style less than 2 mm . long; pods linear, erect or nearly so on ascending pedicels; seeds oblong, I mm. long. On dry sandy banks, Minn. to the N. W. Terr. July-Aug.
4. Erysimum ásperum DC. Western Wall-flower. (I. F. f. 17 S6.) Rough-pubescent or hoary, 2-5 dm. high. Lower leaves lancenlate or oblancenlate, tapering into a petiole, dentate or sometimes entire; upper leaves sessile or nearly
so, entire or rarely toothed; flowers orange-yellow, $\mathbf{1 2 - 2 0} \mathbf{~ m m}$. high and nearly as broad; pedicels stout, spreading, $4-6 \mathrm{~mm}$. long in fruit; pods linear, rough, $5-8 \mathrm{~cm}$. long, nearly 2 mm . wide, 4 -sided; style short, thick. Dry plains, Ark. to Minn., Cal. and the N. W. Terr. May-July.
5. Erysimum Arkansànum Nutt. Yellow Phlox. Taller and greener than the preceding, $6-10 \mathrm{dm}$. high, with a more leafy and branched stem, slightly strigose with branched hairs; flowers $20-25 \mathrm{~mm}$. high ; pod linear, tapering at the summit, about I dm. long. Open places, Ohio and Ill. to Tex. May-June.

## 35. ALÝSSUM L.

Low stellate-pubescent herbs, with small racemose yellow or yellowish flowers. Petals entire. Filaments often dilated and toothed or appendaged. Silicle ovate, oblong or orbicular, compressed, its valves nerveless, the septum thin. Stigma nearly entire. Seeds I-8 in each cell, wingless; cotyledons accumbent. [Greek, curing madness.] About ioo species, natives of the Old World.
r. Alyssum alyssoides (L.) Gouan. Yellow or Small Alyssum. (I. F. f. 1787.) Densely stellate-pubescent, tufted, o.7-2.5 dm. high. Leaves linearoblong or spatulate, narrowed at the base, obtuse, entire, $0.6-3 \mathrm{~cm}$. long; flowers 2 mm . broad ; pedicels 4 mm . long in fruit; pods orbicular, 3 mm . in diameter, margined, minutely pubescent, notched, tipped with the minute style; sepals persisting around the base of the pod; seeds 2 in each cell. In fields, Ont. to N. H., N. Y., N. J. and Iowa, and in ballast about the seaports. Also in the Far West. Nat. or adventive from Europe. Summer.

## 36. KÒNIGA Adans.

Perennial herbs or shrubs, pubescent or canescent with forked hairs, with entire leaves, and small white flowers in terminal racemes. Petals obovate, entire. Filaments slender, not toothed, but with two small glands at the base. Silicle compressed, oval or orbicular. Seeds $\mathbf{I}$ in each cell. Cotyledons accumbent. [Name in honor of Charles Konig, a curator of the British Museum.] About 4 species, natives of the Mediterranean region.
i. Koniga maritima (L.) R. Br. Sweet Alyssum. Seaside Koniga. (I. F. f. 1788.) Procumbent or ascending, $1-3 \mathrm{dm}$. high, minutely pubescent. Stem-leaves nearly sessile, lanceolate or linear, $\mathrm{I}-5 \mathrm{~cm}$. long ; basal leaves oblanceolate, narrowed into a petiole; flowers fragrant, about 4 mm . broad; pedicels 6 8 mm . long in fruit; pods glabrous, pointed, $2-3 \mathrm{~mm}$. long; calyx deciduous; stamens not appendaged. In waste places, occasional. Escaped from gardens. Adventive from Europe. Summer.

## 37. BERTEROA DC.

Herbs, pubescent or canescent with forked hairs, the leaves mostly narrow and entire, and the flowers white or yellow in terminal racemes. Petals 2-cleft. Filaments 2 -toothed at the base. Silicles oblong or subglobose, little compressed. Seeds several in each cell; cotyledons accumbent. [In honor of C. G. Bertero, a botanist of Piedmont, 1739-183I.] About 5 species, natives of Europe and Asia.

1. Berteroa incàna (L.) DC. Hoary Alyssum. (I. F. f. 1789.) Erect or ascending, 3-6 dm. high, hoary-pubescent. Leaves lanceolate or oblong, I-4 cm. long, obtuse, entire or slightly undulate; flowers white, $2-3 \mathrm{~mm}$. broad; pedicels 4-6 mm. long in fruit; pod pubescent, oblong, $6-8 \mathrm{~mm}$. long; cells several-seeded; style $2-3 \mathrm{~mm}$. long. In waste places, Me. to Ont., Minn., N. J., and Mo. Adventive or nat. from Europe. Racemes elongating, the flowers and pods very numerous. June-Sept.

## 38. HÉSPERIS L.

Erect perennial or biennial herbs, pubescent with forked hairs, with simple leaves and large racemose purple or white flowers. Stigma with 2 erect lobes. Siliques elongated, nearly cylindric, the valves keeled, dehiscent. I-nerved. Seeds in I row in each cell, globose, wingless; cotyledons incumbent. [Name from Hesperus, evening, when the flowers are most fragrant.] About 20 species, natives of Europe and Asia,

1. Hesperis matronàlis L. Dame's Rocket or Dame's Violet. (I. F. f. 1790.) Erect, 6-9 dm. high, pubescent. Lower leaves 1-2 dm. long, tapering into a petiole, ovate or ovate-lanceolate, acute, dentate with minute teeth, pubescent on both sides; upper leaves smaller, sessile or short-petioled; flowers 1.5-2.5 cm . broad; blade of the petals spreading ; pods $5-10 \mathrm{~cm}$. long, spreading or ascending, contracted between the seeds when ripe. In fields and along roadsides, Me, to Penn. and Iowa. Native of Europe and Asia. May-Aug.
2. CONRÍNGIA Link.

An erect glabrous annual herb, with elliptic or ovate entire leaves, sessile and cordate at the base, and middle-sized yellowish white flowers in terminal racemes. Sepals and petals narrow, Style 2-lobed or entire. Siliques elongated-linear, angled, the valves firm, I-3-nerved. Seeds in I row in each cell, oblong, marginless; cotyledons incumbent. [In honor of Hermann Conring, 1606-1681, Professor at Helmstädt.]

1. Conringia orientàlis (L.) Dumort. Hare’s-ear. Treacle Mustard. (I. F. f. 1790a.) Stem 3-9 dm. high. Leaves light green, obtuse, $5-13 \mathrm{~cm}$. long; racemes elongating in fruit; pedicels $8-16 \mathrm{~mm}$. long; petals about 1.2 cm . long, nearly twice as long as the sepals; pods $7-13 \mathrm{~cm}$. long, about 2 mm . wide, 4 -angled, spreading. In waste places, Mich. and Minn. to the N. W. Terr., and on the Atlantic Coast from N. B. to Penn.

## Family 3. CAPPARIDÀCEAE Lindl.

## Caper Family.

Herbs or shrubs (rarely trees), with alternate or very rarely opposite leaves, and regular or irregular, mostly perfect flowers. Sepals 4-8. Petals 4 (rarely none). Receptacle elongated or short. Stamens $6-\infty$, not tetradynamous, inserted on the receptacle; anthers oblong. Style generally short, ovules $\infty$, on parietal placentae. Fruit a capsule or berry. Seeds mainly reniform in our species; endosperm none; embryo generally coiled. About 35 genera and 400 species, mostly of warm regions.
Pod long-stipitate on its pedicel.
Pod linear-elongated; petals generally clawed.
Petals entire.

1. Cleome.

Petals laciniate.
Pod short, rhomboid ; petals sessile.
2. Cristatella.

Pod nearly or quite sessile on its pedicel.
3. Cleomella.

## r. CLEOME L.

Herbs or low shrubs. Leaves digitately $3-5$-foliolate, or simple. Flowers mostly racemose. Calyx 4 -divided or of 4 sepals, often persistent. Petals 4 , cruciate, nearly equal, entire, more or less clawed. Receptacle short, slightly prolonged above the petal-bases. Stamens 6 (rarely 4), inserted on the receptacle. Ovary stalked, with a gland at its base. Capsule elongated, many-seeded. [Derivation uncertain.] About 75 species, mainly natives of tropical regions, especially American and African. In addition to the following, 4 others occur in the western part of the United States.
Leaves 3 -foliolate; flowers pink, or white. 1. C. serrulata.
Leaves, at least the lower, 5-7-foliolate.
Flowers pink, or white. 2. C. spinosa.
Flowers yellow.
2. C. Spinosa
I. Cleome serrulàta Pursh. Pink Cleome. (I. F. f. 170I.) Erect. glabrous, 6-9 dm. high. Leaves 3 -foliolate, the lower slender-petioled, the upper sessile or nearly so; leaflets lanceolate or oblong, acute, entire or distantly serrulate, $2-8 \mathrm{~cm}$. long; bracts lanceolate or linear; pedicels spreading or recurved, 1-2 cm . long in fruit; stipe of the pod about equalling the pedicel; petals oblong, slightly clawed, $10-12 \mathrm{~mm}$. long, obtuse; pods linear, acute, $2-5 \mathrm{~cm}$, long.

Prairies, Ill. to Minn., the Canadian Rocky Mts., Kans., N. Mex. and Ariz. Nat. from the west in its eastern range. July-Sept.
2. Cleome spinòsa L. Spider-flower. (I. F. f. 1792.) Erect, 6-12 dm. high, clammy-pubescent. Leaves $5-7$-foliolate, the lower long-petioled, $\mathbf{1}-\mathbf{2} \mathrm{dm}$. in diameter, the upper passing into the simple bracts of the raceme; petioles spiny at the base; leaflets lanceolate, acute, serrulate; flowers long-pedicelled, purple or whitish, $2-3 \mathrm{~cm}$. broad; petals obovate, long-clawed; stipe of the linear glabrous pod at length $5-15 \mathrm{~cm}$. long; stamens often long-exserted. In waste places, S . N. Y. to Fla., Ill. and La. Adventive from tropical America. Summer.
3. Cleome lùtea Hook. Yellow Cleome. (I. F. f. I793.) Erect, glabrous, 4-10 dm. high. Leaves 5 -foliolate, slender-petioled, or the upper 3 -foliolate and nearly sessile; leaflets oblong or oblong-lanceolate, entire, short-stalked or sessile, $1-5 \mathrm{~cm}$. long; bracts linear-oblong, mucronate; pedicels slender, $10-12 \mathrm{~mm}$. long; flowers yellow; petals about I cm. long; pod linear, $3-8 \mathrm{~cm}$. long, acute, borne on a stipe becoming longer than the pedicel. In dry soil, Neb. to Wash. and Ariz. June-Sept.

## 2. CRISTATÉLLA Nutt.

Annual viscid glandular-pubescent herbs, with digitately 3 -foliolate leaves, and small white or yellowish flowers in terminal bracted racemes. Sepals spreading, slightly united at the base. Petals 4, laciniate or fimbriate at the summit, borne on long slender claws, the two lower smaller than the two upper. Receptacle short, with a short petaloid nectary between the ovary and the upper sepal. Stamens 6-14; filaments slender, declined. Ovary stalked, also declined. Capsule linear, nearly terete, many-seeded. [Diminutive of cristatus, crested.] Two species, natives of the south-central U. S.
I. Cristatella Jàmesii T. \& G. James' Cristatella. (I. F. f. 1794.) Erect, I.5-4 dm. high. Leaves slender-petioled; leaflets nearly sessile, linear or linear-oblong, entire, obtuse, $8-25 \mathrm{~mm}$. long; flowers slender-pedicelled; bracts mostly 3 -foliolate; claws of the larger petals $3-5 \mathrm{~mm}$. long; pod much longer than its stipe and somewhat longer than the pedicel. In dry soil, Neb. to La. and Tex. June-Dec.

## 3. cleomélla DC.

Annual glabrous herbs, with small yellow flowers and 3-foliolate leaves. Calyx of 4 sepals. Petals 4 , sessile, not clawed. Receptacle short, glandless. Stamens 6 , inserted on the receptacle. Ovary short, long-stalked. Capsule short, rhomboid or trapezoid, often broader than long, 4-10-seeded. [Diminutive of Cleome.] About 8 species, natives of southwestern N. Am. and Mex.
I. Cleomella angustifòlia Torr. Northern Cleomella. (I. F. f. 1795.) Branching above, 3-5 dm. high. Leaflets linear-lanceolate or linear-oblong ; bracts
 rhomboid, $4-6 \mathrm{~mm}$. broad, pointed, raised on a slender stipe $4-8 \mathrm{~mm}$. long, its valves almost conic; placentae persistent after the valves fall away, each bearing about 3 seeds. Prairies, Neb. and Colo. to Tex. and N. Mex. Summer.

## 4. POLANÍSIA Raf.

Annual herbs, mainly glandular-pubescent, with whitish or yellowish flowers, and palmately compound or rarely simple leaves. Sepals 4, lanceolate, deciduous. Petals slender or clawed. Receptacle depressed, bearing a gland at the base of the ovary. Stamens $8-\infty$, unequal. Pod nearly or quite sessile, elongated, cylindric or compressed, its valves dehiscent from the summit. Seeds rugose or reticulated. [Greek, very unequal, referring to the stamens.] About 14 species, of temperate and tropical regions.
Stamens equalling or slightly exceeding the petals; flowers $4-6 \mathrm{~mm}$. long.
$\begin{array}{ll}\text { Stamens much exceeding the petals; flowers } 8-12 \mathrm{~mm} \text {. long. } & \text { I. P. graveolens. } \\ \text { 2. P. trachysperma. }\end{array}$

1. Polanisia gravèolens Raf. Clammy-weed. (I. F. f. 1796.) Viscid, $\mathbf{1}-4.5 \mathrm{dm}$. high. Leaves 3 -foliolate, slender-petioled; leaflets oblong, obtuse, entire, $\mathbf{I}-2.5 \mathrm{~cm}$. long; sepals purplish. slightly unequal; petals cuneate, emarginate or obcordate ; stamens $9 \mathbf{- 1 2}$, purplish, equalling or slightly exceeding the petals;
style about 2 mm . long; pod lanceolate-oblong, slightly compressed, $2-4 \mathrm{~cm}$. long, $6-8 \mathrm{~mm}$. wide, slightly stipitate, rough, reticulated; seeds rough. Sandy and gravelly shores, Quebec to Manitoba, the N. W. Terr., N. Y., Penn., Kans. and Colo. Summer.
2. Polanisia trachyspérma T. \& G. Large-flowered Clammy-weed. (I. F. f. 1797.) Similar to the last, but flowers twice the size; style $4-6 \mathrm{~mm}$. long; stamens much exserted; filaments purple, conspicuous; pod slightly larger, nearly or quite sessile. Prairies, Iowa to Tex., Br. Col., Nev. and Ariz. Summer.

## Family 4. RESEDÀCEAE S. F. Gray. Mignonette Family.

Herbs, rarely woody, with alternate or fascicled leaves, gland-like stipules and racemose or spicate, bracted flowers. Flowers unsymmetrical. Calyx 4-7-parted, inequilateral. Petals generally 4-7, hypogynous. Disk fleshy, hypogynous, I-sided. Stamens 3-40; filaments generally unequal. Ovary I, compound, of 3-6 carpels; styles or sessile stigmas $3-6$; ovules $\infty$. Fruit capsular in all but I genus. Seeds reniform, without endosperm ; cotyledons incumbent. Six genera and about 65 species, natives of the Old World.

## r. RESEDA L.

Herbs, with small spicate or narrowly racemose flowers. Petals $4-7$, toothed or cleft. Disk cup-shaped, glandular. Stamens 8-30, inserted on one side of the flower and on the inner surface of the disk. Capsule 3-6-lobed, horned, opening at the top. [Ancient Latin name.] About 55 species, natives of the Old World.
Leaves entire; upper petals lobed, the lower entire.

1. R. Luteola. Leaves lobed or pinnatifid.

Petals greenish-yellow, 3 or 4 of them divided. 2. R. lutea.
Petals white, all of them cleft or divided.
3. R. alba.

1. Reseda Lutèola L. Dyer's Rocket. Yellow-weed. (I. F. f. 1798.) Glabrous, erect, $3-8 \mathrm{dm}$. high. Leaves lanceolate or linear, entire, obtuse, sessile or the lower narrowed into petioles; flowers greenish-yellow, $2-4 \mathrm{~mm}$. broad, in long narrow spikes; sepals 4 ; petals 4 or 5 , very unequal; capsule globose, 4-6 mm . in diameter, with 3 or 4 apical teeth and 6-8 lateral ridges. In waste places, N. Y., and in ballast about the seaports. Adventive from Europe. Summer.
2. Reseda lùtea L. Yellow Cut-leaved Mignonette. (I. F. f. 1799.) Ascending or decumbent. Leaves $5-10 \mathrm{~cm}$. long, broadly ovate or oblong in outline, deeply lobed or divided, sometimes pinnatifid, their segments linear or oblong, obtuse; flowers greenish-yellow, 4-6 mm. broad; pedicels about 4 mm . long in fruit; petals 6 or 5, all but the lowest irregularly cleft; capsule oblong, about 8 mm . long, $3-4 \mathrm{~mm}$. wide, with 3 or rarely 4 short teeth. In waste places, Mass. to N. J. and Mich., and in ballast about the seaports. Adventive from Europe. Summer.
3. Reseda álba L. White Cut-leaved Mignonette. (I. F. f. i8oo.) Erect, somewhat glaucous, 3-9 dm. high. Leaves pinnate or deeply pinnatifid, the segments 9-12, linear or lanceolate, obtusish, $8-25 \mathrm{~mm}$. long; flowers nearly or quite white, $4-6 \mathrm{~mm}$. broad, in dense spike-like racemes; petals 6 or 5 . 3 -cleft at the summit; capsule ovoid-oolong, usually 4 -toothed, $10-12 \mathrm{~mm}$. long. In waste places, Conn., N. Y., Ohio, in ballast about the eastern seaports and in Br . Col. Adventive from S. Europe. July-Aug.

## Order 17. SARRACENIÀLES.

Insectivorous plants secreting a viscid liquid, with basal leaves and perfect scapose flowers. Corolla choripetalous. Sepals mostly distinct. Stamens usually hypogynous. Ovary compound, superior.

[^25]Fam. I. Sarraceniaceae.
Fam. 2. Droseraciae.

## Family 1. SARRACENIÀCEAE La Pyl. <br> Pitcher-Plant Family.

Marsh herbs, with tubular or pitcher-shaped leaves, and large scapose nodding flowers. Sepals 4 or 5 , hypogynous, imbricated, persistent. Petals 5, imbricated, hypogynous, deciduous or none. Stamens $\infty$; anthers versatile. Ovary I, 3 - 5 -celled; ovules $\infty$, in many rows. Capsule 3 -5-celled, loculicidally dehiscent; style terminal, peltate, lobed, or in one genus simple. Seeds small, the testa reticulated; embryo small; endosperm fleshy. Three genera and about io species, all natives of America.

## 1. SARRACÉNIA L.

Leaves hollow, with a lateral wing and a terminal lid or lamina. Sepals 5, with 3 or 4 bracts at the base. Petals ovate or oblong. Ovary 5 -celled. Style dilated into a peltate umbrella-like structure with 5 rays which terminate under its angles in hooked stigmas. Capsule 5 -celled, granular, rugose. Seeds anatropous. [Named in honor of Dr. Jean Antoine Sarracin, a botanist of Quebec.] About 8 species, natives of N. Am.
Leaves pitcher-shaped, curved ; flower purple or greenish (rarely yellow).
I. S. purpurea.

Leaves tubular-trumpet-shaped; flower yellow.
2. S. flava.
I. Sarracenia purpùrea L. Pitcher-plant. Side-Saddle Flower. (I. F. f. 1801.) Glabrous, except the inner side of the lamina and inner surface of the pitchers, which are clothed with reflexed hairs. Leaves tufted, ascending, I-3 dm. long, inflated, narrowed into a petiole, broadly winged, persistent; scapes 3-6 dm. high, bearing a nodding nearly globose flower 5 cm . in diameter or more; petals obovate, narrowed in the middle, incurved over the style. In peat-bogs, Lab, to the Canadian Rocky Mts., Fla., Ky. and Minn. May-June.

Sarracenia purpùrea heterophylla (Eaton) Torr. Flowers yellow ; leaves slightly or not at all purple-veined, light green or yellowish. Mass. and N. Y. to N. J.
2. Sarracenia flàva L. Trumpets. Trumpet-leaf. (I. F. f. I802.) Glabrous throughout. Leaves trumpet-shaped, $3-9 \mathrm{dm}$. long, $2-5 \mathrm{~cm}$. wide at the orifice, narrowly winged, prominently ribbed, the lid $2-10 \mathrm{~cm}$. wide, erect, contracted at the base; scape $3-6 \mathrm{dm}$. high, slender; flower $5-8 \mathrm{~cm}$. broad; petals oblanceolate or obovate, drooping, slightly contracted at the middle. In bogs, Va. to Fla. and La. April.

Family 2. DROSERACEAE S. F. Gray.

## Sundew Family.

Perennial or biennial glandular-pubescent herbs, exuding a viscid secretion, mostly with basal leaves, circinate in the bud, and fugacious perfect flowers, racemose in our species. Calyx persistent, 4-8-parted or the sepals distinct and imbricated. Petals 5, hypogynous, convolute, marcescent, distinct or slightly united at the base. Stamens 4-20; filaments subulate or filiform; anthers usually versatile. Disk none. Ovary free, or its base adnate to the calyx, I-3-celled ; styles I-5, simple, 2-cleft or multifid; ovules numerous. Capsule 1-5-ceiled, loculicidally dehiscent. Endosperm fleshy; embryo straight, cylindric. Six genera and about 125 species, of wide geographic distribution.

1. DROSERA L.

Bog herbs, with leaves clothed with glandular hairs which secrete a fluid that entraps insects, and scapose racemose flowers. Calyx-tube short, free from the ovary, deeply 4 - 8 -parted (commonly 5 -parted). Petals usually 5, spatulate. Stamens as many as the petals; anthers short. extrorse. Ovary I-celled; styles $2-5$, usually 3 , distinct or united at the base, often 2-parted so as to appear twice
as many, or fimbriate. Capsule 3 -valved (rarely 5 -valved), many-seeded, generally stipitate in the calyx. abundant in Australia. [Name from the Greek, dew.] About ino species, most Besides the following, 2 others occur in the southeastern States.
Blade of the leaf orbicular, or wider than long; petals white.

1. D. rotundifolia. Blade of the leaf linear, or longer than wide.

Leaves linear or spatulate with a distinct petiole ; petals white. Blade of the leaf spatulate.

Blade $2-3$ times as long as wide. 2. D. intermedia.
Blade 6-8 times as long as wide.
3. D. longifolia.

Blade linear, $10-15$ times as long as wide.
4. D. linearis.

Leaves filiform, much elongated, with no distinct petiole; petals purple.
5. D. filiformis.
I. Drosera rotundifòlia L. Round-leaved Sundew or Dew-plant. (I. F. f. 1803.) Scape glabrous, $\mathbf{I} \mathbf{- 2 . 5} \mathrm{dm}$. high. Leaves orbicular or broader, spreading, the blade $6-12 \mathrm{~mm}$. long, abruptly narrowed into a flat pubescent petiole; raceme I-sided; pedicels $2-4 \mathrm{~mm}$. long; flowers white, about 4 mm . broad; petals oblong; seeds fusiform, pointed at both ends, the testa loose. In bogs or wet sand, Lab. to Alaska, Fla. and Ala., and in the Sierra Nevada to Cal. July-Aug.
2. Drosera intermèdia Hayne. Spatulate-leaved Sundew. (I. F. f. 1804.) Rootstock elongated; scape glabrous, $0.7-2 \mathrm{dm}$. high. Blades of the leaves ascending, spatulate, obtuse, $6-14 \mathrm{~mm}$. long, $3-4 \mathrm{~mm}$. wide, gradually narrowed into a glabrous petiole; raceme 1 -sided; pedicels about 3 mm . long; petals white; seeds oblong, the testa close, roughened. In bogs, N. B. to Sask., Fla. and La. Also in the W. I. and Europe. July-Aug.
3. Drosera longifòlia L. Oblong-leaved Sundew (I. F. f. 1805.) Similar to the preceding, but the leaf-blade erect, longer ( $1.5-3 \mathrm{~cm}$. long, $3-4 \mathrm{~mm}$. wide), elongated-spatulate ; pedicels $\mathrm{I}-6 \mathrm{~mm}$. long; flowers white, $4-5 \mathrm{~mm}$. broad; seeds oblong, obtuse at both ends, the testa loose. In bogs, Newf. and arctic America to Br. Col., Ont. and Cal. Also in northern Europe and Asia. Summer.
4. Drosera lineàris Goldie. Slender-leaved Sundew. (I. F. f. 1806.) Scape low but sometimes exceeding the leaves, glabrous. Petioles erect, glabrous, $5-10 \mathrm{~cm}$. long; blade linear, $2-8 \mathrm{~cm}$. long, about 2 mm . wide, obtuse; flowers few, or solitary, white; seeds oblong, the testa close, smooth and somewhat shining. In bogs, shores of Lake Superior and Lake Huron, west to the Canadian Rocky Mts.
5. Drosera filifórmis Raf. Thread-Leaved Sundew. (I. F. f. I807.) Scape glabrous, $2-5 \mathrm{dm}$. high. Early leaves lanceolate, the apex glandular; later leaves filiform, glandular-pubescent, 1.5-4 dm. long, about 2 mm . wide, woolly with brown hairs at the base; racemes I-sided, 10 - 30 -flowered; pedicels $4-8 \mathrm{~mm}$. long; flowers purple, $8-25 \mathrm{~mm}$. broad; petals obovate; seeds fusiform, the testa minutely punctate. In wet sand, E. Mass. to Fla. July-Sept.

## Order 18. ROSALES.

Herbs, shrubs or trees, the flowers usually petaliferous and the petals distinct. Stamens mostly perigynous or epigynous. Sepals mainly united or confluent with the concave receptacle. Carpels one or more, distinct or sometimes united into a compound ovary.

[^26]Carpels fewer than the calyx-segments.
Staminodia present; carpels 3 or 4, wholly united into a one-celled ovary.
Fam. 4. Parnassiaceae.
Staminodia none; carpels mostly 2, their upper part at least distinct.
Fam. 5. Saxifragaceae.

## Shrubs or trees.

Leaves opposite.
Fam. 6. Hydrangeaceae.
Leaves alternate.
Fruit a 2-celled, thin-walled capsule; its base adnate to the calyx.
Fam. 7. Iteaceae.
Fam. 8. Grossulariaceae.
Fruit a r-celled berry.
Fam. 9. Hamamelidaceae.
$\dagger \dagger$ Endosperm none, or very little (copious in Opulaster, shrub of the Rosaceae); leaves mostly with stipules.
$\ddagger$ Trees with broad leaves and small monœecious densely capitate flowers.
Fam. io. Platanaceae.
$\ddagger \ddagger$ Flowers perfect, or if diœcious or monœecious not densely capitate.
a. Flowers regular.

Pistils usually several or numerous; if one only (as in Cercocarpus and sometimes in species of Alchemilla and Sanguisorba) it becomes a dry r -seeded achene.

Carpels distinct, rarely adnate to the calyx, ripening into follicles or achenes.
Fam. II. Rosaceae.
Carpels united, enclosed by the calyx-tube and adnate to it, the fruit a pome.
Fam. 12. Pomaceaz.
Pistil only 1 .
Ovary 2-ovuled; fruit a drupe; leaves simple. Fam. 13. Drupacea.
Ovary several-ovuled; fruit a legume; leaves 2-3-pinnate.
Petals valvate in the bud. Fam. 14. Mimosaceae.
(Petals imbricated in the bud: Gleditsia and Gymnocladus in the Caesalpiniaceae.)
b. Flowers irregular (nearly or quite regular in Gleditsia and Gymnocladus, trees of the Caesalpiniaceae).
Fruit a legume; upper petal enclosed by the lateral ones in the bud; leaves compound, mostly stipulate.
Fruit spiny, indehiscent; leaves simple, estipulate.
Fam. 15. Caesalpiniaceae.
Fam. 16. Krameriaceae.
Fruit a legume or loment; upper petal enclosing the lateral ones in the bud; leaves compound (sometimes I-foliolate), stipulate.

Fam. 17. Papilionaceae.

## Family 1. PODOSTEMACEAE Lindl.

## River-weed Family

Small aquatic herbs, the leaves usually poorly differentiated from the stem, the whole structure commonly resembling the thallus of an alga or hepatic, the small usually perfect flowers devoid of any perianth and subtended by a spathe-like involucre, or in some genera with a 3 -5-cleft membranous calyx. Stamens hypogynous, only 2 in the following genus, numerous in some others; anthers 2 -celled, the sacs longitudinally dehiscent. Ovary $2-3$-celled ; ovules, usually numerous in each cavity, anatropous; styles 2 or 3, short. Capsules 2-3-celled, ribbed. Seeds numerous, minute, without endosperm; embryo straight. About 21 genera and 175 species, mostly in the tropics.

## r. PODOSTEMON Michx.

Flowers sessile or very nearly so in the spathe-like involucre. Perianth none. Stamens 2, their filaments united to near the summit; anthers 2, oblong or oval. Staminodia 2, filiform. Ovary ovoid, 2-celled; stigmas 2, short, subulate. Capsule ovoid, 6-10-ribbed, 2-valved. [Greek, stalked-stamens.] About 12 species of wide gengraphic distribution.
I. Podostemon Ceratophýllum Michx. River-weed. Thread-foot. (I. F. f. I8c8.) Plant dark green, rather stiff, firmly attached to stones in running water, densely tufted, $2-25 \mathrm{~cm}$. long, the leaves sheathing at the base, commonly split above into almost filiform segments. Flowers less than 2 mm . broad, at length bursting from the spathes; capsule oblong-oval, rather more than 2 mm . long, obtuse, borne on a stipe of about its own length, 8-ribbed. In shallow streams, Mass. to N. Y., Ont., Minn., Ga., Ala. and Ky. July-Sept.

## Family 2. CRASSULÀCEAE DC

## Orpine Family.

Herbs, or somewh shrubby plants, mostly fleshy or succulent, with cymose or rarely solitary regular or symmetrical flowers. Stipules none. Calyx persistent, free from the ovary or ovaries, 4 - 5 -cleft or $4-5$-parted in our species. Petals equal in number to the calyx-lobes, distinct, or slightly united at the base, usually persistent, rarely wanting. Stamens of the same number or twice as many as the petals; anthers longitudinally dehiscent. Receptacle with a scale at the base of each carpel. Carpels equal in number to the sepals, distinct, or united below ; styles subulate or filiform ; ovules numerous, arranged in 2 rows along the ventral suture. Follicles i-celled, dehiscent along the ventral suture. Seeds minute; endosperm fleshy; embryo terete; cotyledons short, obtuse. About 15 genera and 500 species, of wide geographic distribution.

## 1. TILLAEA L.

Minute aquatic or mud-loving herbs, with opposite entire leaves and very small flowers. Calyx 3-5-parted. Petals 3-5, distinct, or united at the base. Carpels 3-5, distinct. Styles short, subulate. Ovules usually few. [Named after Michael Angelo Tilli, 1653-1740, an Italian botanist.] About 20 species of wide distribution. Besides the following, about 4 others occur in the western States.
I. Tillaea aquática L. Pigmy-weed. (I. F. f. 1809.) Stem i-8 cm. high, glabrous. Leaves linear-oblong, entire, connate at the base, $4-6 \mathrm{~mm}$. long; flowers solitary, axillary, sessile or short-peduncled, 1 mm . broad; calyx-lobes, petals, stamens and carpels 4 , rarely 3 ; petals greenish, about twice the length of the calyx-lobes; follicles ovoid, longer than the calyx-lobes, 8-Io-seeded. Muddy banks of streams, N. S. to Mass. and Md. Also in Europe. July-Sept.

## 2. SEDUM L.

Fleshy mostly glabrous herbs, mainly with alternate, often imbricated leaves, and perfect or diocious flowers in terminal often I-sided cymes. Calyx 4-5-lobed. Petals 4-5, distinct. Stamens perigynous, the alternate ones usually attached to the petals. Carpels $4-5$, distinct, or united at the base; styles usually short: ovules $\infty$. [Latin, to sit, from the lowly habit of these plants.] About 150 species, mostly natives of temperate and cold regions of the northern hemisphere. Besides the following, about 20 others occur in western N. Am.

Cyme regular, compound, the flowers not secund; leaves broad, flat.
Flowers diœcious, mostly 4 -parted.

1. S. roseum.

Flowers perfect, 5 -parted.
Petals purple ; plant somewhat glaucous ; petals twice as long as the sepals.
2. S. Telephium.

Petals pink ; plant very glaucous; petals 3-4 times as long as the sepals.
3. S. telephioides.

Flowers secund along the branches of the cyme. Petals yellow.

Leaves short, thick, ovate, densely imbricated.
Leaves linear or terete, scattered on the stems.
Annual ; petals little longer than the sepals.
Perennial ; petals twice as long as the sepals. Plant $0.7-1.5 \mathrm{dm}$. high; native, western. Plant $2-3 \mathrm{dm}$. high, introduced in a few places.
4. S. acre.
5. S. Torreyz.
6. S. stenopetalum.
7. S. reflexum.

Petals purple or white.
Leaves terete; petals purple, pink, or white.
8. S. puichellum.

Leaves flat, spatulate or obovate; petals white.
Lower leaves verticillate in 3 's.
9. S. ternatum.

Leaves all alternate.
I. Sedum ròseum (L.) Scop. Roseroot. Rosewort. (I. F. f. 1810.) Perennial, glabrous and somewhat glaucous, I-3 dm. high. Leaves sessile, oval or obovate, dentate or entire, $1-2.5 \mathrm{~cm}$. long, the lower ones smaller; cyme dense, $\mathrm{I}-5 \mathrm{~cm}$. broad; flowers yellowish-green or purplish, $5-8 \mathrm{~mm}$. broad; sepals oblong, narrower and shorter than the petals; follicles about 4 mm . long, their tips spreading. In rocky places, Lab. and arctic Am. to Me., E. Penn. and on the southern Alleghanies. Also in the Rocky Mts. south to Colo., and in Europe and Asia. May-July.
2. Sedum Telèphium L. Orpine. Live-forever. (I. F. f. i8iI.) Perennial ; stems stout, tufted, glabrous and slightly glaucous, 3-5 dm. high. Leaves alternate, ovate to obovate, obtuse, $2-5 \mathrm{~cm}$. long, coarsely dentate, the upper sessile, the lower larger; cyme dense, compound, $5-8 \mathrm{~cm}$. broad; flowers $5-8 \mathrm{~mm}$. broad; petals purple, twice as long as the ovate acute sepals; follicles about 4 mm . long, tipped with a short style. In fields and along roadsides, Quebec to Ont., Md. and Mich. Nat. from Europe. Blooms sparingly, but spreads freely by its joints. June-Sept.
3. Sedum telephioides Michx. American Orpine. (I. F. f. 18i2.) Similar to the preceding, but more slender, seldom over 2.5 dm . high, glaucous and purplish. Leaves oval or obovate, obtuse, coarsely dentate or entire, $2-5 \mathrm{~cm}$. long, narrowed at the base; cyme dense, $5-10 \mathrm{~cm}$. broad; flowers $6-8 \mathrm{~mm}$. broad; petals pale pink, much longer than the lanceolate sepals; follicles about 4 mm . long, tipped with a slender style. On dry rocks, S. Penn. to W. N. Y., S. Ind., N. Car. and Ga. Aug.-Sept.
4. Sedum àcre L. Wall-pepper. Mossy Stonecrop. (I. F. f. i813.) Perennial, densely tufted, matted, glabrous; sterile branches prostrate, the flowering ones $2-8 \mathrm{~cm}$. high. Leaves sessile, alternate, ovate, thick, imbricated, yellowish green, entire, about 3 mm . long; cyme $2-3$-forked, its branches $1-2.5 \mathrm{~cm}$. long; flowers sessile, about 8 mm . broad; petals yellow, linear-lanceolate, acute, 3 or 4 times as long as the ovate sepals; follicles spreading, $3-4 \mathrm{~mm}$. long, tipped with a slender style. On rocks and along roadsides, N. B. to Ont., N. Y. and Penn. Adventive from Europe. June-Aug.
